Your committee recognizes that health needs and means to supply such needs vary throughout the United States. Studies indicate that health needs are not identical in different localities but that they usually depend on local conditions and therefore are primarily local problems. Your committee therefore encourages county or district medical societies, with the approval of the state medical society of which each is a component part, to develop appropriate means to meet their local requirements.

In addition to insurance for hospitalization, your committee believes it is practicable to develop cash indemnity insurance plans to cover, in whole or in part, the costs of emergency or prolonged illness. Agencies set up

to provide such insurance should comply with state statutes and regulations to insure their soundness and financial responsibility and have the approval of the county and state medical societies under which they operate.

Your committee is not willing to foster any system of compulsory health insurance. Your committee is convinced that it is a complicated, bureaucratic system which has no place in a democratic state. It would undoubtedly set up a far-reaching tax system with great increase in the cost of government. That it would lend itself to political control and manipulation there is no doubt.

Your committee recognized the soundness of the principles of Workmen's Compensation laws and recommends the expansion of such legislation to provide for meeting the costs of illness sustained as a result of employment in industry.

Your committee repeats its conviction that voluntary indemnity insurance may assist many income groups to finance their sickness costs without subsidy. Further development of group hospitalization and establishment of insurance plans on the indemnity principle to cover the cost of illness will assist in solution of these problems.

5 Under Recommendation V on Insurance against Loss of Wages during Sickness In essence, the recommendation deals with compensation of loss of wages during sickness. Your committee unreservedly endorses this principle, as it has distinct influence toward recovery and tends to reduce permanent disability. It is, however, in the interest of good medical care that the attending physician be relieved of the duty of certification of illness and of recovery, which function should be performed by a qualified medical employee of the disbursing agency."

The Council had received in October, 1938, a suggestion from the Medical Society of the county of Westchester in the form of a resolution as follows:

"RESOLVED, that the County Society take such steps as may be required to cause a special meeting of the House of Delegates to be held at the earliest possible date for the sole purpose of formulating and expressing its attitude toward the medical economic problems which are now being brought to the attention of the public by the activities of legislative bodies and government agencies and by ex-

tensive publicity in newspapers and periodicals "

After full consideration the Council directed that all the county societies be officially advised of the following actions of the Council

"Placing the Society on record as in full accord with the recommendations adopted by the Special Session of the House of Delegates of the American Medical Association of September 16, 17, 1938 including that favoring cash indemnity insurance for medical expense.

'Approval of the principle of *non profit* cash indemnity medical insurance.

"Instructions to the Legislative Committee to support legislation for amendment of the insurance laws which would permit nonprofit cash indemnity medical insurance.

Advice from the Council that if in the rapidly moving field of medical economics new matters come up they will be as promptly handled as possible in a Special Session of the House

This information was sent to the secretaries of the county societies under date of November 26, 1938

In addition to its routine minor work the Council has given attention to the following major subjects

Postgraduate Medical Education

Through its Committee on Public Health and Education

Thomas P Farmer, M D , *Chairman*
Syracuse

O W H Mitchell, M D
Syracuse

George Baehr, M D
New York

the Council has arranged courses in the following counties during the current year

| | |
|-------------|------------------|
| Cattaraugus | Pediatrics |
| Cayuga | General Medicine |
| Chemung | General Medicine |
| Clinton | General Medicine |
| Columbia | General Medicine |
| Franklin | General Medicine |
| Genesee | General Medicine |

| | |
|--------------|-------------------|
| Jefferson* | Heart Disease |
| Madison | General Medicine |
| Monroe | General Medicine |
| Oneida | Heart Disease |
| Rockland | General Medicine |
| St Lawrence* | Heart Disease |
| Schoharie* | General Medicine |
| Steuben | General Medicine |
| Sullivan | General Medicine |
| Tioga | Traumatic Surgery |

There is a continually increasing interest manifested by county medical societies in these yearly postgraduate courses. During the current year, this has been evidenced by good attendance at the lectures and comments received from county societies regarding these talks, but most especially by the fact that county medical societies have placed their applications with the committee for these lectures much earlier than has been our experience in the past. There is no doubt that an attempt should be made to expand our program of postgraduate education, whereby resident courses of short duration would be set up in a limited number of centers throughout the state, these would be available to physicians who would be willing to leave their work for short periods of time and benefit by such instruction. Nevertheless, the plan now in practice of taking lecturers to the physicians offers a wider opportunity of instruction than any other method suggested. Regardless of any new plans the present postgraduate courses for county societies should be continued.

With the co-operation of the State Department of Health and the local county medical societies, one-day Pneumonia Institutes have been arranged to be given in Buffalo for the Erie County Medical Society on February 16, and in Troy, for the Rensselaer County Medical Society, on March 2. These institutes are open to members of adjacent county medical societies as well. Although the registration for these institutes has been limited to seventy-five, eighty four applications have been re-

* To be given after the Annual Meeting of the House of Delegates of the State Society

ceived for the Buffalo Institute. As the programs of these institutes have been widely publicized, it is needless to repeat them here. In addition to furnishing more extended professional education regarding pneumonia, these institutes serve as a stimulus for further institutes on other subjects.

During the past year, the work of the Medical Society of the State of New York in postgraduate education has been described in the *Journal of the American Medical Association*, as has been the work in other state societies. The committees on postgraduate education in these other states have organized a group known as the Associated Postgraduate Committees, which meets at the time of the annual meeting of the American Medical Association. The chairman of your committee is vice-chairman of this group. The American Medical Association has invited the Medical Society of the State of New York to place an exhibit of its work on postgraduate education in the scientific exhibits at the next meeting of the American Medical Association.

Public Health Matters

Through Dr. Farmer's Council Committee the Society has continued to give attention to various matters in the field of public health in the state. Conference and co-operation with the State Department of Health and other agencies, as well as with the county societies is an essential part of this activity.

Pneumonia Control Program—The Society has continued to take an active part in this program which it was responsible for launching in New York State in combination with the State Department of Health, the State Association of Laboratories, the Metropolitan Life Insurance Company, and the Commonwealth Fund.

It has worked out with the State Department of Health measures for further professional and lay education in pneumonia therapy.

In addition to the Pneumonia Institute arrangements described under the

title Postgraduate Medical Education, the Society has collaborated with the State Department of Health in lay education. A Speakers' Service Bulletin was issued by our Public Relations Bureau for county societies containing reference material which physicians can use in talks to lay audiences. Information comes from Dr. Alexander D. Langmuir, Medical Consultant, Bureau of Pneumonia Control of the State Department of Health, that this has been widely used by physicians in addressing meetings of the home bureaus through the state.

Cancer Control—The Society has been able to confer on a subject of importance with the Legislative Cancer Survey Commission. The commission, through its member, Dr. Floyd S. Winslow, asked the Society's attitude on a bill which it planned to introduce making cancer a reportable disease. The Council spent a large part of one meeting discussing the details and implications of this bill with Dr. Russell S. Ferguson and Dr. Morton L. Levin, who were at work for the commission. The Council approved the bill in principle and referred it to the Committee on Legislation for any further action that might be necessary during the legislative period.

Maternal Welfare

The Special Committee on Maternal Welfare

Charles A. Gordon, M.D., *Chairman*,
Brooklyn

James K. Quigley, M.D. Rochester

Ferdinand J. Schoeneck, M.D. Syracuse

set up by the House of Delegates, reports to the House, in the manner instructed, through the Council. The report follows.

The Council has directed the Publication Committee to co-operate with the Committee on Maternal Welfare in the publication of articles on prenatal, intrapartum, and postpartum care.

We are aware of committees on maternal welfare in thirty-six county societies. A few societies are interested in infant mortality, or include maternal mortality

in the general activities of a public health committee. The following counties have organized committees Albany, Broome, Bronx (Maternal Mortality), Cattaraugus, Cayuga, Chautauqua, Chemung, Chenango, Erie (Obstetrical Council), Herkimer, Jefferson, Kings, Madison (Public Health), Monroe, Montgomery (Child Hygiene), Nassau, New York, Niagara, Oneida, Onondaga, Ontario, Orange, Queens, Rensselaer (Child Welfare and Infant Mortality), Richmond, Rockland (Public Health and Public Relations), Saratoga, Schenectady, Schuyler, Steuben, Suffolk, Tompkins, Warren, Westchester, Wyoming (Public Health Nursing), and Yates

The immediate concern of committees on maternal welfare is prevention of maternal death. Fetal and neonatal mortality are closely related major problems, which have received less attention. Not a purely medical question because of important social and economic factors, the medical problem can be solved only by education of the public the hospital, and the physician

In several cities of the state, Brooklyn, Buffalo, New York, Rochester, and Syracuse, and in Bronx and Queens Counties, committees have conducted searching inquiries into the circumstances of every puerperal death. They have shown that gross mortality figures are unsatisfactory and have helped to make their communities maternal mortality conscious, yet for the most part the high educational value of discussions of this valuable case material has been lost.

These committees on analysis provide a nearly perfect mechanism for the continuous education of everyone practicing obstetrics. Current group review of personal experience with actual cases is ideal postgraduate education when qualified obstetricians participate in the discussions. Infant mortality may be studied in the same way with the help of pediatricians. This program will excite individual interest on a large scale, and make every physician feel that he can make an important contribution himself

The Special Committee on Maternal Welfare recommends that

1 A Committee on Maternal Welfare be set up in every county medical society of the state. The function of these committees will be to survey local problems and resources, guide and participate in lay education, elevate local standards of practice, initiate and support proper hospital programs, and most important of all, review in detail every puerperal death which may have occurred in the county. The stillbirth and neonatal death problem should be studied currently, but whether by another committee or not will depend upon local conditions

Every hospital in the county which admits women for delivery, ectopic, and abortion should be invited by the president of the county society to name physicians, not necessarily members of the society, who shall act as a Committee on Analysis with the Committee on Maternal Welfare. True copies of certificates of death will be made available by local health officers. The members of the committee will explore the circumstances of each death, and keep a written record on proper forms

At intervals, every physician in the county, whether members of the county society or not, should be invited to attend the meetings at which these cases are to be reviewed. Hospitals or individuals should not be identified, their names being known only to the recorder or secretary of the committee who will report the cases in detail for consideration. To arouse vigorous discussion, it is best to discuss controllable factors. No criteria for preventability need be set up other than those which develop about the case material

2 Organization of this program when requested by a county society, shall be carried on by consultants appointed by the Committee on Maternal Welfare of the Medical Society of the State of New York, which shall be authorized to arrange with the Council for an honorarium for such consultants.

3 In the event that county society committees on maternal welfare find themselves in need of consultants to participate in the meetings of their committees on analysis, the Committee on Maternal Welfare of the Medical Society of the State of New York shall be authorized to arrange with the Council for an honorarium for this service

The Committee is pleased to report considerable decline in the maternal mortality rate for 1938

The medical problem appears in detail in an article entitled "Prevention of Maternal Deaths" in this issue of the *New York State Journal of Medicine* (see page 535)

Part II

Medical Care Surveys in New York State

Two surveys have been in progress, the one by the county societies and the state society which was initiated by the American Medical Association, and the other by the New York State Temporary Commission to Formulate a Health Program which was created by the legislature of the state

The American Medical Association Survey—The Council instructed a committee consisting of O W H Mitchell, M D, *Chairman*, Syracuse, Edward G Whipple, M D, Rochester, Walter W Mott, M D, White Plains, Leo F Schuff, M D, Plattsburg, Frederic C Conway, M D, Albany, Herbert H Bauckus, M D, Buffalo, to go into the various features of the study. On the advice of this committee it was considered best that this survey be started by a cross section of the sixty-two county societies, rather than to advise all to go at once to work on this rather heavy and not inexpensive task. At the Conference of County Society Secretaries some sixteen volunteered. In some of these the work is in progress and at this date, February 27, three are completed, others are on the point of completion. These counties were considered as representative of differing distribution of population, rural, and metropolitan areas, counties with many small towns, and counties where

the population is grouped in cities as well as small towns and rural

The State Society Study relates to distribution of physicians in the state, state hospitals financed and run by the state, etc. This study is practically complete including the metropolitan area in New York City. In this connection Dr Lawrence brought up to date for the decade 1928–1938 his former study of the distribution of physicians in New York State which covered the sixty years by decades from 1878. This was published in the February 1, 1939, issue of the *New York State Journal of Medicine*. The Council directed that full publicity be given this article and the press took wide notice of it in its editorials as well as news columns. The conclusions drawn from the study were

Deductions

1 Resident physicians and hospitals are distributed throughout the state in such fashion that no area is without medical service. Schuyler County has the lowest ratio of physician to population, 1 1,298, and the highest is in Dutchess County, 1 478. In the relation of general hospital beds to the population, the lowest is found in Livingston County, 1 1,644, and the highest ratio exists in Ontario County, 1 84. In evaluating these figures, it must be borne in mind that no county is an isolated unit, so that the services of physicians and hospitals of neighboring counties are always available.

2 Improved conditions for transportation and communications in the rural districts have increased the usefulness of the physician many times over what it was just ten years ago.

3 The same conditions have led the rural resident to seek the services of the city physician except for emergencies. In some instances this trend has induced rural physicians to move to the cities, at the same time retaining their rural practices.

4 Nevertheless, improved living conditions are attracting young men to locate in the rural areas.

5 There is no marked difference in the ages of the men practicing in the rural districts as compared with those in the urban districts.

6 Decreases in population must be marked and prolonged before there is any effect upon the number of physicians. Areas of growing population have larger proportions of young physicians.

7 Nursing service as a part of a public health program demands prompt study

The Survey by the New York State Temporary Commission to Formulate a Health Program—This commission, through its chairman, Senator Leon A. Fischel, invited the Medical Society of the State of New York, through its secretary, to attend a hearing which was held in New York City December 13 to 16, 1938. In the four days various organizations were scheduled to appear as follows

Morning Session

10 00 A.M.—1 00 P.M.

- Dec. 13 Official governmental agencies
- Dec. 14 Public Health organizations Insurance companies
- Dec. 15 Philanthropic groups
- Dec. 16 Representatives of industry funds and foundations

Afternoon Session

2.30 P.M.—5 00 P.M.

- Dec. 13 Medical and dental societies
- Dec. 14 Citizen groups
- Dec. 15 Labor organizations and fraternal orders
- Dec. 16 Allied professional organizations

The invitation asked that five questions prepared by the commission be answered in writing and amplified, if desired verbally. The Council directed that a conference be sought of representatives from the county societies of New York City and the surrounding area, from the State Society, and from the New York Academy of Medicine. This was done, and the following answers were worked out and submitted by Dr. Irving. There was also handed to the commission a copy of the 1938 Report of the Special Committee on Matters Pertaining to Medical Care as adopted with amendments by the House of Delegates.

Question No. 1—The relief population of this state is receiving some kind of medical care. Assuming that the problems of medical care will exist for relief recipients over a number of years, what suggestions would you offer for a long-range health program for this group of the population?

Answer—Assuming that the problems of medical care of the indigent that is those on

relief will exist over a number of years if not permanently the Medical Society of the State of New York offers the following suggestions for a long range program for these people

a That it be considered that the cost of medical care to the indigent is the obligation of their communities and should be met by the taxpayers in so far as voluntary philanthropy can and will shoulder some portion of the burden

b That it is the duty of local government when possible to certify indigency and administer the payments which will have to be made to physicians or hospitals

c. That the state may have to assist the poorer communities to such extent as may prove to be necessary

d That the proper government official of the locality should arrange with the organized medical profession to provide methods of securing medical service

e That while it is recognized that different methods may be needed in different localities, an underlying principle should be accepted on all sides namely the retention of the freedom of choice of physician by the indigent to the end that each may have his own chosen physician

f That with regard to the actual medical care of the indigent the organized medical profession the county societies with the assistance of the State Medical Society should accept the responsibility to see that this care shall be of the highest standard and be kept at that level

g That the Medical Society of the State of New York stands ready to accept its obligation along these lines

Question No. 2—Perhaps the most important problem of medical care presented is that concerning the low income group of population of this state. There has been considerable discussion as to whether or not the application of the principles of insurance to the various aspects of this problem might lead to a solution. At the present time there are various voluntary insurance plans in effect dealing with hospital service insurance. These meet with the approval of the state and national medical and hospital associations. In addition the House of Delegates of the American Medical Association at its special session on September 16 1938 adopted the following statement. In addition to insurance for hospitalization your committee believes it is practicable to develop cash indemnity insurance plans to cover in whole or in part the costs of emergency or prolonged

illness" (*A M A Journal*) What is your opinion as to the efficacy of some form of sickness insurance as a remedy for this situation?

Answer—For the low income group, the following mechanisms are suggested

- a Hospitalization insurance
- b Nonprofit cash indemnity insurance for medical expense.

The Medical Society of the State of New York believes that such insurance coverage should be on a voluntary and not a compulsory basis

With regard to that portion of the low income group who are unable to purchase such insurance, the Society believes that these individuals should be classed as medically indigent, and therefore come under the answer to the first question

Question No 3—Public health activities, including public health nursing, communicable disease control, and school examinations, have been a part of the functions of state and local government for many years Do you feel that present public medical and health facilities meet the need for care of persons unable to provide such care for themselves? If not, specify what needs are not being met and what methods should be used to extend these programs or facilities and under what official auspices

Answer—The Medical Society of the State of New York considers the present official and professional facilities, in so far as they relate to the educational, sanitary, and administrative services for health as these services are developing, meet the needs of the public

Question No 4—The Interdepartmental Committee presented an extensive public health and medical care program at the National Health Conference held last July in Washington This program includes both preventive and curative health measures From your experience and knowledge of the problems of health, would you agree with the statement "that the present efforts of the medical profession in providing medical care should be supplemented by state and local governments?"

Answer—The proposals of the so-called "National Health Program" issued by the Federal Government officers and their technical committee appear to us to be based on estimates that do not apply to conditions in New York State, for this reason, discussion of their suggestions with reference to the population would serve no practical or useful purpose at present

The attitude of the Medical Society of the State of New York on the question of govern-

ment participation is covered in its answers to the previous three questions

Question No 5—What functions do you think private health organizations should perform in public health programs of the state?

Answer—The private health agencies should function primarily for the information of the public on how to utilize available medical facilities, and secondarily to supplement these facilities by furnishing or supplementing bedside nursing when not otherwise available, and by furthering the solution of specific problems, such as tuberculosis and cancer They should educate the people to understand the scientific truths back of proved health promotion procedures

The final report of the studies of this Commission is at this date (February 27, 1939) still to be presented to the Legislature

Medical Relief

Through its Committee on Public Relations and Economics

| | |
|----------------------------|---------------|
| Augustus J Hambrook, M D , | <i>Chair-</i> |
| <i>man</i> | Troy |
| James M Flynn, M D | Rochester |
| Louis H Bauer, M D | Hempstead |

with Dr Lawrence and Dr Irving sitting ex-officio, the Council has conferred at length with representatives of the State Department of Social Welfare looking toward establishment of suitable rules and regulations governing this work

Probably one of the most important problems presented to the members of the committee this year was that of medical relief The present setup has been far from satisfactory and there has been too much centralization of authority, and, as a result, too many arbitrary decisions A central authority cannot have the necessary information to decide a local problem The medical profession has too little to say about its own activities under the Social Welfare Act Administrative rules have necessarily been too inelastic and also there has been an accompanying amount of annoying red tape unavoidable under such a system

The committee has had in mind giving the local welfare districts greater author-

ity in managing their own affairs. It has tried to set up a system more or less comparable to that which has proved so satisfactory in the administration of Workmen's Compensation. The present revised regulations recommend the establishment of Professional Advisory Committees in local welfare districts. This has been done with great success in Nassau County but probably the reason that other counties have not followed suit is because such a committee is purely advisory without any authority. The Public Relations and Economics Committee has felt that the establishment of a Professional Advisory Committee in each county and giving it the authority in local problems now vested in Medical Social Workers or in the Department of Social Welfare at Albany, would obviate many of the unsatisfactory conditions and criticisms which have been current in the past.

There are some thirty situations which can be handled locally by the committee which have heretofore had to be referred to an outside authority. This will obviate endless delays and make medical relief function more efficiently with less red tape or preparation of complicated reports. A revised reporting card is contemplated which may contain the names of all being cared for during the month, one set of signatures only and one notarization only to be required.

Attached hereto is a list of the duties which would be passed over to Professional Advisory Committees. These committees should vary in size depending upon the work prevalent in the county. We would suggest three or more medical members nominated by the Medical Society and appointed by the local Commissioner of Welfare. There should also be at least one dental member, and a nurse or druggist may be added as may be deemed necessary or expedient. One or more survey boards may be designated by the committee to assist it in the investigation of the handling of individual cases. It is possible that in counties that have only a small relief problem the local Compensation Board could

do double duty. In counties with a large relief problem, a separate committee would be essential.

In addition to the general medical problems listed on the attached itemization, these committees would prepare lists of those qualified and desirous of doing relief work under the Act, and should have the power of disciplining if necessary those who fail to co-operate in the program.

In addition, there should be a State Professional Advisory Committee to coordinate the activities of the county committees and act as a buffer between them and the State Department of Social Welfare. It is recommended that this committee be, so far as possible, a continuing committee. It will be necessary for this committee to instruct local committees in their duties and help them get organized and under way. It would be disastrous for the committee to be changed *en toto* each year.

In addition, when the work in the county is sufficient to warrant it, there should be a part time or full time Medical Director of Relief, appointed on the recommendation of the local Medical Society and such an appointee should have the following qualifications:

- 1 Graduation from Class A medical school, licensed to practice in the State of New York.

- 2 At least two years and preferably three years of general practice, one year of which should have included the care of relief recipients.

- 3 Some administrative experience preferably in public welfare, but the following should also be considered: medical director or assistant medical director in a large insurance company, medical supervisor of a public or private hospital dispensary, or Department of Health.

- 4 Knowledge of the psychology of the relief recipient and especially the ability to analyze medical problems relative to that vast group of relief patients whose particular ailments are minor, although they suffer much discomfort as a result of improper mental adjustment and misdirection of their energies. This

can be obtained by relief work and by training in college courses in psychology

The fee schedule has also been discussed very carefully. It has been recognized that the Workmen's Compensation Fee Schedule is the lowest schedule of price which can be paid to insure good medical work and allow the doctor a reasonable profit for his efforts. It must be remembered that the bills paid under Workmen's Compensation come out of industry and the cost of Social Welfare is a direct charge on the public saving and comes out of taxes. To pay Workmen's Compensation Fees on relief cases would bankrupt the state of New York. It has, therefore, been recommended that there be inserted in the Manual a statement that while this schedule is recognized as the lowest one compatible with good work, efficiency, and a reasonable profit, nevertheless, it is impossible to pay such fees, and the doctor is asked to contribute the difference between these scheduled fees and the adopted fees as his share of charity.

The Workmen's Compensation Fee Schedule has been adopted *in toto* with certain minor exceptions with the proviso that a certain percentage of this schedule will be paid for relief work. This percentage will in general vary from 50 to 75 per cent of the Workmen's Compensation Fee Schedule.

There have been numerous complaints that prescribing has been restricted heretofore to the U S Pharmacopoeia and the National Formulary items. There are a number of recognized remedies not yet appearing in either of these publications which should be indorsed. The committee is preparing a supplementary list of items which will be approved without question. Certain other methods of treatment in function now or to be used in the future can be approved locally on the recommendation of the Professional Advisory Committee.

To summarize, therefore, the whole relief problem is under revision to provide a system of administration comparable to that Workmen's Compensation with local autonomy and with a more reasonable fee schedule for payment of the relief pa-

tients' own chosen physicians. This program now awaits the approval of the Medical Society of the State of New York and the Department of Social Welfare. It is felt that such approval will alter the present unsatisfactory administration of medical relief both from the standpoint of the physician and of the Department of Social Welfare.

Duties of the Professional Advisory Committee

Medical problems, needing the opinion of a physician or physicians, may be referred to the local Professional Advisory Committee by the local Commissioner of Public Welfare or the Area Office Medical Social Worker.

Item 1 *Acute Illness*

When medical care has been given for a prolonged period and physician continues to ask for authorization on an acute basis (Ref by Commissioner)

Item 3 *Boarding Homes*

First three months of care refer by Medical Social Worker to Committee if she questions advisability—for renewal Commissioner may refer to Committee before submitting to Medical Social Work. If he does not refer it to Committee certainly Medical Social Worker would see that this be done.

Item 4 *Chronic Illness*

Either Commissioner or Medical Social Worker refer if renewal is requested. If Committee OK's No 4957, secure from them at what period forms should again be referred for review.

Item 5 *Consultant or Specialist*

Only refer when Commissioner questions advisability of request.

Item 6 *Dental*

Commission may wish to refer to dentist or Committee what seems to be excessive or unusual charges and necessity of authorizing such a request. The cost of dental surgery is a problem to Commissioners and may often be referred to Committee.

Item 6g *Chronic Diabetes*

Refer renewal of No 4957 to Committee as routine and ask for recommendation as to when No 4957 should be referred back for second review by Committee.

Item 8 *Drugs*

Refer to Committee all requests for drugs and sera not listed as USP or NF, or sera not

given by Health Department, or for use of long time expensive drugs

Item 9 *Eye Examinations*

Refer problem of eye specialist or specialists refusing to conform with reimbursement price schedule—asking \$8 00—\$10 00 for each examination.

Item 10 *Fractures*

Refer unusual circumstances where surgery has been done at home or physician's offices and where the charges for such services seem excessive.

Item 12 *Hospital Care*

Refer renewal of hospital care to Committee.

Item 13 *Laboratory*

Refer requests for laboratory services in chronic or protracted illnesses Committee to work out a list of physicians who could do this work in their offices where no local, or state aid laboratories are established.

Item 14 *Major Surgery Outside Hospital*

Such requests might be reviewed by Committee if such requests were questioned by Commissioner

Item 15 *Major Surgery in Hospital*

Refer for review those cases where renewal is asked after first thirty (30) days

Item 16 *Medical Attendance*

Refer for review those cases where renewal is asked for after first thirty (30) days

Item 18 *Mileage*

Refer all physician's bills to Committee where a dispute arose over mileage.

Item 19 *Minor Surgery*

Refer where renewal of authorization is requested beyond ten days

Item 20 *Morphine or Narcotic Addiction*

Refer for review before sending to Medical Society Worker

Item 21a *Nursing Care*

Refer for decision after three months and plan when case should be referred on second review

Item 21d. *Home Help (Medical)*

Only refer when Medical Social Worker wishes to have problem reviewed for medical decision relative as to whether or not patient is in need of Institutional Care.

Item 23 *Physiotherapy*

Refer all requests for physiotherapy after 6 RX have been authorized.

Item 24a. *Pneumonia Serum (Home)*

Refer for opinion when conditional authorization is requested after thirty (30) days and when type serum not given by Health Department

Item 24b *Pneumonia Where Serum Not Given*

Refer cases where more than one visit per day or special circumstances have arisen

Item 27 *Radium Therapy*

Refer call cases where renewal is requested after 10 RX.

Item 28 *Sickroom Supplies*

Medical Social Worker may refer such requests as gatch bed back rests etc. if opinion is needed

Item 29 *Treatment Eye Diseases*

Refer chronic eye treatment No 4957 for review by Committee and request when No 4957 should be referred back for a second review

Item 30 *Tuberculosis*

Chronic Refer No 4957—same as above.

Item 31 *V D Chronic*

Refer after 21 treatments have been authorized and further authorization is requested

Item 32 *X Ray Diagnosis—Vol Hospital and Physician's Office*

Refer when cost exceeds \$20 00 and further authorization is requested.

Item 33 *X Ray Treatment—Vol Hospital and Physician's Office*

Refer to Committee for decision and if renewal is requested refer back for opinion

Part III

Nonprofit Medical Expense Indemnity Insurance

To this subject the Council has devoted much time and thought following the declaration of the Special Session of the House of Delegates of the American Medical Association in favor of voluntary cash indemnity insurance and against compulsory health insurance.

After recording the Society in full accord with the policies adopted at the Special Session, the Council formally approved "the principle of nonprofit cash indemnity medical insurance." It then instructed its Committee on Legislation "to support legislation for amendment

of the insurance laws which would permit nonprofit medical insurance." This has been done with respect to a bill introduced at request of the State Department of Insurance, amending Article IX-C to this effect—an enabling act which would permit the setting up of nonprofit organizations and which would prevent a single such corporation from writing insurance for both hospital care and medical care.

The Council has been made aware of much interest throughout the state in this subject, and particularly that certain of the existing successful hospital insurance organizations have expressed a desire to extend their insurance to cover medical expense as well as hospital expense. Conferences have been held with the Directors of the 1,000,000 client Associated Hospital Service, Inc., of New York City, which operates not only in the five metropolitan counties but in twelve neighboring counties. The Council finally expressed itself as follows:

That nonprofit insurance agencies for hospital care should not undertake to supply medical care insurance, either in or outside of a hospital, unless such agencies be so set up as to give the medical profession proper administration over medical aspects of this type of insurance.

That nonprofit insurance agencies supplying cash indemnity for medical expense should cover medical care in the home, in the physician's office and in the hospital.

The Council has learned of the devising in skeleton form of various plans for nonprofit organizations for medical expense insurance to be formed when the enabling act shall have been made law. In anticipation that the Society's approval will be sought by such organizations, the Council has directed its Committees on Public Relations and on Legislation to sit together to study such requests and report. One request for approval has been received. It will be necessary that principles shall be evolved by which the merits and working details of policies can be judged.

Workmen's Compensation

Through its Committee on Workmen's Compensation

Harry Aranow, M D, *Chairman* Bronx
Joseph C O'Gorman, M D Buffalo
David J Kaliski, M D New York City

Director of the Bureau, there have been, effected for the Council many adjustments and readjustments of operation in this field. These are clearly indicated in the following report of the Council Committee, and the Bureau of Workmen's Compensation under its control.

A total of 16,203 licensed physicians were qualified by the various county society boards up to February 1, 1939. In addition, a total of 278 physicians have been qualified by the Homeopathic Society, making a grand total of 16,481 physicians qualified for Workmen's Compensation in the state.

The following totals indicate the number qualified in each county:

| | | | |
|-----------------|-------|-------------|-----|
| Albany | 258 | Niagara | 149 |
| Allegany | 35 | Oneida | 198 |
| Bronx | 1,778 | Onondaga | 336 |
| Broome | 194 | Ontario | 89 |
| Cattaraugus | 70 | Orange | 133 |
| Cayuga | 56 | Orleans | 24 |
| Chautauqua | 94 | Oswego | 61 |
| Chemung | 90 | Otsego | 49 |
| Chenango | 38 | Queens | 964 |
| Clinton | 42 | Rensselaer | 110 |
| Columbia | 33 | Richmond | 103 |
| Cortland | 39 | Rockland | 75 |
| Delaware | 40 | Saratoga | 60 |
| Dutchess-Putnam | 137 | Schenectady | 89 |
| Errie | 741 | Schoharie | 25 |
| Essex | 27 | Schulyer | 11 |
| Franklin | 56 | Seneca | 24 |
| Fulton | 60 | Steuben | 80 |
| Genesee | 46 | Suffolk | 163 |
| Greene | 35 | Sullivan | 60 |
| Herkimer | 50 | St Lawrence | 78 |
| Jefferson | 97 | Tioga | 32 |
| Kings | 3,020 | Tompkins | 59 |
| Lewis | 19 | Ulster | 99 |
| Livingston | 47 | Warren | 48 |
| Madison | 35 | Washington | 38 |
| Monroe | 431 | Wayne | 59 |
| Montgomery | 53 | Westchester | 628 |
| New York | 4,263 | Wyoming | 34 |
| Nassau | 417 | Yates | 24 |

Of these 11,411 are registered in New York district, 1,530 in the Albany district, 1,089 in the Buffalo district, 11,155 in the Syracuse district, and 1,018 in the

Rochester district of the Department of Labor

The committee or the Director of Workmen's Compensation have participated in numerous meetings, conferences, and hearings before the Department of Labor (Commissioner, Industrial Council, etc.) Matters of interest to the State Society or to a particular region or county were considered. In addition, numerous informal conferences were held. These conferences indicate the necessity for continuous contact between the Society and the Department of Labor.* The proper administration of the medical aspects of the Workmen's Compensation Law and the preservation of the rights and privileges of the medical profession require a point of contact between the profession and the Labor Department and other agencies interested in the various aspects of Workmen's Compensation. This is maintained by your committee and the Director of Workmen's Compensation.

After nearly four years of experience in this field the wisdom of the State Society in appointing a special committee on Workmen's Compensation and a director has been amply demonstrated. We receive daily numerous communications and inquiries by letter, telephone, and in person not only from the Department of Labor but also from insurance carriers, employers of labor, welfare organizations, and members of the Legislature involving the various aspects of the law as they apply to physicians and injured employees. Prompt attention is given to all such inquiries and requests for information, and, when necessary, personal contact is made. The bureau has been called upon for assistance a number of times by physicians in various parts of the country who have treated compensation claimants injured outside the state but covered by the New York State law.

There has been established cordial relationships with the various groups and parties of interest to the advantage of the

medical profession, as well as the workers of the state.

In the course of the year the director has appeared before the various county and local medical societies and discussed Workmen's Compensation in an effort to make better known the details of the law and to facilitate its administration. It is hoped that the continuation of these personal appearances will still further smooth out any differences that may exist and result in a more strict compliance on the part of physicians with the requirements of the law.

The director appeared before the annual conference of the chairmen of the county legislative committees, and at numerous meetings of the Industrial Council of the Department of Labor, and at a number of hearings before the Industrial Council affecting the status of authorized physicians. He also consulted with the Workmen's Compensation Board of Albany County with reference to the granting by the Industrial Council of a qualification in roentgenology to a physician who had been rejected for this qualification by the Workmen's Compensation Board of Albany County. Suggestions were made as to the proper procedure to be followed to obtain a reopening of this matter by the Industrial Council so that the local county society board may be given an opportunity to present its reasons in full for rejecting this physician, to the end that a reversal of the action taken by the Industrial Council may be had.

C-4 and C-104 Reports — We have been informed that physicians still neglect to send in their reports on time, and in some instances do not supply sufficient information on their C-4 reports to enable the referee to make an award to the claimant without postponing the hearing and subpoenaing the attending physician to appear in person at another hearing. This results in a serious delay in paying compensation to a workman who is incapacitated. Undoubtedly physicians will be more prompt in their reports and explicit in their answers to the necessary questions on the reports, when they

* If the interests of the medical profession are to be safeguarded.

know that in addition to putting themselves in jeopardy in so far as their bill is concerned, they are causing great hardship to an injured workman whose only means of support may be compensation for time lost while incapacitated.

On November 28, 1938, a questionnaire concerning the administration of the Workmen's Compensation Law in its various aspects was sent to each county society in the state. An attempt was made thereby to determine in what manner the administration of the local county society Workmen's Compensation Committee could be improved and the administration of the law facilitated. Up to the present time the committee has received replies from twenty counties. These indicate that the majority of physicians of the state are satisfied with the new law and the way it is being administered. They also indicate that relationships have greatly improved between the medical profession and insurance carriers and employers. When the survey is completed, an additional report will be issued to the Council of the State Society and suggestions based on the information elicited as to the improvement in county society function, and revisions of the administrative procedure where necessary will be recommended.

Arbitration—During the year 1938 forty-nine arbitration sessions were held in the metropolitan area. Bills amounting to \$58,611.48 were considered, of which \$45,089.72 was in dispute, awards totaling \$28,068.32 were made.

Awards were made in five hundred and two bills under consideration, and the physician received no award in ninety-five instances.

Arbitrations were held on May 19, 1938, in Binghamton for Steuben, Chemung, and Broome counties. On May 20, 1938 in Syracuse for Onondaga, Oneida, and Oswego counties, also on the same day in Rochester for Monroe, Ontario, and Yates counties. On May 21 in Buffalo for Erie, Niagara, and Chautauqua counties. On October 27, 1938 in Kingston for Ulster, Dutchess, Sullivan, Orange, and Greene counties.

At the May arbitrations, bills amounting to \$4,252.66, of which \$3,754.65 were in dispute, awards of \$2,400.66 were made.

At the October arbitration, bills amounting to \$3,194.60, of which \$1,558.00 were in dispute, awards of \$1,033.00 were made.

In sixty-nine bills, no awards were made in four cases, in forty-one cases awards were made, and twenty-four bills were settled without a hearing.

It is intended to hold additional sessions for the upstate area beginning the end of March and continuing through the month of June. Fortunately, a relatively small number of bills have accumulated which require arbitration. In the majority of instances, either through the effort of the local county society, or the intervention of the Director of Workmen's Compensation, a large number of dispute bills have been settled by mutually satisfactory compromise. In many instances arbitration could be avoided and prompt settlement of a physician's bill facilitated if the following suggestions would be followed by practicing physicians and specialists.

The 48-hour report (C-104) and the 20-day report (C-4) and all specialists' consultation reports should be promptly sent to the insurance carrier, as well as to the Department of Labor. Physicians should make every attempt to ascertain the name of the carrier when the patient first presents himself. Where an employer is insured, failure to notify the carrier directly often results in delay in the investigation of the compensation status of the case and also delay in medical inspection by the carrier resulting in objection to or in delay in the payment of the doctor's bill.

Under the rules and regulations of the Department of Labor all specialists and consultants must submit a report of their findings to the Industrial Commissioner, the employer or carrier, and to the attending physician. In failing to send a copy to the insurance carrier, the latter may not be apprised of the fact that consultation was held and may, when the

case is reported, call in a consultant of its own thus increasing unnecessarily costs of insurance. As the result of consultation, the attending physician may follow a plan of treatment to which the carrier after its medical inspection may object. Prompt notification by consultants, as above indicated, would obviate many of these difficulties. Particularly in chronic cases the carrier should be notified of consultation so as to avoid later arbitration of a bill for continued treatment based upon the opinion of the consultant. Where a case has been previously treated by another physician for the same injury, the succeeding physician should always promptly communicate with the first physician, preferably by phone and also by letter, in order to obtain a complete record of the case including all reports of diagnostic procedures regardless of the lapse of time between the treatments of the two physicians. This will avoid in many instances duplication of laboratory and x ray service. Where a considerable lapse of time has occurred since the last treatment of the first physician, it would be advisable for a physician to communicate with the insurance carrier in order to determine whether the case has been closed and to ascertain the compensable status of the case. Bills have been objected to a number of times, especially where long continued treatment was necessary, because the physician failed to call in a specialist or better qualified physician to cope with a complicated or obstinate medical situation. In other words, carriers have frequently objected to paying for long continued treatment where, in the opinion of their medical examiner, a general practitioner should have called in a specialist to treat the case. Many times physicians giving practically only physical therapy treatments have failed to ask for authorization where such treatment exceeded the cost of \$25.00. Authorization should be requested for such treatment, as well as other procedures under Section 13-a(5) of the law when the total visits approach the sum of \$25.00. Authorization is not

required in an emergency or may not be unduly withheld by the carrier or employer, so as to jeopardize the welfare of the patient. Where a claimant informs a doctor that the Labor Department or insurance carrier has advised the claimant to return to the doctor for further treatment, the doctor should check up to determine the accuracy of the claimant's statement. Where a physician is unfamiliar with the minimum fee schedule, his bill is often rejected by the carrier or employer. If a physician is in doubt before rendering a bill, he should confer with the compensation committee or board of his society for advice. It should be borne in mind that authorization should be obtained for a fee in excess of the schedule, but in any event it might be advisable for a physician supplying unusual or extended medical care to apprise the carrier or employer of the procedures being carried out. Progress reports every three or four weeks in long continued cases often result in prompt payment of bills, where failure to so inform the carrier of the progress of the case may ultimately result in objection to the bill.

Physicians Medical Bureaus—Under date of May 13, 1938, the Industrial Council ruled that applications for licenses to physicians to operate more than one medical bureau should not be encouraged that the Compensation Boards of the various county medical societies would be within their rights in refusing to recommend the licensing of such bureaus as would not be conducive to the best interests of injured workers and good medical practice. In other words, the county society compensation board may hereafter use its discretion before granting a physician a license to operate more than one medical bureau other than his own private office.

Amendments to the Law—The Department of Labor may this year introduce a bill calling for a change in Section 13-a(4) to reduce the time of sending in the C-4 report from twenty days to fifteen days. It is also considering changing the procedure to excuse a physician

for failure to file reports which, under the present law, requires action by the Industrial Board. It is contemplated making failure to file within the forty-eight-hour or proposed fifteen-day period grounds for objection of a doctor's bill by the employer or insurance carrier. The issue as to whether the employer or carrier's interests were prejudiced by such failure to file on time is to be determined by the Arbitration Board as now set up to arbitrate medical bills. Although the carriers have not in the past frequently taken advantage of this technicality and required a physician to obtain the excuse of the Industrial Board, there is no question that in many instances failure to report on time has resulted in prejudice to the employer or carrier in investigating the worker's claim for compensation. In some instance it also has jeopardized the interests of the injured worker in obtaining prompt compensation while disabled.

Your committee again recommends an amendment to the Workmen's Compensation Law to give the Department of Labor authorization to assess compensation and medical costs against the non-insured employer. It further recommends a provision in the law definitely to fix a penalty for violations of the provisions of the amended Workmen's Compensation Law, Chapters 258 and 930 of the Laws of 1935, applicable to all interested parties.

The committee also recommends that the Commissioner of Labor be requested to withdraw the provisions under the fee schedule which permit an employer or carrier to deduct 5 per cent of any bill in excess of \$15.00 when paid within thirty days. It is the unanimous opinion of the various county societies of the state that this is an unreasonable deduction and not warranted unless accompanied by a penalty for failure to pay within a similar or other reasonable period of time. No such deductions are permitted from bills submitted by hospitals.

Legislation—The Department of Legislation is sponsoring two bills which have been introduced by Senator Condon, Senate Int No 911-912.

The first bill provides, in addition to a report from an especially qualified physician selected as an impartial examiner by the Department of Labor, a new clause to require the testimony of such impartial examiner if required.

The second bill gives to an employer or laboratory which has applied to the county society Compensation Board for a bureau license and been rejected the right of appeal to the Industrial Council in the same manner that a physician has the right of appeal over the decision of a local county medical society. Workmen's Compensation Board. This bill also provides authority for the Industrial Board to make an award of the reasonable value of medical services or treatment rendered to an injured employee where the employer has failed to secure compensation coverage.

Both of these bills were introduced last year with the approval of the Medical Society and should be endorsed this year.

Two bills were introduced by Senator Washburn relating to occupational diseases, Assembly Int 1244-1245.

A bill, Assembly Int. 1192, was introduced by Assemblyman Wilson, who last year introduced a similar bill amending the Workmen's Compensation Law in a radical manner, so as to take away from the medical societies the responsibility of qualifying physicians and putting the same in the hands of a committee of five physicians to be appointed by the Industrial Commissioner for a term of three years.

Under this bill practically all the functions now vested in the medical society would be served by this committee. It also provides for the creation of an administration committee of three members, one of whom shall be a representative of labor, one a representative of the Industrial Commissioner, and the other a physician who shall be a representative of the employers, to pass upon all disputed bills. This is a bad bill and is being opposed for obvious reasons.

State Radiology Examining Committee—During the past year the committee on x-ray examinations set up by

the State Society has functioned only in the metropolitan area, although only recently a request was received from an up state county to set up an examining committee locally

Twenty seven candidates have been examined during the past year and twelve passed the examination and were qualified by their local county societies with the "D" rating. Fifteen failed to pass.

Where a local county society is in doubt as to the qualifications of a physician applying for rating in roentgenology, the candidate may be referred to the director for examination by the special committee set up by the State Society. Dr William A Stewart served as chairman of this committee until October, 1938, when, owing to press of other duties, he resigned, and Dr Charles W Schwartz was appointed as chairman. The other members of the New York area committee are Dr Alfred L L Bell and Dr John J Masterson of Brooklyn and Dr E Forrest Merrill of New York City. To all these gentlemen the State Society owes a debt of gratitude.

Subcommittee on Industrial Dermatoses—A subcommittee was appointed on industrial dermatoses consisting of Dr Eugene F Traub as chairman and twelve other members.

During the past year and a half numerous complaints have been received about the operation of the Workmen's Compensation law in respect to industrial dermatoses. The committee has been attempting to make an adequate study of the situation, but owing to a failure thus far to obtain the necessary records from the Department of Labor, this work has been hampered. The committee is of the opinion (1) that clinics throughout the state are not making a proper effort to establish the presence of industrial dermatoses among their patients, (2) that many carrier consultants have acted the part of special pleaders rather than dermatologic experts, (3) that hearings before a referee have not been conducted in such a manner as to enlighten the officiating referee at the hearing so as to enable him to render a just award. The

committee hopes by a more complete study with the co-operation of the Workmen's Compensation Division of the Department of Labor to clarify the situation and bring order out of chaos in a very important sector of the medical compensation law.

Injection Treatment of Hernia—During the past few years your committee has given consideration to the subject of the injection treatment of hernia.

The following rules and regulations have been devised as a guide to physicians undertaking this form of treatment.

Injection Treatment of Hernia.—The exact status of the injection treatment of hernia as a therapeutic procedure has not as yet been definitely determined. It is agreed that it is in a more or less experimental stage and has not been established as a routine method of procedure. It should only be used in suitable cases by surgeons thoroughly familiar with the anatomy of hernia and experienced in the method of treatment. The mixture to be injected should be properly standardized and the physician using it should be thoroughly familiar with its composition and the effects after injection.

In view of the fact that the injection method is being actively exploited by certain purveyors of mixtures as a cure for hernia without proper regard to the indications for the treatment, the suitability of the case and the experience of the physician in this type of work, it has been deemed expedient in the interest of the injured workman as well as all other interested persons under the Workmen's Compensation Act to set up certain rules and regulations for the guidance of authorized physicians.

- 1 The injection method is not a substitute for surgery in all cases. For the present surgical treatment should be given preference unless there are definite contra indications to surgery and unless the patient objects to operation. In the latter event the injection method should not be used if there are any contra indications to its use and if the case is not a suitable one.
- 2 After having made and recorded the diagnosis of hernia and before attempting treatment the diagnosis of hernia should be confirmed by the medical representative of the employer or carrier.
- 3 Written authorization for the injection

treatment should be obtained from the employer or carrier and a fee for the treatment agreed upon

- 4 The surgeon should record and keep on file the indications for this method of treatment in preference to orthodox surgical treatment. All contraindications to the new method should be considered before advising it. The possibility of sliding hernia must be kept in mind. If there is any doubt as to the suitability of the case for injection, this method should not be used.
- 5 Only a physician familiar with the anatomy, pathology, diagnosis, and complications of hernia and one experienced in the technic of the injection treatment of hernia should accept these cases for such treatment.

Physicians throughout the state should be made familiar with these rules, especially with the necessity of obtaining authorization for this experimental procedure before undertaking it.

At this time it is not thought advisable to include under the minor specialties the injection treatment of hernia. When requested to do so a local county society compensation board may express an opinion as to the specific qualifications of any given physician in this field.

Fee Schedule—During the past year the Industrial Commissioner promulgated the Metropolitan Fee Schedule for the entire state.

The new schedule has now been in operation officially since May, 1938, and it is the opinion of the committee that it is working out satisfactorily. Replies to a questionnaire recently sent out to every county in the state also indicate that on the whole the schedule is satisfactory. There seems to be general dissatisfaction with the 5 per cent discount allowed for payment of bills within thirty days. The Department of Labor through its Industrial Council, and with the co-operation of your director and a small committee of the Compensation Insurance Rating Board, is undertaking a revision of the fee schedule and the various rules and regulations adopted by the Department of Labor up to the

present time. The revision is more of a clarification than an actual revision and will be promulgated shortly by the department. When revision is completed the Department of Labor expects to issue a new schedule in booklet form.

Still under consideration is a revision of the x-ray fees to include a discount for multiple examination at one time. Where more than one physician treats an injury for which the fee schedule carries a fixed fee for a given period of treatment, it is the rule that such physicians should agree among themselves as to the proration of the fixed fee in accordance with the amount and type of the treatment rendered by each. If the physicians cannot agree, the county society in which the original attending physician resides and practices (should the two physicians not practice in the same county) shall assist in the proration. If a mutually satisfactory agreement cannot be arranged by these efforts, the bill is arbitrated without cost to either party, in the same manner as disputed bills under the law. Up to the present time it has been necessary in very few instances to resort to arbitration.

Consultants and laboratory fees are not included in the above proration, as these carry an extra fee.

No provisions were made in the upstate schedule for mileage fees. It was agreed that in ordinary cases mileage fees would not be paid, but that where unusual circumstances required an attending physician to travel unusual distances to an outlying section, the employer or carrier would, as in the past, pay a reasonable mileage fee in addition to the scheduled fee. A few instances have arisen since the schedule went into effect upstate that required special attention. It was not contemplated, however, that where ample medical service was available in any community a physician from a distant community would be paid mileage to visit a patient in an outlying section. In other words, if treatment was rendered first in one community and the patient subsequently went to his home in a distant community,

the patient should be referred to a local practitioner, preferably of his own choice, for continued care. Only where a qualified physician was not available was it contemplated that a physician should travel to a distant community to treat such a patient and be paid mileage.

X-Ray Plates—In May, 1938, the Industrial Commissioner issued an order requiring physicians, insurance carriers, employers, hospitals, and x-ray laboratories to preserve x-ray films for at least five years, and in no case are they to be destroyed without a report of the findings of such x rays being filed with the Department of Labor as a permanent record.

It is to be noted that x ray films are a part of the physician's record, and his property. A carrier or employer should be accorded the courtesy of reviewing such films with the understanding that they be returned to the physician or laboratory responsible for their preservation.

No-Lost-Time Cases—Considerable difficulty has arisen during the past year in regard to the payment of bills for medical services, especially in no-lost-time cases (a less than seven days loss of time), where the claimant fails to appear at a hearing before the Department of Labor. In such cases the department often fails, because of the nonappearance of the claimant, to establish causal relationship. In a number of such instances employers or carriers have held up the payment of the doctor pending determination by the department. In many instances this has worked a great hardship to physicians who have rendered medical care to claimants who have had more or less trivial accidents which did not incapacitate them for a period of more than seven days. In such instances the claimant was not interested in appearing before the Department of Labor because no compensation to him was involved, and yet the physician rendered medical care. Your director for over a year has been endeavoring to have the Department of Labor change its procedure, and if necessary the provisions of the law, to enable the Department of

Labor to accept a notarized report of the accident by the employer, and a notarized report by the claimant, attesting to the fact that he received medical care, as prima facie evidence in establishing the validity of the physician's bill. This is a procedure comparable to the acceptance of the physician's C-4 notarized report as prima facie evidence before a referee in determining causal relationship. This matter will be pressed for a solution.

Posting of Physicians' Names—The matter of the failure of the Aetna Casualty and Surety Company to abide by the ruling of the Industrial Commissioner to refrain from sending out lists of names of qualified physicians to policyholders has been the subject of study by a committee appointed by the Industrial Commissioner and is now in the hands of the Counsel of the State Society, Mr. Lorenz J. Brosnan, for legal action.

Rule 12—Under date of June 14, a bulletin was issued by this committee advising physicians that Rule 12 on page 6 of the minimum fee schedule did not, as was contended by the insurance carriers' organization, apply to multiple x ray examinations. As indicated elsewhere the question of a discount for multiple x ray examinations is now under consideration by the Industrial Council.

State Insurance Fund—It is well to point out here that recently there has been a reorganization under the law of the State Insurance Fund.

The fund has been given a form of administration that takes into account the business nature of the fund, at the same time separating it more definitely from the department of government which is entrusted with the administration of the Workmen's Compensation Law. This has been effected by placing the administration of the fund in the hands of a board of commissioners of nine, one of whom is the Industrial Commissioner ex-officio, the other eight being all policyholders in the fund. An executive director and his deputy, a medical director, an actuary, and an attorney are all appointed by the commissioners. All administrative authority is vested in the

medical director under the authority of the commissioners. The management is thus made responsive to the interests of the policyholders.

A communication received recently from the Deputy Executive Director, Mr. Henry D. Sayer, former Industrial Commissioner of this state, among other things, states:

"It is quite needless for me to say to you that organized medicine has assumed a grave responsibility in the administration of the medical provisions of the compensation law. You are not only aware of that responsibility but you have insistently declared it to the members of your group. The objectives to be attained are prompt and efficient medical and surgical care for those who require such treatment under the law. Fair dealing is, of course, implied. Undue costs impose an unfair burden on industry. Perhaps it is not always realized that the entire cost of compensation, including the medical expense, is a direct charge on industry and that the insurance carriers are but the agency for collecting and distributing the cost. To that end the machinery has been set up for the administration provided by law for the determination of the reasonableness of the medical charges. That machinery will work smoothly only if all the parties in interest co-operate fully. The co-operation of the medical profession is particularly essential in connection with promptness of reporting. Failure to report promptly renders the doctor so failing liable to have his charges rejected unless excused by the Industrial Board after a hearing. Thus far, carriers, including the state fund, have frequently waived the objection of late reporting. So serious is the matter becoming, however, that it is questionable how long such waivers should be granted. Delay in reporting prejudices the injured man, it is in his interest that prompt reports are required. Insurance carriers cannot pay compensation until they have medical reports that warrant such action. Most doctors, I am glad to say, are prompt in reporting. If the reasons and necessity for prompt reports were had in mind by all doctors I am sure it would result in benefit to all injured workers and would remove the necessity for additional work and checking up by the carriers."

Qualification of Candidates—It was not to be expected that in the haste of qualifying the physicians of the state under the amended Workmen's Com-

pensation Law, necessitated by the brief period of time between the passage of the new law in March, 1935, and its going into effect in July, 1935, the State Society and various county societies would be able to set up a perfect administrative machinery to encompass fully the purpose of the new law. Suffice it to say that under the circumstances the state and county societies set in motion a machinery that operated remarkably well and in the interests of all concerned.

In the course of the past three years the machinery has been perfected until, at the present time, an applicant to practice under the Workmen's Compensation Law either as a general practitioner or a specialist receives prompt attention and his qualifications are scrutinized with great care. It was necessary to instruct the various county medical societies, especially during the first year, as to the scope of a general practitioner's activities and in the use of the code symbols adopted uniformly throughout the state at the suggestion of your committee.

Conditions differ in various parts of the state not only in regard to the standards of medical care and medical specialism, but in the availability of especially qualified practitioners desiring to practice under the Workmen's Compensation Law.

In the large cities and counties a sufficient number of both the general practitioners and specialists are available, not only to provide adequate care for the injured workman under all circumstances, but also to enable the county society Workmen's Compensation Boards to set up qualifying committees before whom all applicants for special rating under the law must apply or appear.

Your committee has given considerable attention to the creation of such standards of qualifications, especially in the specialties as will fully protect the injured workers, as well as assure government authorities and other interested parties that the county and state societies are fully cognizant of their responsibility in according a physician either a general rating or a specialist's rating. While it is true that a practitioner need only con-

form to the average level of qualifications of medical practitioners in his community, yet it has been felt proper for your committee to suggest a general level of qualifications that will serve not only in measuring qualifications of physicians in big cities with university affiliations, but which might also, with perhaps slight modification, be applicable to all parts of the state.

An endeavor has been made to pattern these standards of qualification on those standards which have been adopted by the various national boards, and voluntarily assumed by thousands of physicians throughout the country who wish to be designated as specialists with the approval of these national boards.

Your committee is at the present time completing a set of these standards which will shortly be promulgated to the Workmen's Compensation committees of all the counties with the hope that they will be adopted, with modifications where necessary, in accordance with the peculiar circumstances that may exist in any given region of the state. While it is not to be expected that these rules and standards will be retroactive, yet it is hoped that they will serve in the future to guide those responsible for the qualifications of physicians to practice under the amended Workmen's Compensation Law. As has been indicated elsewhere, the State Society has already set up a committee of x-ray specialists to act in an advisory capacity to local county society boards in qualifying radiologists and radiotherapists about whom there is a question as to qualification. The fact that this board has been called upon during the past year to assist the county societies in increasing frequency in the field of x-ray, indicates that the new standards which will ultimately be promulgated will meet with similar acceptance.

Settlement of Bills—During the course of the year your Compensation Bureau has been called upon to help in the settlement of doctors' bills and the adjudication of other disputes arising between the profession and the county society and between physicians, in-

surance carriers employers of labor, etc.

The attention of the county society boards is called to the fact that this bureau is prepared to continue in this capacity and invites local county societies and physicians throughout the state to utilize the services of the bureau. Many physicians throughout the state write directly to the Department of Labor on matters pertaining to many of the features of the new law. These inquiries are almost without exception referred to your director for reply. It would be better if physicians would realize that the court of first appeal should be the county society and then their State Society Compensation Board, thus relieving the Department of Labor of a great deal of unnecessary labor.

The bureau is prepared on reasonable notice to participate in the Workmen's Compensation problems of all the local county societies, if necessary by personal appearance. All problems affecting the new law should be referred promptly to this bureau.

Municipalities as Self Insurers—Many municipalities throughout the state are self insurers. Some of the smaller communities are covered by insurance carriers. All injured workers employed by the local communities are entitled to the same privileges as provided employees under the Workmen's Compensation Law.

A situation arose in the course of the last year wherein a large municipality failed to pay doctors' bills and refused arbitration. This matter was brought to the attention of the Industrial Commissioner by your director with the request that the Attorney General rule on the necessity of arbitration by such municipalities. The Attorney General ruled that 13-g of the Workmen's Compensation Law was applicable to the municipality and that this section of the law governing arbitration is general statewide, uniform in its provisions, and provides no exceptions. The constitutionality of the statute of which this is a part was sustained by the highest courts. Section 13-g of the Workmen's Compensation Law is not superseded by, nor in conflict

with, any law of a municipality. After the receipt of this ruling the municipality in question proceeded with the arbitration of disputed bills. The attention of physicians throughout the state should be drawn to the fact that all employees, with the exception of those on Work Relief, are covered by the Workmen's Compensation Law of the state.

Bulletins—During the past year of 1938 a number of bulletins were issued covering arbitration provisions for the upstate counties.

On February 24, 1938, a bulletin was issued requesting all county societies to contact legislators with the idea of bringing pressure to bear on the Industrial Commissioner to promulgate the Metropolitan Fee Schedule for the entire state.

A bulletin was issued on June 14, 1938, concerning the necessity of adherence to the fee schedule in the settlement of bills by physicians.

A bulletin was issued on March 4, 1938, on the qualification of physicians as arbitrators.

A bulletin was issued on May 5, 1938, regarding the preservation of x-ray plates.

Rule 21b was promulgated and a bulletin issued on May 5, 1938, advising physicians that any physician, specialist, or consultant involved in the medical care and treatment of compensation cases must appear at a hearing when subpoenaed and shall give his testimony for the prescribed fee set forth in the rules and regulations adopted by the Industrial Commissioner.

This rule does not deprive the consultant or specialist applying to the Industrial Commissioner for a higher fee as provided by Rule 21. In the event of failure to comply with this regulation the physician, specialist, or consultant will be held responsible to the Industrial Council.

Appreciation—In closing, it is believed desirable to call to the attention of the membership that in the course of the past year your committee and the bureau have had the cordial co-operation of the Industrial Commissioner and of the

Division of Workmen's Compensation of the Department of Labor. Mr. Hugh J. Murphy and his assistant, Mr. J. Koneski, have been especially helpful in their co-operation with the State Society and with numerous physicians who have applied to the Department of Labor for assistance.

To the subcommittees who have assisted in special studies our thanks are due, as well as to the members of the various qualifying advisory committees throughout the state who have unselfishly devoted their time and effort in helping to carry out the responsibilities of the state and county societies.

Our special thanks are due to the office staff for their devotion to their duties.

Part IV

Legislation

The Council Committee on Legislation,

James H. Borrell, M. D., *Chairman*

Buffalo

B. Wallace Hamilton, M. D. New York

John L. Bauer, M. D. Brooklyn

makes a preliminary report only at this time with the understanding that there will be a supplementary report when the house meets.

The Constitutional Convention, which was in session during the summer, was almost as demanding in time and effort as a regular session of the legislature. More than twenty propositions for amendments related directly to the practice of medicine or public health activities. These were finally boiled down into three, which were presented to the electorate in November and adopted. During the period that the Convention was in session, we issued three bulletins and, through Dr. Lawrence, were represented at numerous public and private hearings before committees.

Subsequent to election we pursued the usual procedure of assisting county society legislative committees in getting in touch with their newly elected legislators and as early as possible reported to them the personnel of the newly created

legislative reference committees. The committee personnel in the Assembly remains much the same, except that there is a new chairman for the Public Health Committee. The Senate, however, has changed its political aspect, the Republicans having won in the last election and, accordingly, the personnel of all of the committees is largely changed, especially are there new chairmen.

The usual precautions are being taken to keep people informed through our bulletin service and to keep the county society committees and their legislators in close touch with each other.

Bills relating to public health and medical activity have not been so plentiful the early part of this session as was the case in recent sessions, but probably this delay is due to the fact that the Commission to Formulate a Health Program appointed by the last legislature, will not be prepared to make a report before April 1.

Several bills that have appeared are exceedingly important, namely, an amendment to the Insurance Law legalizing the creation of nonprofit medical indemnity associations, a full citizenship bill requiring that no physicians graduating from foreign institutions be granted licenses to practice medicine in this state unless they are citizens of the United States, and our Physicians Lien Bill, reintroduced at our request. A bill on radiology, requiring that radiologists be physicians, has been reintroduced. The chiropractors have reintroduced a bill similar to last years except that they do not ask for the use of x ray equipment. Several bills relating to regulating the manufacture and sale of food and drugs, two of which are re introductions, have appeared, one or two that call for reorganization of the public health program in the state and one requiring that all hospitals receiving assistance from the public be required to admit any patient seeking entrance and to permit all physicians to admit and treat their patients. The merit of some of these bills is highly controversial. A number of amendments to the Workmen's Com-

pensation Law have also been proposed.

This is likely to be a prolonged session and a more complete report will be prepared and submitted at the time of the annual meeting.

Publications and Medical Publicity

Beginning January 1, 1939, the Council, at the suggestion of the Journal Planning Committee, set up a new mechanism for management of the JOURNAL, Directory, Technical Exhibits, and Publicity Work. Three Council committees were created to work separately to supervise literary work, business work, publicity work, and to act together as a Publication Committee. Thus the Publication Department and the Bureau of Public Relations have been merged, as directed by the House in 1938.

The new committees are at present constituted as follows

Business Division

| | | |
|----------------------|----------|----------|
| Donald S Childs, M D | Chairman | Syracuse |
| A L Loomis Bell, M D | | Brooklyn |

Literary Division

| | | |
|------------------------|----------|-----------|
| George W Kosmak, M D | Chairman | New York |
| Samuel J Kopetzky, M D | | New York |
| Warren Wooden, M D | | Rochester |

Publicity Division

| | | |
|-----------------------|----------|----------|
| Guy S Carpenter, M D | Chairman | Waverly |
| Terry M Townsend, M D | | New York |

Acting in concert, these three committees become the Publication Committee under the general chairmanship of Dr Peter Irving.

Journal—During the calendar year 1938 the JOURNAL was published as it had been since January 1, 1934, under supervision of the JOURNAL Management Committee. The total cost for 1938 was \$14,506 17, or 89 cents per member per year.

Beginning with the January 1, 1939, issue, arrangements have been made for control in the headquarters' office of the Society at 2 East 103rd Street, New York City, of all phases of the JOURNAL pro-

duction except the actual printing and mailing Editorial work, advertising solicitation, make-up of text and advertising pages, and the business features are all done at that address and directly under the supervision of the Publication Committee

The page size has been increased by $\frac{1}{4}$ inch each way, making the new page 7×10 inches, the type dimensions are the same as before, thus allowing for wider margins New type faces are being used with space between all lines, and this with the monotype printing makes the reading matter more pleasing to the eye.

Because the change in the method of production of the JOURNAL could not be definitely arranged until the end of November, after advertisers had completed their schedules for 1939, the income from this source may be less this year and therefore the final cost of publication greater Every effort is being made to obviate this possibility and it can safely be said that the next year following should show marked improvement.

Medical Publicity—During the year this work has been continued in the same fashion as previously Medical events, such as meetings of the District Branches, addresses by officers, JOURNAL editorials, and news events of interest, such as speeches of officers of the Society, have been issued and been given widespread publication throughout the state. Publicity has been given the press for the post-graduate courses given by county medical societies under the auspices of the Committee on Public Health and Education There have been twenty-five newspaper releases, and thousands of reprints of articles have been distributed Authors of these were Dr Nathan B Van Etten, Dr Peter Irving, Dr Joseph S Lawrence, Dr Chas Gordon Heyd, Dr Howard W Haggard, Dr Samuel J Kopetzky, and Dwight Anderson

In the matter of Speaker's Service Bulletins the Council carried out the directions of the House at its 1938 session "to make a special review of this particular part of the Bureau's activities and

take proper action as to its continuation or curtailment."

A questionnaire was mailed from the Secretary's office to the list of 958 physicians receiving these bulletins asking 3 questions (1) "Is the purpose worthwhile?" (2) "Is this purpose achieved?" (3) "Do you benefit by these bulletins and wish them continued?"

Replies were classified and a report prepared containing excerpts from comments This was made available to members of the Council A total of 451 replies were received, 389 favorable, 38 unfavorable, and 24 qualified or doubtful

These bulletins of various types form a cross-section of public relations activities, and the replies to the questionnaires are illuminating on the basic question of general approval of public relations as well as the special manner of presenting its principles by means of these publications The essence of the preponderant point of view expressed was that these bulletins are widely used, that the purpose is worthwhile and is satisfactorily achieved, and that all but a very few of the recipients wish them continued, the majority expressing themselves in no uncertain terms on the latter point Mimeographed copies of the complete report are available in the Secretary's office

The Public Relations Bureau has continued the issuance of the Speaker's Service Bulletins, which have appeared as follows since the last Annual Meeting

September 10, 1938 (No 21), "Patients Also Treat Doctors", October 20, 1938 (No 22), "Group Health Associations", December 10, 1938 (No 23), "Outline for Talk on Pneumonia", December 28, 1938 (No 24), "Editorial Comment", January 17, 1939 (No 25), "Second Edition—On The Witness Stand", January 25, 1939 (No 26), "Guard Against Syphilis", February 15, 1939 (No 27), "Has Your Congressman Heard from You?"

The pamphlet, *On the Witness Stand*, written by J Preston Walch and published two years ago by the Society, was revised and published again, appearing

on January 13, 1939 Within six weeks after publication 20,000 copies have been supplied to various state and county societies throughout the country The revision was undertaken because of the rapidly spreading public interest in "Socialized Medicine." Furnishing information to the public on this subject has been one of the principal activities of the Public Relations Bureau, requests for these releases and printed material have come from many sources within the state and from every section of the country

Directory—In accordance with the instructions of the House at its 1938 session, the edition of the directory which would otherwise have appeared at the beginning of this year has been omitted

Part V

Annual Meeting Arrangements

The Council this year directed its three committees on Arrangements, Scientific Program, and Scientific Exhibits to act in concert as a Scientific Assembly Committee, each, however, carrying out its own separate function

Dr Albert F R. Andresen, Chairman of the Scientific Program Committee, and the chairmen of the Sections and Sessions have arranged the scientific program. In accordance with the instructions of the House the new section on gastroenterology and proctology came into being with the following officers: Albert F R. Andresen, M D, *Chairman*, Brooklyn; Harry C. Guess, M D, *Vice-Chairman*, Buffalo; John L. Kantor, M.D., *Secretary*, New York.

Dr William A. Krieger has again served as chairman of the Committee on Scientific Exhibits, and Dr H. Walden Retan, of Syracuse, has had charge of the arrangements for the annual meeting To the general manager was assigned the task of general chairmanship of the combined committees directing the scientific assembly

Technical Exhibits—To Dr A. L. Loomis Bell, of Brooklyn, member of the Business Division of the Publication

Committee, has been assigned the task of selling space at the annual meeting for technical exhibits This arrangement makes unnecessary the employment of an outside agent on commission

A Walter Suiter Lectureship—By his last will and testament Dr A. Walter Suiter of Herkimer, New York, President of the Medical Society of the State of New York in 1892, directed that out of his residuary estate, upon the death of his sister, Mary Grace Suiter, certain bequests be paid to a number of institutions including the Medical Society of the State of New York, Union College, the New York Academy of Medicine, and the University of Michigan

Each of these four beneficiaries was to have received \$5,000, but the funds found available at the time of the recent Surrogate Court proceedings has amounted actually to only \$2,450.32 This amount has been placed in a special fund set out to carry out the purpose of the bequest.

The will specifically directed that the gift to the Society was for the purpose of establishing a lectureship to be known as the A. Walter Suiter Lectureship of the Medical Society of the State of New York. By the terms of the will the lecturer is to be designated by a committee, to be selected by the Society, which must determine the subject of the lecture to be delivered annually before the "regular general meetings of the Society." The lectures are to be on subjects relating to medical science, to become the property of the Society, and to be published.

Arrangements have been made for the 1939 meeting. Dr Francis Carter Wood has been chosen and has consented to deliver the first lecture which will be before the General Session on Thursday afternoon. The title is to be "The Early Diagnosis of Cancer."

The Council is happy to report that Dr Wood has graciously proposed that whatever honorarium would have been set be retained in the fund. This suggestion has been gratefully accepted.

In Memoriam

Dr Frederick H. Flaherty

The Council on October 13, 1938, by a rising unanimous vote, spread the following Memorial Resolution on its minutes

The Council takes this opportunity to express formally its sense of loss in the death of Doctor Frederick H. Flaherty, of Syracuse, New York, former President of the Medical Society of the State of New York.

Among such close associates, there is no need to extol the activities of Doctor Flaherty, his achievements, which are so well known to us, will remain a permanent record. His surgical career began during his early professional life, and he attained eminence which was recognized both by his confreres and the public at large. He was always devoted to whatever was best for the medical profession.

He held every position which it was possible for one to occupy in Organized Medicine, culminating in his election as President of our State Society.

In addition to his hospital and private practice activities, he had been Professor of Clinical Surgery at Syracuse University and, at the time of his death, was Professor-Emeritus. He had been a Member of the Grievance Committee of the Board of Regents since its organization.

Although he never occupied public office, he was frequently consulted and willingly served in matters of civic interest.

Doctor Flaherty detested sham, deceit, and dishonesty, and admired only frankness and integrity. However, he was tolerant and readily overlooked the foibles of his friends.

To us, his close associates, he will be long remembered as a generous and loyal friend.

M.D. License Plates

In accord with the resolutions of the House, negotiations with the Bureau of Motor Vehicles were carried on to final success in the late summer of 1938.

Practicing physicians throughout the state who desired special license plates bearing the designation "M D" for 1939 were asked to apply to the Secretary of the County Medical Society where they resided or had their principal office, and thus have accorded to them for the first time this distinct privilege. This work was under the direction of Dr August J. Hambrook's Committee on Public Rela-

tions and Economics, together with Dr David J. Kaliski of the Workmen's Compensation Bureau. No applications were made direct to the Bureau of Motor Vehicles, but to the County Medical Society Secretary whose certification of the names was an essential part of the procedure. The names thus submitted were transferred to the New York office of the State Medical Society, and after being checked were sent to the Commissioner of the Bureau of Motor Vehicles. The commissioner mailed official application blanks to each doctor, who filled them out and returned them according to directions. The "M D" plates were then mailed direct to the doctor from the Albany office of the bureau. It is hoped that these special "M D" license plates accorded the physicians of the state will obviate difficulties occurring in the past, and will accord the doctor, when in the performance of his professional duties, less inconvenience.

New York State Board Nominations

The State Society during the year was formally requested by state departments to make nominations to fill vacancies. In each instance alternates were also asked for and nominated.

To fill the vacancy on the Grievance Committee of the New York State Department of Education created by the death of Dr Frederick H. Flaherty, the Council nominated Dr George B. Broad, of Syracuse, with as alternates Dr William D. Johnson, of Batavia, and Dr Frederick M. Miller, Sr, of Utica.

To succeed himself as a member of the Grievance Committee of the New York State Department of Education, the Council nominated Dr Moses Keschner, of New York, with as alternates Dr Nathan B. Van Etten and Dr Chas. Gordon Heyd, also of New York.

To succeed himself on the New York State Board of Examiners of Nurses, the Council nominated Dr Paul G. Taddiken, of Ogdensburg, with as alternate Aloney L. Rust, of Malone.

To succeed himself as a member of the New York State Board of Psychiatric

- 1 The base rate has been reduced to \$28 00
- 2 A sliding scale of reduction has been made in rates for all limits of insurance in excess of the minimum.
- 3 The surcharge for x ray therapy has been reduced from \$40 00 to \$30 00, making a minimum rate to include that specialty \$58 00 instead of \$70 00 as heretofore
- 4 Members desiring protection on account of x ray therapy ONLY may now have their certificates so endorsed and issued at the surcharge rate only
- 5 Protection on account of temporary substitutes, permanent assistants, and licensed or specially qualified technicians has been included in the base policy without additional charge, provided that medical substitutes and assistants are members of the State Medical Society and individually insured under its master policy
- 6 Limit No 1 in the amount of insurance has been changed to apply to any one suit or claim regardless of the number growing out of any one cause or action This is a return to the former provision of the policy contract.

- 7 The exclusions on account of unlawful acts have been combined in one paragraph and the wording changed so as to indicate clearly that they apply only when it has been established that an unlawful act has been committed and not to a mere allegation of such an act. This has always been the intent and it has always been so construed, therefore, this change is only a clarification of phraseology
- 8 The exclusion on account of the use of x-ray therapy has been extended to include the detailed prescription of x-ray therapy dosage for some other person to carry out
- 9 Heretofore, the policy, as it applies to any one Assured, has been noncancellable except for nonpayment of premium or failure of an Assured to maintain in good standing his membership in the State Society. In addition, there has been added a provision that a certificate may be cancelled at any time at the request of the Assured upon the customary short rate basis

The importance of these changes is far reaching and promises well for the future. The rate reductions alone will save nearly \$40,000 a year in the bill which members pay for malpractice indemnity and defense. It may be more important, however, to stress the point that members will now be able to increase the amount of their protection under a broader form of coverage without increase in cost. This view will not escape the consideration of prudent members who have watched with apprehension the growing size of suits and the tendency of all juries to return higher verdicts.

It is sometimes asked why the Society has a Group Plan of indemnity and defense and why members are not encouraged to buy their protection as individuals from any company willing to insure them. The older members know the answer to that, of course. But next May the Group Plan will be eighteen years old and during those years a whole

generation of men and women have grown up and come into the practice of medicine, having no knowledge whatever of the chaotic conditions immediately following the war which finally impelled the State Society to take command of the situation in this state. So, for the benefit of the younger members coming into the Society, this question should be answered clearly at least once every year.

Briefly stated, the system of individual buying of malpractice protection from freely competing insurance companies and having to deal individually with those companies, proved a complete failure in New York State after a long and untrammelled test. It failed to provide doctors with competent and satisfactory legal defense. It failed to maintain the cost of indemnity and defense within the reach of the average member. It failed to provide a united and effective check to the constantly increasing threat of malpractice claims. And it denied organized medicine an opportunity to exert its influence upon the trend of events or to intervene with the companies when necessary to protect the interests of its members.

Medical men had learned from bitter experience that, in a malpractice action, expert legal defense for the protection of their professional standing and reputation in their communities is usually far more important than the amount of money at stake. While the insurance companies had the facilities for supplying indemnity, none of them had attorneys with sufficient medicolegal experience or possessing enough knowledge of medicine or its practice to furnish expert and competent defense. On the other hand, the State Society has developed the most expert and successful legal defense to be found any place in the country, but had no facilities for supplying indemnity. Obviously, some plan for bringing these two services together in one undertaking was the logical solution.

The Society took the initiative and worked out all of the details of such a combination to be operated under the

supervision and control of the Society. It became known as the Society's Group Plan of Malpractice Indemnity and Defense and was put into operation on May 10, 1921. It was a unique, astute, and timely action which immediately cured the intolerable conditions which existed at that time, and has prevented a return of them.

During the years which have intervened since its organization, it has supplied, through the legal counsel of the Society, the most competent and able legal defense available in the country. It has prevented high rates, and saved members a total of over a million and a half in premiums for minimum policies alone. It has provided a united front to combat unjust malpractice suits or claims and is effectually educating the suing

public and its attorneys to the understanding that they must have sound and honest claims before they can hope to translate them into money damages through the courts. In fact, without this united front no company would or could afford to insure the members of the State Society. Last but not least, it has helped to support and has made possible the continuance of free malpractice defense of uninsured members. Certainly no activity of the Society is more worthy of the active support of every member.

In publishing to the Society the new rates and coverage which will be available beginning January 1, a word of appreciation should be said on behalf of the York-shire Indemnity officials whose co-operation and assistance have made the changes possible.

Report of the Treasurer

To the House of Delegates

Gentlemen

The accompanying statement, taken from the auditor's report, presents in detail the financial transactions for the last calendar year. An analysis of the same, together with other items, will be included in a supplementary report by the Treasurer, which will be ready for

distribution at the time of the Annual Meeting

The Treasurer desires to acknowledge his appreciation of the co-operative and sympathetic attitude of the Board of Trustees, and likewise of the industry and devotion of the members of the office staff

(Signed) GEO W KOSMAK, M D
Treasurer

Auditor's Statement

We have made an examination of the balance sheet of the Medical Society of the State of New York, as of December 31, 1938, and of the statement of fund additions and deductions and the capital statement for the year then ended. In connection therewith, we examined or tested accounting records of the Society and obtained information and explanations from employees of the Society. We also made a general review of the accounting methods and of the income and expense accounts for the year, but we did not make a detailed audit of the transactions.

The scope of our examination, in accordance with instructions issued to us by the Society, did not embrace the auditing of expense vouchers and invoices in support of disbursements. The division of assets, liabilities, income, and expenses, by funds, is included herein as shown by the books of account without our examination of the minutes of the

Society and other related records, which were not made available for our inspection. Neither were we advised of the dates of creation, purposes, and/or restrictions of the various funds.

Based upon such examination as described above, the accompanying balance sheet and related statement of fund additions and deductions and fund capital, in our opinion, fairly present, in accordance with accepted principles of accounting consistently maintained by the Society during the period under review, its position at December 31, 1938, and the results of its operations for the year then ended.

GEORGE W. KOSMAK Treasurer

Report of the Board of Trustees

To the House of Delegates

Gentlemen

The financial problems of the Society have required close attention this year. The social influences of the tragic era in which we live may increase administrative expense. The readjustments of economics affect the value and income of our investment principal. We must not forget that the tragic era influences the profession of medicine in many ways. We must keep in mind that democracy and American economics are bound together and that organized medicine cannot permit only theorists to reform the methods of medical care, even if it takes more of the Society's money than expected.

The ratio of expenditures to income has been narrowing for more than five years. While expenditures have been increasing 30 per cent, the income has increased 10 per cent. We are spending faster than the increase in membership.

The world has changed. Apparently society has changed faster than the necessary conservatism of the profession. Medicine in its relation to modern society must be given real thought. The good that we are getting out of our activities must be considered. Nothing is static. Every member should carefully avoid seeing the problems of medicine only through his own glasses. If medicine is at the crossroads, its course must be directed and effort made to place the doctor in proper position in any service scheme that may be finally established.

Therefore, the House of Delegates should be thoughtful in adopting resolutions involving financial support.

Three Divisions of the Trustees' Work

1 The Usual Appropriations for Administrative Functions—These, as you know, follow recommendations of the Council based on the studies of its Finance Committee. The Trustees request the Council to be explicit in its reasons for recommending expenditures. Too little explanation frequently ac-

companies recommendations. It is not easy to economize in the administrative expense. The central office is the boiler room. It will not do to let the pressure down too much. However, waste can be controlled, efficient principles of administration established, and activities dropped if they are not doing good.

2 Unusual Expenditures—These were illustrated this year by the problems of the JOURNAL, beginning with recommendations of the Council that the contracts be renewed, later, the request of the Council that the Trustees negotiate with the publisher until they reached an agreement that they were willing to sign, and, finally, the need of consulting-counsel, audits, and a settlement. All extra budgetary appropriations come under this heading. They are initiated by the Council.

3-A The Management of the Investment Principal—

3-B Consideration of Financial Problems Directed by the House of Delegates—An illustration this year is the mandate of the 1938 House of Delegates that the Trustees critically analyze the expenditures of the last five years, and the benefits accruing, and make recommendations to the 1939 House of Delegates. This story is incorporated in the Trustees' Report.

Authority of Trustees to Make and Execute Contracts

The Trustees ask favorable considerations on the amendment to Chapter 5, Section 2, to insert the sentence "The Board of Trustees shall make and execute all contracts for the Society." The Trustees have found that contracts are potentially dangerous instruments and that agreements for the renewal of contracts are especially pernicious.

Audits

An audit is an instrument of control

It should not be limited to a statement of data given. Auditors should be furnished copies of minutes and comparable records that involve expenditures. A joint statement was recently made by the American Institute of Accountants and the New York Society of Public Accountants, expressing the opinion that auditors in business should be chosen by the stockholders of every institution instead of by the management. This brings to mind again the statement that an audit is an instrument of control. The Trustees see that auditors assume a large responsibility in auditing the books of any organization, and they recommend that they be given copies of all resolutions of the House of Delegates involving directly or remotely the expenditure of money, and that their work should not be limited to the papers that our officers may hand them. The Trustees in making this statement are mindful of the fact that they are Trustees of a professional organization and not a purely business organization, but the financial affairs of the State Society are increasing in importance from year to year and if it meets its problems, it will only come about by competent financial administration. Keep in mind that for several years there has been a relatively increasing expenditure to income. The time is near when we may have to select important activities from among the list of activities. Keep in mind that an audit is an instrument of control. There is a beginning tide of opinion among the membership regarding the relative importance of different activities. The Trustees hope that hard thinking about the relation of our expenditures to income and the need of increasing our reserves will not be too painful for clear action. The Trustees have in mind definite principles of fiscal administration that will let us live within our means, keep our investment principal growing, and not diminish essential activities. The Trustees see the danger of too much optimism, and they express the hope that the House of Delegates may catch the meaning of an ever-spending program and of the

danger of a narrow balance at any time when an extra budgetary demand becomes imperative. An illustration is found in the experience of the last year when \$5,000 was needed to successfully terminate the claims which the publisher of the JOURNAL had submitted to the courts.

Let us become introspective enough to face the situation in our spending. The Trustees are impressed with the liberality with which recommendations for appropriations are made without always equal thought of how they are to be paid for. While there has always been opportunity for constructive study in the relation of cost to activities, it has grown less in recent years. There is always a way out, and the Trustees have not lost sight of the fact that there is enough fiscal philosophy and statesmanship in the House of Delegates to advise in fiscal affairs, so as to carry on all the essential parts of our activities without having to provide for an increased income.

Fiscal Adviser

The Trustees have directed the Treasurer to employ a fiscal adviser to aid both the Treasurer and the Investment Committee in the management of the Society's investment principal and to better understand when to buy and when to sell. No investment account should remain static in these days of worldwide financial change. An investment principal should not be allowed to get out of line with changing world conditions. Technical advice is needed to establish proper diversification, to determine the desired period of maturities, to avoid optimism regarding appreciation, to avoid too much attention to income, and to think first and at all times of soundness of principal. This service costs \$300 a year and is paid for from the income of the fund.

Compensation Bureau

What is the opinion of the results of the Compensation Bureau's administration through all parts of the state? Is it

rendering the service needed? Is it as satisfactory in areas outside of the Metropolitan District as it is in the Metropolitan District?

The cost of the Compensation Bureau in

1935-1936 was \$2,140 00

1936-1937 was \$6,900 00 (that year the Director was placed on a salary of \$5,000 a year)

1937-1938 was \$7,700 00 (due largely to increased clerical work)

1938 was \$8,391 28 (for the period Jan 1, 1938 to Dec 31, 1938)

In general, half of their expense is paid by the New York County Medical Society, the other half by the State Society

The Trustees ask your opinion as to whether the Compensation Bureau as now set up is satisfactory to the entire membership

Offices

The Trustees see the opportunity for economy, efficiency of administration, convenience of access, and a saving of time to be had from a centralization of offices on one floor and as near the Grand Central Station as possible

The Society now pays \$4,200 a year for rent. Offices are located on the second, fourth, and sixth floors of the Academy of Medicine. More room is needed for the JOURNAL office. Some study has been given this during the year. The Trustees recommend that the House of Delegates think this over and tell us what they would like to have done

Maintaining a Balanced Budget

There is a steady approach to an unbalanced budget based, the Trustees believe, on the same sort of emotionalism in spending money that is going on throughout the world today. It is plain to the Trustees that if the present trend of expenditure continues, income must be increased by raising the dues. This the Trustees think should not be done. If this is not done, the Trustees may have to adopt the principle of cutting all ex-

penditures at a uniform rate so as to keep within income. The number and size of committees are major factors in unbalancing a budget. All committees cost money. The number of committees in 1937 were 31, with 108 members. The number of committees in 1938 were 13, with 49 members. It is not always that the number of committees or the size of committees determines the efficiency of administration. There have been throughout the year, as always, a few examples of thoughtless spending. There has grown up in the State Society a loose financial system. The Trustees have therefore set up a uniform voucher system. This voucher must state the service rendered and the expense incurred. All bills from within the Society must now be made out on this form.

The Trustees have been lenient. They have paid bills and advised those rendering them not to set a precedent, requesting that it should not happen again. The Trustees will not pay bills in the future unless authorized in advance by recommendation from the House of Delegates or the Council, and with the approval of the Trustees. The custom of the President of entertaining his officers and friends has gradually been shifted to an obligation of the Society. The Trustees have paid these bills under protest and hope in the future to be relieved of an unpleasant situation. The Trustees ask the Society how far it wishes to go in bearing the expense of officers in attendance at unofficial meetings.

At the present time only the President is allowed a per diem of \$15 when engaged in official business. All officers are allowed traveling expenses when engaged in official business. Traveling expenses have been interpreted as railroad fare and hotel bills. Does the Society desire to establish a per diem in lieu of expenses other than railroad fare?

Directory

The experience of omitting the Directory for the year 1938 has been satisfactory and without real complaint. It has

saved more than \$10,000, and this money is needed for other purposes. The Board of Trustees recommends that its publication be omitted for the year 1939 and that the Trustees be directed to study the feasibility of purchasing the New York Section of the American Medical Association Directory and issuing it in pamphlet form to our members at the same intervals as the A. M. A. Directory is issued.

District Branches

The Trustees ask the House of Delegates to comment upon District Branches exceeding their appropriations.

A Few Facts from the Auditor's Report

The dues collected in the year ending December 31, 1938, were \$157,674.00 (including arrears). The cost of administering the Society in the year 1938 was \$139,450.71. Of this amount, \$3,271.53 came from a net gain on the 1938 annual meeting, and this probably will not hold at meetings held elsewhere than in New York City. Without this item the cost of operating the Society for the year 1938 was \$142,722.24. This leaves apparently a balance of \$14,951.76. This does not take into account the extra budgetary expenses, one item of which was defense of the legal claim of the publisher of the JOURNAL. This amount was \$4,688.52. At almost every meeting of the Board of Trustees there are requests for extra budgetary appropriations. For example, at the June 6, 1938 meeting, extra budgetary items to the amount of \$1,040.79 had to be approved. Adding this one alone to the item mentioned of \$4,688.52, gives a total of \$5,729.31.

This is not intended as a complete statement of extra budgetary expenses but it will serve to show the House of Delegates how near operating expenses may come to income from dues, and keep in mind that the dues were nearly \$5,000 greater in 1938 because of arrears from 1937. It may also show the need of care on the part of every officer of the

Society in order that we do not run into the red or dip into our investment principal. The need of building the investment principal by at least its total income each year is imperative.

The gain in our respective funds in 1938 of \$33,224.24 is due to the collection of dues in arrears from 1937, to market appreciation of the investment principal, to interest and dividends on our investment principal, and to the recouping fund set aside last year.

May the Trustees, for the sake of emphasis, call to your attention again the fact that the minutes of the Society and related records have not been available for inspection by the auditors, and it seems to the Trustees that the complexity of our financial structure is so great that the auditors should be furnished all records.

The interest and dividends from the investment principal for 1938 were \$9,070.75. Income from Savings Banks, \$417.47, Lucien Howe Prize Fund, \$130.17, Meritt H. Cash Fund, \$50.40, Recouping Fund, \$275.00. Total \$10,843.88.

The Society has \$70,225.13 invested in stocks in thirteen companies. The market depreciation in value of these is about 9 per cent. The Society has \$189,793.58 invested in bonds. The market depreciation of these is about 11 per cent. Further details will be found in the auditor's report, in the Treasurer's report, and in the Treasurer's supplementary report, and, if necessary, in a supplementary Trustees report.

We repeat that the income from dues in the year 1938, including arrears for 1937, was \$157,674.00. The cost of operating the Society for the year 1938 was \$155,644.16 (including the JOURNAL and Directory), leaving a balance of \$2,019.84. In other words, we spent in operating the Society all of our income, except \$2,019.84 (leaving out of account, of course, the income from our respective funds, dues collected in 1938 which were arrears from 1937, and market appreciation of our respective funds).

The depreciation in the Society's in-

vestment principal including its trust funds was, on December 31, 1937, \$35,523 76 On December 31, 1938, it was \$30,060 36 This means that there was an increase in market value of \$5,-463 40 in the year 1938

The Society owns \$25,125 00 of defaulted bonds The interest lost on these bonds since their default up to December 31, 1938, is \$5,051 17 A problem that must be worked out by the Treasurer and Trustees with our fiscal adviser is whether to sell these bonds and invest the receipts in interest-bearing securities at the present low rate or to write them down to market value and wait for appreciation, which may be long in coming, if it ever comes in the tragic financial era confronting us

The respective fund capital was \$249,-743 76 on December 31, 1937 On December 31, 1938, it was \$282,968 00 This shows a gain in all funds of \$33,-224 24 in 1938 Taken alone, the last statement is pleasing, but think deeper! There are \$25,000 in defaulted bonds and \$30,000 in market depreciation, and a trend toward a diminishing ratio between expenditure and income

The Trustees are not sympathetic with such things as revolving funds or contingent funds unless reappropriated These funds are set aside for contingencies and should not be used except upon recommendation by the Council and specific approval by the Board of Trustees Otherwise, they may be just invitations to spend Last year the Society set aside \$13,000, \$7,000 to be used to advance our investments toward purchased value and \$6,000 to be used for any extra budgetary expenditures, but not to be used unless needed We report that the \$13,000 has been all used to help to restore our investment principal The direction of the House of Delegates diminished the available funds for budgeting for administrative purposes We are able to report that the Society has lived within this restriction

For the sake of clarity and information the Trustees attach a narrative statement of expenses and income for the year

July 1, 1937, to July 1, 1938 (See opposite page) This gives a different picture than the calendar year January 1, 1938, to December 31, 1938, would give

Now, let us look deeper and think in the period January 1, 1937, to January 1, 1938 "Excess" is from income of the Society's respective funds, \$10,843 88 (which is not to be spent), and from market appreciation of investments, \$5,-463 40 (as of December 31, 1938), but the latter is only a "paper profit" This totals \$16,307 28 Deducting this figure from \$17,539 51 (Excess of Income over Expenses) we have \$1,232 23 Let these figures sink in! Again, the Trustees ask that every officer be careful in spending money

Journal

The Board has been engaged in a year-long negotiation with the publisher of the JOURNAL and Directory and his counsel

This involved many conferences, interpretations of audits, the implications of sworn statements of circulation greater than the Society's membership, the quality of advertising, the ethics of medicine in its relation to the public, a knowledge of contracts, legal defense, and a settlement after months of work

The JOURNAL was published by contract from January 1, 1934, to December 31, 1938, a period of five years The Society paid fifty cents per member and about fifty cents per member more to maintain the activities of the Journal Management Committee, and the publisher made as much profit as he could from advertising, sale of reprints, and use of complexities of the printing and publishing industry The publisher claimed a loss each year until about the end of the fourth year Then he asked an increase of about 100 per cent

For the first six months of 1937 the Trustees and Council disagreed as to renewing the contracts, because of increased cost and the method of "farming out the JOURNAL"

There was in existence an agreement which provided that if the publisher

showed a profit and he and the Society agreed on its division, the contracts should be renewed for three years. It did not include renewal of contract for managing the technical exhibits at annual meetings.

The situation regarding unethical advertising came into serious consideration in November, 1937. You will recall the midnight debate at the last session of the House of Delegates about the Society's publishing its own JOURNAL. The publisher asked early in the year 1938 for increased compensation. The Council recommended several times by majority vote a renewal of the contracts and requested the Trustees to make an appropriation. Therefore, the Trustees laid the several recommendations on the table month by month. Finally, the Council asked the Trustees to negotiate with the publisher until they reached an agreement which they were willing to sign. Up to this time the publisher negotiated for a renewal of his contracts with several proposals for publishing at diminishing cost. About the first of June, 1938, the publisher changed his attitude and notified the Trustees by letter that he would stand on the strict legal commitments embodied in his present contract and agreement for renewal.

The publisher had shown a loss by audits every year up to the fifth year. On May 24, 1938, he submitted a letter through his attorney showing that he had made a profit up to that date in 1938, and would make a profit for the rest of 1938, and thereby under the Extension Agreement must have his contracts renewed.

The records of the negotiation cover 500 pages. Anyone may study them. They are on file. We were fortunate in having able consulting counsel. The publisher's lawyer was able. After receiving a statement from consulting counsel, concurred in by our counsel, as to the enforceability of the Extension of Contract Agreement entered into by the Society in 1935, the Trustees informed the publisher by letter as follows:

*Mr Thomas R Gardiner
New York State Journal of Medicine
33 West 42nd Street
New York, New York*

DEAR SIR:

With reference to the letter of your counsel, Benjamin Shuverts, Esq., dated June 17, 1938, containing a demand that the Medical Society of the State of New York furnish you with copy for the publication of the Medical Directory of New York, New Jersey and Connecticut on or before August 12, 1938, on behalf of the Medical Society of the State of New York, I am instructed to advise you that the Society has decided to furnish no copy for said publication of the Medical Directory in accordance with the resolution of the House of Delegates of the Society, adopted May 9, 1938, to omit the publication of the Medical Directory for the year 1938-1939.

I advise that it is the position of the Society that your contract for the publication of the Medical Directory, dated June 28, 1935, has terminated upon the third publication by you of the said Directory. I hereby serve you with notice that it is the intention of the Society not to be bound by a certain "Memorandum of Agreement made the 28th day of June, 1935," between the Medical Society of the State of New York and yourself, which said agreement purports to extend both the aforesaid contract for the publication of the Medical Directory and also a contract likewise dated June 28, 1935, for the publication of the New York State Journal of Medicine.

The Society is advised by counsel that the said Memorandum of Agreement purporting to extend the two above-mentioned contracts for a further period of three years is unenforceable and creates no legal obligation binding either of the parties thereto. Accordingly, the Society takes the position that the aforesaid contract for the publication of the New York State Journal of Medicine will be terminated on December 31, 1938, said date being the expiration date provided in said contract.

Inasmuch as the Society takes the position that the Memorandum of Agreement purporting to extend the two above-mentioned contracts is unenforceable, it is of course unnecessary to submit to arbitration the question of whether or not net profits have been earned by the publication of the Medical Directory and New York State Journal of Medicine during the three-year period, 1936-1938, in accordance with the terms of the said Memorandum of Agreement. Accordingly I hereby serve you with notice that

the Society does not intend and hereby refuses to submit the determination of profits to arbitration.

Very truly yours

MEDICAL SOCIETY OF THE STATE OF NEW YORK
WILLIAM H. ROSS M.D. *Chairman*
Board of Trustees

Notwithstanding this, the publisher brought suit on August 29, 1938. If successful this would have involved the Society to more than \$70,000.

The final chapter is summed up in a report to the Council on December 8, 1938. The Board of Trustees reported as follows:

"The negotiations with the publisher of the JOURNAL and Directory have been finally completed.

"That an agreement signed by both parties, cancels the so-called extension agreement and stipulates discontinuance by Gardiner of the action brought against the Society for a declaratory judgment on the extension agreement. This leaves the Society free without any interference or further claims from Mr. Gardiner to publish the JOURNAL.

"That the Board of Trustees considers that this settlement, which is in keeping with mandate of the House of Delegates, is entirely satisfactory and that the expense incurred is slight compared to what might have been the expense of continued law suits.

"And, that the Society now is entirely free to publish its JOURNAL and Directory from its own offices without interference."

This ends a year of effort at clear thinking and a successful ending of one of the most controversial matters ever before the Society.

The Trustees are sure that all who know the details, or who will inform themselves from the records, will agree that never again should the Society enter into a contract pertaining to an administrative function, not even for one year let alone three and should never again execute an agreement to become effective three years later which would then extend the contracts for three years. Never

again should the Society tie its hands and give up its freedom to control its own affairs.

The new JOURNAL is before you. You will note the change in format and that its pages are easy to read.

Work is yet to be done to make its advertising large enough in volume to carry the cost. This means that someone must sacrifice time and effort enough to bring this about. Many advisers say that there is no doubt that this can be done and within ethical lines. It just requires business acumen and enough work.

Construction Policies

The Trustees single out one policy this year and recommend to the House of Delegates its careful consideration, namely, a policy for the management of the so-called President's Dinner in connection with the Annual Meeting. If not changed, it should be discontinued, for it has grown to such proportions and expensiveness that it no longer serves its purpose.

The situation is an awkward one and it will not rectify itself. To make a distinction between upstate and downstate, or for the Society to give the dinner on one occasion and on another have it be given by an individual, is in no way beneficial to its members. For the giving of the dinner by the Society to depend upon the profits of the particular meeting is not sound policy. It lacks dignity and it puts emphasis in the wrong place for what should be a purely official gathering. An individual should not be asked to compete with the Medical Society of the State of New York in elaborateness of such a dinner. Unless he has a goodly income he cannot afford to pay several hundred dollars as the Society has spent, nor should it be made a burden that can not be borne by the ordinary man and cause him to be excluded from the presidency because of the expense, or to be embarrassed in any way. The theory that only when the money is available from the proceeds of the meeting may it be spent for a dinner is also a bad policy for

obvious reasons. The profits, if any, belong to the Society and should be accounted for and paid in to it in regular form.

The President has only minimal control over the finances of the Annual Meeting and should not be so directly interested in them. The meetings in the smaller centers may be just as valuable to the Society as in the larger ones although not as profitable financially.

Let the Board of Trustees decide whether or not we shall have an administration dinner, strictly limit the expense and declare who shall be invited. The invitation list might well be limited to the official family, ex-presidents and such distinguished guests from outside the

state as happen to arrive in time. Let it be a simple, inexpensive, and dignified, get-together meeting on the Sunday night just prior to the opening day. It should be an official function given in the name of the Society and the Committee on Arrangements should have charge of it.

Respectfully submitted,

Trustees

WILLIAM H. ROSS, M D, *Chairman*, Brentwood

GEORGE W. COTTIS, M D, Jamestown

February 15, 1939

Report of the Board of Censors

To the House of Delegates

Gentlemen

On February 5, 1938, as reported to the House of Delegates, the Board of Censors of the Medical Society of the State of New York first heard an appeal by Dr. Donald R. Keller of Westhampton Beach, New York, from a decision of the Suffolk County Medical Society excluding him from membership.

The decision of the Board of Censors at that time was as follows:

Pursuant to the authority conferred on us by Section 6 of Chapter VI of the Constitution and Bylaws of the Medical Society of the State of New York, and in the interest of orderly procedure, we hold the decision appealed from should be modified to the extent that the appellant's application for membership in the respondent County Society shall still be considered open and undecided, and that the entire matter be remanded to the County Society for further action in accordance with the mandatory instructions contained in this decision.

It appears without dispute that the appellant physician duly applied for

membership in the respondent County Medical Society, his application for membership was rejected by the said County Medical Society, that the respondent County Medical Society has not submitted any stenographic data as to what took place at the meeting or meetings of the Board of Censors of the said Society, nor in lieu thereof has any résumé of these proceedings been submitted.

It appears further without dispute that the appellant was not present at the meeting or meetings of the Board of Censors, nor was he invited to be present thereat.

In remanding this matter to the County Society for further action we do so with the following mandatory instructions:

"Within one month from this date, i.e., February 5, 1938, the respondent County Medical Society shall call a meeting of its Board of Censors to which the appellant shall be invited.

"Ten days' notice of the date and place of that meeting shall be given to the appellant by registered mail.

"At such meeting the Board of Censors shall have present a stenographer so that the minutes of the meeting may be stenographically recorded

"The Board of Censors shall have present at that meeting any person or persons who wish to give proof of any alleged act or acts of the appellant which would establish his ineligibility for membership in the respondent County Society

"All witnesses shall first be sworn by a notary public, and their testimony stenographically recorded.

"The appellant shall have the right to be present at said meeting or any adjourned meeting thereof with counsel if he so desires, and the appellant or his counsel shall have the right to cross examine any and all witnesses who may appear against him

The appellant shall have the further right, if he so desires, to testify under oath and to call any witnesses on his behalf who shall also be sworn by a notary public and testify under oath.

"The Board of Censors of the respondent County Society shall have an equal right to have an attorney present, if it so desires. Such counsel or any member of the Board of Censors shall have the right to cross-examine the appellant or any witness that may be called on his behalf

"The Board of Censors shall have the right to adjourn such meeting, but such adjournment or adjournments shall not be for an unreasonable time.

"When all of the testimony both of the appellant and the respondent County Medical Society shall be concluded, the County Medical Society shall at the next regular meeting following the conclusion of the hearings aforesaid submit its report, together with all the data, to the membership of the respondent County Medical Society, and the membership shall vote thereon. In doing so, the Secretary shall first read to the members attending such meeting not only the report of the Board of Censors upon the appellant's application, but also all of the testimony taken at any hearing or hearings

We do not wish to be understood as passing on the merits of the appellant's application, but we do feel in the interests of both parties, and in the interests of orderly procedure, the matter should be disposed of in this manner "

This decision was duly transmitted to both appellant and respondent.

In due course the Suffolk County Medical Society obeyed the Board's instructions and again voted on the application of Dr Donald R Keller with the result that Dr Keller was denied membership

Dr Keller appealed from the decision excluding him from membership, and the Board of Censors of the Medical Society of the State of New York heard this appeal on February 9, 1939

There were present at this meeting Drs Irving Gray, Bertran W Gifford, Carl R. Comstock, Charles A. Earl, Reeve B Howland, Alfred B Armstrong, Louis Klostermyer, the President—Dr Terry M Townsend, the Secretary—Dr Peter Irving, Mr Lorenz J Brosnan, and Mr Thomas A Clearwater

There appeared Dr Donald R Keller, appellant, and Guy O Walser, attorney for the appellant, Dr Edwin P Kolb, Secretary, and Dr John H Nugent, Chairman of the Board of Censors of the respondent, Suffolk County Medical Society

After full consideration of the grounds for the second appeal of the records furnished by the Suffolk County Medical Society including those of the transactions in the matter following the prior appeal, the Board of Censors of the Medical Society of the State of New York came to the conclusion stated in the following decision

Decision

On the prior appeal in this matter we modified the action of the respondent, Suffolk County Medical Society, in excluding the appellant from membership by reopening the matter and remanding it to the County Society with certain instructions as to the procedure to be followed

On this appeal we find that these instructions have been substantially complied with by the respondent, Suffolk County Medical Society, and that the appellant has been given a fair opportunity to be heard as well as an opportunity to cross-examine, through counsel, the witnesses appearing against him. In addition, Mr. Guy O. Walser, the attorney appearing for the appellant in this appeal, stated with commendable frankness that he did not wish to urge any technical grounds for reversal but requested a decision on the merits.

The Board of Censors has given careful consideration to the arguments advanced on this appeal by both parties. It has

carefully read the record which forms the basis of this appeal. Following this it has fully discussed the matters under consideration and after careful consideration by ballot taken, it has reached the conclusion by a vote of six to one (the President and Secretary not voting) that the judgment appealed from should be affirmed.

This decision was duly transmitted by the Secretary in writing to both appellant and respondent.

Respectfully submitted,
PETER IRVING, *Secretary*

March 15, 1939

Report of the Counsel

*To the House of Delegates
Gentlemen*

Your Counsel herewith submits his report of activities of the Legal Department of the Medical Society of the State of New York for the period from February 1, 1938, to and including January 31, 1939.

Within the proper confines of a report of this character it is not possible to give any adequate idea of the details of the work done or the responsibility assumed by our department. A report of this character must necessarily state only conclusions. Some evidence of how busy a year we have had, both in court and in consultation in the field of litigation alone, is found in the fact that we were able to reduce the pending cases from 493 pending on January 31st of last year to 441 pending on January 31st of this year—a reduction of 52 cases, this despite the fact that during the present reporting period, 177 new actions were commenced. This has only been accomplished by the intensive and loyal co-operation of every member of my office staff.

At the outset of this report, your Counsel wishes to record his appreciation for

the assistance and co-operation furnished him by your officers and your committeemen. It is difficult for those not in close touch with the workings of your Society to realize the immense amount of work done and the responsibility assumed by your trustees, officers, and committeemen.

In making his report your Counsel adheres to the convenient category employed in previous years whereby his activities have been divided into three main divisions: (a) the actual handling of malpractice actions before courts and juries and in the Appellate tribunals, (b) counsel work with officers, committees, and individual members of the Society, and (c) legislative advice and activities.

Litigation

In his report of the last few years your Counsel has had occasion to point out to the membership of your Society the harm done by careless, hasty, and unjustified criticism by one physician of the work of another. While it would appear that this admonition is bearing fruit, the situation in question still persists. We therefore

believe that attention should again be focused upon it. Members of your Society should remember that in these parlous times not much is needed to plant in the mind of a patient the seed of litigation against another physician.

As in the past we again call attention to the hazard of a malpractice action to a practicing physician and we again repeat that it must be remembered that the facts in any given malpractice case rest entirely in the hands of a lay jury.

Fortunately your Society has, through the operation of its Group Plan, given an opportunity to your members to adequately protect themselves against this ever present hazard. The Group Plan of insurance has operated with conspicuous success for the members of your Society for a period of eighteen years. Through it and by presenting a united front we have been able to successfully combat the forces which at one time threatened to engulf the profession in a tidal wave of malpractice actions. The success of our Group Plan is an established fact. It deserves and should receive the loyal support of every member of the Society. The practical application of the maxim, "in union there is strength," has been the reason for the conspicuous success of our Group Plan during the past eighteen years. The operation of this Plan is not a matter of guessing, speculation, or conjecture. It is predicated on eighteen years of actual experience in this field.

I have yet to meet a member of your Society sued for malpractice and not insured under our Group Plan who has not expressed deep regret that he is facing litigation without the benefits of indemnity. The expression, I meant to insure under the Group Plan but somehow I never got around to it," is something we have heard many, many times.

Commencing on the first of January of this year important changes, advantageous to the policyholders of our Group Plan, have been put into operation. These changes have already been published by the Committee on Insurance and are familiar to the members.

Mention should here be made of the splendid work of your Insurance Committee headed by Doctor Clarence G. Bandier, and of Mr. Harry F. Wanvig, your authorized indemnity representative. With these gentlemen your Counsel has conferred on a number of occasions during the reporting period.

Your Counsel wishes to record his appreciation of the splendid co-operation of the officers, agents, and employees of the Yorkshire Indemnity Company, the carrier under our Group Plan. They have demonstrated a desire to do everything to further the interests of the Group Plan and the members who have taken advantage of it.

My associates, Mr. William F. Martin and Mr. Thomas H. Clearwater, the Attorney for the Society, deserve the highest praise for the splendid work done by them. Mr. Martin's reputation in the defense of malpractice actions is well known. Eleven years of intensive experience in this highly specialized field have won for him from judges, lawyers, and doctors in all parts of the state expressions of the highest approval, not only for his ability as an advocate but for his fine personal qualities as well.

Mr. Clearwater through the years has been in close contact not only with your officers and committeemen but also with many individual members of your Society. Mr. Clearwater is a gentleman of exceptional ability and character and your Counsel feels fortunate indeed to have the benefit of his services as one of his associates.

We cannot leave this subject without paying tribute to the splendid spirit of industry, loyalty, and devotion manifested by your Counsel's entire staff, both legal and clerical.

With this preliminary statement we note that there were commenced in the present reporting period 177 actions as against 175 actions reported during the previous reporting period. These figures do not, of course, include a number of claims outstanding in which suit may ultimately be brought. Throughout the year your Counsel has been in conference

TABLE I

COMPARISON OF THE NUMBER OF SUITS INSTITUTED AND DISPOSED OF IN 1937-1938 AND 1938-1939

| | INSTITUTED | | DISPOSED OF | |
|---|--------------------------|--------------------------|--------------------------|--------------------------|
| | 1937-1938 (12 months) | 1938-1939 (12 months) | 1937-1938 (12 months) | 1938-1939 (12 months) |
| 1 Fractures, etc | 17 | 22 | 21 | 19 |
| 2 Obstetrics, etc | 12 | 13 | 24 | 20 |
| 3 Amputations | 1 | 3 | 2 | 3 |
| 4 Burns, x-rays, etc | 27 | 22 | 27 | 33 |
| 5 Operations abdominal, eye, tonsil, ear, etc | 38 | 41 | 45 | 52 |
| 6 Needles breaking | 3 | 2 | 9 | 2 |
| 7 Infections | 17 | 12 | 19 | 19 |
| 8 Eye infections | 6 | 5 | 4 | 4 |
| 9 Diagnosis | 22 | 17 | 24 | 24 |
| 10 Lunacy commitments | 2 | 1 | 2 | 2 |
| 11 Unclassified—medical | 30 | 39 | 40 | 51 |
| Totals | 175 | 177 | 217 | 229 |
| <i>Further Comparisons</i> | | | | |
| Actions for death | 15 | 17 | 26 | 26 |
| Infants' actions | 17 | 23 | 25 | 27 |
| Totals | 32 | 40 | 51 | 53 |
| <i>How Disposed of</i> | | | | |
| Settled | | | 48 | 55 |
| Judgment for defendant, dismissed, discontinued or abated | | | 165 | 168 |
| Judgment for plaintiff | | | 4 | 6 |
| Totals | | | 217 | 229 |
| <i>Further Comparisons</i> | | | | |
| Appeals | | | 3 | 4 |
| Judgments for defendant | | | | |
| Judgments for plaintiff | | | | |
| Pending on January 31, 1938 | 493 | | | |
| Pending on January 31, 1939 | 441 | | | |

and consultation with many claimants and their attorneys and frequently we have successfully demonstrated to them that in fact and in law no valid claim exists.

The Table of Comparisons which is above, shows that we disposed of during the present reporting period 229 cases as against 217 cases during the previous year. Of the 229 cases disposed of during the present reporting period 55 cases were settled and 168 actions were successfully terminated in favor of the physician. In 6 cases judgment was rendered in favor of the plaintiff.

Of the cases in the Appellate Courts we were successful in four instances.

We note from Table I that there were pending as of January 31, 1939, 441 cases as against 493 cases pending January 31, 1938.

Table II gives a comparison of the number of members insured in 1936, 1937, 1938, and 1939, and the number of members in the county societies and the percentage of insured members in the county societies and in the entire State Society.

Counsel Work

During the period of this report your Counsel prepared for the Society's JOURNAL articles in the nature of editorial comment. These articles have included the following:

Professional Misconduct—Falsely Advertising Cure for Cancer
Physicians' Automobiles—Right of Way
Evidence—Privileged Communications

(Continued on page 604)

 Cancer Cure—Responsibility of Physician and Hospital
 Practice of Medicine by Chiropractor

Your Counsel has also digested case reports upon malpractice actions which were felt to be of special interest to the members of the profession. These have been published in the State JOURNAL. The case reports which were published during the previous year are as follows

Separation of Symphysis Pubis
 Fistula—Following Delivery
 Claimed Loss of Sexual Powers Following Herniotomy
 Foreign Body in Eye
 Claim of Improper X-Ray Treatment
 Alleged Injury Caused by X-Ray Machine
 Hemorrhage Following Removal of Tumor
 Claimed Improper Diagnosis of Cancer of Breast
 Foreign Body in Eye
 Failure to Diagnose Tuberculosis
 Death from Cancer Following Injury to Knee
 Accidental Breaking of Forceps
 Death Following Amputation of Leg

Broken Anesthesia Needle
 X-Ray Treatment of Psoriasis
 Removal of Scar by Plastic Surgery

It is pleasing for your Counsel to learn from the members of your Society throughout the state that they enjoy reading these reports and articles and that they find them to be interesting and instructive

In addition to his other duties your Counsel receives frequent requests for opinions, orally and in writing, on various topics. Some of the matters upon which advice has been given (in writing) are the following

1 Request for form of consent in connection with the performance of a partial vasectomy

2 Inquiry from a physician, the director of a hospital, as to the method in which doctors' orders should be recorded in hospital records and as to the necessity of requiring such orders to be signed by the physicians making such orders

3 Inquiry as to the advisability of forcing a collection of a bill after dispute had arisen with a father concerning the propriety of treatment rendered by a physician to his son

4 Request from a county medical society for information concerning the right of a physician to reveal diagnoses to welfare officers in order to collect their fees for treating welfare cases

5 Inquiry concerning the order of right among surviving relatives to consent to the performance of an autopsy upon a deceased person

6 Question concerning the legal responsibility of a husband for medical bills covering treatment rendered by a physician to a wife, including the question of whether the wife has a free choice to employ any physician desired by her regardless of the husband's likes or dislikes

7 Inquiry by a county society as to the proper disposition of a physician's records upon his death when his practice has been sold to another physician

8 Inquiry by a county society concerning a physician's conduct when requested by police authorities to certify that a patient involved in a motor accident was intoxicated

9 A request for information with respect to a physician engaged in the business of manufacturing and preparing medicine asserted to be beneficial to patients suffering from heart ailments

(a) As to the ethics of a physician taking an active part in a company manufacturing and selling such a preparation

(b) As to the propriety of a physician preparing circulars and literature explaining the advantages of such medicine.

10 A request for information concerning a physician's right to publicly offer for sale a list of uncollectible accounts of patients.

11 Inquiry as to whether a physician has the legal right to refuse to treat a particular person if he does not wish to do so providing no emergency exists

12 Inquiry from a physician as to whether a hospital is legally required to see to it that a licensed physician should be in attendance during the rendering of certain specified care, or whether such care could be administered with an intern in attendance.

13 Request by a physician for information as to the ethical or legal problem in the display of an electric sign bearing the name of a physician

14 Inquiry from a county society as to the responsibility of a hospital, and of a physician who has permitted a patient to leave a hospital to attend to a business matter, prior to discharge from the hospital

15 Inquiry from a physician as to whether he was legally justified in presenting a bill for services rendered to certain persons while on ship-board

16 Request for opinion as to the responsibility of the surgeon and the

anesthetist, respectively, in the case of an anesthesia accident.

17 Inquiry from a physician as to whether he is entitled, without the consent of the husband and wife, to administer x ray therapy in an attempt to cure cancer, which would render the patient sterile.

18 Request for information as to whether a physician may be held liable in a malpractice suit after a patient had already recovered damages from the owner of an automobile, which caused the injuries which had been treated by the physician

19 Inquiry as to question of upon whom legal responsibility rests when a hospital patient receives a radiation burn

20 Request from a physician for information as to the applicability of Workmen's Compensation and Unemployment Insurance to physicians with respect to professional help in their employ

21 Request by a county society for information concerning the legal responsibility of a surgeon for the acts of a graduate nurse.

22 Request for information as to the Statute of Limitations applicable to malpractice actions where various situations are present.

23 Request from a county medical society for advice as to the propriety of making full citizenship a requirement for membership

24 Inquiry from a county society as to its right to accept a legacy

25 Inquiry from certain physicians who had formed a hospital corporation, concerning certain legal liability arising out of the operation of said institution

26 Request from a county medical society for advice as to the right of a society to compile a list for use of members of the society of patients who had repeatedly failed to make good financial obligations to doctors

27 Request from county society for advice as to conduct of a physician who had given an opinion with

respect to the settlement of a damage claim, and whose conduct had been criticized by an attorney interested in the matter

28 Request for information as to the responsibility of the state for judgments rendered against physicians employed by state hospitals

29 Inquiry regarding the responsibility of an anesthetist when an explosion or fire occurs in the operation of anesthesia apparatus

30 Request from a physician for information as to whether he is compelled by law to notify the civil authorities when a case involving an obvious assault, comes to his attention

31 Inquiry from a physician whose office is located near the state line as to his privilege of practicing across the state line

32 Inquiry from a physician as to the problem presented when a patient suffering from a serious neurologic condition discharges the physician in charge of the case and refuses to consult a neurologic surgeon and calls in a chiropractor

33 Inquiry from a physician concerning the legality of a vasectomy

34 Inquiries from numerous physicians as to the scope and general plan of malpractice defense afforded to members of the Medical Society of the State of New York under the Resolution of the House of Delegates

35 Requests from several physicians for sample forms to be used for the purpose of obtaining consents to operations with a particular view toward guarding against possible actions based upon breach of warranty or breach of contract

36 Request by a county society for advice as to the applicability to such a society of Social Security Legislation

Other Counsel Activities

Your Counsel acting with the Committee on Bylaws has examined various proposed Amendments to the Constitution

and Bylaws of the State Society and of a number of component county societies and has rendered advice and made suggestions in connection therewith

Your Counsel has frequently conferred and given advice to Doctor Harry Aranow and Doctor David Kaliski in connection with the operation of the Workmen's Compensation Law

Your Counsel is constantly in communication with Doctor Peter Irving, Secretary and General Manager of the Medical Society of the State of New York, with regard to many legal questions which arise almost daily in connection with his work

Your Counsel participated in association with consulting counsel in conferences and litigation which led to the termination of the contract between Mr Gardiner and the Medical Society of the State of New York

In addition, your Counsel has also given legal advice and opinions to the various committees of your State Society

Scarcely a day goes by without telephone calls to your Counsel by members of your Society seeking advice and assistance on various problems in connection with their practice

Legislative Advice and Activities

At the writing of this report the Legislature has been in session only about one month. Your Counsel has examined and given advice with respect to the bills that have so far been introduced affecting the medical profession

Conclusion

Once again, in closing this report we do so by expressing our deep appreciation for the generous co-operation in court and consultation furnished us by many members of your Society in the defense of malpractice actions. Without this co-operation it would not have been possible to obtain the results shown by this report

Respectfully submitted,
LORENZ J. BROSNAN, *Counsel*

Report of the Journal Planning Committee

To the House of Delegates

Gentlemen

The JOURNAL Planning Committee has functioned under the resolution adopted by the 1938 House of Delegates, which recommended that the President with the approval of the Council appoint and set up an appropriate Committee to consider ways and means of carrying out the recommendations of the House of Delegates regarding the publication of the JOURNAL and Directory and the management of the technical exhibits.

As soon as the Council authorized the Board of Trustees to negotiate with the publisher of the JOURNAL and as soon as they reached an agreement that they could sign, the Planning Committee meetings were called into conference with the Trustees for the purpose of giving them a background of information. The Committee gave freely of time and thought to the publishing of the JOURNAL by the State Society. Each meeting was attended by the full membership. An agreement for printing was made with the Mack Printing Company of Easton, Pennsylvania. Details of editorial work, business management, the procuring of advertising, and the development of a new format and other details were arranged and approved by the Council.

The old JOURNAL Management Committee carried on until January 1, and then a new Publication Committee was suggested to the Council to carry on when the Society became free to publish the JOURNAL directly from its own offices.

The Bureaus of Public Relations and

Publications have been merged into a Department of Publication, and details have been arranged.

The Council approved the personnel of the Publication Committee recommended by the Planning Committee. This Committee has been given the task of employing such office force and using such advertising means as would be necessary for the JOURNAL. The administration of the production and distribution of the JOURNAL has been placed under the direction of the General Manager of the Society.

The specifications and changes in the format of the JOURNAL have been worked out. It is unnecessary to describe them when the Society has the means of seeing the JOURNAL itself.

The new Publication Committee has carried out its work, found ways of publishing the JOURNAL, established its offices and arranged for its business management. The Society now controls and publishes its own JOURNAL.

The management of exhibits will be carried on under the General Manager by an experienced member of the Publication Committee, Dr. A. L. Loomis Bell of Brooklyn, at a minimum of expense to the Society without employment of an outside individual.

Report of the Committee on the Revision of the Principles of Professional Conduct

To the House of Delegates

Gentlemen

In undertaking this task your special committee of five has carefully read and

studied the Principles of Professional Conduct of the Medical Society of the

State of New York, and also of the American Medical Association. There is much for serious thought in both, but inasmuch as this order to recodify is limited to the principles as adopted by the Medical Society of the State of New York, we have concentrated on these principles.

The sections to which we would particularly like to call attention are

Section 31—Relative to Advertising

Section 32—Relative to Commission or Bonus

Section 35—Relative to Unprofessional Conduct

Section 39—Relative to Enforcement, Discipline, and Punishment

We are convinced that suitable changes would be so far-reaching as to require a continued and careful further study of these sections and therefore we recommend that this committee be continued for another year before making its final report.

Respectfully submitted,

ORRIN S. WIGHTMAN, M. D., *Chairman*

OTTO A. FAUST

LEO F. SIMPSON

ALBERT A. GARTNER

HARRY E. WHEBLOCK

Amendments to Constitution and Bylaws

To the House of Delegates

Gentlemen

Certain amendments and revisions are before you for action at your 1939 Annual Meeting

The first was introduced formally on May 9, 1938, by the Council at the suggestion of the Board of Trustees

Bylaws

Chapter I, Section 2

Add to (a) new sentence following the words "and payable"

"The dues' year shall coincide with the fiscal year, July 1st to June 30th of the succeeding year"

Change (b), first sentence, by deleting the words "May 31" and inserting the words "December 31st," making it read

"A member whose dues and assessments are unpaid after December 31st of any current year is not in good standing"

Change (c), first sentence, by deleting the words "December 31" and inserting the words "June 30th," making it read

"A member whose dues and assess-

ments are unpaid after June 30th of any current year shall automatically be dropped from the rolls of membership"

Add a new portion to be known as (d) to read as follows

"The change of the dues' year shall first become operative on July 1st, 1940, provided, however, that County dues and State assessment shall be paid at half the annual rate for the six months' period, January 1st, 1940, to June 30th, 1940, the full regular annual rate to be paid thereafter, as heretofore provided"

In the event of the adoption by the House of Delegates of the foregoing sentences, (a), (b), (c), and (d), it will be necessary to change the following previously suggested amendment (d)

"Dues and State assessment of a member elected or reinstated after November 1st shall be credited to the ensuing calendar year, all rights and privileges of membership, however, dating from the time of election"

to read as follows

"(e) Dues and State assessment of a member elected or reinstated after May 1st shall be credited to the ensuing calendar year, all rights and privileges of membership, however, dating from the time of election "

In the event that the amendments changing the dues' year should not be adopted, there would still be before the House for action the previously suggested amendment to Section 1, which would become sentence (d), allowing dues collected after November 1st to be credited to the ensuing calendar year

The second was also submitted by the Council amending

Chapter XV

Amend by adding a new Section 7 to read

"The component County Medical Societies, their officers, committeemen and members shall not initiate any policy, propose any legislation or participate in any activities that are contrary to the policies of the Medical Society of the State of New York. This shall not be interpreted to prevent a component County Society from initiating any policy applicable to the profession within its boundaries and within the framework of adopted policy of the Medical Society of the State of New York."

A third amendment was introduced by the Board of Trustees

Amend Section 2, Chapter V, by the insertion before the last sentence of the following

"The Board of Trustees shall make and execute all contracts for the Society

The fourth provides for amendments and revisions of the Constitution and Bylaws in accord with notice formally given by Dr James F Rooney to the 1938 House of Delegates in the following statement

"I desire to give notice that I propose to

submit an amendment to Article IV of the Constitution and Chapter IV of the Bylaws, and to make such other changes in other Articles and Sections as to bring the whole Constitution and Bylaws into conformity. In view of the fact that this will require quite an extended survey of the interrelationship of all of the provisions, I desire to give this verbal notice, and to state that after consultation with the Counsel of the Society I shall submit the written proposals in time to meet the requirement of the Constitution and Bylaws concerning the publication of proposed amendments thereto "

Dr Rooney has submitted the following amendments

"That the Constitution of the Medical Society of the State of New York be amended as follows

Constitution

Article IV—Council

That Article IV be deleted and the following substituted

"The Council shall be composed of (a) officers of the Society, (b) chairmen of the standing committees, (c) the retiring President for a term of one year after his term of office expires "

Article V—Officers

That Article V be amended by adding after the word "Delegates " "five Trustees and one Councilor from each District Branch, who shall be the President thereof", and that the last sentence of the present Article V be deleted and the following substituted therefor

"The officers shall take office at the termination of the annual meeting at which they were elected with the exception of the Councilors elected by the District Branches, who shall take office at the termination of the next annual meeting of the State Society. That the Bylaws of the Medical Society of the State of New York be amended to read as follows

Bylaws

Chapter II—Section 1

That Section 1 (c) be amended by deleting the first sentence, to wit "the Presidents of the District Branches sitting as District Delegates" and adding a new sub-paragraph "(d) the chairmen of Standing Committees" Section 1 will then read as follows

Sec 1 The House of Delegates shall be composed of (a) Delegates elected by the component County Medical Societies, (b) Officers of the Society and other members of the Council and of the Board of Trustees, (c) Past Presidents of the Society shall be life members of the House of Delegates, and (d) the chairmen of Standing Committees Each component County Society shall be entitled to elect as many delegates as there shall be State Assembly Districts in such County at the time of the election, but each component County Medical Society shall be entitled to elect at least one delegate A component Society representing by its name more than one County shall be entitled to as many delegates as there are Assembly Districts in the Counties named in the title of such Society

That Section 8 be amended by changing item 12 to read "Reports of the Councilors," item 13 to read "Reports of the Standing Committees," and renumbering the balance of the section Section 8 will then read as follows

Sec 8 The following shall be the order of business at the sessions of the House of Delegates

- 1 Calling the meeting to order
- 2 Report of Reference Committee on Credentials
- 3 Roll call by the Secretary
- 4 Reading the minutes of the previous meeting
- 5 Report of the President
- 6 Address by the President-Elect
- 7 Report of the Board of Censors
- 8 Report of the Council

- 9 Report of the Secretary
- 10 Report of the Treasurer
- 11 Report of the Board of Trustees
- 12 Reports of the Councilors
- 13 Reports of the Standing Committees
- 14 Reports of the Special Committees
- 15 Reports of Reference Committees
- 16 Unfinished business
- 17 New business
- 18 Adjournment

Chapter III

That Chapter III, Section 1 be amended by deleting the following words in the first sentence, "members of the Council" and substituting therefor, "chairmen of Standing Committees," Section 1 will then read as follows

Sec 1 The Officers, chairmen of Standing Committees, and of the Board of Trustees of the Society, and the Delegates to the American Medical Association shall be elected as the first business of the second day's session of the annual meeting of the House of Delegates No member of the Society who is in arrears for county dues or State Society per capita assessment shall be eligible for any office or entitled to vote for any officer, member of the Council, trustee or delegate.

That Section 2 be amended by adding after the words "Vice-Speaker of the House of Delegates" the words "chairmen of Standing Committees" and that the last paragraph of said Section 2, beginning with the words "Three members" and ending with the words "unexpired term" be deleted Section 2 will then read as follows

Sec 2 The President, the President-Elect, who shall serve as first Vice-President, the second Vice-President, the Secretary, the Assistant Secretary, the Treasurer, the Assistant Treasurer, the Speaker and the Vice-Speaker of the House of Delegates, and chairmen of Standing Committees

shall be elected for one year or until their successors have been duly chosen

That Section 4 be amended by deleting the following words in the first sentence "other members of the Council" and the following substituted therefor, "chairmen of Standing Committees" Section 4 will then read as follows

Sec 4 The first order of business on the second day of the session of the House of Delegates of each annual meeting shall be the nominations for officers of the Society and chairmen of Standing Committees, a member of the Board of Trustees, delegates to the American Medical Association, and the appointment of a sufficient number of tellers by the Speaker After all nominations have been made the Secretary shall cause to be displayed in full sight of the delegates a list of nominees for each office arranged in alphabetical order, and shall also cause to be distributed a sufficient number of blank ballots for the use of the House of Delegates These ballots shall have printed or stamped thereon the appropriate headings for each office with spaces thereunder in which may be written the name of the candidate or candidates to be voted for

Chapter IV—Council

That the present Chapter IV be deleted and the following substituted therefor

CHAPTER IV

Council

Sec 1 The Council shall meet at the close of the annual meeting of the House of Delegates The members of the Council shall hold office until their successors are duly elected and qualified

Sec 2 It shall meet twice a year, the time and place to be selected by the President, and it shall meet at other times upon the request in writing of five members of the Council, or upon the call of the President.

Sec 3 A quorum shall consist of eleven members

Sec. 4 The Council shall be the executive and administrative body of the Society and shall control all arrangements for the annual meeting, shall elect an Executive Committee of the Council to carry on during the interim between the regular meetings of the Council the affairs and the business of the Society Its action shall be governed by the Constitution and Bylaws of the Society and the rules and regulations of the House of Delegates It shall have power to employ legal counsel

Sec 5 The Council shall take such action as is necessary to carry out the Constitution and Bylaws and to give full effect to any resolution or vote of the House of Delegates It shall also have power to legislate as a House of Delegates, when the latter is not in session, on all matters consistent with the Constitution and Bylaws Such legislative action of the Council shall not become effective or binding on the Society until approved by a majority of a referendum vote of the House of Delegates, provided a majority of the House of Delegates vote thereon within fifteen days after the mailing of the question submitted for referendum The Secretary shall send the question for referendum vote to all the members of the House of Delegates

The Council shall have power to fill any vacancies which may occur in any elective office not otherwise provided for, until the next annual meeting of the House of Delegates

Sec 6 The following shall be the order of business at meetings of the Council

- 1 Calling the meeting to order
- 2 Roll call by the Secretary
- 3 Reading of minutes
- 4 Communications
- 5 Reports of chairmen of standing and special committees
- 6 Unfinished business
- 7 New business.

Chapter V—Executive Committee

That a new chapter reading as follows be inserted to follow the present Chapter IV to become "Chapter V" entitled "Executive Committee "

CHAPTER V

Executive Committee

Sec 1 At its first regular meeting the Council shall choose by a majority vote five members of the Council, three of whom shall be councilors, who together with the President, the President-elect, the Secretary, the Treasurer and the immediate Past President shall constitute the Executive Committee. Candidates for election to the Executive Committee shall be nominated by the President, but other candidates may be nominated by any member of the Council. The Executive Committee shall hold office until the following annual meeting of the Council or until their successors shall be duly chosen. The Executive Committee shall, when elected, organize immediately under the Chairmanship of the President of the Society and proceed to elect a Vice-Chairman. The Executive Committee shall hold regular meetings at times and places that shall be fixed by the Chairman, and any two members of the Executive Committee may require the Chairman thereof to call a meeting for such time and place as shall be designated by them in writing, of which the members shall have at least two days' notice. Five members shall constitute a quorum. It shall prepare a budget to be acted upon by the Board of Trustees.

Sec 2 The following shall be the order of business at meetings of the Executive Committee

- 1 Calling the meeting to order
- 2 Roll call
- 3 Reading of minutes
- 4 Communications
- 5 Reports of committees
- 6 Unfinished business
- 7 New business

Sec 3 The Executive Committee shall superintend all publications of the Society and their distribution and shall have authority to appoint a Publication Committee, and Editor and such assistants as it may deem necessary and provide for the publication of official pronouncements of component county societies when requested by said society. The Standing and Special Committees of the Society shall report to the Executive Committee and shall be subject to the jurisdiction of the Council or the Executive Committee when the House of Delegates is not in session. No Standing or Special Committee shall inaugurate or initiate any policy or commit the Society to any policy unless the same has been expressly approved by the House of Delegates, and/or the Council and/or the Executive Committee. The Executive Committee shall have such other powers and duties as may be delegated to it from time to time by the Council. It shall act as adviser to the legal counsel of the Society in suits brought against members of the Society for alleged malpractice. It shall, with the aid of the legal counsel, examine the Constitution and Bylaws of component County Societies and District Branches, and all amendments thereto which may be submitted to the Council for approval, and shall report to the Council its approval or disapproval thereof. The Chairman of the Executive Committee may order, or any two members of the Committee may require the Chairman to order, a referendum vote of the Council on any question that may come before the Executive Committee and members of the Council may vote thereon by mail, telegram, or telephone. The poll on the question so submitted shall be closed at the expiration of one week after the mailing of the question and if the members of the Council voting shall comprise a majority of all the members of the Council, a majority of such vote shall determine the question and be binding.

upon the Council and the Executive Committee.

Sec. 4 In case of any vacancy in the Executive Committee through death, resignation, disqualification, or other cause, the Chairman shall appoint a successor to fill such vacancy until the next meeting of the Council.

Sec. 5 The Executive Committee shall have charge of the administrative and business affairs of the Society while the Council is not in session, and may adopt rules and regulations in conformity with the Constitution and Bylaws of the Society or to the rules, regulations, or orders of the House of Delegates or of the Council.

That the present Chapter V (Board of Trustees) be renumbered to become Chapter VI.

That the present Chapter VI (Censors) become Chapter IX.

That the present Chapter VII be deleted and the following substituted therefor

CHAPTER VII

Duties of Officers

Sec. 1 The President shall preside at all meetings of the Society, the Council, and the Censors. He shall be Chairman of the Executive Committee. He shall be ex-officio member of the Board of Trustees and of all committees. He shall appoint all committees not otherwise provided for. He shall deliver an address at the annual meeting of the Society. He shall perform such other duties as the House of Delegates or the Council shall require. He shall not accept any civic or public duties without the advice and consent of the Council.

Sec. 2 The ranking Vice-President in the absence of the President shall perform the duties of such officer. In the event of the President's death, resignation, removal, incapacity or refusal to act the ranking Vice President shall succeed him.

Sec. 3 The President-Elect shall perform no specific duties other than those of a member of the Council and the Executive Committee. He shall not accept any civic or public duties without the advice and consent of the Council.

Sec. 4 The Speaker shall preside at all meetings of the House of Delegates. He shall appoint all parliamentary committees serving during the meeting of the House of Delegates.

Sec. 5 The Vice-Speaker shall perform the duties of the Speaker when requested by the Speaker to do so, or in case of the absence, death, resignation or refusal of the Speaker to act.

Sec. 6 The Secretary shall attend all meetings of the Society, the House of Delegates, the Council, Board of Trustees, the Executive Committee of the Council, and the Censors, and shall keep minutes of their respective proceedings in separate records. He shall be responsible for and have general charge of the Society's offices and the employees therein. He shall be the custodian of the seal of the Society, and of all books of records and papers belonging to the Society, except such as properly belong to the Treasurer, and shall keep an account of, and promptly turn over to the Treasurer, all funds of the Society which come into his hands. He shall provide for the registration of the members at all sessions of the Society. With the aid and co-operation of the secretaries of the county societies, he shall keep a proper register of all the registered physicians of the State by counties. He shall aid the Councilors in the organization and improvement of the county societies and the extension of the power and influence of the Society. He shall conduct the official correspondence, notifying members of meetings, officers of their election and committees of their appointment and duties. He shall affix the seal of the Society to all credentials issued to members of the Society elected by the House of Delegates and to such other papers and

documents as may require the same. He shall make an annual report to the House of Delegates and also the reports of the Council and the Board of Censors. He shall supply each county society with the necessary blanks for making their annual reports to this Society. Acting in co-operation with the Committee on Scientific Work he shall prepare and issue all programs. He shall be ex-officio a member of all standing committees. He shall record the name and date of admission of each member of the Society.

Sec 7 The Assistant Secretary shall aid the Secretary in the work of his office and in the absence or disability of the latter, he shall perform the duties of the office until the Secretary resumes the work, or in case of a vacancy until a successor shall be elected. He shall be entitled to all the rights and privileges of the office while acting as Secretary.

Sec 8 The Treasurer shall keep accurate books of accounts of all moneys of the Society which he may receive, and shall disburse the same when duly authorized by the Board of Trustees, but all checks drawn by the Treasurer upon the funds of the Society shall be countersigned by the Secretary of the Society. He shall collect, on or before the first day of June in each year, from the Treasurer of each component county society the State per capita assessment. He shall, at the expense of the Society, give a bond for the faithful performance of his duties, which shall be approved by the Board of Trustees as to amount, form, and surety. He shall make an annual report to the House of Delegates and, whenever requested, to the Board of Trustees.

Sec 9 The Assistant Treasurer shall aid the Treasurer in the work of his office, and in the absence or disability of the latter, he shall perform the duties of the office until the Treasurer resumes the work, or in case of a vacancy until a successor shall be elected. He shall, at the expense of

the Society, give a bond for the faithful performance of his duties, which shall be approved by the Board of Trustees as to the amount, form, and surety. He shall be entitled to all the rights and privileges of the office while acting as Treasurer.

Sec 10 Each District Councilor shall visit the counties of his district at least once a year and make a careful inquiry of the condition of the profession in each county in his district and shall report thereon to the House of Delegates.

That a new chapter to be entitled "Chapter VIII" be interpolated between the present Chapter VII and Chapter IX and to read as follows

CHAPTER VII

Committees

Sec 1 The Committees shall be classified as Standing, Reference, and Special Committees. Standing and Special Committees shall report to the Council and/or the Executive Committee and/or the House of Delegates.

Committee on Scientific Work

Committee on Legislation

Committee on Public Health and Medical Education

Committee on Economics and Public Relations

Committee on Arrangements

Sec 2 The Committee on Scientific Work shall consist of the Chairman, a member to be nominated by the President of the Society and elected by the Council, and the Chairmen of the different sections. It shall hold meetings and prepare the necessary programs for the annual meeting of the Society and for such other special meetings as may be designated by the House of Delegates. It shall forward programs in ample time for publication, and not later than thirty days before the annual session shall send a completed program to the Secretary for the printing of the final program.

Sec 3 The Committee on Legislation shall consist of five members in-

cluding the Chairman. It shall be the representative of the Society on all matters of medical legislation and shall have charge of all hearings before the Committees of the Legislature. The component county societies and their committees on legislation shall co-operate with this Committee and act in harmony with it on all such matters. It shall keep in touch with professional and public opinion on matters relating to medical legislation. It shall represent the Society in procuring the enactment of the medical laws of the State, in the interest of public health and of scientific medicine as will best secure and promote the welfare of the whole people. It shall take all legal and honorable means of opposing and preventing all vicious legislation detrimental to the best interests of the profession and the welfare of the public.

Sec. 4 The Committee on Public Health and Medical Education shall consist of five members including the Chairman. It shall be the function of this Committee to investigate, study and report to the House of Delegates on matters of public health, preventive medicine, and medical education. It shall gather facts regarding the activities of health organizations, both official and nonofficial, and report to the House of Delegates regarding the same when it so deems necessary. It shall be the duty of this Committee to advise the House of Delegates as to plans for postgraduate education for the general profession and shall be in charge of carrying out such plans as are approved by the House of Delegates. It shall co-operate with similar committees of component county societies in carrying out recommendations of the House of Delegates dealing with public health and medical education.

Sec. 5 The Committee on Economics and Public Relations shall consist of five members, including the Chairman. The function of this Committee shall be to conduct investigations, to gather facts, to make studies or surveys on the general subject

of the relationship of the physician individually and collectively with the public. It shall receive matters of general public information and study them both in regard to their effect upon the practice of medicine in private or institutional work. It shall concern itself with the financial aspects of the practice of medicine, throughout the State of New York, especially insofar as it affects the efficiency of medical service to the public. It shall concern itself with all economic phases regarding the practice of medicine in hospitals, private or public clinics, commercial organizations, and other institutions established for diagnosis and treatment.

Sec. 6 The Committee on Arrangements shall consist of nine members, including the Chairman. It shall provide suitable accommodations for the meeting places of the Society, the House of Delegates, and the Sections and shall make all necessary arrangements for these meetings. The Chairman of the Committee shall send an outline of the arrangements to the Secretary for publication in the program, and shall make such announcements during the session as occasion may require.

Sec. 7 The Chairman of all Standing Committees shall be elected by the House of Delegates unless otherwise provided for in the Bylaws. The remaining members shall be elected by the Council.

Reference Committees

Sec. 8 At least one month before the meeting of the House of Delegates the Speaker shall appoint such Reference Committees as he shall deem expedient for the purposes of the meeting. Immediately after the organization of the House of Delegates he shall formally announce the appointments to the Committees. Only members of the House of Delegates are eligible for appointment on the Reference Committees. Such Committees shall consist of five members, three members

constituting a quorum, and shall serve during the meeting at which they are appointed

Sec 9 Reports of Officers and Standing Committees shall be printed at least one month before the meeting of the House of Delegates and sent to the members of the Reference Committee appointed according to Section 9, for their preliminary consideration. All recommendations, resolutions, measures and propositions presented to the House of Delegates and which have been duly seconded shall be referred by the Speaker to the appropriate Reference Committee.

Sec 10 Each Reference Committee shall, as soon as possible, take up and consider such business as may have been referred to it and shall report when called upon to do so

Special Committees

Sec 11 Special Committees may be created by the House of Delegates to perform the special functions for which they are created. They shall be appointed by the officer presiding over the meeting at which the committee is authorized, if such committee is to conclude its work during said meeting of the House of Delegates. The President shall appoint all other committees unless otherwise ordered by the House of Delegates

Sec 12 A Special Committee on Prize Essays consisting of three members, including the Chairman, shall be appointed by the President. Its duty shall be to receive all essays offered in competition for prizes which may be offered by this Society. The Committee shall make all necessary rules and regulations for the award of prizes subject to the terms of the deeds of gift, and shall report the result at the next annual meeting of the House of Delegates. They shall give notice through the Society's publication or by other methods within thirty days after their appointment, of the amount of the prize and when the essays shall be submitted to the Committee

Sec 13 Any member of the Society shall be eligible to serve on Standing or Special Committees. All members of committees, who are not members of the House of Delegates, shall have the right to present their reports in person to the House of Delegates and to participate in the debate thereon, but shall not have the right to vote

Sec 14 Completion of Work In all cases where certain work is being performed or problems studied by Standing or Special Committees, such work or study shall not be considered finished when the tenure of office of such Committee ends but shall be continued by the succeeding Committee

That the present Chapter VIII (Direction of Activities) to become Chapter XII

That the present Chapter IX (Meetings) be renumbered and become Chapter X

That the present Chapter X (Expenses) be renumbered and become Chapter XI

That the present Chapter XIII remain the same

That Chapter XIV be amended to read as follows

CHAPTER XIV

District Branches

Sec 1 Each District Branch shall elect a President for two years who shall be the Councilor for that Branch

Sec 2 Each District Branch shall elect such officers as are provided for in its Bylaws who shall attend the business meetings of the Branch

That the present Chapter XV, Chapter XVI, Chapter XVII, and Chapter XVII remain the same

These amendments to the Bylaws will take effect at the termination of the

Annual Meeting of the Medical Society
of the State of New York in 1940

*as provided in the present Bylaws, Chapter
XVIII*

*All of the foregoing amendments, having been
properly introduced, are here published*

JAMES M. FLYNN, M.D., *Speaker*
PETER IRVING, M.D., *Secretary*

Report of the First District Branch

To the House of Delegates

Gentlemen

The 32nd Annual Meeting of the First District Branch was held on November 17, 1938, at the New York Hospital and Cornell Medical School. A full day was devoted to sessions consisting of lectures, demonstrations, operative clinics in general surgery, orthopedic surgery, pediatrics, obstetrics and gynecology, hematology, diabetes and endocrinology, neurology and psychiatry, roentgenology, urology, ophthalmology, and otolaryngology.

After the luncheon, which was praised for its excellence, the assembled physicians were addressed briefly by Mr. Smith, chairman of the New York Hospital Board, and by the medical heads of the various branches and services.

Dr. West presided at the regular business meeting.

This meeting was addressed by Mr. Murray Sargent, executive officer of the hospital, in the form of a short word of welcome.

This was followed by appointment of a nominating committee, consisting of Dr. Stanwix of Yonkers, Dr. Holman of Orange, and Dr. Nott, of Westchester, which brought in the following slate for president, Theodore West, Westchester County, 1st vice-president, A. N. Selman, Rockland County, 2nd vice-president, M. R. Bradner, Orange County secretary, I. J. Landsman,

Bronx County treasurer, H. C. Taylor, Jr., New York County.

These men were then duly elected as the officers of the First District Branch for the ensuing two years. Brief talks followed. The President of the State Society took as his title 'An Optimistic Note on the Future of Medicine', the Secretary of the State Medical Society, Dr. Peter Irving, equally optimistic, spoke on "Cash Indemnity Insurance", Dr. Joseph Lawrence on "Medical Care of the Indigent", and Dr. West made the concluding remarks.

The meeting was well attended, and the keen interest shown by the membership in the previous annual meetings encouraged the officers to plan this meeting along the same general lines, and it is very obvious that this one day postgraduate study has become a favorite with the members of the First District Branch.

The success of the annual meetings of the past two years has demonstrated the fact that there is a definite place for the First District Branch in the metropolitan district, and that meetings can well be clinical in character. It is hoped that a similar meeting will be held next fall, and that it will continue the high standards which have been previously set.

Respectfully submitted,
THEODORE WEST, *President*

February 23, 1939

Report of the Second District Branch

To the House of Delegates

Gentlemen

The Annual Meeting of the Second District Branch was held at the Garden City Hotel on November 16, 1938. A full day's scientific program on the subject of diseases of the gastrointestinal tract met with the approval of some two hundred physicians in attendance. The morning's program was devoted to a pathologic exhibit on the various phases of diseases of the gastrointestinal tract, under the chairmanship of Dr Theodore J Curphey. Pathologists of Brooklyn and Long Island hospitals who participated were Dr Alfred Angrist, Queens General Hospital, Dr Edward J Buxbaum, Jamaica Hospital, Dr Theodore J Curphey, Meadowbrook Hospital, Medical Examiner, Nassau County, Dr Earl B Erskine, Mary Immaculate Hospital, Dr Harold Fink, Coney Island Hospital, Dr Louise D Larimore, North County Community Hospital, Glen Cove, Dr Max Lederer, Jewish Hospital, Brooklyn, Dr Lawrence Sophian, Nassau Hospital.

The afternoon program was devoted to lectures on the medical and surgical aspects of the subject under consideration. Physicians in attendance had the pleasure of listening to the following addresses and speakers:

"Medical Management of Peptic Ulcer," by Dr Albert F R Andresen, Brooklyn, "Treatment of Gastric Hemorrhage," by Dr John B D'Albora, Brooklyn, "Surgical Indications in Diseases of the Gastroduodenal Tract," by Dr Benjamin W Seaman, Hempstead, "Sur-

gical Indications in Diseases of the Colon," by Dr Charles C Murphy, Amityville, "Gastrointestinal Allergy," by Dr Matthew Walzer, Brooklyn, and "Interesting Gastrointestinal X-Ray Case Reports," by Dr I S Startz, Elmhurst.

A luncheon at the hotel was attended by approximately 175 physicians and members of the Woman's Auxiliaries of the Medical Societies of the Counties of Kings, Queens, Nassau, and Suffolk. The speakers' table was graced by the President of the State Society Woman's Auxiliary, Mrs Daniel J Swan, as well as the past president of the State Society Woman's Auxiliary and the presidents of the County Woman's Auxiliaries. The officers of the Second District Branch are grateful to Mrs James M Dobbins, Chairman of the Committee on Arrangements of the four county auxiliaries, and the members of her committee for their cooperation in making the annual meeting a social success.

We were honored by the presence of officers of the State Society—Dr William A Groat, President, Dr Terry M Townsend, President-Elect, and Dr Joseph Lawrence, Executive Officer.

The general enthusiasm at the meeting and the opportunity for social and professional relationships among the four counties of Long Island was made possible only by the existence of the district branch.

Respectfully submitted,
IRVING GRAY, *President*

February 10, 1939

Report of the Third District Branch

To the House of Delegates

Gentlemen

The Third District Branch, composed of the Counties of Albany, Columbia, Greene, Rensselaer, Schoharie, Sullivan,

and Ulster, held its Thirty-second Annual Meeting at the Central High School Auditorium in Cobleskill, New York, September 20, 1938. Over a hundred members were present, besides several

guests from neighboring medical districts Dr Carolyn L Olendorf of Cobleskill, President of the Schoharie Medical Society, opened the meeting with a hearty address of welcome. Then followed an instructive scientific program.

Dr Frederick A D Alexander, Director of Anesthesia, Albany Hospital, spoke on "Modern Anesthesia." A paper prepared by Morris A Goldberger of Mt Sinai Hospital, New York, on "Modern Trends in Obstetrical Practice" was read. Dr T Wood Clarke of Utica, spoke on "Allergic Manifestations in the Central Nervous System." Dr Donald Guthrie of the Guthrie Clinic, Sayre, Pa., spoke on "The Diagnosis and Surgical Treatment of Hyperthyroidism." These papers were each followed by lively discussions by various doctors and proved highly instructive.

At noon a fine lunch was served at Hotel Augustan during which several guests were introduced, among whom were State President William A Groat, State Secretary Peter Irving, Augustus J Hambrook, members of the Council, and others.

At the election of officers which fol-

lowed the luncheon, Dr Arthur M Dickinson of Albany, was chosen president, Dr Mahlon H Atkinson of Catskill, vice-president, Dr Stephen H Curtis of Troy, second vice president, Dr Wm Rapp of Catskill, secretary, and Dr E E Billings of Kingston, treasurer.

During the afternoon scientific session, Dr Louis K Diamond of Harvard University spoke on "Anemia in Children," and Dr Chas Gordon Heyd of New York City presented a paper "The Diagnostic Interpretation of Jaundice," which was illustrated with lantern slides.

I wish to thank all the officers, committees, and members of the Third District Branch for their attendance and for their efforts to make this meeting a success. I would especially thank the speakers who contributed so much of interest and instruction. Also, I wish to thank heartily the members of the Schoharie Medical Society and the ladies of the local society who did so much to make our visit to Cobleskill pleasant and entertaining.

Respectfully submitted,

BERTRAN W GIFFORD, *President*

February 10, 1939

Report of the Fourth District Branch

To the House of Delegates

Gentlemen

The Thirty second Annual Meeting of the Fourth District Branch was held at the Elks' Club in Amsterdam in the afternoon and evening of Friday, September 31, and in the morning of Saturday October 1, 1938.

During the afternoon session the following papers were read: "The Menopausal Syndrome," by Dr Lyle A Sutton, Albany, "Menopausal Bleeding," by Dr Arthur J Wallingford, Albany, and "Fever Therapy," by Dr Stafford L Warren, Rochester.

These papers were timely, extremely well presented and aroused much dis-

cussion. At the close of the scientific session the following officers for 1939 and 1940 were elected:

President Dr Sylvester C Clemans Gloversville, first vice president, Dr E Harrison Ormsby, Amsterdam, second vice president, Dr Warriner Woodruff, Saranac Lake, secretary, Dr Harold A Peck, Glens Falls, and treasurer, Dr John E Free, Ogdensburg.

During the evening the members and guests of the Fourth District Branch were entertained by the Montgomery County Society at a dinner which was also held at the Elks Club. Among the distinguished guests were Dr William A Groat, President of the State Medical

Society, Dr Peter Irving, Secretary of the State Society, and Dr Joseph Lawrence, Executive Secretary. There was no stated program but addresses were given by President Groat and Dr Irving. Informal talks were also presented by various past presidents of the district.

On Saturday morning the scientific schedule was continued and the program was as follows: "The Diagnosis and Treatment of Tic Douloureux and Allied Conditions," by Dr Eldridge H Campbell, Albany, "The Food Factor in

Allergy," by Dr Will Cook Spain, New York City, and "Recent Advances in the Surgical Treatment of Pulmonary Tuberculosis," by Dr Edward S Welles, Saranac Lake.

The high character of the papers was amply appreciated in this program which was provocative of much interest and discussion.

All meetings were well attended.

Respectfully submitted,

CARL R COMSTOCK, *President*

February 15, 1939

Report of the Fifth District Branch

To the House of Delegates

Gentlemen

The Thirty-second Annual Meeting of the Fifth District Branch of the Medical Society of the State of New York was held on Thursday, October 6, 1938, at the Elks' Club, Oneida, New York.

The meeting was called to order at 10 05 A M. The minutes of the previous meeting were read and approved. Under the heading of scientific program Dr F J Schoenech, of Syracuse, gave a splendid paper on the progress of obstetrics. Dr Robert Sloan, of Utica, gave an extensive review of the abuse of cesarean section, and Dr Wendell George, of Watertown, outlined a technical review of puerperal infections, with special reference to the use of sulfanilamide. These three papers were discussed by Dr Francis Irving, who stressed conservatism and the low cesarean. Dr W J Newell considered our high mortality statistics might be better if we excluded heart disease, et cetera, up to a period of say six months, and he stressed, particularly, the need of consultation before cesarean. Dr E H Carpenter referred to the advantages of prenatal care. Closing remarks were made by the three speakers answering questions and elaborating in more detail on the various points suggested. The

meeting adjourned across the street to the Masonic Temple, where a luncheon was served by Oneida Chapter No 21 OES, following which the President called on Dr Farmer to introduce Dr Van Etten, who paid a splendid tribute to Dr Groat as an exemplar of the best in medicine. Dr O W H Mitchell then presented Dr Groat, President of the Medical Society of the State of New York and past president of the Fifth District Branch, 1933-1934.

Dr B W McCuen read a resolution of condolence in regard to the death of Dr Frederick H Flaherty. The meeting stood for a moment in silence in respect to Dr Flaherty. The president ordered the resolution to be incorporated in the minutes of this meeting and a copy to be sent to the family of Dr Flaherty.

Dr Russell L Haden, of the Cleveland Clinic, spoke on the mechanism of anemia. Accompanied by charts and lantern slides, Dr Haden made a difficult subject seem very simple. Dr Ellery G Allen discussed Dr Haden's paper, stressing several important points. Dr Edward C Reifensstem spoke in appreciation and called attention to the progress and treatment of aplastic anemia, which he said is a very rare occurrence. Dr William W Hall made reference to the small spleen, sometimes found by x-ray in cases of

leukemia Dr Haden closed the discussion

Dr Herman O Mosenthal, of New York, continued the scientific program with a discussion of Protamine Zinc Insulin, illustrating by numerous charts the progress made in New York City in the treatment of diabetes and the advantages of this drug when combined with insulin Discussion was joined in by Dr Hall of Watertown, and Drs

Reifenstein, Groat, and Holmes, of Syracuse, also Dr Raymond of Cazenovia, all of whom stressed important points in the paper and asked interesting questions

The meeting adjourned at 5 P M There were 164 present

Respectfully submitted,
CHARLES A EARL, *President*

February 14, 1939

Report of the Sixth District Branch

To the House of Delegates
Gentlemen

The Thirty second Annual Meeting of the Sixth District Branch of the Medical Society of the State of New York was held at Elmira, New York, August 27, 1938, in the Hotel Mark Twain A goodly number of physicians were in attendance—119 from the District and 14 from outside—a total of 133

The morning session was opened promptly at ten o'clock, with Dr Reeve B Howland, president, presiding An excellent program had been prepared The first paper, 'Postoperative Pulmonary Complications,' by Dr Donald J Tillou, was a very interesting discussion of this interesting subject. The discussion of this paper was opened by Dr Mark H. Williams of Binghamton A thorough discussion was entered into by several surgeons of the District, including Dr Ethan Flagg Butler, F.A.C.S., of Ithaca, Dr John Wattenburg, F.A.C.S., of Cortland, Dr Frank M Dreyer, F.A.C.S., of Binghamton.

At 11 00 A.M moving pictures of the fluoroscopic image by Dr William Stuart, F.A.C.R., Director Department of Radiology, and Dr Francis H Ghiselin, Associate, Lenox Hill Hospital, New York City, were shown, giving vivid pictures of moving organs within the body These marvelous pictures were greatly appreciated by the audience. The discussion

of this paper was opened by Dr Hobart H Burch, Director, Department of Radiology, St. Joseph's Hospital, Elmira Others taking part in the discussion were Dr Leo Larkin, Ithaca, and Dr John Bennett, Elmira

Luncheon was served in the dining room of the Mark Twain at 1 00 P.M to the physicians present. The ladies were entertained at luncheon at the Elmira Golf and Country Club

At 2 00 P.M the meeting again came to order and a very valuable and comprehensive discussion of 'The Anemias and their Treatment' with moving pictures of 'Pernicious Anemia' was delivered by Dr William P Murphy of Boston His discussion of this practical subject was listened to with rapt attention The members greatly appreciated the effort Dr Murphy made to get to the meeting, as he was caught in the flood in Massachusetts and had extreme difficulty, and many extra miles of driving, in order to get through The discussion of his paper was opened by Dr George MacKenzie, of Cooperstown The paper was greatly enjoyed and thoroughly discussed

At 4 00 P.M Dr James K Quigley, F.A.C.S., of Rochester, delivered a very interesting paper 'Ablatio Placentae,' one of the more uncommon accidents in the practice of Obstetrics Dr Stewart B Blakey, F.A.C.S., of Binghamton,

opened the discussion of this paper and brought out several valuable facts relative to treatment

The meeting was one of enthusiasm and the members expressed their apprecia-

tion to the speakers for the efforts they made in coming so far to Elmira

Respectfully submitted,

REEVE B HOWLAND, *President*

February 19, 1939

Report of the Seventh District Branch

To the House of Delegates

Gentlemen

An "Information Please" Program

At the annual meeting of the Seventh District Branch, held at the Oak Hill Country Club in Rochester on Thursday, September 22, 1938, something rather new in medical programs was undertaken

An attempt was made to attract members to the forenoon session which in previous years has apparently been difficult. The idea was to make the program of a popular nature. Therefore, the session opened at 9 50 with the showing of the sound motion picture, *The Birth of a Baby*, produced under the sponsorship of the American Committee on Maternal Welfare. This showing apparently met with unanimous approval. The picture is as near perfect in details as can be, and is not an amateur production. It was shown under ideal conditions by means of a portable apparatus set up in the large lounge of the country club.

The morning session closed with a popular address by Dr Wm N Macartney of Fort Covington, N Y, author of *Fifty Years a Country Doctor*, a very popular "best seller."

When the doctors registered and purchased dinner tickets, they were offered a choice of four luncheon-forums. These forums were held simultaneously while the members were served luncheon in different rooms of the clubhouse. During the serving of the luncheon written questions were prepared by those in the session, and these questions were answered by a group of experts who were specialists,

each in his own field. The topics were as follows:

"Gastrointestinal Problems," with Dr A H Aaron of Buffalo as chairman, "Modern Drug Therapy," with Dr James H Sterner of Rochester as chairman, "Children in Health and Disease," with Dr Albert D Kaiser of Rochester as chairman, and "Pneumococcal Infections," with Dr David B Jewett of Rochester as chairman.

The committee of experts in each group included from three to twelve specialists. The most popular group apparently was the one on modern drug therapy, but it was surprising how evenly the two hundred and forty-nine in attendance were divided among the four groups.

With one exception this was the largest meeting of the Seventh District Branch ever held, this in spite of rain which continued all day long.

The success of this meeting is attributed to the following: (1) early selection of the date of the meeting and good publicity, (2) a large, hard working committee on local arrangements and program, headed by Dr B J Slater, (3) a division of labor among a comparatively large number of workers, each one doing his own job well, (4) an attractive program beginning on time and closing promptly when the work was done, and (5) an attractive meeting place with facilities to take good care of a large crowd.

A high standard has been set for future meetings.

Respectfully submitted,

ALFRED W ARMSTRONG, *President*

Report of the Eighth District Branch

*To the House of Delegates
Gentlemen*

The annual meeting was the only significant activity of the Eighth District Branch during the year 1938. It was held at the City Hospital in Buffalo, October 4. Well over a hundred members were present from the eight component County Societies.

The forenoon was devoted to clinics given by Staff Members in various departments of the hospital. Medical Clinics included arthritis, pneumonia, anemias, tuberculosis, and ward rounds with bedside demonstrations.

The Surgical Department held operative demonstrations, clinics in urology, proctology, and fractures.

Dermatology and syphilology departments gave demonstrations of common skin diseases, all stages of syphilis, and discussed problems of therapy. A résumé

of interesting cases was given by the Department of Roentgenology.

The large number and variety of clinics assured each member the opportunity to observe work in which he was especially interested. Many comments indicated that the clinic morning was much enjoyed.

The afternoon session was opened with a short address by Dr. William A. Groat, President of the State Society. Two presentations of unusual interest completed the scientific session. Dr. Walter A. Bastedo of New York discussed "Stomach Remedies New and Old." "Fact and Fiction in the Treatment of Deficiency Diseases" was presented by Dr. William P. Murphy of Boston.

Respectfully submitted,
L. L. KLOSTERMYER, *President*

February 21, 1939

Medical Society of the State of New York

Annual Meeting, Syracuse, April 24, 25, 26, 27, 1939

All meetings will be held by Eastern Standard Time

House of Delegates

The regular Annual Meeting of the House of Delegates of the Medical Society of the State of New York will be called to order at 10 00 A M on Monday, April 24, in the ballroom of the Hotel Syracuse

JAMES M FLYNN, M D , *Speaker*

PETER IRVING, M D , *Secretary*

Annual Meeting

The Annual Meeting of the Medical Society of the State of New York will be held on Tuesday, April 25, at 7 00 P M , in the ballroom of the Hotel Syracuse

WILLIAM A GROAT, M D , *President*

PETER IRVING, M D , *Secretary*

Registration

Registration will be held in the Hotel Syracuse for Delegates on Monday, April 24. Members are expected and requested to register at either the Hotel Syracuse or the Hotel Onondaga April 24, 25, 26, 27, from 9 00 A M to 6 00 P M

Exhibits

Scientific and Technical Exhibits will be located in both hotels

Scientific Sessions

General Sessions on Tuesday and Thursday afternoons in the Hotel Syracuse

Section meetings on Tuesday morning, Wednesday morning and afternoon, and Thursday morning, will be held in both the Hotel Syracuse and the Hotel Onondaga as shown in the program

133rd Annual Meeting

The Hotel Syracuse, ballroom—Tuesday, April 25, 7 00 P M

Calling the Society to order by the President, William A. Groat, M D

Reading of the minutes of the 132nd Annual Meeting by the Secretary, Peter Irving, M D

The Annual Banquet

The Annual Banquet will be held in the ballroom of the Hotel Syracuse on Tues-

day, April 25, at 7 00 P M. Addresses will be given by

Alexander Woolcott, Guest,

Logan Clendenning, M D , Guest,

Irvin Abell, M D , President of the American Medical Association,

William A. Groat, M D , President of the Medical Society of the State of New York,

Terry M. Townsend, M D , President-Elect of the Medical Society of the State of New York

Requests for tickets and reservations should be sent to Dr. H. Walden Retan, Chairman, Arrangements Committee, 713 East Genesee St., Syracuse. Telephone Syracuse 2-1131. Tickets will be \$5 00

Informal Dinner and Entertainment

On the next evening, Wednesday, April 25, in the ballroom of the Hotel Syracuse there will be an informal dinner, followed by an entertainment. Tickets will be \$2 00, to be obtained from Dr. Retan.

For those who make early reservations for the banquet and the dinner the combination price will be \$6 00. Early reservation is strongly advised, and groups are encouraged for tables of ten.

The Woman's Auxiliary

The headquarters will be in the Hotel Onondaga, and the ladies are asked to register at the registration desk in the lobby after 9 00 A M Monday, April 24

Monday will be given over to meetings of the Executive Board and House of Delegates of the Auxiliary in the Roof Garden

The dinner will be held in the Roof Garden at 7 00 P M. Tickets should be secured before 4 00 P M at the registration desk

A Hobby Show will begin Monday and continue through the four days

On Tuesday there will be a luncheon at the Onondaga Golf and Country Club. Apply at registration desk

On Wednesday there will be a musicale at the Syracuse Museum of Fine Arts, 407 James Street, to be followed by a tea

Scientific Program

[All papers read before the Society by members become the property of the Society. The original copy of each paper shall be left with the chairman of the meeting.]

GENERAL SESSIONS

Place of Meeting Hotel Syracuse, Ballroom

Tuesday, April 25—2 00 P M

EMERGENCIES—THEIR RECOGNITION AND TREATMENT

As evidenced by mortality statistics, many of the emergencies met with in daily practice are still not being recognized sufficiently early to save lives, or are not being treated in the manner which has been shown to be most effective. This practical program of thirty minute talks should do much to clear up some popular misconceptions

1 THE ACUTE ABDOMEN

Thew Wright, M D F.A.C.S., Professor of Surgery University of Buffalo School of Medicine, Buffalo

2 OBSTETRICAL EMERGENCIES

Edward A. Schumann, M D F.A.C.S. Professor of Obstetrics University of Pennsylvania School of Medicine, Philadelphia (Invited Guest)

3 ACUTE CEREBRAL EMERGENCIES

Orman C. Perkins, M D F.A.C.P. Professor of Clinical Neurology Long Island College of Medicine Brooklyn

4 CARDIAC EMERGENCIES

Edward C. Reifstein, M D F.A.C.P. Professor of Medicine Syracuse University College of Medicine Syracuse

Thursday, April 27—2 00 P M

CHRONIC DISEASES—THEIR EARLY RECOGNITION

Unfortunately, many serious chronic diseases are not recognized until they have advanced to an incurable stage, or until they appear as serious complications in the treatment of some new, acute disease. The following program of thirty minute practical talks stressing early diagnosis should prove of unusual interest.

1 THE EARLY EVIDENCE OF CARDIOVASCULAR DISEASE

Samuel A. Levine, M D., F.A.C.P. Assistant Professor of Medicine Harvard University Medical School Boston (Invited Guest)

2 THE EARLY DIAGNOSIS OF CANCER (The A. Walter Sulter Lectureship)

(This will be the first lecture to be delivered under this new lectureship fund set up for the Medical Society of the State of New York by the will of the late Dr. A. Walter Sulter of Herkimer President of the Society in 1892.)

Francis Carter Wood, M D Professor of Cancer Research, Columbia University College of Physicians and Surgeons New York

3 EARLY DIAGNOSIS AND TREATMENT OF PULMONARY TUBERCULOSIS

James Alexander Miller, M D , F A C P ,
Professor of Clinical Medicine, Columbia Uni-
versity College of Physicians and Surgeons,
New York

4 EARLY RECOGNITION OF MENTAL DISEASES AND THEIR TREATMENT

Clarence O Cheny, M D , Professor of Clinical
Psychiatry, Cornell University Medical College,
New York

THE SECTIONS

[All papers read before the Society by members become the property of the Society The original copy of each paper shall be left with the Secretary of the Section Discussers should have their remarks typed and hand them to the Secretary Time limits twenty minutes for each paper, five minutes for individual discussion Section meetings shall begin promptly at the hour specified

[At some period in the meetings, an executive session will be held for the purpose of electing officers for the ensuing year]

SERUM AND SULFANILAMIDE—REPORT OF A CASE

Wallace B Hamby, M D, Buffalo, and Clayton W Greene, M D, Buffalo

DISCUSSION William P Van Wagenen, M D, Rochester, and J Worden Kane, M D, Binghamton

4 THE VALUE OF BLOOD SEDIMENTATION RATE IN INTRACRANIAL TUMORS

Walter O Klingman, M D, New York, and Robert W Laidlaw, M D, New York

DISCUSSION Leon H Cornwall, M D, New York, and Foster Kennedy, M D, New York

Wednesday, April 26—2 00 P M

1 THE USE OF AMPHETAMINE (BENZEDRINE) SULFATE IN ALCOHOLISM WITH AND WITHOUT PSYCHOSIS

Edward C Reifenstein, Jr, M D, Syracuse, and Eugene Davidoff, M D, Syracuse

DISCUSSION Wardner D Ayer, M D, Syracuse, and Albert B Siewers, M D, Syracuse

2 ANXIETY IN RELATIONSHIP TO HYPERTHYROIDISM

Gilbert M Beck, M D, Buffalo

DISCUSSION George E Beilby, M D, Albany, and John J Rooney, M D, Rochester

3 ACUTE DEMYELINIZING PROCESSES IN THE NERVOUS SYSTEM

Andrew J E Akelaitis, M D, Rochester, and Paul H Garvey, M D, Rochester

DISCUSSION Joseph H Globus, M D, New York

4 THE TEACHING AND PRACTICE OF NEUROLOGY AND PSYCHIATRY IN THE OUTPATIENT DEPARTMENT

Noble R. Chambers, M D, Syracuse

DISCUSSION J G Fred Hiss, M D, Syracuse and Harry A Steckel, M D, Syracuse

SECTION ON OBSTETRICS AND GYNECOLOGY

Chairman

William T Kennedy, M D, New York

Secretary

Edward P McDonald, M D, New York

Place of Meeting Hotel Onondaga, Roof Garden

Tuesday, April 25—9 45 A.M

1 SIMPLE METHOD OF ROENTGEN PELVIMETRY (Lantern Slides)

Jacob Fierstein, M D, New York

2 RADIUM IN THE TREATMENT OF CANCER OF THE FUNDUS UTERI—ISODOSE CURVES WITH NEW APPLICATORS

Hyman Strauss, M D, Brooklyn

DISCUSSION Nelson B Sackett, M D, New York

3 STUDY OF CESAREAN SECTIONS FOR TEN YEARS

James Knight Quigley, M D, Rochester

DISCUSSION Edward P McDonald, M D, Albany

4 ROENTGEN RAY THERAPY OF ACUTE MASTITIS DURING LACTATION

Harriet C McIntosh, M D, New York

5. UROLOGICAL COMPLICATIONS IN GYNECOLOGY

Arthur J Murphy, M D New York

DISCUSSION William A Milner M D Albany

6 INDICATIONS FOR OESTROGEN THERAPY IN GYNECOLOGY

Samuel H. Geist, M D New York, and
Udall J Salmon, M D New York

DISCUSSION C. Arthur Elden, M D Rochester

Wednesday, April 26—2 00 P.M

1 EXPERIENCES WITH VAGINAL HYSTERECTOMY BY THE CLAMP METHOD

Milton G Potter, M D Buffalo

DISCUSSION David Nye Barrows, M D New York

2. THE VALUE OF ENDOMETRIAL BIOPSIES IN ENDOCRINE DISORDERS

Daniel R. Mishell, M D Newark, New Jersey
(Invited Guest)

3 CONGENITAL ABSENCE OF THE VAGINA—FEATURES MODIFYING AND SIMPLIFYING THE PROCEDURES FOR RECONSTRUCTION

Nathan P Sears, M D Syracuse

4 THE ETIOLOGY AND TREATMENT OF TRUE TOXEMIA OF PREGNANCY

Maurice B Strauss, M D Boston Massachusetts
(Invited Guest)

DISCUSSION Edward C. Hughes, M D Syracuse

SECTION ON OPHTHALMOLOGY AND OTOLARYNGOLOGY

Chairman
SecretaryAlgernon B Reese, M D, New York
Chester C Cott, M D, Buffalo

Place of Meeting Hotel Syracuse, Parlor D

Wednesday, April 26—10 00 A.M

Instruction Hour 9 00 A M to 10 00 A M

THE DIAGNOSIS AND TREATMENT OF DISEASES OF THE CORNEA

Trygve Gunderson, M D Boston, Massachusetts
(Invited Guest)

2 THE SPASMOGENIC TENDENCY AND ITS EFFECT ON THE EYES

Robert K. Lambert, M D New York

DISCUSSION Charles A Perera M.D New York
Harold VanLammers M D Flushing
and Macy L Lerner M D Rochester

1 DACTRYOCYSTITIS OF THE NEWBORN

Harry V Judge, M D., Albany

DISCUSSION Mortimer A Lasky M D Brooklyn
James I Farrell M D Utica, and
Jason L Wiley M D Auburn

SECTION ON SURGERY

Chairman
Secretary

Clarence V Costello, M D , Rochester
Frederick S Wetherell, M D , Syracuse

Place of Meeting Hotel Syracuse, Ballroom

Tuesday, April 25—10.00 A.M.

1 THE USE OF PEDICLE FLAPS FOR THE STUDY
OF HEALING IN HUMAN SKIN

Leon E Sutton, M D , Syracuse

DISCUSSION Gustave Aufricht, M D , New
York

2 THE USE OF SULFANILAMIDE IN THE TREAT-
MENT OF HEMOLYTIC STREPTOCOCCUS

Leon J Leahy, M D , Buffalo

DISCUSSION William J Orr, M D , Buffalo

3 PERITONEOSCOPY

C Douglas Sawyer, M D , Brooklyn

DISCUSSION Thomas M Brennan, M D ,
Brooklyn, and Charles H Goodrich, M D ,
Brooklyn

4 THE ADVANTAGES OF SILK IN GENERAL
SURGERY

Donald Guthrie, M D , Sayre, Pennsylvania
(Invited Guest)

DISCUSSION Frank L Meleney, M D , New
York

Wednesday, April 26—2:00 P.M.

1 REDUCE HEAD INJURY MORTALITY

Fred W Geib, M D , Rochester

DISCUSSION Eldridge H Campbell, Jr ,
Albany

2 INFECTIONS OF THE NECK

Albert G Swift, M D , Syracuse

DISCUSSION Chas Gordon Heyd, M D ,
New York, and James A Fisher, M D , Asbury
Park, New Jersey (Invited Guest)

3 ACUTE PANCREATITIS

John J Morton, Jr., M D , Rochester

DISCUSSION William Barclay Parsons, M D ,
New York

SECTION ON UROLOGY

Chairman
Vice-Chairman

THE SESSIONS

SESSION ON PHYSICAL THERAPY

Chairman
Secretary

Madge C. L. McGuinness, M.D., New York
Harold J. Harris, M.D., Westport

Place of Meeting Hotel Onondaga, Oak Room

Wednesday, April 26—10 00 A.M.

Address PHYSICAL THERAPY AS A USEFUL
ADJUVANT IN PROBLEMS OF REHABILITATION

Madge C. L. McGuinness, M.D. New York

1. CHRONIC ARTHRITIS—DIFFERENTIAL DIAG
NOSIS—SPECIAL TREATMENT METHODS MEDI
CAL, ORTHOPEDIC, PHYSICAL THERAPY

Bernard L. Wyatt, M.D. Robert A. Hicks,
M.D., and Harry E. Thompson, M.D. Tucson,
Arizona (Invited Guests)

2. THE ROLE OF POSTURE IN CHRONIC AR
THRITIS

Henry Jordan, M.D. New York

3. PROPHYLACTIC EXERCISES FOR CHILDREN

Jerome Weiss, M.D. Brooklyn, and Hans J.
A. Behrend, M.D. New York

DISCUSSION Harold J. Harris, M.D. West
port Madge C. L. McGuinness M.D. New
York and Samuel Kleinberg M.D. New York

4. HAVE SPAS AN ESSENTIAL PLACE IN THE
NATIONAL ECONOMY AND HOW RESPONSIBLE
IS ORGANIZED MEDICINE IN EFFORTS TO
PROMOTE AND CONTROL THEIR ACTIVITIES?

John Carroll, M.D. New York

DISCUSSION Walter S. McClellan M.D.
Saratoga

SESSION ON REGIONAL AND GENERAL ANESTHESIA

Chairman

S LeRoy Sahler, M D , Rochester

Vice-Chairman

T Drysdale Buchanan, M D , New York

Secretary

Frederick A D Alexander, M D , Albany

Place of Meeting Hotel Syracuse, Parlor E

Thursday, April 27—9·45 A.M

1 AN EVALUATION OF INTRAVENOUS ANESTHESIA

Ralph M Tovell, M D , Hartford, Connecticut, and Mario Garofalo, M D , Hartford, Connecticut (Invited Guests)

DISCUSSION Paul M Searles, M D , Buffalo (Invited Guest), and L Franklin Anderson, M D , Buffalo

2 RESPIRATORY DISTURBANCES DURING ANESTHESIA ATTRIBUTABLE TO SEDATIVE MEDICATION—A CLINICAL AND LABORATORY STUDY

Charles L Burstein, M D , New York

DISCUSSION Frederick A D Alexander,

M D , Albany, and Virginia Apgar, M D , New York

3 THE MANAGEMENT OF COMPLICATIONS ARISING DURING CYCLOPROPANE ANESTHESIA

Harold R. Griffith, M D , Montreal, Canada (Invited Guest)

DISCUSSION Emery A Rovenstein, M D , New York, and John C Dessloch, M D , Rochester

4 STUDIES IN RESUSCITATION

William Branower, M D , New York

DISCUSSION John H Evans, M D , Buffalo, and Charles J Wells, M D , Syracuse

Scientific Exhibit

HOTEL ONANDAGA

[All exhibits must be in place on Monday, April 24, 1939, at noon and must remain until Thursday noon, April 27]

1

Jacob Fierstein, M D

Greenpoint Hospital

Brooklyn

RAPID ROUTINE ROENTGEN PELVIMETRY A simple procedure that can be carried out with any standard x-ray installation, without special accessories. No calculation is required, although the procedure is mathematical. It can be performed accurately without extensive experience.

2

Louis C. Kress, M D
Division of Cancer Control
State Department of Health
State Institute for the Study of Malignant Diseases
Buffalo

CANCER OF THE BREAST Transparencies in illuminated frames depicting cancer in various stages before and following different types of therapy with special reference to the evaluation of preoperative radiation

3

Arthur J. Bedell, M D
Albany

COLORED FUNDUS PHOTOGRAPHS 150 direct color photographs, covering major ophthalmoscopic changes of constitutional disease, tuberculosis, syphilis pernicious anemia diabetes, hypertension papillitis including illustrations from several types of brain tumor injury and many other conditions.

4

New York State Medical Library
State Education Department
Albany

POSTERS, BOOKS AND JOURNALS A representative of the library will be present to answer all questions concerning the services of the library. The New York State Medical Library cordially urges all of the members of the Medical Society of the State of New York to use their library in the Education Building Albany. There are over 45 000 volumes in the Medical Library and over 500 periodicals received currently. Special books are sent to the borrower on request or selected material will be sent if the subject desired is given. This service is extended without charge, to physicians and nurses registered in New York State. The only obligation imposed on the borrower is the payment of the transportation charges both ways.

5

Maurice L. Malins, M.D.
Sydenham Hospital
and
John C. Ruddock, M.D.
University of Southern California
Los Angeles

PERITONEOSCOPY Abstract of 900 cases. Description of procedure by means of charts and diagrams. Presentation of sections from biopsies with short case histories. The value of the procedure, contraindications and complications. Demonstration of special technic for determining operability of gastric malignancy tumor masses and ectopic pregnancy.

6

Morris Morrison, M D
A. A. Sammick, M.D
Jewish Hospital
Brooklyn

CLINICO-HEMATOLOGICAL OBSERVATIONS OF BONE MARROW A study of the bone marrow in blood dyscrasias and other conditions The bone marrow pictures are correlated with the peripheral smears Criteria for diagnosis are presented Charts summarizing the findings in 300 normal and pathological cases are presented

MOTION PICTURE

7

Henry C Bacon, M.D
Henry C Schneider, M D
Proctologic Department
Temple University School of Medicine
Philadelphia

EXTRA-RECTAL METASTATIC GROWTHS FROM UPPER ABDOMINAL MALIGNANCY Frequently misinterpreted and misdiagnosed are extra-rectal metastatic growths from upper abdominal and mammary malignancy This exhibit presents a diversified series of cases in color photomicrographs, x-ray findings, and moulage specimens to permit palpation and visualization of artificial growths Differential diagnosis shown by illustrations by W B McNett

8

C O Davison, M D
Vassar Brothers Hospital
Poughkeepsie

A REVIEW OF SPECIAL POSITIONS IN ROENTGENOGRAPHIC STUDY OF BONES AND JOINTS Films and diagrams will be used to demonstrate various positions that have been found useful in demonstrating fractures and pathology, sometimes overlooked in standard positions

9

Samuel E Last, M D
Evangelical Deaconess Hospital
Brooklyn

RADIOGRAPHIC VISUALIZATION OF SPERMATOCELE AND PROSTATIC ABSCESS Exhibits consist of roentgenograms visualizing spermatocele and prostatic abscess by means of new procedures using contrast media Clinical and operative findings will be demonstrated

10

James J. Short, M.D.
S. Wm. Kalb, M.D.
A. Bengelsdorf, M.D.
Charles Weissberg, M.D.
Obesity Clinic

New York Post Graduate Medical School and Hospital
New York

OBESITY PATHOLOGY, METABOLISM, AND MANAGEMENT Mortality statistics glucose tolerance basal metabolism and total heat production dietary treatment, effect of massage artificial fever local heat on blood lipides electrocardiograph findings etc.

11

Edward F. Hartung, M.D.
Louise W. Johnson, A.B.
Jessie R. McKelvey, B.S.
Arthritis Clinic

New York Post Graduate Medical School and Hospital
New York

POSTURE RECORDING AND RESULTS OF POSTURAL TREATMENT IN CHRONIC RHEUMATISM A method of recording posture practicable for clinic workers is described. The results of corrective measures on postural defects in patients with chronic rheumatism are portrayed.

12

C. R. Straatsma, M.D.
New York Post-Graduate Medical School and Hospital
and
Manhattan Eye, Ear and Throat Hospital
New York

PLASTIC SURGERY Exhibit will consist of photographs and casts of various plastic procedures and results of the head neck and extremities.

13

Henry M. Johnson, M.D.
James J. Short, M.D.
J. Ramser Crawford, M.D.
The Life Extension Examiners
New York

THE PERIODIC HEALTH EXAMINATION Tables, charts, graphs diagrams and x-rays showing types and incidence of findings in the periodic health examination.

14

C. Douglas Sawyer, M.D.
Methodist Episcopal Hospital
Brooklyn

THE CLINICAL USES OF SODIUM HYPOCHLORITE A demonstration of methods of use in the prevention of infection in traumatic cases and in treating the various types of suppuration. Also a statistical study of results in over 500 cases treated with sodium hypochlorite and the evaluation of the results.

15

William A. Howes, M D
Brooklyn Cancer Institute
Brooklyn

THE CURABILITY OF SKIN CANCER

16

Mortimer M Kopp, M D
Lutheran Hospital
New York

RHINOPLASTIC SURGERY Photographic transparencies of all forms of rhinoplastic surgical procedures Moulages demonstrating subcutaneous structures and procedures
MOTION PICTURE Typical Rhinoplastic Procedure

INCIDENCE OF GAS BACILLUS INFECTION IN NEW YORK STATE Statistical analysis of cases of Gas Bacillus Infection (Gangrene) in New York State in recent years

SCIENTIFIC MOTION PICTURE EXHIBIT

These films will be shown in the Louis Room of the Hotel Onondaga

The Woman's Auxiliary

To the Medical Society of the State of New York

Mrs Daniel J Swan, President

Mrs John J Beuttner, Chairman of Convention

Convention Headquarters—Onondaga Hotel, Syracuse

Only a month until the 4th convention of the Woman's Auxiliary of the State of New York in Syracuse. Your committee plans have matured rapidly and we are now able to present the complete schedule of activities. Please look it over carefully and see if you can really afford to miss this convention.

Let me call your attention particularly to the Delegates' Dinner on Monday evening, the 24th. Henry Scott, pianist and humorist, will offer many novelties in entertainment. For lovers of fine renditions of the classics, Mr Scott's educational background and his masterful technic allow him to satisfy the most critical. For those who prefer popular music, he gives them their choice in the modern manner. A Scott program is always received with rousing enthusiasm.

We are anticipating with keen interest the 4th Hobby Show and look for a large entry of exhibits.

The musicale and tea on Tuesday, the 25th, offers a charming afternoon's entertainment.

(From Mrs John J Beuttner, Chairman of Convention)

Convention Program

All Doctors' wives will please register at Registration Desk in lobby, Onondaga Hotel.

All Doctors' wives, whether members of a Woman's Auxiliary to a County Medical Society or not, are cordially invited to participate in all parts of the program.

Mrs Henry H Haft, Co-Chairman of Convention

The Woman's Auxiliary

To the Medical Society of the State of New York

A MEETING of the Executive Board of the Woman's Auxiliary to the Medical Society of the State of New York was held at the Hotel Ten Eyck on February 16, 1939. The president, Mrs. Daniel Swan, welcomed the members and expressed her pleasure at seeing so many present. Those who attended were Mrs. Daniel J. Swan, president, Mrs. G. Scott Towne, president-elect, Mrs. Edwin A. Griffin, first vice-president, Mrs. Louis A. Van Kleeck, second vice-president, Mrs. Henry L. Hirsch, recording secretary, Mrs. Abraham Braunstein, corresponding secretary, Mrs. Carlton Potter, treasurer, Mrs. John L. Bauer, Mrs. James M. Dobbins, Mrs. Francis R. Irving, Mrs. Herman W. Galster, directors.

Chairmen of standing committees who attended were Mrs. John Beuttner, convention, Mrs. William Godfrey, finance, Mrs. William Benenson, historian, Mrs. Horace Whitely, *Hygeia*, Mrs. Royal F. Sengstacken, legislation, Mrs. Luther H. Kice, organization, Mrs. Thomas d'Angelo, press and publicity, Mrs. Otto Pfaff, printing and supplies, Mrs. George Green, program, Mrs. J. Emerson Noll, public relations. The county presidents who attended were Mrs. Albert Van De Veer, 2nd, Albany, Mrs. Raymond F. Johnson, Cayuga, Mrs. Henry J. Noerling, Columbia, Mrs. H. L. Yokey, Jefferson, Mrs. Milton Bergmann, Kings, Mrs. Otto Pfaff, Madison, Mrs. Luther Kice, Nassau, Mrs. Harry F. Pohlmann, Orange, Mrs. George F. Marsden, Oswego, Mrs. William J. Lavelle, Queens, Mrs. James H. Donnelly, Rensselaer, Mrs. John C. Dugman, Rockland, Mrs. Mark K. Nettles, Saratoga, Mrs. Leslie Sullivan, Schenectady.

Officers, chairmen of committees, and county auxiliary presidents gave their reports on what they had done since the last board meeting. Varied and very interesting were the reports of county presidents. The promotion of *Hygeia* is

playing an important part in the work of county auxiliaries. Some auxiliaries have placed *Hygeia* in the high schools and libraries in their counties. Other auxiliaries have promoted the sale of *Hygeia* among the laymen. One auxiliary has equipped a camp for underprivileged children, another has given playground equipment to a boys' camp. Several auxiliaries are working on health institutes for the public and in another county the auxiliary conducted a contest among the high school students on health subjects. It was gratifying to our president to see what excellent work the county auxiliaries are doing and how anxious each one is to do better and greater things.

Mrs. Swan gave a report of the meeting of the board of directors of the National Auxiliary held in Chicago on November 11, 1938.

Mrs. Henry Hirsch told us of the exhibit she is planning to send to the Convention of the National Auxiliary this summer. The pet project of each county auxiliary is to be represented in this exhibit to which Mrs. Hirsch is giving a great deal of thought and time.

County Auxiliary News

Albany

A meeting of the Woman's Auxiliary to the Medical Society of the County of Albany was held on January 25, at the Joseph Henry Memorial. Dr. Joseph Lawrence, executive secretary of the Medical Society of the State of New York, spoke on "Recent and Pending Legislation." After the business session and program, the members of the entertainment committee acted as hostesses and served refreshments.

Rensselaer

The Woman's Auxiliary to the Medical Society of the County of Rensselaer met

on February 14, 1939, in the Samaritan Hospital. The president, Mrs. James Donnelly, introduced Dr. Stephen Curtis who spoke on "Socialized Medicine." An open forum followed his talk. Mrs. Arthur Benson discussed bills pending before the legislature.

Dr. Harry L. Harvie, county chairman of the Control of Cancer, has asked the members of the Woman's Auxiliary to sponsor the cancer control drive in the county. Mrs. Harry P. Van Wagenen of Kingston, a member of the Women's Field Army of the American Society for the Control of Cancer, met with members of the auxiliary to discuss details of the work.

Saratoga

The members of the Woman's Auxiliary to the Medical Society of the County of Saratoga and many guests enjoyed 2 interesting films, one a film of Mexico taken by Dr. Carl Comstock, who spent a few months in Mexico with Mrs. Comstock. Beautiful colored pictures of sunsets, flowers, country scenes, cities, and palaces were included in Dr. Comstock's films. Many enjoyed the sea fishing pictures and the movie of a Mexican bull-

fight. The second film, *Alaskan Adventures*, was taken by Dr. G. Scott Towne. Many interesting phases of life in Alaska were told. Dr. Towne emphasized the importance of radio service in Alaska. He thrilled his audience with a description of how his son captured a ferocious Kodiak bear.

Mrs. Mark Nettles presided at the meeting of the Woman's Auxiliary to the Medical Society of the County of Saratoga held on February 7, 1939. Public health nurses and nursing service in general were discussed. Miss Marion Laird, Agent of the Saratoga County Tuberculosis and Public Health Association, spoke on health nursing and generalized the nursing science. Miss Katherine Mezera, a county nurse, reviewed the activities in a nurse's day.

Schenectady

The Woman's Auxiliary to the Medical Society of the County of Schenectady held a dinner dance and hobby show on Saturday evening, February 18, 1939, at the Mohawk Golf Club.

Mrs. Leslie Sullivan, president of the auxiliary, greeted the many guests who attended.

INFECTED JAPANESE SHAVING BRUSHES

A warning to all residents of the State against Japanese shaving brushes infected with germs of anthrax, is sounded by Dr. Edward S. Godfrey, Jr., State Commissioner of Health.

These brushes are of a cheap variety, small in size, $4\frac{1}{2}$ inches over all, the handles $\frac{3}{4}$ of an inch in diameter, painted in two colors. The

lettering, "Japan 332," is stamped on the top of each brush while on the sides appear the words "Imperial-Sterilized."

The brush is of stiff hair, grayish in color, or mixed black and white. Any such brush discovered should be sent to the State Health Department, Albany.

At the forthcoming Annual Meeting of the Medical Society of the State of New York, the newly formed Section on Gastroenterology and Proctology will hold its first session and for its first day has decided to conduct a type of meeting new to our Society, but which has proved of interest in other similar organizations.

The morning will be devoted to a Round Table discussion of subjects to be submitted in advance by any member of the State Society who expects to attend the meeting. A

round table group of speakers, consisting of two gastroenterologists, an internist, a surgeon, and a roentgenologist will discuss the previously submitted subjects in turn, supplemented by brief discussions from the floor.

It will be much appreciated by the officers if members of the Society will send in questions for discussion either to the Chairman, Dr. A. F. R. Andresen, 88 Sixth Avenue, Brooklyn, or to the Secretary, Dr. John L. Kantor, 145 West 86th Street, New York City.

Medical News

Broome County

The Broome County Medical Society is studying the possibility of setting up a nonprofit organization through which county residents in the lower income brackets would be assured of proper medical care by making regular monthly payments in advance.

The proposal is being studied by the society's economics committee headed by Dr Harry I Johnston, chairman. Findings of the committee with recommendations will be submitted to the executive committee and then placed before the membership.

Present regulations of the State Insurance Department are holding up phases of the establishment of such an organization but legislation to eliminate these difficulties is being considered in Albany, officials of the society explained.

Dutchess County

At the regular meeting of the Dutchess County Medical Society on February 8, the speaker was Dr John E Deitrick, attending physician at the New York Hospital, who gave a paper on "Failure of the Peripheral Circulation." The meeting was held at Ryon Hall of the Hudson River State Hospital.

Erie County

A deadlock developed in February in the plans to provide medical aid for relief clients in Erie County. The plan to pay \$240,000 for their medical care, sponsored by Welfare Commissioner, Thomas W H Jeacock, and approved by the Board of Supervisors, was rejected by State Welfare Commissioner David C Adie "because the same work could be done for \$60,000." The plan provided for paying physicians \$1 an office call and \$2 a home call, whereas the State Welfare authorities say the relief clients should go to the free clinics.

"To the State Welfare administration is attributed the assertion that the pro-

posed county plan is 'designed to improve the economic status of the private physician, rather than to provide adequate low-cost medical care for the relief clients. It would have been fairer,' observes the Buffalo *Courier Express* in a strong editorial, "to have stated the case the other way around—to have said that Buffalo physicians and Buffalo hospitals are giving so much free service that there is no need for state and county to spend large sums to duplicate this service on a paid basis. It must not be forgotten that the free clinics are kept going by private physicians who donate unpaid services thereto.

"According to the state's own figures, this free clinical service makes a difference of \$180,000—the discrepancy between the county estimate of \$240,000 and the state estimate of \$60,000. According to medical authorities, the value of free service given by Buffalo physicians runs into much larger figures. In a speech before the Buffalo branch of the American Association of Medical Social Workers, Dr Harry C Guess, former president of the Erie County Medical Society, said that 'the state doesn't take into account the fact that, at present, private physicians in Buffalo annually give more than \$1,000,000 worth of free medical treatment.'"

Dr Carlton E Wertz, President of the Medical Society of the County of Erie, said in a published statement:

The state's attitude reeks of politics. Why did the state sit calmly by while we were working out this program and say nothing, then suddenly announce that it would not reimburse?' he said, in commenting on the action of the State Welfare Commissioner requiring welfare clients to patronize free clinics paid for by the city of Buffalo.

"Not until a month ago did we receive any inkling that this was to be the state's attitude. It's a good example of

how the politicians would try to control any type of socialized medicine

"This is a purely local problem. Now the state steps in, without warning and after we had the plan nearly perfected, to make the arbitrary decision that it won't reimburse

"If the state is so dictatorial about this whole thing, why has it been reimbursing all this time on fees paid to the doctors these many, many months in the rest of Erie County? The state's policy just simply is not consistent

"The state seems to think we doctors want to make a lot of money. That isn't true. We have been treating relief clients in the city free of charge for years. And let me add this—we are far more interested in seeing that the client gets adequate medical care than we are in making a few extra dollars

"Under the present system of free treatment, all relief clients cannot possibly get adequate care. Most of the clients themselves are backward in asking for medical care, often when it is badly needed

"I still believe the thing can be worked out through our committee."

Franklin County

Dr. Esmond R. Long of the Henry Phipps Institute, Philadelphia, addressed more than fifty members and guests of the Saranac Lake Medical Society in the John Black room at the Saranac Laboratory on February 1, on "Some Correlations of Pathology and Epidemiology of Pulmonary Tuberculosis."

Jefferson County

Dr. Joseph S. Lawrence, Executive Officer of the Medical Society of the State of New York, addressed the Jefferson County Medical Society on February 2 at the Black River Valley Club, on medical conditions in the county. He recounted the striking improvement in the rates of illness and death, due to the advance in medical science, and gave many interesting facts and figures about the doctors, hospitals, etc., in the county

Dr. Richard L. Gray, of Clayton, who died there on January 28 at the age of sixty-nine, had practiced medicine in that vicinity for forty years.

Kings County

A number of women's groups in Brooklyn are urging Governor Lehman to appoint Dr. Maryland Burns Byrne, lawyer and physician, to fill the vacancy in the Supreme Court, Second Judicial District, in Brooklyn, caused by the death of her husband, Justice Edward J. Byrne, on February 7, in Miami.

Mrs. Byrne, who lives at 25 Hill St., Glen Cove, Nassau, was formerly Health Officer of Glen Cove. She is a graduate of Adelphi College, Columbia University, Bellevue Hospital Medical College, and Brooklyn Law School, and was admitted to the bar in 1921.

Livingston County

Dr. N. Stanley Lincoln, Superintendent of the Mt. Morris Tuberculosis Hospital, spoke to members of the Livingston County Medical Society on "The Statistical Aspects of Tuberculosis," at a meeting held at the Mt. Morris Hospital on January 31.

Monroe County

With city and county wrestling with a general plan for retrenching on welfare costs, a new supermedical unit for regulating all handling of indigent sick would be set up at a cost of \$48,100 a year under a recommendation of Dr. Carl E. McCombs, New York expert on welfare. Dr. McCombs, in his report submitted by City Manager Harold W. Baker to Rochester City Council members, hospital authorities, and Monroe County officials, claims this sum could be saved on present overlapping and loose handling of indigent sick.

The biggest evil to be removed by the new unit would be small town medical practice with indigent sick.

"Apparently a number of physicians specialize in practice among relief recipients in the several towns," Dr. McCombs reported.

Against this, he said, some towns operate efficiently and are reimbursed by the state to the full limit of needs. Others, he said, ignore state reimbursement altogether.

Dr McCombs would have the county medical bureau a county organization to embrace the medical unit of the city welfare bureau as well as all the scattered units of the towns.

A full time medical director would be placed at the head with a staff of investigators and assistants with a payroll that should be possible to keep within \$50,000. He fixes the estimate for office administration of the unit at \$16,000 per year.

This is exclusive of \$33,100 to be paid a staff of field physicians as follows:

Eleven physicians, part time, for the city, \$17,000, one dentist, part time, \$1,500, one physician, full-time, Irondequoit, \$2,000, eight physicians, part-time outside of Irondequoit in the towns, \$12,000.

The office staff would consist of a director at \$5,000, general investigator, \$2,400, secretary-office manager, \$1,800, statistical clerk, \$1,500, assistant clerk, \$1,040, three stenographers, \$936, telephone operator, \$720.

A strenuous campaign for legislation to prevent 'over the counter' sale of sulfanilamide, a drug effective in the treatment of gonococcal and other infections when administered by a physician, will be pushed by the Tuberculosis and Health Association, the Monroe County Medical Society, and public health officials.

Calling attention to the dangers of self medication, Dr Robert Schanz, chairman of the social hygiene committee, says that a number of druggists have already established the practice of refusing to refill prescriptions unless ordered by a physician.

Dr Arthur M. Johnson, Rochester city health officer, declares, 'There has been too much self medication in the treatment of gonococcal infections and the person who tries unsupervised use of

sulfanilamide preparations risks anemia, which may be fatal.

'Better druggists have refused to sell these preparations without the direction of a physician.'

Nassau County

The Nassau County Medical Society met for the first time in its new quarters in the Cathedral house, Garden City, on January 31.

Heretofore the society has met in the Nassau Bar association building at Mineola. Officers of the society pointed out that greater facilities for parking and attendance at meetings are provided in the new location.

Dr Jesse G. M. Bullowa, physician at the Harlem and Willard Parker hospitals, consulting physician at the New York Infirmary for Women and Children and consultant in serum therapy at Long Beach hospital, spoke on "Serum Therapy and Chemotherapy in Pneumonia," during the scientific session.

New York County

Now that sixty-three physicians and surgeons have been granted licenses as school medical inspectors (personnel) in the New York City school system, the Board of Superintendents is scheduled to proceed promptly with its projected reorganization of the school medical staff.

Superintendent of Schools Harold G. Campbell announces that he intends to bring the matter before the board in the very near future, so that details may be decided upon to put into effect its general plan for an expanded school medical program, designed to raise the general level of teacher and pupil health.

"The fact that we have a long eligible list gives us plenty of leeway in bringing about any reorganization that the members of the board may have in mind," Dr Campbell said. "I intend to present the question as soon as we dispose of the nomination of new assistant superintendents so that we can actually begin the reorganization we have been talking about for a long while."

The purpose of the reorganization,

according to its proponents, is to convert the school medical division from an office for examining sick teachers to a positive force for the improvement of pupil and teacher health

Dr John A Hartwell, New York surgeon and past president of the New York Academy of Medicine, who has been serving as director of the academy since 1934, has been appointed associate director of the American Society for the Control of Cancer, it is announced by Dr Clarence C Little, managing director of the society. Dr Hartwell recently announced his resignation as director of the academy as of April 1, on which date he will assume his new duties

Dr Walden Evermont Muns, assistant clinical professor of medicine at the New York Post-Graduate Hospital, 303 East Twentieth Street, and assistant medical director of the medical division of the Federal Reserve Bank of New York, died at Montgomery, Ala., on February 1. He was fifty-four years old.

Dr John William Watson, sixty years old, a retired New York physician, died on February 7 in New Orleans while on his way to California with his wife.

Onondaga County

In a resolution adopted unanimously, the Onondaga County Medical Society, meeting on February 7 at the College of Medicine, Syracuse University, commended Dr George L Wright, fire department physician, for his long hours of work during the Collins Building fire disaster.

The citation read "Resolved That the Onondaga County Medical Society commend Dr George Lamont Wright for the fine example of devotion to duty which he displayed by his untiring efforts during the recent fire tragedy in Syracuse."

The society also approved the principle of voluntary, nonprofit sickness indemnity insurance and appointed a committee to work out a practical plan of this

type for Onondaga County if and when the State Legislature approves such insurance. The committee consists of Dr Leo E Gibson, chairman, Dr Arthur N Curtiss, Dr Gerald C Cooney, Dr Carl E Muench, Dr Arthur B Raffi and Dr Ellery G Allen.

A rising vote of recognition was given Dr Garrison L Brown of Euclid for his fifty years of membership in the society. He was president of the group forty years ago.

Recommendations of a special committee appointed by the Onondaga County Medical Society to consider the problem of hospital visiting hours, with a view to curtailing and standardizing them are summarized as follows:

1 That the Hospital Council be re-instituted for the purpose of co-ordinating matters of interest to its former constituent institutions.

2 That until such time as, in the opinion of the hospital executives, public acceptance of standardization of visiting rules is assured, attending physicians are requested to prescribe visiting limitations for all patients under their care.

3 That hospital visiting rules be standardized as follows:

A Private patients, 2 to 3 30, 7 to 8 P M daily.

B Public wards, 2 to 3 30, 7 to 8 P M, three days weekly.

C Children's wards, 2 to 3 30 P M, parents only, three days weekly.

D Maternity wards, 2 to 3 30, 7 to 8 P M, three days weekly.

E Where three visiting days are suggested, it is important that the days selected be specifically agreed upon by the Hospital Council.

F No visitors except immediate family upon major surgical or maternity cases for five days after operation or delivery.

G Not more than two visitors, except immediate family, be permitted any patient at any one time.

H Visiting period to be limited to twenty minutes for any visitor other than immediate family.

I Except under unusual circumstances and with the consent of a hospital executive, no children under fourteen years of age to be admitted as visitors at any time.

4. That Group Hospital Plan, Inc., be advised it is the opinion of this society that improperly controlled visiting of the hospitalized sick is undoubtedly a factor in increasing the length of hospitalization

5 That when standardized visiting rules have been agreed upon by the Hospital Council, the society be requested to supply suitable notification to all member physicians

During a meeting of the special hospital committee, it is said, one physician cited an instance when one ward in one of the Syracuse hospitals had 47 visitors milling around in the room at one time.

Dr Hugo Roesler, internationally known heart specialist, gave an illustrated address at a dinner meeting under the auspices of the heart committee of the Onondaga Health Association at Hotel Syracuse on February 7 on "Some Aspects of Humor and Art in the History of Medicine."

Dr Roesler was in Syracuse as guest of the medical education committee of the Onondaga County Medical Society, under whose sponsorship he has been conducting clinics and lectures for small groups of local physicians on the x ray interpretation of heart and lung conditions.

Ontario County

Dr Leon A Stetson was host to the Canandaigua Medical Society, on February 9, at his home on North Main Street. Dr Frederick C McClellan was reader

Queens County

The Queensboro Tuberculosis and Health Association, in conjunction with the Queens Medical Society, is planning a new series of one-dollar x-ray clinics, it is announced by Martha Rains, Association supervisor

Richmond County

"Management of the Diabetic Patient" was discussed by Dr Enrico C Soldini, attending physician at St Vincent's Hospital, West Brighton, at a meeting of the Richmond County Medical Society in the Richmond Health Center, Stuyvesant Place, St. George, on February 8

Another speaker was Dr Nathan Rosenthal, attending physician at Mount Sinai Hospital, Manhattan, whose topic was "Diseases of the Blood"

Dr Frederick M Schwerd presided Refreshments were served

Saratoga County

A joint meeting of the Saratoga County Medical Society and the Saratoga Hospital staff was conducted at the hospital on January 25 with lectures and practical demonstrations on subjects of interest. A lecture, with practical demonstrations, on diabetes mellitus, was in charge of Drs Donald W Ingham and Edward J Callahan Drs Carl R Comstock, Robert S Hayden, and H Dunham Hunt gave a lecture on heart disease, with demonstrations of the use of the electrocardiograph. Drs Earl H King and Joseph Lebowich assisted in these lectures, and Dr G Scott Towne was in charge of the motion pictures used in connection with them

Miss Clara P Sinclair, superintendent of the hospital, spoke on "What the Hospital Has to Offer to Diabetics," and Miss Ruth Johnson, dietitian, demonstrated the use of diabetic diets

A buffet luncheon was served by the staff in the nurses' lounge. The program was in charge of Dr Thomas J Goodfellow, chairman of the program committee of the staff, and Dr Edward J Callahan, chairman of the program committee of the society

Suffolk County

At a meeting of the Suffolk County Medical Society held recently at Friede's Riverside Inn in Smithtown, Dr William H. Ross of Brentwood, gave an address on "Socialized Medicine."

"The problems of medical care are not only agitating the medical profession, but the laity of the whole country," Dr. Ross said. "Up to now, organized medicine has been backward in efforts to improve its availability. The time is at hand for the profession to assume the leadership of these reforms. If it doesn't, it will follow the lead of those who know less than they. The socialization of medicine is likely to be an increasingly discussed issue until a solution is found. There is a wide divergence of opinion as to what is the best solution. Organized medicine and many thoughtful laymen do not believe that compulsory health insurance is the answer. Voluntary hospitalization insurance has been successfully working for several years."

"We, as a profession, should use our leadership to increase and improve the availability of medical service for the entire population and accept the fact that it requires two sources of finance, taxation for the indigent and voluntary insurance for others."

Complaints have been made by the medical boards of the Southampton Hospital and the Eastern Long Island Hospital that Welfare Commissioner Irving Williams has been removing children to the Suffolk County Home Infirmary at Yaphank for tonsil operations, instead of having them treated at the local hospitals. The Commissioner defended his action at a meeting of the county board of supervisors on January 30 on the ground of expense, but the Suffolk County Medical Society has issued a statement declaring that "the policy adopted by the Welfare Commissioner and affirmed in his proposals, of removing welfare medical and surgical cases to the County Home Infirmary at Yaphank is not in the best interests of the patients and not in accordance with the most efficient medical care of these patients," and offering "to make such arrangements with the Commissioner of Public Welfare, regarding the care of chronic cases, as may be legal, and for the best medical interests of these welfare cases."

Westchester County

Public welfare officials have "exploited" medical clinics and dispensaries in providing care for the indigent sick during the depression, Dr. Ralph T. B. Todd of Tarrytown, told members of the Westchester County Hospital Association at a luncheon meeting at the Hotel Commodore in New York.

Dr. Todd, who is the newly elected president of the Westchester County Medical Society, declared the practice of sending "border line" cases to clinics rather than to private physicians had resulted in apparent "savings" in welfare budgets for medical care at the expense of the private practitioners. He pointed out that a survey had shown that, based on a moderate standard of fees, 411 doctors in Westchester County had contributed \$1,800,000 worth of service to such cases in one year.

To remedy this situation, he said, the County Medical Society proposes that ambulatory cases be sent to private physicians and that a standard schedule of moderate fees be established. Doctors will continue to contribute their services to clinics and dispensaries, he stated, explaining that they desire to maintain their original purposes, providing facilities for diagnosis and as a training ground for young physicians.

New Rochelle will not join the County Health Department, it was decided on February 6 at a meeting of the City Council. Instead, plans for reorganizing the city department, long the center of stormy controversy, will be submitted to the medical society and then discussed at a public hearing.

This action was taken after a report from Dr. Cleland A. Sargent, district state health officer, had been revealed for the first time, although it long has been in the possession of city officials.

In a sweeping statement, Dr. Sargent held the facilities quite inadequate for health protection and recommended 1. The addition of nine public health nurses to the present staff of three. 2.

Employment of additional clerical help
 3 Addition "of a competent, well-trained public health officer to the staff" 4 The cleaning and repairing of clinic equipment. 5 The renting of "adequate quarters" to replace the present bureau in an old school building

Dr Theodore A. Jost, of Mt. Vernon, has been appointed the city's first full time Public Health Commissioner

Dr John A. Knapp, of Mt. Vernon,

who died on February 2 at the age of eighty-four, began the practice of medicine in 1888. While he belonged to the "horse and buggy" days, he was one of the first to shift from oats to gasoline, buying a car in 1903. Motor troubles of those days, it is said, often made him doubt the wisdom of the change.

In his long practice of nearly half a century, he delivered more than 1,000 babies, and lost only one mother.

WITTY M.D.'S

Some amusing stories of famous doctors are told by Dr W. Schweishelmer in *The Medical Record*. Undoubtedly one of the wittiest doctors of all times was the Baltimore-born dermatologist, Philippe Ricord (1799-1889). Dr Ricord was for many years the head of L'hôpital du Midi for syphilitics in Paris and his particular specialty made a certain readiness of wit and tact quite necessary at times.

At a party he was introduced to a young woman who had been a former patient of his. Immediately recognizing him as her former physician the lady hesitated and blushed. Her husband was surprised at her strange behavior but Ricord saved the situation by saying:

"Madame, I see that the reputation of my particular profession has reached your ears. But I can give you my word of honor that your suspicion is unfounded. So far, I had neither opportunity nor cause to treat your husband."

Ricord had also a masterly ability for settling a conflict between professional secrecy and ethical obligations. One of his patients wished to marry the daughter of one of Ricord's best friends in spite of the doctor's opposition. Ricord made an appointment with the young man and at the same time, with his friend, the girl's father. They met in the doctor's waiting room. But Ricord had forgotten all about the appointment and kept them waiting. In the mean while, the two had sufficient time to discuss matters. The marriage never took place.

Moreau, once surgeon at the L'hôpital de Paris, was once called by King Louis XV because of a wound on his foot. "I hope," said the king

that you will treat me better than your patients at the hospital.

Sire replied: "Moreau, I regret to tell your Majesty that it is impossible to treat your Majesty in any way differently."

And why not?

Because all my patients in the hospital are treated like kings!

Etienne Pariset, secretary of the Parisian Académie de Médecine, accompanied his teacher Portal, to a wealthy stomach-disease patient one day. Portal was a famous physician, and furthermore physician in ordinary of Louis XIV and other French kings. The patient was prescribed a very severe diet approaching a real hunger-diet.

Portal felt the patient's pulse and said with raised eyebrows: "Monsieur, you have eaten a soft boiled egg in spite of my orders."

"What? You can tell from feeling my pulse?" asked the astonished patient.

"Naturally. The egg contains sulphur, phosphorus and proteins which excite the stomach walls. A strong drink of Roman camomiles and pulverized crayfishes will make good for the slip. The patient, anew convinced of Portal's wisdom, promised to follow the doctor's orders strictly from now on.

Outside Pariset took the master's hand. Great man, I bumble myself before you. You were able to recognize that the patient had eaten a soft boiled egg merely feeling his pulse!"

Moreau replied: "Portal, he had the yolk on his shirt."

Periodic examination of the adults in a family is a simple means to wipe out a large and important sector of childhood disease, remarks

the *New York Medical Week*. Physicians should not hesitate to emphasize the importance of this to the parents of children under their care.

Hospital News

The New Nursing Law in This State

NO LITTLE confusion and misunderstanding attend the efforts of nurses and others to understand the new state nursing law, which goes into effect next year. It means enrolling some 80,000 persons, according to authorities at Albany, half of whom already have licenses under the old law as professional nurses. The new act provides two distinct groups of nurses—professional and practical—each of them to be recognized by the state, with hospitals and physicians setting the duties of members of each group. The main problem, said Dr. Harlan H. Horner, of the State Health Department in an address before the State Nurses Association, will be to organize the groups. He said plans are under way to set up satisfactory standards for instruction in schools, where one may choose whether to become either a professional or a practical nurse. Between 15 and 20 such schools may be operating within a year, he said. Many hospitals, he predicted, will employ practical nurses to work under direction of registered professional nurses in order to reduce special nursing costs to patients.

Clarifying the Confusion

The confusion is due in part to the length of the new law, which covers 24 pages in small type, remarks John Hayes, administrator of Lenox Hill Hospital, in a clarifying article in *The Modern Hospital*. Some seem to fear that it will elevate the practical nurse into direct competition with the registered nurse, while others take the opposite view—that it “will put the practical nurse out of business altogether.” Neither apprehension is grounded in fact.

Briefly, explains this authority, “after July 1, 1940, every hospital in New York State will be restricted to the employment of nurses licensed by the State,” and “no person will be allowed to nurse for hire unless he or she has one of the two

licenses stipulated by the law,” one for the registered nurse, as now, and the other for the practical nurse. “The most sweeping change from the hospital’s point of view,” says Mr. Hayes, “lies in the enforced discontinuance of employment of any or all nurses without a New York State license. The acceptability of their nursing service and training or the holding of a registered license obtained outside this state does not alter the case. To conform with the law, the nurse in New York State must qualify for employment with a license for her type of nursing, registered or practical.”

Groundless Fears

No fear need be felt by the more than five hundred nurses, graduates of courses in state institutions now discontinued, for they may exchange their present licenses for the new ones, without examination, before July 1, 1940, and until that date, too, the state will continue the examinations for trained nurses under the old act, so that those who have completed their courses may win their trained-nurse licenses.

Then there are the nurses who were graduated outside New York State. Under the old law they were debarred from examination here unless their nursing schools had been visited and accredited by the New York State Board of Nurse Examiners. Now, however, we are told, to such a nurse the new law offers an open door. For example, she not only becomes eligible for examination, but under the qualifications just cited she may be relieved from the obligation to take it. She may obtain a New York license without examination, assuming that she meets the other requirements of age, residence, four years of high school or its equivalent, character, and citizenship.

To other graduate nurses from out of the state who do not meet the residence

requirement, and whose schools of nursing have not been accredited by another state, and who lack a license from another state, the new law is again more lenient than the old act of 1920. The applicant becomes eligible for the examination heretofore closed to her. She has only to pass it to obtain a registered license.

Penalties

The penalty for any person holding a practical license who attempts to claim or to assume any other title, includes the revoking of her license, thus prohibiting employment. Equally severe measures are stipulated for the holder of the registered nurse license. If, through unprofessional conduct or habits, neglect of duty, the use of liquor or drugs, or mental illness, such a nurse is declared unfit, her license may be revoked, again prohibiting the practice of nursing for hire.

It is only fair to add that physicians who sign affidavits for nurses as to character and ability may be called to appear before the state's investigating committee set up by the new law, if serious charges are made against the applicant as to violations or neglect of duty. In several cases, the new law requires a nurse to present affidavits from two members of a county medical society

The Practical License

Now as to the practical license. If a practical nurse has been lawfully and reputably engaged in nursing for one

year prior to July 1, 1938, and has 2 affidavits from physicians who vouch for her, she is eligible for a practical nursing examination by the state for a practical license. For her there are the requirements of citizenship, age, and character, such as there are for the registered nurse.

If the practical nurse has been engaged in practice for five years within the last ten years, no examination is required. She gets her license if two physicians certify to her practice. If a certificate for a trained attendant is held, she may exchange it for a practical license. A nine-months course for a practical nurse will be required of all those who apply for a practical license after July 1, 1940. These nine months' courses were announced last fall.

Licensing Orderlies

An interesting byproduct of the practical license is that it will be required of hospital orderlies performing nursing duties. At the last state hospital association meeting this was discussed and agreed upon. The feeling is that this will do much to elevate the standards for all orderlies who perform certain simple nursing duties for male patients. In not a few hospitals deplorably low standards in the selection of orderlies exist. Some orderlies who perform nursing duties would undoubtedly make acceptable male nurses, given an opportunity for adequate training; others, unfortunately, are more fitted for the street from which they drifted in.

The financial condition of St. Francis Hospital in Port Jervis, established 24 years, has become so serious that it may have to close its doors. Unless there is a guarantee by the municipality to take responsibility for a reasonable number of welfare cases, Catholic Charities will withdraw its support. Hospital authorities are faced with the task of raising

\$4,000 to meet a deficit for last year and \$2,000 additional due for laundry repair work and annual interest. The chief source of difficulty in the past two years, according to Sister Francis Xavier of the Third Order of St. Francis, has been failure on the part of the Port Jervis Welfare Department to approve bills of patients admitted as public charges.

The Gray Ladies

GRAY LADIES" units have been set up by the American Red Cross as a part of its volunteer hospital and recreational service, says a note in *Hospitals*. These young ladies, in preparing themselves for membership in these units, together with many other requirements, have to complete a fifteen-hour course conducted by the professional staff of a recognized hospital.

The "Gray Ladies" have a uniform of gray dresses and chiffon veils which identifies them from uniformed employees of other services in the hospital.

The "Gray Ladies" pledge themselves to give a minimum of fifty-two hours of service a year. The services include reading to patients, shopping for them, and rendering any other nonprofessional aid. Among the other duties are handling

of correspondence for patients, providing lectures, musicales, and theatricals, arranging motor drives for convalescents, and other duties helpful to both the patient and the hospital officials.

The "Gray Ladies" were first established in the Walter Reed Hospital, Washington, D C. Units are now being trained in various hospitals throughout the country. On January 11, the Menorah Hospital, Kansas City, Missouri, graduated its first class of twenty-two young ladies, the first "Gray Ladies" unit established in the Middle West. The Unit is designated as the Lottie E Hurd Unit, in tribute to the memory of the late Mrs Hurd, who was the first chairman of the hospital recreational service of the Red Cross in Menorah Hospital.

Newsy Notes

EFFORTS of the Mayor of North Tonawanda to interfere in the affairs of the De Graff Memorial Hospital there, have caused the Twin Cities Academy of Medicine and the De Graff Memorial Hospital Staff to adopt resolutions branding his interference as "dictatorial, undemocratic, and without balance of power." He is accused of trying to act as "a one-man hospital board," usurping the authority of the hospital superintendent, deciding alone on the purchase of medicines and equipment, disciplining physicians, and "delving into the personal affairs of our private patients." Public sentiment is with the doctors, according to the local paper, which says:

"Stand by your guns, Doctors, and you will stand by the people of the Tonawandas, who will stand by you in your battle for service that only De Graff Hospital can provide in continuing to operate, but not if a 'one man' institution "

. . .

The crippled and chronically sick patients in Montefiore Hospital, 100 East Gun Hill Road, New York City, be-

lieve in developing their minds while the medical staff develops their bodies.

As a result, Montefiore now boasts of one of the largest hospital schools in the city, with scores of patients taking a variety of courses under the aegis of the W P A adult education division of the Board of Education.

Courses in art, current events, photography, drama, and diction and music appreciation are given daily in a library that has been remodelled into a class room. Patients, ranging in age from 18 to 70 years, wheel their chairs into the room while others are carried in on stretchers and placed in a semihorizontal position.

"We are amazed at the tremendous demand for these classes," said Celia M Pearson, head of the occupational therapy department.

A literary magazine is published every three months by the students of the story-writing class and distributed to all the patients of the hospital. The drama class is at present rehearsing a play which it intends to broadcast over a local station. The play was written by a patient who is a scenario writer by profession.

Editorial

The Wagner Health Bill

At last the national health bill, prepared by Senator Wagner, has seen the daylight. Congress has it

Instructed by the Interdepartmental Committee through its conferences and the various addresses of its chairman, as well as through sundry press releases, as to what the national health program entails, we thought that the propositions the program embraces would be reflected in the bill which Senator Wagner was so long in preparing

The bill is the epitome of vagueness. It leaves the control of medical practice to the supervision of lay political bureau chiefs. It indicates that they *may* have advisory medical boards, but it does not provide that these lay chiefs must take the advice of such boards, nor does it show how such boards are to be brought into being, or what type and kind of man shall serve on them.

Departments of the Federal government have a voice in the distribution of funds, which are held out to states to lure them into experimentation on ways and means of delivering medical care to the low income earning groups and to the indigents. The Children's Bureau, the Department of Labor, the Public Health Service, the Social Security Board, and their departmental chiefs, are each and all interested in this particular part of the propositions, and, in the main, the act would function under them.

The bill evidences a total lack of any provision for establishing adequate medical standards, and it seems to make the state health officer almost the sole arbiter of the manner of delivering medical care to the underprivileged in his state. There is some vaguely outlined provision calling for the development and education of

medical career officials. If this means the experimental setup of an educational system to train men who will later be the means of delivering *state medicine* to the people, then this should be frankly comprehended and our people must decide whether or not they eventually want pure state medicine. This in itself is an insidious wedge which leads to straight state medicine.

If the American people do not want straight state medicine, there seems little use in educating and developing a group of men to deliver it.

On the whole, the bill seems to have been introduced so as to be amended. It most certainly needs amendment upon amendment. Would it not be better to withdraw the bill, rewrite it with the aid of the medical profession, who must eventually administer it, and really make an attempt to accomplish some of the things that are enunciated in the parallelism of thought and of ideas of both the organized profession and the governmental agencies who took part in the various Interdepartmental Committee conferences? What end have these so-called conferences had, if the Wagner bill is the outcome?

Most thoughtful people will concede that there is actual need of medical policy being determined by doctors. There is need for the adoption of adequate standards of care for the various groups in our national body politic. There is a strong desire everywhere to lower the expenditures of the Federal government in bringing health measures, and health agencies together in useful coordinated work, *where they are needed*—and who is to determine the medical needs of a community if not its doctors! There certainly seems also to be a need to correlate local community needs, and the distributional agencies for medical care in those same communities. This correlation should not be placed in the hands of a purely political group whose “weather eye” never loses sight of the effect of its decisions on the electorate, and its vote.

Whatever our individual opinions may be anent the five major proposals of the national health conference—and there is much in them that even we deem unnecessary and uncalled for, much that would entail an unjustifiable tax burden on an already overtaxed public—this particular Wagner Health bill fails even to meet these propositions. It is wholly impractical, it is almost unworkable, it is certainly extremely vague, and absolutely unsuitable from our standpoint. If enacted into law, it will bring the medical profession into such difficulties that it will take decades to extricate itself from them. Particularly will it be difficult to evade the bureaucratic *interpretations* which must be made, perforce, because the bill is full of uncertain terms, and contains too many unprecedented tentative permissive clauses.

With all due respect to the senior Senator from New York, we would characterize the Wagner Health bill as extremely *amateurish* did we not suspect that this veteran political strategist has purposely drawn it so vaguely that its passage through Congress would encounter the least amount of oppositional friction in its passage toward enactment. The program seems to be meet opposition with vagueness, let decisions be made later. *Après moi, le déluge!*

The public concern for the health of the people is entitled to more than a good piece of political strategy in a health bill. The profession which will have to work under the bill, the governmental agencies which plan the measures and procedures under its permissive clauses, and the taxpaying public which will foot the bills to pay for it—all deserve a *precisely drawn bill*, so that all will know beforehand just what is being proposed, what it will deliver, who sits at the controls, and what it is going to cost.

It seems to us that it should be realized that now is not the time to write another blank check on the Treasury to be filled in, at will by lay experimenters in health measures for the general public.

Osteopathy's Limits

The Milroe bill, authorizing osteopaths to perform minor surgery and employ anesthetics, antiseptics, narcotics, and vaccines, disregards the inherent limitations of osteopathic theory and training. Osteopathy insists on the body's power to heal itself. Since it attributes disease to dislocation of the bony structures, its therapeutic principles depend on manipulation of the joints. Other treatment methods are inconsistent with osteopathic theory—so much so that *materia medica* is omitted from even the best of osteopathic courses.

To permit osteopaths to perform surgical procedures of any kind would break down an important distinction between osteopaths and physicians—a distinction which is inherent in osteopathic theory and in the limited educational preparation osteopathic students receive.

Include surgery and the administration of drugs in osteopathy and for all practical purposes you have the practice of medicine. If osteopaths desire to practice medicine, they should complete the premedical course required of medical students, take the full medical course in a medical college, and intern in an accredited institution, as physicians do.

The desire of osteopaths to employ drugs and perform surgery is an admission of the deficiencies of osteopathy proper. Even the

best educated osteopaths are trained in accordance with this limited, sectarian theory. They are not qualified to embark on the broader duties of medical practice.

Let no one imagine that if osteopaths received the unwarranted privileges accorded them by the Milmoie bill, they would be satisfied to rest there. In a very short time they would be back for more—for the right to prescribe all drugs, practice obstetrics, and perform all types of surgery. In short, they would be full-fledged medical practitioners—in all but qualifications.

The Milmoie bill opens medical practice to a sectarian school which is antipathetic to essential principles of modern medicine and is not trained to put these principles into effect. The legislature should discourage similar attempts to undermine the standards of medical practice by administering a decisive rebuff to this bill.

Equal Standards for All

The influx of foreign physicians into this country, and particularly into this state, lends special importance to recent decisions of the Appellate Division of the Supreme Court. In one case, Dr G E De Luca, an Italian physician, had requested the Regents to indorse his Italian license. Thus the Regents refused to do without examination on the grounds that there is considerable uncertainty as to the standards of many European colleges today. Dr De Luca appealed from their decision. Another ruling concerned two physicians who demanded indorsement of their German licenses after failing in the New York State Board Examination. In both cases the Court held that the Regents are within their rights in requiring foreign applicants to take the regular State Board Examination in order to obtain a license to practice here.

The decay of educational standards in certain European countries today is undeniable. New York State requires its own citizens to undergo an exacting training to practice medicine. It cannot be expected to license foreign graduates without first making sure of their qualifications.

As the opinion written by Justice Heffernan sets forth, "The State has the right to demand that those who seek to practice medicine and surgery shall pass a satisfactory examination as evidence of skill and competency. Such a requirement is neither unreasonable or discriminatory."

The medical profession, like the lay public, has the utmost sympathy for European physicians who are compelled by religious,

racial, or political persecution to abandon practices laboriously built up and seek out strange lands to start anew. Nevertheless, it cannot sanction destruction of the standards medicine has painstakingly developed in this country or the subjection of native physicians to unfair competition.

The decisions of the Appellate Division in the cases cited above set a sound precedent. They permit qualified practitioners from other countries to establish themselves here without compromising American educational standards.

Another Court Decision of Importance

The organized profession has always held as one of its fundamental tenets, that only doctors could practice medicine. The privilege of practicing medicine—for it is a privilege and not an inherent right—was granted to individuals after they had demonstrated to the state, through its regularly constituted authority for ascertaining it, that they who held themselves out as having the ability to practice medicine were duly educated and technically qualified to exercise this privilege.

It was the profession's point of view that those having the ability to diagnose and treat the sick thereby incur an individual responsibility. In the interest of public welfare, this policy has been continuously upheld.

A corporation is a collection of individuals banded together to accomplish specific purposes. Legally, a corporation can have no mind, nor can it exercise the priceless privileges granted by the state to qualified individuals. By no process of reasoning can a corporation qualify itself to practice medicine. There are in the record long lists of judicial opinions and decisions which state that corporatism cannot apply in law acts which require the functions of the mind and reasoning, and which imply the use of individualistic intelligence. Hence, corporations may not engage in the practice of law nor can they practice medicine. Nor for that matter, can such corporations evade the basic principle of the law by hiring licensed physicians to do the essential intellectual acts comprising medical practice. The long list of recorded decisions now finds another one written into the record.

Late in February, the newspapers carried reports from Washington that the Supreme Court of the United States had declined to review a decision of the California Supreme Court which held that the Pacific Health Corporation, operating in San Francisco, had vio-

lated the state's Medical Practice Act, by hiring licensed physicians to give care to its members. The action of the highest legal tribunal of the country thus virtually announced that there is no need to review such an issue. The California Supreme Court settled it.

This is of special interest to the medical profession of our state, now when lay organizations are attempting to nullify the law and are also attempting to practice medicine as corporations. In the study of various schemes for providing medical care to the low income earning groups on a voluntary basis, let us beware that *we* do not abrogate or negate this law which safeguards our privileges. It is a high privilege with which the State entrusts us. Let us preserve it.

Pneumococcus Antigen as Prophylactic

The intensity of the present campaign against pneumonia has proved the efficacy of the modern therapeutic measures. Further important studies are now appearing which indicate the value of sulfapyridine as a potent chemotherapeutic agent in all forms and types of pneumonia. Little, however, has been done from a clinical standpoint along the line of conferring immunity against this disease and it is of interest, therefore, to call attention to the investigation of Ekwurzel, Simmons, Dublin, and Felton¹ concerning the prophylactic value of Felton's pneumococcus antigen for Types I and II. The antigen is a sugar derivative obtained by the chemical purification of the pneumococcus itself.

In the tests conducted in two groups of CCC camps, the incidence rate of pneumonia in the New England group was 7.28 cases per thousand years of life in the uninoculated, whereas in the inoculated the incidence was reduced to 4.34 cases per thousand years of life. On the West Coast, the incidence rate of 15.69 cases in the controls was reduced to 1.73 cases per thousand years of life in the inoculated group. The effectiveness of this pneumococcus antigen was most marked in adolescents and younger men.

This experiment, of course, is far from conclusive but it is extremely promising. The investigation is being continued among adequate samples of our population. Information concerning the length of time for which the antigen may influence morbidity rates from pneumonia will be obtained only after some time has elapsed. The continuance of this work is important and deserves the encouragement and support of the profession and the health groups interested in the problem of pneumonia.

NONDOGMATIC PSYCHOTHERAPY

ALFRED GALLINEK, M D , New York City

THE leading method of psychotherapy in this country may seem to be orthodox psychoanalysis. However, a thorough study of the situation reveals the fact that more and more frequently the dogmatism, one sidedness, and claim to exclusiveness of the orthodox psychoanalytic sect are severely criticized and objected to.

The situation becomes even more confusing when we look at European countries, and it seems more than justified to talk of a crisis of psychotherapy. In contrast to America, where at the present time orthodox psychoanalysis is identified with psychotherapy, several different schools and systems have originated in Europe. In Russia a new psychotherapy has developed on the basis of Pavlov's theory of conditioned reflexes while in the rest of Europe numerous new systems can be found in addition to the orthodox Freudian movement. Since we are limited in space we can mention only the most important ones here: Stekel's active psychoanalysis, Adler's individual psychology, Jung's movement, particularly concerned with the collective unconscious and the archetypes, Prunzhorn's psychotherapy, based on the ideas of the famous Swiss philosopher, Klages, I. H. Schultz's autogenous training, resembling the Indian Yoga, and finally Kronfeld's psychagogy.

We shall attempt to show how a non-orthodox psychotherapy may be developed out of a theoretic and practical knowledge of all these various schools.

How unfortunate may be the results of the rigidity of an orthodox theory is very strikingly illustrated by the psychoanalytic school. It is Freud's tragic fate that instead of remaining an abstract scientist he became the head of a school—more correctly, of a sect. When the leading representatives of German medicine rejected Freud's teachings for purely

emotional and unfounded reasons, this great scientist was forced to have himself proclaimed the founder of a new sect. As a result, we find that the work of a genius, instead of being integrated organically into the structure of medical knowledge, is rigidly imitated with an exaggerated emphasis on its one sidedness and details.

Without any criticism whatsoever, a school of faithful followers accepts a psychological theory and a therapeutic method as a new philosophy and a profession and organizes groups which are closed like sects. These sects are not only outwardly closed, but, worse than that, their members shut their minds to other therapeutic teachings and methods.

Together with psychoanalysis, all other modern methods may be designated as 'uncovering psychotherapy'. The fundamental principle is never symptomatic and calming, but etiotropic, aiming to cure the disease by an understanding of its origins. In the general sense of the expression they are all "analytic." With the exception of orthodox psychoanalysis most other schools are not satisfied with merely finding the origin, but it is the essential element of the therapy in all.

In contrast to these analyzing modern methods we have the older methods tending to cover up, suggestion, persuasion, and hypnosis. We shall soon see that within the scope of a universal psychotherapy these methods have by no means lost their importance.

The psychotherapist must decide what attitude to assume with regard to the numerous schools and movements and their deviating theoretic bases and practical methods. An unprejudiced examination reveals good and bad points, something true and something false in all theories. No one theory or method will be one hundred per cent acceptable or entirely rejectible. By this statement alone

a distinct differentiation from orthodox psychoanalysis is expressed, since the latter claims exclusiveness.

Even though the analytic and causal attitude is predominant, it must not be overlooked that the suggestive methods still maintain a certain significance. In certain cases it may be predicted immediately that the application of one of the analytic methods would be an unnecessary waste of time, money, and energy, as, for instance, in primitive individuals suffering from superficial hysterical conversions. However, in cases of nuclear neuroses, disturbances affecting the deeper strata of the personality, this would not be true. Let us illustrate with an example.

A patient was brought to the hospital on a stretcher. The young man, a primitive personality, had been struck by lightning while working in the field. From that time on (about six months), he was completely paralyzed in both legs. The neurologic examination was negative, an organic paralysis was out of the question. It could not be determined whether he had suffered an organic injury, the symptomatology of which had been psychogenetically fixed, or whether it was merely a question of fright reaction. This patient, who had come to the hospital on a stretcher, left it two hours later walking normally.

He had been faradized with energetic verbal suggestion—thus, one of the oldest methods had been applied. Orthodox psychoanalysis admits that such recoveries occur but claims that only the symptom disappears and that some other symptom, for example, vomiting, should be expected to replace the paralysis of the leg. The patient, however, remained perfectly well. In another case the method might have failed entirely.

In the case of a woman with hysterical paralysis of the leg, who in this manner unconsciously wanted to deprive herself of the equally unconsciously desired possibility of going out and being unfaithful to her husband, the same method would not have been successful. The paralysis of the legs of this patient prob-

ably would have disappeared too, but some time later she would suffer from a neurosis of the stomach, agoraphobia, or something else. This person cannot be helped but by an analytic uncovering of the unconscious conflict. From the obscurity of repression this conflict is brought out into the light of consciousness, the escape into the state of illness is cut off. The patient herself must decide on a solution of her problem with a perfectly clear mind. Either the moral standard can be maintained and the desire is renounced, or the desire is satisfied and the moral position is lost.

On the other hand, the young peasant would not have been helped in any way by an analytic approach. Cases like his must be approached with a roughly suggestive method, tending to "cover up." Thus the suggestive methods are justified in certain special cases, but the number of these is small compared with the number of cases calling for an analytic treatment. More important, however, than the occasional use of the suggestive method in individual cases is its successful application in connection with secondary problems arising in the course of an analytic therapy—contradictory as this may sound.

How should we now make our choice among the analytic schools? Shall we follow the orthodox psychoanalysis of the Freudians, the active analysis of Stekel, individual psychoanalysis, psychagogy, or shall the chief interest center about the symbolism of archetypes in the collective unconscious of Jung? Instead of deciding in favor of any of these methods, each case must be treated individually and the most suitable treatment selected. One patient may suffer particularly from a repressed desire to assert himself, in his case—to talk in terms of St. Augustine—the *superbia* is more important than the *concupiscentia*, and the treatment will have to be conducted along the lines of individual psychology. In another case the sexual problem may be foremost, and Freudian methods must be used, whereby it is essential for the physician to think inde-

pendently, without following too closely the norm of the sect. This is necessary for merely practical reasons: the duration of an orthodox treatment, daily conferences over a period of several years, and the expense of the treatment would render the blessings of psychotherapy available to only a limited circle of patients, and the misera contribuens plebs would remain locked out in front of the doors of the sanctuary. This requirement for a long duration of an orthodox analysis was based on the fact that it meant going back step by step over the entire development of the patient from childhood on. By the method of free association the length of time required by this analysis is further increased. The patient, reclining on the couch, may talk at random, merely for reasons of resistance, and may communicate any idea occurring to him which leads nowhere at all. The orthodox analyst listens passively for hours to this waste of time. On the basis of permanent cures which have been attained, the conclusion may be drawn that independently from any theory, results may be achieved much more rapidly.

However, in order to reach this goal, it is an important prerequisite to be thoroughly acquainted with Freud's theory and to be able to think in terms of its conceptions. The essential Freudian mechanisms, condensation, repression, displacement, the principal complexes, and the dream symbolism are practically always present.

It is true that the "road back" must usually be retraced, but that alone does not guarantee the patient's cure, and if a cure is achieved it need not be a permanent one. By an abbreviated method the "road back" is covered more rapidly. Before psychoanalysis had advanced to its present stage, Freud naturally had to study each step carefully. How else could he have made his discoveries? But just as we need not repeat Harvey's experiments in order to diagnose and treat a case of circulatory disturbance, we need not acquire psychoanalytic knowledge step by step in each case, but apply what is already well known.

The treatment begins with an intensified anamnesis following an average psychiatric anamnesis. We shall ask questions which gradually assume one particular tendency, the entire development of the patient, particularly his sexual development, must be described from the beginning on. This intensified anamnesis may sometimes be concluded in three to four hours. In other cases twenty hours or more are required. This intensified anamnesis gradually changes into an active analysis, into a study of the unconscious pathogenic mechanisms. Stimulated by the questions of the physician, the patient tells his story, and in the course of his tale he begins to remember things. He may stop in the midst of his story, look dream forlorn and say:

I just remember something I had not thought of for years."

With alert, intelligent persons, these events remembered suddenly in the course of an intensified anamnesis and under the influence of the physician's questions will illuminate a large part of the unconscious mechanisms without the aid of a true analytic technic. In a large number of cases an essential part of the treatment consists in this dialogue during an intensified anamnesis, interrupted only by spontaneous associations of the patient.

In other cases the flow of narration ceases rather quickly. In order to learn something about the essential complexes of such patients, especially of those where no active direction of thought can be seen, the Bleuler-Jung association experiments will indicate the topics. This experiment cannot be described here, but one may read about it in any good textbook of psychology and psychotherapy.

The association experiment, however, only indicates the topics, it never leads into the real depth, and stops where the shaft begins that leads into the depth of the unconscious.

On the basis of these topics indicated, the patient will then be asked: "What do you remember in this connection?" It must always be emphasized that the answer must not be the result of conscious

reasoning Completely relaxed, he must tell spontaneously what associations are caused by the given topic He must talk equally freely about his sexual fantasies, about any antagonism toward the physician or doubts regarding the merit and worth of the treatment It may take considerable time until the patient learns to relate absolutely spontaneously and uncensored those ideas that come to him as in daydreaming

In addition to the free associations, the analysis of dreams leads as *via regia* into the unconscious I frequently dispense with the association experiment and let myself, instead, be guided by dreams into the center of the unconscious conflict If the patient is asked to tell about his dreams at the next visit he almost invariably replies "I never dream," and just as invariably the patient will tell about a most significant dream when he comes again

Dreams are interpreted through free associations The question is again "What occurs to you in this connection?" It will be found that the essential dreams are all determined in many different ways The mechanisms of condensation, displacement, transference, and resistance are particularly at work in the formation of the manifest dream The actual conflict may be expressed by the same symbolism and the same dream action as analogous conflicts during puberty and childhood

It is only rarely, and after a long and deep analysis, that we come upon images from the primeval, nonindividual collective unconscious of Jung, which are common to all humanity Finally, we encounter the anagogic tendency of symbolism, and thus not only the actual or infantile part, but also the contents of the dream pointing to future events In this way a possible solution of the problem may be indicated

During all these analytic procedures the patient will continually be encouraged to focus his attention on the essential points, while the orthodox method permits the patient to lose himself indefinitely in his ideas and interpretations If, in the

course of the therapy, the patient complains of any physical discomfort he will be treated by means of suggestion or even medicaments, and in contrast to the rules of the analytic sect the patient must undergo a neurologic and general medical examination by the psychotherapist himself Often it will also be necessary to regulate the life of the patient during the analysis, to forbid strictly and demand certain things In certain cases, exercises for concentration and relaxation will be necessary, especially with patients with pronounced organ neuroses The exercises for relaxation are rendered easier to the patients if they are first trained by means of visualization of definite colors, especially of the restful blue

In other cases one may have to attempt to replace pathologic conditioned reflexes by new ones

At the end of the analysis it will be seen that the patient is by no means cured by the analysis alone Psychosynthesis and psychagogy must follow In the average case, however, it will be observed that at the end of the analytic treatment the structure of the patient's neurosis is very much shaken He himself may be in a state of analytic shock, he may have undergone a complete change, not only with respect to the neurotic parts of his personality A young person's complete outlook on life may be changed It is a mistaken belief of Freud's that an analysis is a cold, rationalistic method and nothing else It is unavoidable that the patient will be influenced by the psychotherapist's philosophy of life In the course of the treatment general problems of life will arise, and whether one wants to or not, one will have to enter the metaphysical world It must be avoided to propagate a superficial standard world outlook in the manner of Adler All of this takes place during and immediately after the analysis proper At the end of the latter the already changed patient undergoes a general repetition and the genesis of the symptoms is studied again within the frame of the development of the personality

The next step is of an actively educat-

ing, psychosynthetic, and psychagogic nature. Let us repeat that complete results are not attained by the analysis alone. If the patient desires, he may conclude from the analysis that his neurosis is unchangeable. If he wants differently, however (if we can make him want differently), he can start anew on the right road from that point where he took the wrong direction years ago and where he retrogressively arrived again by means of the analysis. Even in this phase, traces of resistance may be encountered. In every neurosis there is a gain of pleasure, every cure means denial of desire and loss of pleasure. We have to prove to the patient that it is far better for him to pay less attention to the principle of pleasure and to acknowledge the principle of reality. We shall compel him to make a better decision at the crossroad. When he arrives at this crossroad, by means of the analysis, it is up to him to choose freely between the denial of pleasure and a healthy mind and the neurosis. It will be the task of the psychotherapeutic personality to force the better decision.

In the preceding discussion I have differentiated between three phases of therapeutic work—(1) intensified anamnesis, (2) analysis, and (3) psychosynthesis and psychagogy.

The essential characteristics of the third phase are education, guidance, searching, and forming of new libido fixations in order to apply energies released from the neurosis after the patient has been forced to a better decision. We hope to be perfectly clear when we say that the division into analysis and synthesis must be more of an inner division in the mind of the psychotherapist than an actual time division in the course of the treatment. I believe, in other words, that with sufficient practice both phases may be covered almost simultaneously. Synthesis and education may begin long before the analysis ends.

The significance of the nonanalytic methods has been discussed above. There are cases in which the analytic disclosure is not of the greatest importance. This applies to symptom complexes origi-

nated years ago from Freudian mechanisms but now petrified, rigid, and without meaning. Such symptoms may be based on a conflict which has gradually lost all significance because it has been resolved either inwardly or outwardly or simply because of the time which has passed. In such cases there remains merely a façade of symptoms with no substance but only a history. Roughly expressed, the symptoms have remained simply because they have become a habit. Instead of analyzing, it is more important to break up the patient's former pattern of behavior and to teach him facts leading to a new and better one.

A typical example of such a case was a woman pianist who suffered from stage fright. She could play only if she herself remained invisible to the audience. Moreover, any attempt at an erotic approach on the part of a man caused fear, shyness, and a desire to escape in the twenty-one year-old patient. She herself knew exactly what the cause of this was—an incestuous relation which she had had with a brother nine years older than she, at the age of twelve to fourteen years. The essential factor, however, was not the incest, but the lost virginity. The patient suffered from an overestimation of the hymen taboo and seriously believed that the audience could sense her missing virginity. She fled if a man tried to approach her because she was afraid that an intimate situation might reveal the fact of her lost virginity to the man. There was little that could be analyzed in that case. She was enlightened about the different attitudes which different civilizations have with regard to the importance of the state of virginity, and cured by re-education on that basis. The knowledge of folklore, the psychology of religion and a study of the psychology of the primitive mind are absolute necessities for the psychotherapist.

In cases where a substance is still present behind the symptomatic façade this complex structure may sometimes be successfully broken up from the outside, from the façade, in a manner impossible to arrive at by analysis alone. In general

it is true that the outside, the façade, the symptom is only of secondary importance "What appears on the outside is present also on the inside" Sometimes, however, the sentence may be reversed "What is present on the inside, is apparent also on the outside" If it is possible to alter and regulate the expression, the inner surface of the disturbance will disappear too

Severe cases of compulsion neurosis disclose from the analysis only the deeper justification of their disturbance, and the façade itself remains to be attacked In severe cases of compulsion the analysis may cause real harm A patient who had been analyzed by an orthodox authority developed a new neurosis when he was asked to tell the analyst everything and to withhold nothing He was always afraid not to have told everything The analytic discovery of the origin of the disturbance is almost never of any use in cases of compulsion neurosis One patient who had been analyzed said to me "I always waited for the miracle, the promised breakdown of the symptoms, but nothing ever happened"

In moral disturbances, analysis is not the most important method (In this connection we do not talk of neuroses—kleptomania, criminal perversions—where the unmoral action is only the final result of a neurotic disposition, but of unbalanced, uninhibited impostor types) If any part of the personality is still healthy and reasonable, moral training and strengthening are more important than the analysis

In all neuroses resulting from an actual conflict, the moral factor plays a role inasmuch as it must be shown to the patient that escape from the conflict into illness betrays a lack of health conscience. This health conscience must be intensified at the same time as the analysis takes place in order to impress upon the patient that it is more honest to experience the conflict consciously than to become ill

Let us discuss briefly two more types of cases where nonanalytic psychotherapy is indicated On the basis of my experi-

ences with neurotic children who had been analyzed mostly by female analysts, orthodox psychoanalysis is considered inadvisable with neuroses during childhood Nevertheless, the psychotherapist dealing with children must be just as familiar with the analytic method as with any other

Patients with incurable, inveterate compulsion neuroses are helped best if they are trained to adapt themselves to their neuroses and if they are guided in finding possibilities of a compromise between reality and their neuroses The patient must be taught to bear his neurosis, and to make it serve higher purposes—"to brew balm out of poison," in Nietzsche's words

How, then, may psychotherapy be applied to psychoses? If any better method, like malaria, is available, psychotherapy is out of the question Schizophrenias, inasmuch as they show enough responsiveness to make an analysis possible, may be very much aggravated by an orthodox psychoanalysis Nevertheless, a psychotherapy of psychoses is possible It is not based on analysis, but on psychiatric tact, ability to sympathize, human understanding, and psychagogy At any event, the educational element must by no means be neglected Patients with hallucinations and delusions may be brought to a point where at least in their outward behavior a compromise with the world of reality is made They still hear their voices and hold on to their delusions, but they are able to push them somewhat into the background In Kretschmer's words, they hallucinate only for private use. The originally vivid picture of the psychosis fades away like an old painting

The psychotherapist wishing to achieve this will have to fulfill, at least to some extent, the requirements which Nietzsche expressed in these words "He must possess the persuasiveness that adjusts itself to every individual, a diplomat's suave way of negotiating, and the adroitness of a detective in understanding the secrets of a soul without betraying it."

I believe that he will have to possess all these qualities, because he does not, as the

analysts believe, apply his method like a purely scientific instrument, but he must work with the force of his whole personality, and not without passion. A grain

of charity will be needed too, for without it, to express it in St. Paul's words, his efforts would be 'as sounding brass or a tinkling cymbal.'

1165 Fifth Ave.

A PHYSICIAN APPRECIATED

Gordon Bostwick Maurer M.D. a physician in Margaretville N.Y. was instantly killed on November 12 1938 by the accidental discharge of his shotgun while hunting partridges. Dr. Maurer was graduated from Yale in 1923 interned at the New Haven Hospital and located in the little New York village in 1926. His death caused great distress to the people in his community.

The *Catskill Mountain News* the town's weekly paper not only devoted more than half of its first page to Dr. Maurer but there were seven different items in the issue in connection with the lamentable death of this brilliant young physician.

The finest testimonial of a medical man in years was published in a column *Mountain Dew* and signed *The Mountaineer*. In this day of proposed state medicine its proponents should read this encomium and ponder well.

The following is quoted verbatim from *The News*:

Thirteen years ago there came here a city chap trained in one of the great universities.

The other members of his class went to big towns.

He, with the best record of them all wanted to begin the practice of medicine in a country village.

He had compiled a list of prospective communities. He looked over several and chose us.

An untried city college boy—with magic hands, a keen vision and uncanny knowledge of both the human body and the soul which activates it.

Soon after arrival he was called upon to care for a life given up as lost. He saved it.

He began to save others. He worked night and day. When he did not have proper appara-

tus or appliances he built some. When the snows kept him from patients he constructed a snowmobile.

Neither storm nor night nor mud nor snow kept him from the sick.

He took people into his home. It became a veritable hospital.

The fame of the boy spread throughout the section. Men and women from all walks of life asked for his attention.

The community built a hospital that he and others might the better care for those who needed care, medication and operation.

He continued. When a tired body all but gave up he took a year out and returned to Yale for special work that he might come home and serve better.

He had tired of city pastimes. The lure of the country had been breathed into his soul. Camp, rod and gun, open fires, life in the great outdoors gave zest, relief, happiness.

He loved our hills, our mode of life. He knew our ambitions, he smiled at our shortcomings.

He gave freely much of the work he did was without charge. Few knew the extent of his help to those who needed help. He served as few had ever served here before.

He was physician, parson, priest, confessor—we told him both our physical and mental troubles and he put us back on the road to reason and living.

Thirteen years he served. It was a life work worth while.

Today our hearts are numb at his loss, our senses belogged to know how to live without him.

Thank God for those thirteen years.

—*Medical Pocket Quarterly*

The legislature of New Mexico has passed a bill requiring physicians to be citizens of the United States.

The annual 'Spring Day' of the Cornell University Medical College Alumni Association will be on April 20 this year.

THE RADIOLOGIC DIAGNOSIS OF CORONARY THROMBOSIS: A NEW APPROACH

L H BERK, M D , New York City

(From the Bellevue Hospital, First Medical Division)

THE object of this presentation is to focus attention on the roentgen diagnosis of coronary thrombosis and to develop a greater familiarity with the objective and diagnostic evidence of the disease afforded by it

With the growing understanding of the clinical picture of coronary thrombosis, it is increasingly evident that a considerable number of patients survive their first attack and live many years thereafter with myocardial competence in spite of the fact that they frequently have repeated attacks of myocardial infarction with their sequelae ^{1,2,4,5,6,13,16}

The characteristic radiologic signs afforded by these cases have been rather neglected in the literature in favor of the clinical and electrocardiographic findings. Although the radiologic signs are often, in typical and atypical cases, no more than corroborative, they may form the only positive evidence of the disease

Pathologic Considerations

The obstruction of a coronary artery of the heart, slowly produced by arteriosclerosis and often completed by thrombosis, causes the gradual degeneration of the cardiac muscle in the area supplied by the obstructed artery and its replacement by fibrous tissue. Such occlusion of the coronary arteries produces a rather characteristic position of the scars—in that they are most commonly found in relation to the anterior descending branch of the left coronary artery, the left circumflex branch of the left coronary artery, and also the right coronary artery.

Obstruction of the anterior descending branch of the left coronary artery commonly results in a scarring of the more anterior part of the interventricular septum, sometimes even extending through

to the right ventricle, and of the apical and more anterior part of the wall of the left ventricle. Obstruction of the left circumflex branch of the left coronary artery results in a scarring and thinning of the wall of the left ventricle in its more median portion. Obstruction of the right coronary artery produces a scar which begins sharply in the middle of the interventricular septum and extends backward behind the papillary muscles of the mitral valve to curve around on the more posterior part of the left ventricle.

In 26 cases of coronary occlusion studied by Barnes and Ball,¹ the coronary arteries, singly and in various combinations, were found to be involved in the following proportions: anterior descending branch, 69 per cent, circumflex branch, 27 per cent, right coronary, 35 per cent. According to Moritz and Beck,¹³ occlusion of the left coronary occurred in 54 per cent of the cases, of the right coronary in 13 per cent, of the left and right coronary in 33 per cent. The descending branch of the left coronary was involved in 72 per cent, the circumflex portion of the right coronary in 42 per cent, and the circumflex portion of the left coronary in 12 per cent.

With the healing of a myocardial infarction, areas of scarring remain. The wall of the heart in this area becomes thinner, and stretching and bulging may result, giving rise to aneurysmal dilatation. The site of predilection is the apical region and the left lower pole. Development of this condition has been observed within a few weeks following an acute attack of coronary thrombosis. Localized pericardial thickening is commonly present at the site of the old infarction and mural thrombi are frequently formed on its inner surface. Both aneurysmal

wall and thrombus may show calcification

Sternberg,⁴¹ who in 1914 first described the typical course of chronic partial cardiac aneurysm, distinguished four stages (1) the stage of attacks of cardiac pain, often of very short duration, (2) the stage of localized pericarditis at the site of infarction, occasionally represented by a pericardial friction rub of only a few hours' duration, (3) the stage of latency, or apparent cure, lasting several weeks to many years, (4) the stage of advanced

myocardial disease, associated with chronic hydrops or leading to rupture.

Roentgenologic Features

The roentgenologic findings of coronary thrombosis allow us to visualize grossly these pathologic changes. During the stage of recent infarction, the roentgenologic procedure is naturally limited to radioscopy at the bedside. Indicative of myocardial damage is a diminished amplitude of ventricular contractions, most marked at the lower left cardiac

FIGURE 1b

pole where they are scarcely perceptible. Kymographic studies have demonstrated correspondingly silent areas, commonly in the middle portion of the left cardiac border (Stumpf²⁸).

In measurement of the heart, four points on the cardiac silhouette are distinguished as landmarks. They are (1) the point D at the junction of the vascular trunk and the right ventricle, (2) the point D¹ at the junction of the right lower border and the diaphragm, (3) the point G at the junction of the pulmonary conus and the left ventricle, (4) the point G¹ at the most distant point of the left lower pole. (See Figure 1a.) The actual measurements are made by means of diameters drawn between these points.

1 The long diameter is the distance between the points D and G,¹ normally about 13.6 cm.

2 The bisector of the left ventricle is a perpendicular dropped from the outermost point on the left ventricle to a line connecting G and G¹. It is normally 1.2–1.8 cm.

3 The right median diameter is a perpendicular drawn from the midsternal line to the outermost point on the right border of the silhouette, normally 3.1–5.3 cm.

4 The left median diameter is a perpendicular drawn from the midsternal line to the outermost point on the left ventricle, normally 7.7–8.4 cm.

Having established the above system of measurements, we may now consider

Fig. 2a

the changes in the cardiac shadow brought about by coronary thrombosis

Size and Shape

In coronary thrombosis, one may distinguish two general types of heart (1) the arteriosclerotic type, and (2) the essential hypertensive type. While these two types may exist in combination, their production is dependent on different mechanisms, and they must be discussed separately. However, the size of the heart in many cases of coronary thrombosis is normal, examination after months and years may reveal no enlargement.

In type one (see Figure 1) the heart is not enlarged. It is triangular and flabby, sitting with a broad area in contact with the diaphragm. The left cardiac border is straight or concave, both the right and left median diameters lie almost on the same level, close to the diaphragm. The left ventricle is small. The amplitude of the ventricular contractions is markedly diminished.

In type two (hypertensive heart, see Figure 2), in the early stage during which one encounters only slight dilatation, the cardiac apex is displaced downward, the longitudinal diameter is increased, and the transverse diameter and the bisector

FIGURE 2b

of the left ventricle are normal. If the left ventricle becomes more prominent later, the bisector is much increased. In the advanced type, in long-standing cases with a marked left ventricular hypertrophy, all diameters are increased. In this stage of hypertrophy there is slight dilatation with moderate left enlargement and pronounced rounding off of the left lower pole. There is a heaving apex displaced upward one to two centimeters above the diaphragm and to the left.

When a coronary thrombosis occurs in a hypertensive heart, the gross appearance is little changed, the bisector being somewhat decreased. The amplitude of ventricular contraction, however, is greatly diminished.

Two case reports follow, illustrating these two types.

Case 1—P S, male, aged 41, while at work on September 27, 1934, was suddenly seized with a severe epigastric pain lasting for four hours, followed by a squeezing pain in the substernal area radiating to the neck. Physical examination on admission to the hospital revealed distant heart sounds, A2 greater than P2. B P 110/72, no cardiac enlargement. The next day his temperature rose to 102 F. EKG showed rapid changes of Q3 T3 type with low voltage. The course was uneventful except for recurrence of

precordial pain one month after admission, relieved by amyl nitrite. Because of marked EKG changes the patient was kept in the hospital for nine weeks and has been followed for the past three years in the cardiac clinic.

X-ray Findings (See Figures 1a, 1b) Heart not enlarged. Left cardiac border straight, diminished amplitude of ventricular contraction, sagged type of heart. Both hila moderately enlarged.

Case 2—P W, male, age 49, candy maker. Admitted to Bellevue Hospital April 29, 1935, complaining of sudden onset of precordial pain radiating down left arm lasting several hours. Physical examination on admission revealed an enlarged heart with gallop rhythm at apex and frequent extrasystoles. The point of maximal impulse was in the fifth intercostal space within the left nipple line. B P 172/84. Serial EKG showed changes suggestive of coronary thrombosis, Q1 T1 type and low voltage. The convalescence was uneventful, and the patient is now free from cardiac pain and doing a moderate amount of work. B P is now 120/74.

X-ray Findings (See Figures 2a, 2b) The enlarged diameters are drawn in Figure 2b. There is marked left ventricular hypertrophy and dilatation. The apex is rounded off and elevated. There is considerably diminished amplitude of ventricular contractions and absence of pulsation at the apex. The amplitude of the left auricular contractions, on the contrary, is increased.

FIGURE 3

Cardiac Aneurysm

A diffuse and eccentrically dilated cardiac apex (see Figure 3) with hardly perceptible systolic contractions is frequently encountered, following a typical attack of coronary thrombosis. In about half of the cases (Zadek⁴²) the findings are very suggestive of apical infarction that has been followed by aneurysm if aortic regurgitation and decompensated hypertension can be excluded.

The circumscribed oval or angular bulging aneurysm (see Figure 4), varying in size and situated most commonly at the apex or middle portion of the left cardiac border, is less frequently seen. The pulsation in this area is absent, or rather indefinite, especially if the aneurysm is small, as in Figure 4 (1 and 1a), seen by Assmann.¹⁷ Even the larger one may show no pulsation if marked pericardial thickening and adhesions or obliteration of the aneurysmal sac are present, as in the case 4 (0) reported by Boller.²⁴ The large aneurysms will occasionally show a passive pulsatory postsystolic lagging, as in the case reported by Kalisch⁴¹ (Figure 4 [4]), and in the case in which Lenk⁴³ observed no marked pulsation during systole (Figure 3 [5]).

Sometimes the hypertrophic myocardium adjacent to the border of the aneurysm shows a marked prominence with systolic pulsations. This has been mistaken for the aneurysm itself, as in the case of Christian and Frik,³⁸ seen in Figure 4 (2, 2a) where the bulging in 2a was diagnosed as the aneurysm, because of its marked pulsation. The necropsy revealed only hypertrophic muscle at that point, while the aneurysm was situated at (2).

The calcification of the aneurysmal wall, which occasionally occurs, is curved and shows a systolic and sometimes rotatory pulsation, as in the case reported by Jaksch Wartenhorst.⁴⁰ Figure 4 (3, 5) reported by Brenner³⁴ shows a large calcified sacular aneurysm of the left ventricle near the base, which is quite an unusual location. Local pleuropericardial adhesions occur frequently and are

an indirect corroborative sign of some importance (See Figure 4 [1a]).

Aneurysms of the ventricular septum can be visualized only if large enough to cause a displacement of the right heart to the right (See Figure 4 [6] Boller²⁴).

Direct roentgenologic visualization will be impossible if a cardiac aneurysm develops on the diaphragmatic or hepatic surface or retropericardially, or if it does not make up a part of the left cardiac

FIGURE 4

border, or if, due to adjacent pericardial thickening and adhesions, it does not show bulging or pulsations.

Case Reports

Two case reports follow, to illustrate the diffuse and the circumscribed type of cardiac aneurysm.

Case 3—A. B. female, aged 70 first seen in the medical clinic in May 1935 with symptoms of heart disease present since 1926. Onset of illness was marked by sharp sticking precordial pain, palpitation and dyspnea followed by pulmonary infarction. Recovery slow.

Following that she had ten admissions to various hospitals because of cardiac decompensation. She had had frequent attacks of nocturnal dyspnea and edema of legs had been present in varying degrees for eight years. In

Fig. 5.

view of the patient's admissions to the hospital and the general satisfactory condition during the free periods, it was felt that total thyroidectomy might prevent or delay recurrence of decompensation.

Total thyroidectomy was performed on February 15, 1934, under cervical block anesthesia. The postoperative course was uneventful. The patient was readmitted in the eleventh postoperative week and again in the thirteenth postoperative month, with mild congestive

failure. On each occasion improvement was slow.

The patient was again admitted in October, 1935, 20 months postoperatively, with symptoms of congestive failure. She grew steadily worse, became psychotic, and finally died on December 26, 1935.

Laboratory Data. EKG showed normal sinus rhythm, with marked left ventricular preponderance and myocardial changes. The roentgenogram (Figure 5) shows a diffuse and eccentric

Fig. 6.

trically dilated cardiac apex. Radioscopy revealed a diminished pulsation.

Necropsy revealed an old thrombosis of the anterior descending branch of the left coronary artery and fibrosis of the myocardium. In the apex of the left ventricle there was an aneurysmal dilatation of the myocardium about 7 cm in diameter. The myocardium covering this aneurysm was very thin measuring a few millimeters in thickness. The overlying endocardium was firm and appeared to contain mostly fibrous tissue. From the tip of this aneurysm to the mitral ring, the wall of the left ventricle had become greatly thickened, so that at the mitral ring the wall of the left ventricle measured 3 cm in thickness. The anterior descending branch

of the left coronary artery was occluded about $1\frac{1}{2}$ cm from the source of the artery. The remainder of the coronary arteries showed a marked thickening of the intima with atheromatous material.

Case 4—M. W. female age 67 first began to notice shortness of breath and weakness in March 1932 followed by swelling of her feet and ankles. P. B. on admission revealed an enlarged heart. Point of maximal impulse in fifth intercostal space 12 cm. from midsternal line. Heart sounds at apex were distant with normal sinus rhythm. A2 greater than P2. B. P. 128/90. There was marked thickening of the peripheral vessels. The liver was just palpable and tender. There was slight pretibial

FIGURE 7a

edema She became progressively worse and died November 1, 1933

Laboratory Data EKG showed normal sinus rhythm, marked left ventricular preponderance, and myocardial changes Roentgenogram (Figure 6) shows small circumscribed bulging at the apex, radioscopic findings were not available

Necropsy revealed an old myocardial infarction and an aneurysm of the apex of the left ventricle, as well as previous coronary occlusion due to an organized and partially calcified thrombus in the descending branch of the left coronary artery The myocardium was hypertrophied and reddish brown in color, except in an area of the interventricular septum, 8 cm in diameter, where the myocardium was practically replaced by fibrous tissue, and where the entire thickness of the wall was about 4 mm This area bulged over the intervening right ventricle The endocardium over this area was smooth, but thickened No thrombus formation was seen

FIGURE 7b

Coronary Arteries

The most important factor in the production of coronary thrombosis is sclerosis of the coronary arteries The calcified coronary arteries can be demonstrated roentgenologically if proper technic is used

One should search for them carefully under the radioscope, with the eyes well adapted and using the smallest diaphragm, preferably in the right oblique position They will be seen as dense linear shadows moving only slightly during systole, similar to the cardiac contour next to them, quite close to the left cardiac border in the region of the coronary sulcus On a speed film, the calcified coronary arteries appear as linear, curved, interrupted segments, sometimes double and parallel

FIGURE 7c

Differential Diagnosis of Intra- and Extracardiac Calcifications

The differential diagnosis of the various intracardiac calcifications, although difficult, can be made with modern radioscopic and radiographic technic

The calcified valves are situated more medially than the calcified coronary arteries (See Figures 7a, b, c, and d) The aortic valves are located low at the left border of the spine in the direct postero-anterior view, and about in the middle in the left antero-oblique view The calcified mitral valves are seen more to the left of the spine in the former view and

FIGURE 7d.

near the posterior cardiac wall in the latter view (See Figures 7a and c) They are usually semilunar, the mitral showing a marked pulsatory movement toward the apex and the aortic showing a dancing motion.

The calcified mural thrombi usually occur in mitral stenosis and are commonly situated in the left auricle. They are round or semilunar, dense, sharply outlined, larger than the valvular calcifications, and show a dancing motion synchronous with the heart.

Figure 8 shows a few thrombi radiologically recognized during life and confirmed by necropsy—calcified thrombi reported by Scholcz³³ (Figure 8 (1)), Beaser³⁴ (Figure 8 (2)), Heeren³⁷ (Figure 8 (5)), and noncalcified thrombi reported by Arendt³⁴ (Figure 8 (3)) and Fussl³⁶ (Figure 8 (4)).

The calcified cardiac aneurysms have been mentioned previously. They are semilunar, large, show a strong systolic pulsation, and have their site of predilection near the apex.

The pericardial calcifications are more

frequently located in the lower surface of the right ventricle, but also occur in the coronary sulcus, usually leaving the apex free. They are more solid, linear, often branching, and show only a minimal pulsation. On rotation, they can be seen to run parallel to the cardiac border (Cutler and Sosman,⁷⁸ Hessman and Israelski,⁷⁹ Jones and Roberts,⁸⁰ and Youmans and Merrill⁸¹).

Calcified costal cartilages are denser and more clear-cut and one can identify them by following their course. Calcified glands and calcifications in the lungs and mediastina are round and dense, and by rotation of the patient can be projected outside the cardiac shadow, they move upward and downward with respiration. The bronchi can be easily differentiated

Discussion

The Electrocardiographic Signs of Coronary Thrombosis—It is apparent from our own experience and that of other observers that the typical case of coronary thrombosis is easily recognized. Yet the atypical case with the presence of substitution symptoms may very well be confused and requires the use of special diagnostic methods, such as electrol

THROMBI

FIGURE 8.

cardiographic changes and radiologic findings for corroboration

The atypical form of coronary thrombosis is found in a rather high percentage of cases after the first attack of coronary thrombosis. Such repeated episodes of coronary occlusion present a bizarre picture in the majority of cases. These cases of multiple myocardial infarction are not easily recognized without the aid of electrocardiographic changes and x-ray findings.

The popular view, supported by many investigations, is that the electrocardiographic changes due to myocardial damage after the coronary thrombosis are of two types: (a) inverted T1, T2 (Q1 T1 class), and (b) inverted T2, T3 (Q3 T3 class). There is still another group of cases, comprising, according to some authors, about 50 per cent of the cases of coronary thrombosis, whose electrocardiographic changes are not typical of the above two classes, and these may be difficult to recognize. The occurrence of this type of case must be kept in mind as a possibility, and makes necessary the use of other corroborative methods for accurate diagnosis. In coronary thrombosis the radiologic findings may be the only positive objective evidence that the disease is present.

The Radiologic Signs of Coronary Thrombosis—A survey of the literature shows that there is much contradictory opinion as to the cardiac enlargement following coronary thrombosis. Although coronary thrombosis might cause some hypertrophy (Parkinson²⁵) or occasionally some acute dilatation (Roesler²⁶), cardiac enlargement as a result of coronary thrombosis alone is not a common feature unless other concomitant factors are present, the common being hypertension (Parkinson,²⁵ Palmer,^{23,24} Bartels and Smith,¹⁸ Horine and Weiss,¹⁹ Roesler,²⁶ and Uhlenbruck²⁹).

Palmer,²⁴ in a well-observed group of 200 cases, determined radiologically that the heart was not enlarged in 36 per cent and that it was enlarged in 64 per cent. Of these, 80 per cent were due to a concomitant hypertension.

Regarding cardiac aneurysm following coronary thrombosis, it is safe to say that without the radiologic aid their diagnosis cannot be made with certainty, although a small number of aneurysms, as mentioned above, may escape roentgenologic visualization. Their incidence at necropsy varies from 3 per cent (Palmer²⁴) to at least 9 per cent (Bedford,¹⁴ Levine,⁷ Lisa¹⁰). In our group of 25 necropsies it was found in 6 cases, 4 of them with hypertension. Zadek,⁵² who found it radiologically much more frequently, states that the diffused type occurs in about half of his cases. Still, there are only a few cases reported in literature where cardiac aneurysms were correctly diagnosed roentgenologically during life and confirmed by necropsy.

As to the coronary arteries, the connective tissue and atheromatous changes of the intima are not directly demonstrable by the x-ray. However, calcareous depositions in the wall can be visualized, and they, too, indicate the narrowing of the vessel.

Only a few cases of calcified coronary arteries have been demonstrated roentgenologically during life (Lenk,⁴³ 1 unconfirmed case, Wosika and Sosman,^{73,74} 3 cases occurring in angina pectoris, 1 of them confirmed by necropsy). The large amount of calcareous material so frequently found in the coronary arteries at necropsy would indicate that, with an improved radiosopic and radiographic technic and a greater experience on the part of the examiner, a much larger number will be recognized during life.

During the attack, the roentgenologic diagnostic procedures are naturally limited. In the late stage, the follow-up work and exact history are often neglected by the radiologist, whereas the cardiologist is very often not sufficiently acquainted with modern radiologic, technical, and diagnostic methods.

Summary

A careful study of the radiologic evidence of coronary thrombosis helps us to become familiar with the corroborative

signs of the disease. The roentgenologic findings of coronary thrombosis allow us to classify hearts as of two general types on the basis of size and shape (1) the arteriosclerotic type, and (2) the essential hypertensive type

In type one the heart is not enlarged, is triangular, flabby, sitting with a broad base in contact with the diaphragm. The left cardiac border is straight or concave. Both the right and left median diameters lie in almost the same plane, close to the diaphragm

In type two (hypertensive heart) in the early stage the cardiac apex is displaced downward. In the advanced stage there is a pronounced rounding off of the left lower pole, with a heaving apex displaced upward.

In the typical and atypical forms of coronary thrombosis, the radiologic findings may be the only positive objective evidence of the disease

Radiologic examination is of utmost value in the diagnosis of cardiac aneurysms and mural thrombi following coronary thrombosis. In the future, a larger number of cases of calcification of the coronary arteries will be recognized through improved radioscopic and radiographic technic.

Only if one is vigilant and constantly aware of the characteristic radiologic signs, will it be possible to make the roentgenologic diagnosis of coronary thrombosis more frequently than in the past.

cardiographic changes and radiologic findings for corroboration

The atypical form of coronary thrombosis is found in a rather high percentage of cases after the first attack of coronary thrombosis. Such repeated episodes of coronary occlusion present a bizarre picture in the majority of cases. These cases of multiple myocardial infarction are not easily recognized without the aid of electrocardiographic changes and x-ray findings.

The popular view, supported by many investigations, is that the electrocardiographic changes due to myocardial damage after the coronary thrombosis are of two types: (a) inverted T₁, T₂ (Q₁ T₁ class), and (b) inverted T₂, T₃ (Q₃ T₃ class). There is still another group of cases, comprising, according to some authors, about 50 per cent of the cases of coronary thrombosis, whose electrocardiographic changes are not typical of the above two classes, and these may be difficult to recognize. The occurrence of this type of case must be kept in mind as a possibility, and makes necessary the use of other corroborative methods for accurate diagnosis. In coronary thrombosis the radiologic findings may be the only positive objective evidence that the disease is present.

The Radiologic Signs of Coronary Thrombosis—A survey of the literature shows that there is much contradictory opinion as to the cardiac enlargement following coronary thrombosis. Although coronary thrombosis might cause some hypertrophy (Parkinson²⁵) or occasionally some acute dilatation (Roesler²⁶), cardiac enlargement as a result of coronary thrombosis alone is not a common feature unless other concomitant factors are present, the common being hypertension (Parkinson,²⁵ Palmer,^{23,24} Bartels and Smith,¹⁸ Horne and Weiss,¹⁹ Roesler,²⁶ and Uhlenbruck²⁹).

Palmer,²⁴ in a well-observed group of 200 cases, determined radiologically that the heart was not enlarged in 36 per cent and that it was enlarged in 64 per cent. Of these, 80 per cent were due to a concomitant hypertension.

Regarding cardiac aneurysm following coronary thrombosis, it is safe to say that without the radiologic aid their diagnosis cannot be made with certainty, although a small number of aneurysms, as mentioned above, may escape roentgenologic visualization. Their incidence at necropsy varies from 3 per cent (Palmer²⁴) to at least 9 per cent (Bedford,¹⁴ Levine,⁷ Lisa¹⁰). In our group of 25 necropsies it was found in 6 cases, 4 of them with hypertension. Zadek,⁵² who found it radiologically much more frequently, states that the diffused type occurs in about half of his cases. Still, there are only a few cases reported in literature where cardiac aneurysms were correctly diagnosed roentgenologically during life and confirmed by necropsy.

As to the coronary arteries, the connective tissue and atheromatous changes of the intima are not directly demonstrable by the x-ray. However, calcareous depositions in the wall can be visualized, and they, too, indicate the narrowing of the vessel.

Only a few cases of calcified coronary arteries have been demonstrated roentgenologically during life (Lenk,⁴³ 1 unconfirmed case, Wosika and Sosman,^{72,74} 3 cases occurring in angina pectoris, 1 of them confirmed by necropsy). The large amount of calcareous material so frequently found in the coronary arteries at necropsy would indicate that, with an improved radiosopic and radiographic technic and a greater experience on the part of the examiner, a much larger number will be recognized during life.

During the attack, the roentgenologic diagnostic procedures are naturally limited. In the late stage, the follow-up work and exact history are often neglected by the radiologist, whereas the cardiologist is very often not sufficiently acquainted with modern radiologic, technical, and diagnostic methods.

Summary

A careful study of the radiologic evidence of coronary thrombosis helps us to become familiar with the corroborative

URINARY INFECTIONS IN INFANTS AND CHILDREN

A Comparison of Therapeutic Methods

BENJAMIN W. CAREY, JR., M D , Boston

(From the Department of Pediatrics Harvard Medical School and the Infants and the Children's Hospitals Boston)

THIS afternoon I wish to point out some of the methods of approach to the study of patients with infection in the urinary tract. I propose to point out briefly certain diagnostic procedures and to present a comparison of results obtained in two groups of patients, one group having been treated with mandelic acid, the other with sulfanilamide

Investigation of Patient with Urinary Infection

The presence of an unexplained fever, abdominal pain, or even vomiting and diarrhea, or symptoms referable to the genitourinary tract, such as frequency or pain on urination, should lead one to suspect the presence of infection in the urinary tract. The finding of leukocytes, erythrocytes, or casts in a centrifuged specimen of urine usually suffices to establish the diagnosis. It should be remembered that a negative sediment from an uncentrifuged urine specimen does not absolutely exclude the presence of leukocytes, erythrocytes or casts in the urine. In the event that abnormal elements are found in the sediment, anomalies or infection in the vagina or urethra should be excluded before proceeding further with the investigation.

As a further means of securing information as to the presence of an infection, urine should be obtained by catheterization and examined for the presence of leukocytes, erythrocytes or casts. A portion of the specimen should be cultured to determine the nature of the infecting organism. The procedure of catheterization will furnish information as

to the volume of residual urine and may help to exclude the presence of a posterior urethral anomaly, especially in boys.

The second step in the study of a patient with infection in the urinary tract is to secure a flat roentgenogram of the abdomen, including the bladder. This procedure may give information as to the size of the kidneys, the presence of large intra abdominal masses, or renal or bladder calculi. As a measure of kidney function valuable information may be secured by measuring the blood pressure and estimating the nonprotein nitrogen in the blood.

These procedures may be quite adequate if the infection is the initial attack of the patient, but in the event of recurrent attacks of infection or an infection of long duration, further studies of the urinary tract and function of the kidneys are desirable. These should include a test for the concentrating power of the kidneys, an intravenous pyelogram and, if evidence is at hand of diminished kidney function or anomalies in the urinary tract, it may be necessary to obtain a urea clearance test and even to perform a cystoscopy and obtain retrograde pyelograms.

If the infection is the patient's first attack and it has been demonstrated that the kidneys have normal concentrating ability and that the blood nonprotein nitrogen, blood pressure, and intravenous pyelograms are normal, medical treatment may be instituted without performing cystoscopy and retrograde pyelography.

If unsatisfactory evidence has been ob-

tained from intravenous pyelography, a cystogram may be done prior to retrograde pyelography. Information may be secured from this procedure as to the presence of a diverticulum of the bladder, tumors of the bladder, and posturethral obstruction.

Indications for cystoscopy may include (1) evidence from intravenous pyelography of impaired function of one kidney or a portion of a kidney, (2) absence of a part of the urinary tract, (3) evidence of an anomaly of the bladder or urethra, and (4) the necessity of examining the urine and determining the function of each kidney separately. However, if inoperable bilateral abnormalities are observed in the intravenous pyelogram or if the kidney function is markedly diminished, cystoscopy may be contraindicated.

To obtain successful intravenous pyelograms, certain general principles must be followed. It is necessary to restrict the fluid intake of the patient for some hours preceding injection of the dye to obtain a concentration of at least 1:20 of the urine, as experience has proved that unless this concentration is attained, the dye will not be sufficiently concentrated to give proper visualization of the urinary tract. The presence of an excess amount of gas in the small intestine will obscure the dye in the urinary tract. Measures to control excessive amounts of gas include the limitation of diet prior to injection of the dye, the administration of mild cathartics and small enemas, and even the use of drugs such as pitressin to facilitate removal of the gas. A flat roentgenogram of the abdomen should always be taken prior to injection of the dye to secure information as to the amount of gas in the intestine, and if it is found to be excessive the procedure should be postponed until the proper conditions are attained for good visualization of the urinary tract. The dose of the intravenous dye should be adequate and it should be remembered that the dose for infants is relatively larger than the dose for older children. It is cus-

tomary to take roentgenograms five, fifteen, and thirty minutes after injecting the dye.

Mandelic Acid

The use of sulfanilamide has almost entirely replaced mandelic acid in the treatment of urinary infections, except in the case of sensitivity to sulfanilamide as manifested by one of the toxic reactions to be described later, or the presence of a species of bacteria resistant to destruction by sulfanilamide.

It is desirable to review briefly the knowledge concerning the mode of action and plan of treatment of mandelic acid.

Rosenheim,¹ in 1935, showed that the antiseptic power of mandelic acid depended on a concentration of the drug in the urine between 0.5 per cent and 1.0 per cent, and the maintenance of a high degree of acidity of a pH of 5.6 or below. Helmholtz and Osterberg² verified the factors of acidity of the urine and concentration of mandelic acid and found that all members of the colon-aerogenes group of bacteria and some of the paratyphoid and dysentery-like organisms were easily killed, but that some strains of the streptococcus fecalis and the bacillus proteus were often insufficiently inhibited in their growth for effective results.

In considering the use of mandelic acid it is important to remember that prolonged urinary infection or the presence of congenital abnormalities in the genito-urinary tract may result in kidney dysfunction which will not allow sufficient concentration of the urine, and the proper degree of acidity will not be attained. Campbell and Lyttle³ have shown that chronic pyelonephritis is accompanied by such abnormalities in a considerable percentage of patients.

The drug is administered in the form of a 10 per cent elixir of ammonium mandelate. The total daily dose is estimated so that a 1 per cent concentration in the urine may be constantly maintained. It is necessary to restrict the fluid intake of the patient to maintain this concentration. The acidity of the urine should be

checked daily to ascertain if the pH is at the necessary level of 5.6 or below. Occasionally it may be necessary to supplement the mandelic acid with an acid salt such as ammonium chloride to obtain a urine which is sufficiently acid.

The sediment of a centrifuged specimen of urine should be examined daily to detect the appearance of erythrocytes or casts. If these elements appear, having been previously absent, an irritant effect of the mandelic acid on the kidney may be occurring.

The mandelic acid should be continued at least one week after the urine culture has become sterile. A limit of three weeks is placed on the continuation of therapy because if sterilization of the urine has not occurred within this time it is not likely to occur by prolongation of the therapy.

Sulfanilamide

Kenny³ reported the results obtained in the treatment of pyelitis complicating pregnancy with sulfanilamide. The dosage of the drug was small and no alkali was given with the sulfanilamide. The urine concentration of free sulfanilamide was not over 100 mg per cent in any of the patients. He stated that favorable results were obtained when the infecting organism was a member of the colon-aerogenes group, but the streptococcus fecalis was not destroyed by the drug.

Mellon and Shinn⁴ studied the action of sulfanilamide *in vitro* on the colon bacillus. They found that a better demonstration of the bactericidal action occurred when urine, rather than broth, was used as a diluent for the bacteria, and that a pH of 7.2, rather than 0, favored bactericidal action.

Helmholz⁵ found that sulfanilamide in small doses accompanied by sufficient alkali to increase the pH of the urine to 7.2 or above was effective in sterilizing the urinary tract if the infecting organism belonged to the colon aerogenes group or was the bacillus proteus. He stated that if the streptococcus fecalis was the causative organism, sterilization of the urine did not occur.

Long,⁶ in a recent address, verified the studies of Mellon and Shinn,⁴ and stated that sulfanilamide was effective in curing urinary infections due to the colon bacillus, the staphylococcus, the B hemolytic streptococcus, and the bacillus proteus, but that no bactericidal action occurred in infections caused by the streptococcus fecalis. He suggested that sulfanilamide be administered with alkali, and the fluid intake be restricted so that a concentration of free sulfanilamide in the urine of 200-400 mg per cent might be maintained.

The exact mode of action of sulfanilamide has not been discovered. Suggestions offered include a direct bactericidal action, stimulation of phagocytosis, destruction of the capsule of the bacteria, neutralization of toxin produced by the bacteria, and chemical change in the bacterial cell. Certainly no one of these suggestions can be the sole factor because the organisms for which sulfanilamide seems to be effective do not have characteristics necessary to fulfil each of these suggestions.

The previously quoted studies have shown that the objects to be attained are a concentration of free sulfanilamide in the urine from 100 to 400 mg per cent and a pH of the urine of 7.2 or higher. The lower concentration seems to be sufficient if the infecting organism is a member of the colon aerogenes group or the staphylococcus. Higher concentrations are necessary if the organism is the streptococcus fecalis or the bacillus proteus. The collection of the total twenty-four hour urine specimen in adult patients for the determination of free sulfanilamide is a relatively easy matter but the difficulty of such collections in infants and young children makes it more feasible to regulate the dose of the drug on the basis of the concentration of free sulfanilamide in the blood. The optimum level of the blood concentration seems to be from 8 to 12 mg per cent. The dose necessary to maintain this blood concentration varies from 1.5 grains per pound of body weight per 24 hours in infants to 0.75 grain per pound

CHART I—MANDELIC ACID

| GROUP | NO OF CASES | MALE | FEMALE | SUCCESS | FAILURE TO STERILIZE | RECURRENCE < 2 Weeks | RECURRENCE > 2 Weeks | NO FOLLOW- UP | REACTION |
|-----------------|-------------------|------|--------|---------|----------------------------|----------------------------|----------------------------|---------------------|----------|
| <i>Infants</i> | | | | | | | | | |
| I | 9 | 2 | 7 | 8 | 1 | 0 | 1 | 2 | 0 |
| II | 2 | 0 | 2 | 0 | 2 | 1 | 0 | 1 | 0 |
| III | 3 | 1 | 2 | 3 | 0 | 0 | 0 | 1 | 1 |
| <i>Children</i> | | | | | | | | | |
| I | 5 | 0 | 5 | 5 | 0 | 0 | 1 | 1 | 0 |
| II | 9 | 1 | 8 | 5 | 4 | 1 | 2 | 1 | 4 |
| III | 11 | 0 | 11 | 11 | 1 | 0 | 3 | 0 | 0 |
| Totals | 40 | 4 | 36 | 32 | 8 | 2 | 7 | 6 | 5 |

Group I—Acute infection without anomalies in urinary tract.
 Group II—Chronic or recurrent infection lasting over two months with anomalies.
 Group III—Chronic or recurrent infection lasting over two months without anomalies

in children ten to twelve years of age Experience has shown that a constantly alkaline urine (pH 7.2 or above) cannot be attained without the use of sodium bicarbonate in conjunction with the sulfanilamide In infants, approximately 2 grains of the alkali per pound per 24 hours is necessary to attain the proper alkalinity One grain per pound will usually suffice in older children The sulfanilamide and sodium bicarbonate should be given at either four- or six-hour intervals to maintain a constant concentration of the drug in the blood The fluid intake of the patient should remain at the minimal side of normal for the age and weight of the patient or from 800 cc each 24 hours in an infant to 1,400 cc in a child of ten to twelve years

A culture of the urine should be obtained three days after the sulfanilamide is started and at intervals of two to three days until the culture remains sterile The full dosage should be maintained at least two days after the culture becomes sterile, then decreased to about one-half the estimated amount and continued two or three days so that a recurrence of the infection will not occur

The pH of the freshly voided urine should be checked at least once daily by the addition of three or four drops of a 0.04 per cent aqueous solution of phenol red to 5 cc of urine If the resulting color is pink or red the proper pH of 7.2 or above has been reached If the color remains yellow after the addition of the indicator it signifies that the dose of the sodium bicarbonate should be increased

The urinary sediment should be ex-

amined daily for the presence of leukocytes as this is an additional index of the response of the infection to the specific therapy

It is advisable to determine the blood leukocyte level at intervals of two or three days to detect evidence of the onset of leukopenia

The patient should be examined daily for the presence of possible toxic reactions to the sulfanilamide such as fever, skin rash, hemolytic anemia, headache and mental confusion, nausea and vomiting, abdominal pain, and acidosis, as evidenced by hyperpneic breathing If any of these reactions appear it is desirable either to reduce the dose of the sulfanilamide or to discontinue it altogether

Results of Treatment

I Mandelic Acid—Chart I represents a summary of a group of 40 patients treated with mandelic acid Other reports of the results of treatment with mandelic acid in the Infants' and Children's Hospitals have been given by Wheeler⁸ and Dietrich⁹

The patients in the group having anatomic abnormalities as determined by intravenous pyelography or cystoscopy and retrograde pyelography were those in whom surgical treatment was deemed inadvisable This group included patients with unilateral and bilateral dilated kidney pelves and ureters, chronic pyelonephritis with hypertension, and markedly diminished kidney function

The infecting organism in 33 of the patients was the colon bacillus, mixed colon bacillus and streptococcus fecalis in 4

CHART II—SULFANILAMIDE

| GROUP | NUMBER OF CASES | MALE | FEMALE | SUCCESS | FAILURE TO STERILIZE | RECURRENCE < 2 Weeks | RECURRENCE > 2 Weeks | NO FOLLOW UP | REACTIONS Cyanosis | Rash Fever |
|-----------------|-----------------|------|--------|---------|----------------------|----------------------|----------------------|--------------|--------------------|------------|

| II | 5 | 1 | 4 | 4 | 1* | 0 | 0 | 0 | 5 | 0 |
| III | 10 | 1 | 9 | 10 | 0 | 0 | 1* | 0 | 8 | 2 |
| Totals | 41 | 4 | 37 | 40 | 1 | 0 | 1 | 4 | 34 | 3 |

Group I—Acute infection without anomalies in urinary tract.

Group II—Chronic or recurrent infection lasting over 2 months with anomalies.

Group III—Chronic or recurrent infection lasting over 2 months without anomalies.

* Recurrence two weeks later Mandelic acid with recurrence two months later

** Diverticulum of bladder Suprapubic cystostomy three days after F.A.B. S. started.

patients, and the streptococcus fecalis, atypical paratyphoid B bacillus, and the H influenza in each of 3 patients.

Thirty two of the 40 patients were successfully treated with the mandelic acid. Two of the children who were unsuccessfully treated had marked anatomic defects, one having a bifid left kidney pelvis and the other having a fused left kidney and megaloureter with a congenitally absent right kidney. The latter patient was readmitted later for sulfanilamide therapy and the urinary infection was successfully treated. An other child had chronic pyelonephritis with markedly diminished kidney function and hypertension. In 3 of the infants whose urinary infection failed to respond to mandelic acid treatment the pH of the urine could not be lowered to 5.0 even with large doses of ammonium chloride supplementing the mandelic acid.

The average time of follow up visits after discharge from the hospital of the group of infants was four months and of the children a group was three and one-half months. During this time 2 of the infants and 7 of the children had a recurrence of the urinary infections. One of the infants who had a recurrence was of the group without demonstrable anomaly of the urinary tract and one had a chronic infection prior to treatment with an associated anomaly. Three of the children whose infection recurred had no demonstrable anomaly of the urinary tract and 8 of them had a chronic infection prior to treatment with associated anatomic anomalies.

II Sulfanilamide—Chart II is a summary of 41 patients who were treated with sulfanilamide. Surgical treatment was considered necessary in 1 patient of this group. This patient was a female child in whom a large diverticulum of the bladder was discovered after an intravenous pyelogram. A suprapubic cystostomy was performed on the patient three days after the sulfanilamide was started. The urine did not become sterile and the patient died on the sixth postoperative day of a hemorrhage from the bladder. This case represents the only failure in sterilization of the urine of this group of patients. Only 1 patient of this group had a recurrence of the infection after the drug had been stopped. No anomaly of the urinary tract had been found after an intravenous pyelogram had been done. She was subsequently treated with mandelic acid but had another recurrence of the infection two months later.

The average time of follow-up after discharge from the hospital was three months for the infants and two and one-half months for the children.

The infecting organism was the colon bacillus in 32 patients, mixed colon bacillus and streptococcus fecalis in 4, streptococcus fecalis in 2, staphylococcus albus in 1, and the bacillus proteus in 2.

The average time in which a sterile culture of the urine was obtained after the sulfanilamide had been started was three days for infections caused by the colon bacillus and the staphylococcus albus, five days for the bacillus proteus and nine days for the streptococcus fecalis.

Reactions to Drugs

I Mandelic Acid—Two of the patients treated with mandelic acid developed a mild albuminuria and casts were found in the urinary sediment. One patient complained of abdominal pain after receiving the mandelic acid. One who had an acute urinary infection superimposed on bilateral tuberculous kidneys developed gross hematuria. One child with hypertension, chronic urinary infection, and markedly diminished kidney function developed vomiting and acidosis after receiving mandelic acid and ammonium chloride.

These toxic reactions disappeared rapidly after the mandelic acid was discontinued and a liberal intake of fluid was allowed.

II Sulfanilamide—Thirty-four of the 41 patients treated with sulfanilamide developed cyanosis of the lips and nailbeds. This reaction was not considered to be dangerous and the treatment was not changed after its appearance. One child developed a febrile reaction after receiving sulfanilamide for four days. The child's temperature rose to 103 F each afternoon for two days and no reason for the fever could be found after carefully examining the patient. The temperature remained normal after the sulfanilamide was discontinued, therefore it was considered to have caused the fever. Two children developed a morbilliform rash over the face and trunk after receiving sulfanilamide for six days, they showed no signs of measles or German measles other than the rash, therefore it was assumed that the drug was the cause.

Summary and Conclusions

A discussion and a suggested method of investigation for patients with infection of the urinary tract have been presented.

The dosage and the method of administration of mandelic acid and sulfanilamide have been discussed.

The comparative results of treatment with mandelic acid and sulfanilamide of a group of 81 patients suffering from acute and chronic infection of the urinary tract have been presented.

Sulfanilamide appears to be a valuable addition to the drugs available for the treatment of urinary infections.

The limitations for the use of mandelic acid are the presence of fever, vomiting, or acidosis, diminution of kidney function to the extent where concentration of the urine to 1:20 is impossible, and infection due to the bacillus proteus.

Sulfanilamide should be used with caution and should not be considered as a panacea, the possibility of severe toxic reactions such as fever, leukopenia, hemolytic anemia, and skin rashes should be kept in mind. The appearance of cyanosis of the lips and nailbeds is not considered to be a contraindication for continued administration of the drug.

Sulfanilamide may be administered in the presence of fever and to patients with diminished kidney function. However the drug will not be excreted by the kidney as rapidly if the function is diminished. In such an event it is advisable to determine the amount of sulfanilamide in the blood at frequent intervals and reduce the dose if the concentration rises above 15 mg per cent.

An adequate dose of both mandelic acid and sulfanilamide should be given and the proper pH of the urine during administration of the drugs should be maintained.

In our experience sulfanilamide is effective in sterilizing the urine of patients infected with organisms of the colon-aerogenes group, the bacillus proteus, the staphylococcus aureus and albus, and the streptococcus fecalis, although the last named organism requires a longer period of treatment than any of the others.

Discussion

Dr. Albert D. Kaiser, Rochester, N. Y.—

Dr Carey has given us a very timely and thorough review of the modern treatment of urinary infections. Both the urologist and the pediatricist have traveled a long distance since Holt Thompson, and others described pyelitis as a cause of so many of the unexplained temperatures in infants. All pediatricians must now be certain that the mere presence of a few pus cells in the urine is not sufficient for a positive diagnosis of pyelitis. Still I am sure that we are more apt to institute alkaline or other treatment before we obtain catheterized specimens of urine. While this is not highly scientific the treatment does clear up the urine and reduce the temperature in a large number of these patients. One wonders how many of these cases really have pyelitis. Pus cells in the urine of a female infant very often come from the urethra or vagina. We may, in private practice, be excused for this easy-going method of diagnosis and treatment, but certainly no pediatrician should be excused for so conducting severe pro-

longed or recurrent cases. Urologists have too often pointed out the possibilities of anomalies and other urologic problems to justify any pediatrician in neglecting to have a complete urologic study of the case.

The use of sulfanilamide seems to me the greatest advance we have made in the treatment of these cases. One handicap in other methods of treatment has been the inability to make these small children take medication by mouth. With sulfanilamide a parenteral injection of 1 per cent of the drug in a physiologic solution of sodium chloride overcomes this problem. If it is not possible to secure this solution prontosil may be used.

I would like to ask Dr Carey regarding his experience with bacilluria where but few pus cells are present.

The section has been fortunate in having this important subject brought up to date in such an excellent manner.

JUDICIAL DECISION PACKED WITH COMMON SENSE

Magistrate Sabbatino's decision in the case of chiropractor Frederick C. Zinke strips spinal manipulation of its various subterfuges and reveals it for what it is—namely the illegal practice of medicine by unlicensed unqualified practitioners, says the *New York Medical Week*. In holding Zinke for Special Sessions Judge Sabbatino summarized the entire chiropractic situation in a few terse sentences.

The practice of chiropractic is the practice of medicine. And the fact that chiropractors abstain from the use of words like diagnosis treatment or disease is immaterial. What they hold themselves out to do and what they do is to treat disease, and the substitution of words like analysis palpation and adjustment does not change the nature of their acts.

By his ruling on the display of chiropractic signs Magistrate Sabbatino opens the door to a wholesale clean-up of this persistent form of unlawful practice. 'These signs and certificates are in themselves presumptive evidence of a holding out (to treat disease)—the titles doctor (of chiropractic) and chiropractor carry with them definite implications that the possessor is able to treat bodily conditions.

This portion of Magistrate Sabbatino's decision is of inestimable importance. It clearly

rules that the display of chiropractic signs violates the law prohibiting unauthorized use of a medical designation. Armed with this the law enforcement agencies of the state should find it much easier to establish their case against chiropractors.

Various sectarian healing cults charge that the medical practice laws are designed to give physicians a monopoly on medical care. Lay men who are influenced by this viewpoint may find enlightenment in a Court of Appeals decision quoted by Judge Sabbatino in the Zinke Case.

The regulation of the practice of medicine is undertaken by the state, not for the protection of the physicians themselves but for the protection and welfare of the people. 'The power of the state to provide for the general welfare of its people authorizes it to prescribe all such regulations as in its judgment, will secure or tend to secure them against the consequences of ignorance and incapacity as well as of deception and fraud. Those seeking medical attention have no means of estimating the skill and ability of the physician and must depend upon the state to permit only those qualified to engage in that profession.' Judge Sabbatino's ruling strengthens the power of the state to give the people this necessary protection.

FRACTURES OF THE RADIUS OR ULNA—LOWER FIFTH—IN ADOLESCENCE

DONALD E. McKENNA, M D , F A C S , Brooklyn, New York

PERHAPS more physicians are more familiar with the mechanism and treatment of a Colles fracture than of any other. The aphorisms of the lecture hall and quiz room of medical colleges lend themselves to a somewhat ritualistic formula for its reduction. In time the practitioner, by imperceptible stages, is apt to consider all fractures about the wrist as some modification of a Colles, and, by correlation of thought, proceed to treat them by the well remembered formula of hyperextension, traction, and flexion, apply a short splint, and place the forearm in a sling. Such management is often harmful, particularly in childhood, and this paper has for its purpose a plea that less dogma be employed in reducing wrist fractures, to the purpose that better functional results may be attained, especially in the treatment of lesions of the radius and ulna in the lower fifth in adolescence.

The fracture of childhood which most accurately simulates a Colles is an epiphyseal separation of the distal radial epiphysis, and yet a lesion of both bones of the forearm in the lower fifth, the so-called crumpled, adolescent, or torus fracture is much more common than even epiphyseal separation. This fracture, furthermore, presents a confusing syndrome, following a fall on the extended arm, of pain, swelling, and a deformity near the wrist—a clinical picture not unlike the other two lesions, and while its management and treatment should be quite different, often enough is not.

Just what is a Colles fracture? One textbook (Böhler) says "it is a fracture of the lower end of the radius, the lower fragment angulated backward, and the ulnar styloid broken off." Colles said it was a transverse fracture of the radius situated about 4 cm above the articular

margin, resulting from a fall on the outstretched hand. Other authorities, Wilson and Cochrane, have proposed to limit it to "fractures of the radius as described by Colles, in which the entire thickness of the bone is involved—either transverse, fissured, or comminuted in type." With this the author is in accord.

When an adult falls on the outstretched arm with the wrist in hyperextension the palm slaps against the pavement, floor, or other obstruction, and the stress is transmitted to a rigid radius, which usually fractures where Colles said it would. If it doesn't, the force travels upward, resulting in a fracture of the shaft, or radial head, with or without a fracture of the diaphysis of the ulna, usually on a slightly lower level.

In children and adolescents the mechanism is different. Their wrists are more flexible and are capable of greater hyperextension, as they fall they strike on the butt, rather than the palm of the hand. There would seem to be a recoil of the force by virtue of the elasticity at the epiphyseal line. The cancellous bone in the diaphysis also modifies the transmission of the force. The pronator quadratus is tense, the cortex of the radius is comparatively thin, and the fibers of the interosseous ligament are more nearly transverse. The force snaps the radius in the lower fifth, travels across the interosseous ligament, and is dispersed when the ulna gives way.

The ulna occupies a place of secondary importance when discussing fractures about the wrist joint, and rightly so. It does not articulate with the carpal bones, it is not intimately concerned with wrist function, it obtains stability near the wrist by articulation with the radius, but is bound throughout its shaft to the radial diaphysis merely by the

interosseous ligament, it is not primarily concerned in the transmission of force, and not subject to fracture by such force (i.e., transmitted) unless preceded by a fracture of the radius.

One other anatomic factor deserves mention in falling, the attitude of subconscious protection of the hand is ulnar deviation. This attitude puts two muscles under excessive tension—the brachioradialis, which is attached to the radial styloid, and the pronator quadratus, running transversely between both bones.

FIG 1 Epiphyseal separation. Backward displacement of epiphysis. Typical silver fork deformity.

in the lower fifth. The pronator quadratus seems to determine the level of the fracture site, namely, at a point just above its proximal margin, while the brachioradialis, whose tendon of insertion is attached to the radial styloid, contributes largely to backward displacement of the lower fragment.

The first collected observations of this fracture were reported by Thore in 1844. It is the most common bone injury of childhood. In our series on the Fracture Service at the Methodist Episcopal Hospital, Brooklyn, we have observed

FIG 2 Typical fracture of lower fifth in adolescence $1\frac{1}{2}$ inches above the distal end. Both bones involved at same level. Dorsal displacement of distal radial fragment.

210 cases during the past five years. Textbooks in general mention the lesion in a superficial way, and dispense with it by a few cursory remarks. It is, however, a clinical entity, entitled to specific consideration, differing from other fractures about the wrist, and, if treated incorrectly, may produce lasting deformity and dysfunction.

There are all gradations of severity, from the mild, so-called crumpled, torus, or greenstick variety, to the grossly displaced type. What has been said about the mechanism applies to all varieties. Violence of the force, timing of the impact, and constitutional variability determine the degree of displacement. The fracture occurs at a distinctly higher level on the shaft than a Colles'. The ulna is usually implicated, and invariably one obtains the history of a fall on the outstretched arm.

The examination is most important. It pays to take a few minutes to gain the patient's confidence—they are frightened youngsters. Seat them on a stool and allow them to rest both forearms on the examining table. Observe the butt of the hand. Note whether it is red, swollen or ecchymotic. This not only gives a clue to diagnosis but is a reliable index of the

FIG 3 Immobilization from midarm to fingers Forearm pronated Wrist slightly flexed

violence of the force Then note the relative size of the forearms at or near the wrist and record the point of maximum swelling, also the presence or absence of deformity and whether this is greater on the dorsum or palmar surface Further note whether the hand is held in radial or ulnar deviation, in relation to the wrist Gentle palpation will indicate the point of maximum tenderness It is usually on the dorsum, and will correspond quite accurately to the level of the fracture site—usually two inches above the wrist Inspect the relative relations of the radial and ulnar styloids, if the relationship is varied by the radial styloid being on a higher level than it should be, an additional clue to diagnosis is obtained Do not try to elicit crepitus or abnormal mobility Abstain from any attempt to institute immediate traction for correction of the deformity Be content with concluding the examination with a diagnosis Gently apply a temporary splint to the entire forearm and hand, place the parts in a sling if possible, and obtain an x-ray

Treatment should be instituted as soon after the x-ray films have been examined as expediency permits The earlier these fractures are reduced and immobilized, the easier the task, and the better the position If the fracture be of the commonest variety, the so-called crumpled, trousers, or greenstick type, one needs but

to properly apply splints without anesthesia It is best to use pliable material such as molded plaster, not only the wrist, but the elbow as well, should be immobilized, with the forearm in pronation The splints may be removed after the tenth day, for gentle massage of the parts, but not discarded until the third or fourth week, when there is clinical or x-ray evidence of firm union

Angulation at the fracture site injects an added responsibility, calling for more precise measures than mere immobilization The angulation should be slightly overcorrected to insure avoidance of accentuation of the deformity during the remaining years of bone growth A slight residual defect may cause a considerable defect in function of the forearm or wrist at maturity Lesser degrees of angulation are possible to overcome by leverage at the site of deformity, applied by the hands through the cast or splint while the plaster is setting When a gross degree of angulation is detected, it is more provident to use an anesthetic, manipulate the parts, restore normal surface contour, and recheck the position by x-ray Leverage is preferable to traction in accomplishing such correction, as the latter (i e, traction) may disengage the fragments and gross displacement result

It is this degree of the injury which gives the most concern When force has been sufficient, a jagged fracture line results—the radial fragments are displaced, the distal one as a rule posteriorly, while the entire wrist and hand are in lateral, or radial, deviation The complete disruption of the continuity of both bones produces a deformity somewhat like that observed in a Colles fracture The flexor muscles contract, producing an added factor, that of overriding Swelling of the soft parts is rapid and extreme, becoming brawny in but a few hours The fingers may become blanched and cold, due to impaired circulation Pain is acute It is obvious that such a problem is in need of prompt attention, best given in a hospital The

premanipulative anteroposterior x-rays are often misleading. The lateral film, however, divulges the gross displacement of the distal radial fragment.

It is a great mistake to manipulate this fracture without first obtaining complete muscular relaxation by satisfactory anesthesia. Without such relaxation the already damaged soft tissues are reinsulted, increased muscle tension defeats all efforts, and the attempt fails, leaving the patient's wrist in a worse plight than it was originally. Unless one is particularly proficient in the use of local anesthesia, a general anesthesia is much more desirable, and, while not absolutely essential, fluoroscopic control is greatly to be desired, for without it there is no assurance of retention of the fragments in a satisfactory position during immobilization.

The most frequent mistake made in manipulating this fracture is to attempt to reduce it as one would a Colles'. A certain few of them can be reduced by extreme hyperextension, followed by traction, leverage of the lower fragment by digital pressure, and flexion of the wrist, but the greater number fail to respond. The mechanism is faulty in that the wrist flexors are in an extreme state of contraction, and the added tension, which dorsiflexion of the wrist produces in them, only accentuates the displacement of the lower fragment.

Manipulation should be preceded by flexion of the elbow to 90 degrees, then with countertraction on the arm, grasp the hand and make steady traction on the forearm until the muscles relax, which is a matter of minutes, not seconds. The forearm should then be completely pronated, i.e., palm downward. Traction is then increased, and the wrist extended 10 to 20 degrees, but not hyperextended. Digital pressure of the thumb on the lower radial fragment aids in levering the lower fragment past the obstructing ledge of the upper. The wrist is then flexed about 15 degrees, and if closed reduction is to be accomplished, there will often be a sense of reposition of the frag-

ment, and a restoration of normal contour of the dorsal surface of the wrist.

It is at this point in the reduction that fluoroscopic control is of inestimable value. The fractured fragments are composed of such spongy bone that they frequently do not convey a convincing sense of crepitation on reposition. Swelling of the soft parts is usually so great, and of such a brawny character, as to make the bony landmarks elusive. Fluoroscopy in the lateral plane will immediately confirm, or deny, the reduction of the posterior displacement, and also indicate whether the degree of palmar flexion necessary to maintain apposition has been rightly estimated. There must be no angulation of the radial fragments in either plane, or else restriction of forearm and wrist function will supervene.

The position of the wrist is the important factor in maintaining reduction. The most satisfactory results have been obtained by immobilizing it in slight palmar flexion—10 to 15 degrees. Under no circumstances should one place it in full flexion and ulnar deviation (Cotton-Loder position). This will cause lateral angulation of the fragments, ultimately limiting supination of the forearm. Extreme flexion and radial deviation will permit the fragments to redislocate, while any degree of dorsiflexion will produce anterior angulation, resulting in limited wrist flexion and weak hand grasp.

Immobilization is best accomplished by means of two molded plaster splints, lightly padded with glazed cotton, applied from the mid arm to the knuckles, with the elbow in 90 degrees flexion, the forearm completely pronated, and the wrist slightly flexed. The splints, one anterior, and the other posterior, are snugly bound together by a flannel bandage, and lightly reinforced by one or two layers of plaster bandage. The position of the fragments is again checked by fluoroscopy, to determine whether the position has been maintained during the application of the splints. If the position is lost, obviously the dressing is discarded and the procedure repeated.

FIG 4 Unusual anterior displacement of distal radial fragment. Open reduction. Wire suture.

As soon as convenient, premising satisfactory reduction, anteroposterior and lateral x-ray films should record the position, and as the swelling subsides the splints are to be tightened by reinforcement with adhesive, or firm bandage. It is not uncommon for the fragments to slip during the first four to seven days. Hence our present preference of splints to a circular plaster cast which does not lend itself to adjustment. The parts should be x-rayed again at the end of five to seven days. If it is impossible to reduce the fracture by manipulation on the first attempt, or if redislocation of the distal fragments occurs early during convalescence, there are no advantages in subjecting the patient to repeated manipulations. One should unequivocally advise and perform an open reduction.

The approach to open reduction is through a 3-inch incision on the dorsal surface of the wrist, to the radial side of the midline, the midpoint of the incision being over the site of maximum deformity. No important anatomic structures are encountered. The extensor tendons are easily visualized, and the incision carried to a greater depth by retracting them. Some fibers of the annular ligament are cut, and the knife

blade sunk through the remaining soft tissues to the bone, exposing the fracture site. The wound must be sufficiently liberal to insure good lateral traction of the soft parts without too much tension. The radial fragments should be levered loose, using a periosteal elevator, supplemented by the traction of an assistant on the wrist. Sometimes considerable force is required to disengage the fragments, even in a recent fracture. The pronator quadratus muscle seems to cause this phenomenon, although the contracted flexor tendons are also a factor.

When the distal fragment has been disengaged and sufficiently exposed, select an area as distal from the fracture margin as possible, and with a small drill place a hole obliquely through the cortex, emerging at the fracture margin. It is not necessary to drill through the entire thickness of the shaft, possible damage to the soft tissues on the flexor surface is thereby avoided. Through the drill hole a No. 2 chromic suture is threaded, left long, and clamped. The proximal end of the radius is then levered dorsally, and a similar drill hole placed obliquely through its cortex. Through this latter drill hole a flexible wire snare is passed. The free end of the chromic suture is fastened in the loop, and the loop withdrawn, completing the placement of the retention suture through both radial fragments. With countertraction on the arm, flexion of the elbow, and traction on the wrist, with the forearm pronated, reduction is accomplished, usually with the aid of a periosteal elevator used as a skid to lever the fragments into accurate apposition. The slack in the chromic suture is taken up, the fracture site gently impacted by a few taps on the butt of the hand, and the suture is tied. The soft tissues are closed by an assistant, while the operator carefully maintains the position. Immobilization is identical with that described for the closed reduction. We have had no instance in which the ulnar fragments needed to be exposed, the key to reduction being re-

position of the radial elements. This applies to the closed reduction as well.

Routine aftercare in the closed cases is as follows. The posterior or dorsal splint is removed at the end of the second week and gentle massage instituted, with equally gentle passive movement of the wrist. The sling and palmar or anterior splint are retained for another week or ten days, when a short molded plaster splint is reapplied from the elbow to the palm, with the wrist in moderate dorsiflexion. After the third week massage is more vigorous, hand grasp is encouraged, the sling gradually discarded, and finally, when there is definite x ray evidence of callus at the fracture site, usually between the fifth and sixth weeks, the short splint is dispensed with. Such physical therapy as follows is a matter of choice. Following open reduction, the plan is identical, but slightly longer. Gentle massage is not started until the fourth week and splints are retained from six to eight weeks.

The complications that arise in the aftercare of this type of fracture are malposition, delayed union, or nonunion. They can all be avoided by accurate and early reduction, plus adequate immobilization. This fracture will always unite if the radial fragments are in end to end apposition.

Malposition can only be avoided by rather frequent checkup x rays. The first one should be obtained five days after reduction, and not later than the seventh day. Any degree of angulation must be immediately corrected, resubjecting the patient to anesthesia for its accomplishment if necessary, although it is usually possible to restore alignment by simply changing the splint, and remolding the parts while the plaster sets.

Delayed union is not infrequent. It is usually provoked by failure to keep the elbow immobilized long enough, or permitting too early active motion of the wrist. It is more apt to occur after open reduction. Prolonged immobilization will suffice, providing of course, that good alignment and apposition have been maintained.

For nonunion, which we have only encountered on two occasions—both following open reduction—reoperation is necessary. Removal of the fibrous plug, freshening of the bone ends, and a repetition of the technic used in the recent cases, have sufficed to promote union.

A very infrequent complication is radial nerve palsy, due to contusion from close proximity of one of the fracture fragments to the nerve on the flexor surface of the wrist. In one instance this was produced during open reduction. The symptoms, however, have been transitory and limited to a slight disturbance of sensation over the dorsal surface of the thumb and index finger, with slight motor weakness of thumb adduction for a few weeks.

Too much emphasis cannot be placed upon the importance of keeping this type of fracture immobilized for a much longer period than one would the average fracture about the wrist, such as a Colles. Complication, deformity, and disability are often the result of too much enthusiasm for early active motion, and rapid restoration of wrist function.

Conclusions

- 1 The most frequent site of fracture of both bones of the forearm in childhood and adolescence is in the lower fifth

- 2 The distal radial fragment is usually displaced posteriorly, producing a deformity not unlike a Colles fracture.

- 3 The treatment of this lesion differs radically from that of a Colles fracture.

- 4 It is a great error to attempt reduction without providing for complete muscular relaxation. A general anesthetic is best.

- 5 For failure to obtain satisfactory reduction after one manipulative trial, open reduction is indicated.

- 6 A minor degree of malposition produces considerable disability of forearm and wrist function.

- 7 Union occurs rather slowly. Immobilization for six weeks or longer is frequently necessary.

HITLER SANCTIONS "INTUITIVE" HEALING PRACTITIONERS

A law published under Chancellor Adolf Hitler's signature in the *Official Gazette*, February 20, gave recognition to "healing practitioners"—healers who are without regular medical training and therefore without a license to practice.

To persons possessing an "intuitive ability" to cure the sick it gives the right to practice under the title of "heilpraktiker"—healing

practitioner—provided the practitioner is more than 25 years old and can show three years of successful work in healing.

The purpose of the law was said to be the eradication of quackery, especially in rural districts. It also helps make up for a shortage of qualified physicians resulting from elimination of Jewish doctors.

SCIENCE AND TRUTH WILL PREVAIL

"The illegitimate, unethical and peculiar forces which have been arrayed against the advancement of scientific medicine for a quarter of a century seem suddenly to have felt a new stimulus," the *J. A. M. A.* for February 4 says in an editorial.

"Like a snarling, vagrant, yapping pack at the heels of some great mastiff they cry today to the public the wails of their envy and their discontent. This they believe is their long awaited opportunity to destroy the American Medical Association. Almost since the day when the propaganda leading to the indictment of the association began to appear, the radio, the mails and the commercialized press have occasionally carried this material. Now comes an editorial by Bernarr Macfadden, publisher of *Liberty*, in the current issue of that publication. Says Mr. Macfadden, 'doctors—whether they be allopaths, homeopaths or any other kind of "paths"—after having spent from six to ten years studying their profession, should be guaranteed a decent living by the government. Capable doctors of all kinds should be paid by the government.' Indeed, he proposes a competition between all sorts of peculiar healers with regular physicians, each having certain sections of the community assigned to them, the mortality and health records of such communities being compared year by year and prizes being offered

to the quacks who develop the best records. Moreover, Mr. Macfadden feels that many of the measures for the care of disease which he has promoted in the past have not had a suitable trial. He wants to cure syphilis by fasting followed by an exclusive milk diet. He wants to cure gonorrhea with water treatments. He wants to replace drugs with artificial fever, and he thinks an exclusive grape diet will cure cancer.

"Perhaps some of the forces within the practice of medicine who have been doing their utmost to disrupt medical organization in recent years will welcome this new ally to their cause.

"As the campfires are lighted appear the tents of the makers of innumerable nostrums and panaceas, of cosmetics promoted with false and fraudulent claims, of strange glandular mixtures and vitamin capsules—all united to batter at the walls of the city in which honest medicine has been reared and nurtured. Now the American people can observe the nature of those who are endeavoring to disrupt, destroy and ruin the standards of scientific medicine. Under a free American government our profession has reached a peak never before reached in any other country—a peak which scientific medicine proudly inhabits and which it will defend to its utmost. In the end, science and truth and honesty and ethics must prevail."

SHORT WAVE MEDICAL DIATHERMY

Clinical Applications

JOHN S. COULTER, M D, D T M, and STAFFORD L OSBORNE, B P E, M S,
Evanston, Illinois

(Associate Professor and Associate Respectively Department of Physical Therapy Northwestern
University Medical School)

INVESTIGATION of the physiologic effects and clinical applications of short wave diathermy was started in our laboratory and clinic in 1934. As a result of these investigations the therapeutic possibilities as well as the therapeutic limitations have become better understood. The clinical applications are based on the knowledge of the physiologic effects.

The detailed discussions of these physiologic effects have been published in previous articles.^{1,2,3,4,5,6,7} Briefly, they show that the claims of a specific biologic effect independent of the heat generated by the current, a specific bactericidal effect, or a special selective thermal action were not substantiated. Two hundred and ninety temperature observations on the human thigh have been made with short wave diathermy currents with wave lengths varying from 25 to 6 meters.

To ascertain whether heat could be produced in bone marrow of living animals by short wave diathermy treatments to the animal's leg and, if the bone was heated, whether the temperature of the contiguous muscle is higher or lower than that of bone, we inserted thermocouples in the femur of large dogs through cannulas. Thermocouples were placed in the muscle in the same manner. Temperature readings were taken before the leg of the dog was heated, and the thermocouple removed to avoid any spurious readings that might occur due to the presence of the high frequency current. Short wave diathermy was applied to the dog's leg for twenty minutes on the side opposite to the cannulas, and temperature measurements were repeated at the end of this time. There were 20 different animals used.

| | BONE FINAL AVERAGE TEMP | MUSCLE FINAL AVERAGE TEMP |
|---------------------------------|----------------------------------|------------------------------------|
| 6 Meter electric field | 104.7 | 106.2 |
| 1. Meter electromagnetic field | 106.0 | 108.0 |
| 3/4 Meter electromagnetic field | 107.4 | 111.4 |

These results showed that the thermal gradient is always from the periphery to the interior, that wave length plays no specific role, and that the electromagnetic induction method is the most effective.

In our most recent experiments on the heating of the human thigh with short wave diathermy we used a machine of 6 meter wave length, using both the electric field and the electromagnetic induction. The electromagnetic field was applied by means of a conducting cable, three full turns applied around the thigh. The double cuff technic for the electric field was applied by means of a similar but shorter cable applied 1 1/2 turns around the thigh, and a similar short length of cable with 1 1/2 turns around the thigh approximately 5 inches below the other. Both cuffs were equidistant from the cannula. Eighteen observations were made on 4 subjects.

The average final temperature for the electromagnetic field was 107.9 F and for the electric field it was 106.9 F. In this experiment the only variable was the technic, and it again shows the superiority of the electromagnetic field.

From the human and animal temperature observations and five years' clinical work in a free dispensary service, in office practice, and in three hospital physical therapy departments we believe that the electromagnetic field is the most effective and most convenient method of applying

Read by invitation at the Annual Meeting of the Medical Society of the State of New York
New York City May 11 1938

short wave diathermy With the electric field the double cuff technic and the air spaced electrodes, when properly applied on the same surface and in the same plane of the part to be treated, are effective for deep tissue heating

In our clinical work we have found short wave diathermy to be the most effective method of applying deep heat. It can produce burns but this danger is much less than with contact metal electrode diathermy

Kovacs⁸ calls attention to the fact that the regulation of dosage with short wave diathermy is an even more empirical procedure than with ordinary diathermy The milliamperemeter is connected to the oscillatory circuits of the apparatus and serves chiefly as an indicator that electrical energy is passing It will also indicate that in a certain position of the controls, when the patient's circuit is tuned to the main oscillator circuit, there is a maximum flow of energy in the treatment field, but it does not indicate that the energy is passing through the patient

Short wave diathermy is given according to the patient's skin tolerance for heat, in much the same manner as infrared radiation This limit of tolerance is a variable factor, and Bierman in his investigation of infrared radiation called attention to the fact that this variable factor is influenced by the general state of the patient's health, his body temperature, his psychic reactions, and the condition of the environment, such as the temperature of the air in the treatment room, the rate of air flow, and the degree of humidity

Our clinical work showed that the local applications of short wave medical diathermy are contraindicated (1) in acute inflammatory processes, such as acute nondraining cellulitis, acute infectious arthritis, and acute pelvic infection, (2) in any condition in which there is a tendency to hemorrhage, such as a gastric ulcer, (3) over areas in which the appreciation of heat has been impaired or lost, as in certain peripheral nerve injuries, (4) through the abdomen, pelvis, or lower part of the back

during pregnancy, during menstruation, (5) over areas where there is a suspected malignant growth, and (6) in diseases or injuries in which simpler methods of applying external heat give satisfactory results

Short wave diathermy is distinctly valuable in the treatment of a fairly large number of pathologic conditions It offers promise of further usefulness as more accurate methods of administration are developed In this short discussion it will be impossible to consider in detail the cases in which short wave diathermy is useful, so we will confine ourselves to those in which we use it most.

In muscle strain, sprain, and dislocations, fixation by a removable plaster splint and daily application of heat and massage are to be preferred to strapping with adhesive plaster which does not permit recourse to physical therapy The removal of the splint and bandage is followed by the application of external heat from an electric lamp baker for twenty minutes followed by massage. This should be repeated at least once daily Besides the external heat, short wave medical diathermy, with the electromagnetic induction cable wound around the joint or placed over it as a coil, has proved especially effective in our clinic for the local increase of circulation and thus the reduction of pain and swelling Diathermy should not be applied where there is a danger of hemorrhage from torn vessels It should be applied at half strength for ten minutes for the first treatment to ascertain if the hemorrhage or edema increases

Acute Subacromial Bursitis—A first attack of an acute subacromial bursitis can usually be relieved by physical therapy in about two weeks A soft triangular pad is placed in the axilla and the arm is fixed to the side by bandages Infrared from a lamp bulb or baker is given for thirty minutes at least twice daily with the arm in abduction if possible. Short wave diathermy is applied for twenty minutes once daily As the pain diminishes, careful massage and active and relaxed motion should be given

In a few cases these measures will not relieve the pain, and the diathermy may aggravate it. In these it may be necessary to put the patient to bed with adhesive traction on the arm above the elbow and to apply continuous moist heat.

Chronic Subacromial Bursitis—Many surgeons advise the removal of the bursa and its calcified deposit before conservative measures are begun. Campbell⁹ believes that if this dictum is followed many cases will be operated upon unnecessarily, for in many cases these opaque plaques have been observed to be spontaneously absorbed, and in other cases the function of the shoulder has been restored without operation. Campbell states that, on the other hand, after conservative measures have been given a thorough trial, without improvement, and the deposit as shown by x ray is still present, the removal of this foreign body by operation is indicated.

In some cases with severe pain the shoulder should be immobilized, possibly in an aeroplane splint. Infrared radiation should be applied several times daily for thirty minutes and short wave diathermy at least once daily for twenty minutes. Massage and exercise are added later. In other cases without the severe pain it is not necessary to immobilize the arm, but the patient is instructed to apply the radiant heat by means of a baker with his arm in abduction.

Traumatic tenosynovitis may be the result of a single strain or contusion but is usually due to the repeated performance of an unfamiliar motion or continuous pressure or strain. The tendons most commonly affected are those of the wrist, Achilles tendon, and the long head of the biceps. The treatment is to immobilize the joints whose motion causes pain in the tendons. The splint is removed to apply short wave diathermy twenty minutes once daily, followed by radiant heat, in the physical therapy department and radiant heat at home once or twice daily for thirty minute periods. It may be advisable to use heat and underwater

exercise in a whirlpool bath to prevent adhesions. Rheumatic or gouty tenosynovitis is treated similarly to the traumatic form.

In *acute myositis* or *myalgia* it has been found that hot fomentation compresses or continuous warm moist heat is more effective than diathermy. In chronic myositis, Albee's myofascitis and fibrositis, diathermy is an adjunct to massage and manipulation.

Our experiments using short wave diathermy on animals show that an appreciable rise of temperature is secured in the bone marrow, although the muscle temperatures are higher. It was suggested years ago that diathermy be used in delayed union, but few reports have appeared in the literature to support this suggestion. Medical diathermy may be used in fracture cases for its deep heat effect, but generally it is difficult to apply at a time early enough to influence the healing process.

The action of diathermy in stimulating consolidation of a fracture must be regarded as distinctly *sub judice* until additional evidence has been obtained, according to Wilson¹⁰. He also states

"In the meantime, if the effect of diathermy is to be tried in cases of delayed union, it will be advisable to limit its use to those fractures where no mechanical causes exist to account for the retarded healing, such as interposition of tissue between the fragments or lack of proper reduction, and also to use it not later than three or four months after the injury. Beyond this period the local situation in respect to callus formation has become so static that it is impossible to see how heat or hyperemia would be of any assistance."

The local application of heat in *chronic arthritis* is used to help increase the circulation in areas where it is diminished. Therefore, we believe that the use of physical therapy once daily is not sufficient. It seems definitely indicated that these agents should be applied at frequent intervals during the day. In our clinics the patient, the nurse, or some

member of the family is instructed in the use of the local application of heat in the hospital room or the home. For this purpose we have a mimeographed sheet of directions. The agent to be used is marked on this sheet and directions given as to the number of times it is to be used daily.

When medical diathermy is used in chronic arthritis, it should be used for a short period and of low intensity for the first few doses, for at times medical diathermy in arthritis causes an aggravation of the local symptoms. This usually happens in cases with active foci of infection. It has so often been observed to be of benefit from a clinical viewpoint that we always give it a trial. We use short wave medical diathermy in the form of electromagnetic induction daily or every other day for twenty-minute periods at an intensity determined by the patient's tolerance. The first doses are always half time and half intensity, and some form of heat is applied at home two to four times a day.

The experimental work on the use of diathermy in *pneumonia* still rests on the work of Binger and Christie.¹¹ Stewart,¹² who has used diathermy in the treatment of pneumonia for fifteen years, believes that there has been a great deal of misconception and misinterpretation of the findings of Binger and Christie. He discusses their results in this article but most of Stewart's objections to the findings were answered by Binger.¹³ Stewart states that the mortality is reduced at an average of about 70 per cent.

In the last fifteen years numerous articles have been published on the use of diathermy in pneumonia. The results have been judged on the statistical method, but usually without a full analysis of all the factors. Karsner and Goldblatt¹⁴ in their article on the "Evaluation of Methods Used in Physical Therapy" state that since the statistical method does permit of opinion on the part of the observers, the number of observations must be multiplied so as to decrease this particular factor of error.

Further, they state that this error can be practically eliminated by objective evaluation of the effects without knowledge of the type of treatment used. Thus, one experimenter gives the treatment and another makes observations on the patients, without knowledge as to which have and which have not been treated. This method does not seem to have been followed in any of the reports on the use of diathermy in pneumonia. Further, the cases treated and the controls were not analyzed for the many factors that enter into the pneumonia picture, such as age, amount of lung involved, heart condition, etc.

At the Illinois Central Hospital in Chicago we have used for some years both conventional and short wave diathermy on early cases of pneumonia. From our study of the temperature, pulse, and respiration charts and leukocyte counts, there was no evidence of a specific response to medical diathermy. We have observed that in the management of pneumonia, medical diathermy does seem to be of definite benefit in reducing the severity of the thoracic pain.¹⁵

This symptomatic relief is often important. The main factors concerned in the production of anoxemia are the passage of blood through the unaerated portion of the lung and shallow breathing. The shallow breathing may be due to pleuritic pain restricting the respiratory excursions. The relief of this pain by diathermy increases the respiratory excursions and this may be the explanation for the decrease in cyanosis that is usually noted.

It is believed that diathermy is not a specific cure for pneumonia, that we have not accumulated sufficient critical evidence that it lowers the mortality, that while there is a suggestion of its value, we have no evidence to prove its effect upon the course of the pneumonia. It is a helpful adjunct in treatment of pneumonia because it is the best method for the application of deep heat which is of definite benefit in reducing the severity of thoracic pain.

In our clinic we use a short wave diathermy machine that has been accepted by the Council on Physical Therapy as giving efficient heat by electromagnetic induction. The coil or a disc electrode containing the cable coiled is applied to the chest wall over the pneumonia area. At Illinois Central Hospital we give at least two treatments a day over the involved area.

In all kinds of chronic inflammations of the eye heat is helpful in relieving pain and seems to aid the natural processes of resistance to infection and the absorption of inflammatory products. Heat may be applied by hot moist dressing, infrared radiation, or medical diathermy. Medical diathermy is used for the same purpose as any other form of heat. It has the advantage of deeper heat penetration but the indications for its use in preference to other forms of heat are by no means well established.

It has been shown by experimental work by Moncrief, Coulter, and Holmquest¹⁴ that the rise of temperature produced in the eye was greatest with diathermy, next with infrared radiation, and least by a heating pad. Puntenney and Osborne have been investigating the temperature of the orbit, vitreous chamber, and conjunctiva of dogs while using short wave diathermy. While this investigation has not been completed, so far their findings substantiate those of Moncrief, Coulter, and Holmquest.

In acute suppurative otitis media Hollender¹⁷ calls attention to the fact that the effects of heat applications should not be overrated. Radiation cannot replace surgical intervention but he believes it will prove gratifying as an adjuvant before and after operation.

In the treatment of chronic otitis media medical diathermy has been widely advocated. Beck and Guttman¹⁸ give their views on the use of long wave or conventional diathermy. It is believed that there is at present no evidence on the use of short wave diathermy to change these opinions. When treating otitis media, they state, "the use of

diathermy is contraindicated before the rupture of the drum and after incision it is of little benefit." For acute mastoiditis, "medical diathermy is mentioned only to be condemned in such conditions." For chronic otorrhea, they state, "as a rule we have seen little or no benefit follow the use of medical diathermy in spite of the enormous amount of literature dealing with the use of these agents in this condition." In the management of deafness, their opinion is that medical diathermy has caused little if any benefit in deafness due to chronic adhesive otitis media, otosclerosis, or labyrinthine deafness. They state that in tinnitus aurium, diathermy has been repeatedly advocated, but that in their hands it has been attended with little success.

In acute sinusitis, infrared radiation is a valuable adjunct to other treatment. Short wave diathermy by the electromagnetic induction method is the most efficient method of administering heat, it is easier to apply than conventional diathermy, and it is much less likely to produce burns. For these reasons short wave diathermy has a value as an aid in the treatment of acute sinusitis after adequate drainage of the sinus has been established.

In chronic sinusitis, short infrared radiation from a 250-watt incandescent bulb or short wave diathermy has a limited value as an aid in the relief of pain. Hollender¹⁷ calls attention to the fact that the frontal and maxillary sinuses are the ones most suitably located for diathermic treatment.

In a series of experiments to determine the heating value of various physical methods applied to sinuses, Andreen and Osborne,¹⁹ at our department at Northwestern University Medical School, introduced a thermocouple into the natural opening of the antrum and applied conventional diathermy, short wave diathermy by electric field (16 meter) and electromagnetic induction, infrared radiation from a thermo-spectral water-cooled lamp, the Compsoite, and the Elliott

treatment. The temperature rises were insignificant in any of these methods, ranging from 0.4 to 0.9 F. Rosenwasser and Bierman,²⁰ in applying short wave diathermy to the paranasal sinuses, found the elevation of temperature after treatment in the antrum varied from 0.6 to 4 F, and in the sphenoid sinuses of patients who had undergone sphenoidectomy, varied from 0.6 to 4.5 F. Shambaugh²¹ recently gave an analysis of the pathology of chronic sinusitis that prevents spontaneous recovery. With a picture of the pathology of chronic sinusitis before us it is impossible to see the value of the most efficient methods of applying heat as a curative agent—in these conditions if they give only such a small rise of temperature in the antrum. This means that their effect is limited to a circulatory increase in one wall of the sinus.

In *urologic disorders* short wave diathermy has been recommended for many conditions, but in our clinics the only cases that are referred for treatment are prostatic disorders.

Local heat in some form or other is commonly employed in the amelioration of prostatic symptoms. There is a free anastomosis between the superior hemorrhoidal artery (the terminal inferior mesenteric), the middle hemorrhoidal (a branch of the hypogastric), and the inferior hemorrhoidal (a branch of the internal pudendal). Therefore the local application of heat rectally should increase the blood flow to the prostate and seminal vesicles.

There are many methods of applying heat to the prostate gland, such as hot sitz baths, hot rectal irrigations, hot water instillations, electrical prostatic heaters, the Elliott treatment, and short wave diathermy.

In our clinics we use the Elliott treatment or short wave diathermy. Where these are not available or for home use, the hot sitz baths are used once or twice daily.

In giving short wave diathermy we use the electromagnetic induction method.

Four to six layers of Turkish toweling are placed on a wooden chair. The cable from any accepted machine giving the electromagnetic field is formed in a pancake coil of three turns and placed on the padding. A pillow is placed over the coil. This pillow should be of sufficient thickness that with the patient seated it provides a pad one inch thick between the patient and the coil. The inner surface of the thighs should be protected by a towel between them.

It is believed that the beneficial effects in the application of heat in these conditions is secondary to the local tissue response which follows any local form of hyperthermia with its resultant increase in blood flow, increased oxygen tension and cellular response, mechanisms of which we are beginning to learn from the physiologists.

Schmidt, Beazell, and Ivy²² measured the total venous blood flow from various levels of the gastrointestinal tract over a two and one-half hour period following the use of the Elliott treatment and short wave diathermy. They made quantitative measurements and ascertained that heat applied during the second and third thirty-minute intervals increased the blood flow from two to four times, under optimum conditions. When short wave diathermy was used, the blood flow was not increased until the temperature of the tissues had been raised to 102 F while the maximum effects were obtained at a temperature of 106.7 F.

Short wave diathermy may be used in *salpingitis* as a method of applying heat. In our clinic a study was undertaken to ascertain to what degree short wave diathermy could heat the female pelvic organs.²³ The electromagnetic field produced the highest temperature in the vagina, ranging from 100.9 to 104.4 F, and gave the most comfortable treatment to the patient. With similar conditions other authors quoted by Horowitz *et al* secured the same results. Horowitz and his co-workers also used a metal vaginal electrode with short wave diathermy, with a dispersive pad

electrode placed some distance from the patient's lower back. With this technic they secured rectal temperatures averaging 108.2 F. The method of using metal official electrodes with short wave diathermy has one disadvantage in our opinion. In normal conditions, the vaginal mucous membrane is in rugae or folds, and in inflammatory conditions these may be greatly increased so that the temperature produced from an electrode would be quite unevenly distributed.

The treatment in the acute stage is essentially palliative and consists of rest in the Fowler position, regulation of the diet and bowels, the application of heat, and the avoidance of trauma.

In the application of heat in the acute stage, the pelvis should be carefully guarded from trauma. In our opinion this can be most effectively accomplished by the use of short wave diathermy by the electromagnetic induction method. The patient should be lying on her back. Place one-half inch of bath towel over the lower abdomen. Form the cable into a pancake coil of two or more turns held in place by wooden separators. This avoids the introduction of any electrode or apparatus into the vagina.

The acute attack lasts generally from five to ten days. After this period the application of heat may be given by general hyperpyrexia, by short wave diathermy, by the Elliott treatment, or hyperpyrexia in combination with either the Elliott treatment or short wave diathermy.

Conclusions

1 It is believed that the indications for the use of short wave diathermy are essentially the same as those for the use of conventional diathermy.

2 Short wave diathermy is more efficient in producing heat in human tissues than conventional diathermy, and the electromagnetic field is the most effective method for its application.

3 With its superiority in generating heat, it is possible to concede that short wave diathermy may prove to be of

greater use than conventional diathermy, or its use may produce successful clinical results where conventional diathermy has failed.

4 Further research and careful evaluation of clinical results are required.

Discussion

Dr. Gustav Bucky, New York City—Everyone who has listened to Dr. Coulter's paper will agree that thorough and sober investigations have been performed by the authors. Neither bias nor overenthusiasm is noticeable in their statements. We are therefore entitled to compliment the authors for their precise presentation of the facts.

Being an old timer and pioneer in diathermy after using the method for more than twenty five years and having watched Schleichke in my own department in Berlin for six months I feel justified in the following statements which are in accord with Dr. Coulter's presentation.

First of all I am opposed to comparisons between diathermy and short waves in an assumpt

tion that one could replace the other. Physically and biologically their action is different. They are electromagnetic oscillations of the same physical nature but so are x-rays and ultraviolet rays too. There is no reason to assume similar or related biologic actions of all the wave lengths in the spectrum of the electromagnetic oscillations, even if their ranges are located closely together. The spectrum represents biologically and physically a rather arbitrary numerical order of the wave lengths, so far with practically no relation to specific biologic actions which are bound in their characteristics to rather narrow ranges of the spectrum.

Keeping these facts in mind our task should be to define the indications for each of the two methods and not to expect that there will be an equally beneficial effect in a certain disease. Such an undertaking requires a great material of similar cases. The paper of Dr. Coulter and his co-workers is one step forward in this direction.

Short wave therapy is stylish and has the marked advantage over diathermy in that its application is less time-absorbing and less painful than that of diathermy. No doubt the danger is less, too, as to possible damages. These are some of the reasons, besides its therapeutic value, for the almost volcanic expansion of the short wave therapy in medicine. I don't know how many physicians now using short waves would be able to switch over to diathermy for the simple reason that the application of the electrodes would require much more of their valuable time. Results obtainable with diathermy depend greatly on knowledge and skill of the therapist. As soon as a method becomes a schematic or mechanical procedure results are apt to decrease. It does not matter so much that a certain method is used but *how* it is applied. I refer to cases treated before unsuccessfully which we could improve and cure by applying the same method.

According to my experience diathermy has a larger field of indications than short waves. On the other hand, there are affections like effusions, sinus troubles, certain acute infections, and others which are treated more efficiently by short waves.

It has been proved that the heat effect is quite different in different tissues with both methods, especially when we consider the manner of application. In diathermy there is a great difference between the longitudinal and transversal application. Here, the current is traveling similar to an ordinary current, mainly along the path of least resistance, if we may express it in a more popular way. And the current follows the law of OHM, which means a rather important change of the current path and heating of tissues with different applications. In short wave, however,

an electric field is established which shows no great differences in distribution of electricity and heat if we apply the electrodes either longitudinally or transversally. The consequence is that the art of giving diathermy treatment is a more delicate one requiring a rather extensive knowledge of physical, physiologic, and pathologic fundamentals. To apply diathermy in the proper way is more or less like playing a musical instrument which only a skilled individual can handle properly. Short wave therapy is a more mechanical method, less flexible, and does the trick in those rather limited indications in which it is superior to diathermy, more or less irrespective to subtle modalities and technique. Here the electromagnetic lines depend mainly on the contents of the irradiated area, whereas in diathermy the thorough therapist has to find out the most effective manner of application. Whereas in short wave therapy the location of maximal energy transformation into heat is more or less a given factor, it can be modified greatly in diathermy by placing the electrodes according to the pathologic requirements.

Let me emphasize, in a few words, another important factor hardly mentioned in literature. In by far the majority of the cases, physical therapy is applied to, or through the skin. Only the two last decades have taught us to recognize the importance of the skin in physiology and pathology, and its regulating action on internal organs and processes. I always emphasize the fact that skin is one of the most important communication organs with the outer world and a station for transforming different forms of energy into others useful for the body budget. In some respects it likens the digestive tract bringing energies into a state fit for body consumption. This energy nutrition is at least as important as that of food. You all know the consequences of depriving an individual of light radiation and temperature differences, to mention only the main factors.

In both our high frequency methods the skin is affected, but much more in diathermy. Do not assume that this heat of the skin penetrates to deeper layers by simple conduction. It is carried away mainly by the blood stream. But this heating of the skin accelerates the physiologic action of the skin tremendously. All its endocrine and autonomic functions are sped up. That cannot be without influence on the entire body. According to physical laws the maximal heating in diathermy takes place in the skin, not considering a few exceptions. It is by far less in short waves. Here is a striking difference of action of both methods, worthwhile to be investigated thoroughly in a large clinic.

A few words as to the names of the methods I hope my few explanations revealed the most striking differences in action which makes it mandatory to avoid misunderstandings by putting them so to speak under the same headline. I suggest avoiding expressions like short wave or long wave diathermy—may Dr Coulter forgive me. The expression *diathermy* establishes a relationship which does not exist, in my opinion and if my reasoning might not be sufficient I refer to the literature. But now comes a rather comical point. The expression *diathermy* is much more applicable to short waves than to longer waves. We can obtain temperature elevation throughout the cross section of the body with short wave much more readily than with the old long wave diathermy in which the curve of the temperature fall in deeper layers is so steep that we can hardly talk of a heating throughout the cross section which is the meaning of the name. Expressions like *conductive oscillations* and *capacitative oscillations* would avoid confusion.

I deplore the fact that a method aims to absorb the field of a well established therapy without being able to fulfill the promises. The so-called simplicity has conquered the hearts of many physicians in general practice. However satisfactory results in difficult cases require the skill and experience of a specialist which is most evident in physical therapy.

Dr Harold J Harris, Westport New York—The persistent statements that ultra-short waves do not cause biologic responses in tissues differing from conventional diathermy is very confusing to the practicing physician who sees and reads so much to the contrary. There is much clinical evidence that waves in the neighborhood of 6 meters have a markedly salutatory effect on certain infections and that the longer waves do not. Oddly laboratory evidence such as quoted by Doctor Coulter seems to conflict. How then, can we reconcile these opposing points of view? Certainly we cannot dismiss the careful experimental and clinical evidence produced today and heretofore by Doctor Coulter and other workers of unquestioned ability. Neither can we ignore the clinical and laboratory evidence of Schliephake, Egan Kobak and others nor our own day-to-day results. Perhaps there is a simple explanation of why we now commonly abort infections superficial or deep or cause their prompt resolution whereas we were unable to do so before the advent of these ultra-short waves. Perhaps conventional diathermy would do the same things, but it never did them in my experience nor do I know of any such effects from the literature.

In the instance of the gonococcus it seems to be pretty conclusively proved that thermal death of the organism is accomplished and that it may be done by long or short waves the main difference being the greater ease of technique such as Bierman's and the time saving factor. If heat alone were the sole effect of the ultra short waves in other infections, why should we not get as good effect from long wave diathermy or the infrared lamp in superficial infections such as carbuncles as we do from ultra-short waves? I doubt if it is just the greater concentration of heat accomplished by ultra-short waves. It seems reasonably conceivable that certain as yet unidentified biochemical or biophysical effects are engendered by ultra short waves in tissues that are comparable to the effect of the roentgen ray. The result has been demonstrated. The explanation should be forthcoming ultimately. It required a great many years for the therapeutic effect of the roentgen ray to be generally accepted and even now its exact action is the subject of speculation.

I am sure that many will disagree with Doctor Coulter's statement that high frequency currents are contraindicated in acute inflammatory processes such as acute non-draining cellulitis, acute arthritis and acute pelvic infection. I have treated many of these conditions and have found the 6 meter wave to be of great value. Often the results are dramatic. I have used 6 meter diathermy through the lower abdomen during menstruation when necessary with no untoward effect other than slight increase of flow. Acute suppurative otitis media has resolved without drainage with properly applied 6 meter diathermy. Suppurative adenitis, cellulitis, acute suppurative bursitis, peritonsillar abscess, acute empyema of the antrum or frontal sinuses, acute infectious arthritis, furuncles and carbuncles have either resolved without drainage, have been sharply localized and drained spontaneously, or have made surgical drainage a safe and simple procedure.

The metal vaginal electrodes devised by Bierman, Horowitz, and Gottesman have been used with no ill effect referable to trauma and with safe heat distribution in the acute stage of pelvic infections when temperature elevations of just sufficient degree are attained. I have seen a rapidly spreading gonorrheal peritonitis, in a woman with a temperature of 104 F and board like rigidity of the abdomen, completely resolve within twenty four hours following an hour of 6 meter diathermy with vaginal electrodes at 111 degrees as well as scores of less spectacularly successful results.

The evidence compiled by many who specialize in conservative physical therapy as well as by other careful workers in this field tends to make one question the completeness of the conclusion that short wave diathermy is indicated for the same uses as conventional diathermy and to assert that properly selected ultra-short waves, generated by well constructed units of sufficient output, supplement the usefulness of the long wave current and, in many serious conditions, is effective where conventional diathermy is inefficient or perhaps even contraindicated. It is a source of satisfaction to know that Krusen very recently wrote "The indications for the use of short wave diathermy should be considered, in the light of present knowledge, to be the same as those for the use of conventional diathermy. *Further studies may prove that other indications do exist*." I stress the last sentence and venture to predict that further studies *will* prove this.

Dr Norman E Titus, *New York City*—I most heartily endorse everything that Dr Bucky said. He knows diathermy from A to Z and appreciates its true worth. This does not mean that he is not expert also in the handling of short wave, and with the years of experience back of him his opinion is well worth taking seriously.

I had many points about Dr Coulter's paper I wished to discuss but time will not permit. I must, however, mention that I disagree with him particularly in the use of short wave in infected processes. I think this is the greatest use we have for short wave, whereas diathermy is contraindicated.

I hope that at the meeting of the American Congress of Physical Therapy in Chicago next September, one-half a day will be given to a general meeting at which we can have a sort of debate on the uses and abuses of short wave and diathermy.

Dr Joseph Echtman, *New York City*—The paper on short wave diathermy is, no doubt, of interest. I wish, however, to emphasize that

various physiologic phenomena that may appear during or after treatment especially depending upon the skin zones where the active electrode is applied, have shown that there is a difference in the reactions, between short wave and diathermy, if one studies them carefully. Lichterman and his co-workers who studied these reactions employed conventional and short wave diathermy directing the energy to the same area of the spinal column. On placing the active electrode in the region between the fourth cervical and the second thoracic they have observed a series of interesting physiologic phenomena of which I shall mention the following because of their great clinical importance. (1) Diathermy tends to lower the intraocular pressure while short wave causes a tendency to increase that pressure. (It is important to keep this in mind in treating patients suffering from glaucoma or detachment of the retina, and for cervicodorsal spondylitis.) (2) Diathermy applied to that zone causes a noticeable hypotensive action. Short wave does not cause any noticeable hypo- or hypertensive action. Another interesting phenomenon is the behavior of short wave when applied to the region of the head as, for instance, in the treatment of sinus conditions by short wave diathermy. When one employs the thermocouple he may find in many patients the temperature at the end of the séance to be less than that at the beginning. This is because the lines of the condenser field passing through the brain may affect the thermoregulating center. In animals, especially when higher intensities were employed, a destruction of some cells of that center was observed (Slavsky). Referring to the employment of short waves in arthritis and bursitis I can state that according to my most careful observations, short wave does not materially affect calcified (subdeltoid) bursitis especially if the air-spaced method is employed. The same may be said with reference to hypertrophic arthritis where there is spur formation. This can no doubt be proved by a radiologic study.

A SAD DAY

It will be a mighty sad day for the American people when they have to take a doctor because he is a good politician, or when groups decide to let their practice to the lowest bidder—*The Mississippi Doctor*

A PLEA IN BEHALF OF THE ANOXEMIC PATIENT

JOHN H. EVANS, M D, Buffalo, New York

THERE is no doubt that thousands of lives could be saved each year by a better understanding of oxygen therapy. Anoxemia is frequently a serious complication of many diseases and conditions and its control is often of vital importance. Even a slight lowering of the blood oxygen in a critically ill pneumonia patient may tip the scales to the fatal side. Reports by experts in oxygen therapy show that the dosage of oxygen now in general use, namely, "40 to 60 per cent," is inadequate for the successful treatment of severe anoxemia. As oxygen is a specific for anoxemia when enough is given, the remedy is to remove the restrictions which, without just cause, have been placed on the dosage of oxygen.

An attempt will be made to show (1) that 40 to 60 per cent oxygen fails to restore the arterial blood oxygen to its normal level in cases of severe anoxemia, (2) that this dosage was based on a fallacious theory, (3) that the so-called 'dangerous percentages' of oxygen, namely, those between 80 and 100 per cent, are safe and necessary for the successful treatment of anoxemia, and (4) that even when there is no cyanosis 100 per cent oxygen can be safely administered continuously throughout the course of pneumonia.

Failure of 40 to 60 Per Cent Oxygen

When oxygen therapy is being administered by a novice and the clinician observes that his patient is still deeply cyanotic even while under the oxygen tent, he may be inclined to attribute the failure to faulty application of the method rather than to the low concentrations of oxygen employed. This inclination of the clinician to blame the technique rather than the oxygen percentages is supported by the claim, which

has appeared from time to time in our medical journals, that 'The administration of 40 to 60 per cent oxygen to pneumonia patients suffering from acute anoxemia raised the oxygen saturation of the arterial blood to or near the normal value.'

It will be shown that this claim is not borne out by the facts, as the following reports by experts in oxygen therapy show.

In 1921 Barach and Woodwell¹ reported 10 cases of pneumonia to whom oxygen was administered. The arterial blood oxygen was restored to its normal level in only 4 of the cases.

In 1922, Stadie² reported on the effect of treating 8 cases of pneumonia in an oxygen chamber. In several an arterial unsaturation of 85 to 50 per cent was quickly relieved and the blood became almost completely saturated. In other cases the anoxemia was partially relieved. In some instances, despite the administration of 50 to 60 per cent of oxygen, the arterial unsaturation remained high.

In 1925, Binger³ published charts which showed the effect of 40 to 50 per cent oxygen on the anoxemia of 5 pneumonia patients. The oxygen failed in all cases. The nearest approach to success was when in 1 case the cyanosis was abolished for two days out of the three and a half days of treatment.

In 1926, Barach⁴ reported 16 cases of pneumonia treated with 40 to 60 per cent oxygen. In the report he states that "in only two cases was the arterial oxygen brought to the normal level."

In 1929, Haines and Boothby⁵ reported 91 cases where oxygen was given following thyroidectomies. Some of these patients developed pneumonia. They state "In 65 of the 91 cases definite cyanosis was

present on the patient's admission to the chamber

The cyanosis was controlled at once in all cases, but in a few instances it reappeared even in concentrations of oxygen from 50 to 60 per cent as the pneumonia progressed in both lungs. In cases in which it was necessary to use progressively higher concentrations of oxygen to control the cyanosis and in which finally it was impossible to control it, all the patients died."

Haines and Boothby apparently did not exceed 60 per cent concentration of oxygen in the treatment of these cases, as Boothby⁷ in 1932 expressed his views on oxygen dosage as follows: "The concentration of oxygen in the tent, at or near the sea level, should never exceed 60 per cent and should preferably be maintained as close to 50 per cent as possible."

In 1929, Barach¹ reported the results obtained by the administration of 40 to 60 per cent oxygen to 100 anoxemic pneumonia patients. Each case is reported separately, but Dr. Barach failed to summarize the effect of the oxygen on cyanosis. The writer will attempt to do this as well as he is able from the data submitted. It appears that the arterial blood oxygen was restored to its normal level in only 3 cases, in 51 cases it was restored to near the normal level, while in 46 cases the arterial oxygen saturation was less than 85 per cent even while they were inhaling the oxygen, and in 9 of them it was below 80 per cent.

According to Stadie⁸ there is a 93 per cent death rate in pneumonia when the arterial blood oxygen falls below 80 per cent. This, then, may be called the asphyxial death zone in pneumonia. The fact that the 9 cases of Dr. Barach's died substantiates Stadie's observations. In this series of 100 cases there were 45 deaths and 55 recoveries, and it appears that the recovery group was 43.3 per cent better oxygenated than the mortality group.

The Healthy Animal Theory

As "40 to 60 per cent oxygen" was based on the theory that the clinical

dosage of oxygen could be determined by experiments upon healthy animals, it may appropriately be called the healthy animal theory.

This theory is divisible into three parts, all of which, it will be shown, are contrary to fact.

The first part of the theory assumes that facts concerning human beings and the lower animals are interchangeable and that data obtained by experiments upon animals would therefore apply to humans.

This assumption is contrary to the facts, as there has never been any uniformity in the reactions of humans and the lower animals to drugs or other therapeutic agents. Even the various species of animals react differently, and facts which apply to one do not necessarily fit another. For example, the anesthetic dose of sodium amytal for a human could not be determined by any of the lower animals, as it is, per kilo for a human, 8 mg., for a rabbit, 45 mg., for a dog, 60 mg., and for a rat, 90 mg. Dogs can safely tolerate doses of morphine that would be fatal to humans. It requires only 0.5 cc. per kilo of air when injected into a vein to kill a rabbit, but 15 cc. per kilo is required to kill a dog.⁹ Many more such examples could be cited.

Unlike humans, the animals used in the experiments were covered with hair. It has been found that when a rabbit is shaved the metabolic rate is increased 30 per cent,¹⁰ which should mean a 30 per cent increase in oxygen tolerance.

It is apparent that, inasmuch as facts concerning humans and the lower animals are not interchangeable, the only way to determine human tolerance to oxygen is to make the necessary tests on human beings.

The second part of the theory assumes that if a given dosage of oxygen is harmful to a healthy animal, it would also be harmful to an anoxemic patient.

Clinicians are constantly giving therapeutic doses that would be detrimental or fatal to healthy animals or persons. Take, for example, the dosage of insulin

required for the successful treatment of diabetic coma, the large amounts of morphine necessary to relieve a patient suffering severe pain, and the large volume of normal salt solution that can safely be injected into the circulation of the shocked or exsanguinated patient. The dosage in these cases far exceeds the safe dosage for normal individuals.

We have given continuous 80 to 100 per cent oxygen to dogs suffering from distemper for several days with only beneficial results.

The third part of the theory assumes that the tolerance of healthy animals to oxygen represents dosage for the treatment of anoxemia.

When a vital constituent of the body, such as insulin or oxygen, is reduced from normal, the term dosage, as generally used, is the amount required to restore it to its normal level. This depends entirely upon the degree to which it is reduced and has nothing whatever to do with the tolerance of healthy animals. How can it be possible to determine the required dosage of insulin or oxygen for the treatment of diabetes or anoxemia by observing the reactions of healthy animals to these agents? All of their body constituents are up to par and all that can be learned is how much in excess of normal they can tolerate.

It was found that healthy rabbits could inhale 60 per cent oxygen for as long as four months without harm.¹¹ Had these animals been anoxemic their tolerance to oxygen would have been found to be much greater.

In cases of anoxemia we have to consider first, the dosage required to restore the arterial blood oxygen to its normal level, second, the amount beyond this point that can be safely tolerated. The total tolerance of such an animal would be the usual dosage plus the tolerance of a healthy animal.

We know that 40 per cent will restore the blood oxygen to normal if the anoxemia is of mild degree. After this percentage has been given and the arterial blood oxygen is at the same level as that of a healthy animal, there is still an

oxygen tolerance of 60 per cent. Adding the 40 and the 60 we find that an animal with only a mild degree of anoxemia has a total tolerance of 100 per cent oxygen. If it requires 100 per cent oxygen to restore the arterial blood oxygen to normal, it is logical that after this has been accomplished 60 per cent more could be given with safety. The 100 per cent is dosage, as that term is used for deficient body constituents, and the 60 per cent is the amount of oxygen which can be safely inhaled by an animal with normal blood oxygen.

In order to administer 160 per cent oxygen, it will, of course, be necessary to give it under pressure greater than that of the atmosphere at which pressure oxygen is generally given.

The dosage of oxygen has been curtailed to fit a theory which is contrary to medical teaching and practice. In all other therapies we are taught that the patient, and not a healthy animal, is the guide to dosage. In practice we give enough to obtain the desired results, and are not interested in the effect which the required dosage would have on healthy animals.

In oxygen therapy the reverse is the case. The dosage is governed entirely by the reactions of healthy animals to oxygen, and the objective, which should be the restoration of the arterial blood oxygen to normal, is lost sight of. This is accomplished only in those cases where the anoxemia is of mild or moderate degree. Apparently the reason for adopting a separate ruling for the dosage of oxygen was that it was found to be fatal to healthy animals. On this basis the same ruling should be applied also to insulin since it, too, cannot only be fatal to healthy animals but to humans as well.¹²

Healthy animals have been thrown into fatal convulsions with from 10 to 16 units of insulin.¹³ If the healthy animal theory were applied to insulin therapy, the maximum dosage would be less than 10 units, which would be sufficient dosage perhaps for mild cases of diabetes. However, this is inadequate

for the treatment of severe diabetes, as many times the fatal dose for a healthy rabbit is often required. For example, Joslin¹² has given 100 units twice a day intravenously for several weeks without a single insulin reaction. The maximum dose of insulin, if governed by the healthy animal theory, would be as ineffectual in the treatment of severe diabetes as 60 per cent oxygen is for severe anoxemia.

When the clinician is engaged in the duty of restoring these two deficient body constituents to their normal level, he is confronted by two contrasting admonitions. He is told that in the treatment of diabetic coma the danger is in giving too little insulin, and that in dealing with asphyxia the danger is in giving too much oxygen.

We know that good health depends upon keeping the vital constituents of the body at their normal levels. We know, too, that death may result when they are markedly reduced. The advocates of the healthy animal theory would have us believe that in cases of severe oxygen want, the arterial blood oxygen cannot be restored to normal without jeopardizing the life of the patient. What about the danger to life when this is not accomplished?

When the dosage of oxygen is governed by the healthy animal theory, oxygen therapy is prevented from functioning successfully in those cases where it is most needed.

The 40 Per Cent

Why was the pre-eminently safe dosage of 60 per cent oxygen reduced to 40 per cent for the treatment of mild cases of anoxemia? No reason has ever been given. At least it was not based upon clinical or experimental data. This 33 $\frac{1}{3}$ per cent reduction has worked to the detriment of the anoxemic pneumonia patient.

When oxygen therapy is instituted, the anoxemia may be mild and, as recommended, only 40 per cent oxygen given. However, the anoxemia may suddenly become severe due to new involvement of lung or to pulmonary edema, and

many hours may elapse before the patient is again seen by his physician and the concentration of oxygen raised to 60 per cent. During this time he has suffered from a certain degree of anoxemia which could have been, even according to the healthy animal theory, safely avoided.

Warnings

The clinician has been influenced not to depart from the dosage of "40 to 60 per cent oxygen" by frequent warnings such as the following: "Very rich oxygen mixtures, such as those between 80 and 100 per cent, have repeatedly been shown to produce irritant inflammatory lesions in the lungs when used continuously for two to three or more days."¹⁴

Warnings such as this would not be so potent in preventing the clinician from giving enough oxygen to abolish cyanosis, if it were made clear that the "inflammatory lesions" had not been produced in the lungs of anoxemic patients or animals, but only in the lungs of healthy animals in which oxygen therapy was not indicated.

In 1934, Dr. Barach made the following statement: "The use of oxygen concentrations between 90 and 100 per cent in human beings for long continuous periods is entirely unwarranted by present experimental data. The author has previously expressed his disagreement with the advice of Evans to employ these very high concentrations."

To the clinician it is important to know whether anoxemic or healthy animals were employed in securing the "experimental data." This point should have been made clear.

The consolidation of lung tissue which can be produced in healthy animals with 80 to 100 per cent oxygen is explained by Binger¹⁵ as follows: "This process possibly is of a protective reaction nature on the part of the organism, but going too far culminates in death."

It does not seem proper to use the term "inflammatory lesions" when referring to these areas of consolidation,

since there is no fever and no bacterial invasion.

Defense of Theory by Dr Barach

In defense of the healthy animal theory, Dr Barach, in 1934, said¹⁴ "The argument of Dr Evans that investigations of the effect of pure oxygen in animals applies only to normal lungs and would therefore not apply to diseased lungs seems fallacious to me. The pneumonia patient may have only one or two lobes involved and the rest of the lungs normal. There is every reason to believe that pure oxygen administered for two or more days would cause pulmonary irritation and edema in these normal lungs" Dr Barach has apparently overlooked the fact that there is no normal lung tissue in a patient suffering from pneumonia. It is true that the consolidated areas are more diseased than the rest of the lungs, but it is only one of degree. The tissue which Dr Barach terms "these normal lungs" is characterized by fever, abnormal cell chemistry, toxemia, possibly anoxemia or bacteremia, and an accelerated metabolic rate. None of the requirements for normal lungs are present in these so-called uninvolved areas.

Since there is no normal lung tissue in pneumonia, the healthy animal theory does not apply, and Dr Barach's prediction regarding pulmonary edema can be disregarded.

The 70 Per Cent

It appears that, according to the healthy animal theory, 70 per cent oxygen should have been included in the dosage. At least, no conclusive evidence has been produced to classify it as "dangerous."

In 1926 Dr Barach¹¹ subjected 2 healthy rabbits to 70 per cent oxygen. At the end of three weeks (exp 8) one of them "appeared active and well" and had gained 170 Gm in weight. This rabbit was then used for another experiment. The other rabbit (exp 5) was apparently active and well for twelve days, as there is nothing in the record to the contrary. However, on the twelfth

day the flow of oxygen into the chamber was accidentally shut off and the rabbit died of asphyxia. Apparently there was nothing found at the autopsy that could not be explained by the slow asphyxial death. However, it was thought that "70 per cent oxygen appeared responsible for serious exudate into the alveoli."

Apparently it was on this fine discrimination in the interpretation of the autopsy findings that 70 per cent oxygen was, for eight years, excluded from the clinical dosage.

Eight other rabbits were used during this investigation to test their reactions to various concentrations of oxygen, and in his summary Dr Barach said "On the basis of the above experiments, the highest concentration of oxygen compatible with safety should be regarded as 60 per cent."

In 1934, Dr Barach¹⁴ modified his previous views as follows "There are especially severe cases in which concentrations as high as 70 per cent may be used continuously for two to three days or more."

Dr Sayers' Experiment with 100 Per Cent Oxygen

It was formerly thought that if 100 per cent oxygen were inhaled for more than a very brief period of time serious damage to the lungs would result.

In 1925, the writer personally inhaled pure oxygen for four hours a day for several days without harmful effects. This was done in order to find a safe dosage for the treatment of diseases not complicated by anoxemia.

In 1928, Sayers¹⁸ found that healthy animals (rabbits, guinea pigs, and white rats) could safely inhale pure oxygen for sixteen hours a day for at least fifty consecutive days, thus materially changing previously concerned notions regarding the toxicity of oxygen in healthy animals.

Dr Sayers' experiment opened up new possibilities for the advocates of the healthy animal theory. However, it did not appear to attract attention until several years later, although it was pub-

lished by the author several times, the first being in 1928 ¹⁷

Proposed Change in Oxygen Dosage

In 1936, Dr Barach¹⁸ published the results of an investigation based on Sayers' experiment "Dr Sayers, in unpublished work, shows that animals can live in pure oxygen sixteen hours a day without harmful effects. I have confirmed Dr Sayers' work but have also shown that if animals are kept in 50 per cent oxygen instead of air the remainder of the time, pulmonary edema develops. However, it appears safe from animal experiments to administer from 90 to 100 per cent oxygen for ten or twelve hours a day and 50 per cent oxygen the rest of the time "

Dr Barach still continues to stick tenaciously to the theory that oxygen dosage must be based on the reactions of healthy animals only

The alternate use of 100 per cent and 50 per cent oxygen may be satisfactory for mild cases of anoxemia provided there is no danger of a sudden increase in the degree of anoxemia. This method, however, will not be practical or desirable for cases of severe anoxemia, if continuous normal oxygenation of the blood is the objective sought

Suppose this alternating dosage had been used for the 9 cases of Dr Barach's in which the arterial blood oxygen was below 80 per cent in spite of the 40 to 60 per cent oxygen. For twelve hours they would be in the recovery zone with a bright pink color, and in the asphyxial death zone for the following twelve hours with a deeply cyanotic color

In the carrying out of any method of treatment the psychology of the patient must be taken into consideration. It will be difficult to persuade a patient, after he has been free from dyspnea for twelve hours, that it is to his advantage to suffer from it for 50 per cent of the time.

Clinical History of Oxygen

Beddoes¹⁹ was the first to investigate the therapeutic value of oxygen. His

research, which extended from 1793 to 1801, included other gases as well. He found that oxygen was valuable in the treatment of various diseases and conditions. He was the first to substitute a light gas for the nitrogen of the air in the treatment of asthma. He said "In asthma it is extraordinary that oxygene, hydrogen, and hydrocarbonate, should have afforded relief "

No interest was again taken in oxygen therapy until 1917, when Barcroft²⁰ began treating gassed soldiers with 40 to 50 per cent oxygen. His favorable report on 23 cases appeared in 1920.

This gave an impetus to other investigators, and reports on the effect of 40 to 60 per cent oxygen in pneumonia soon followed.

The writer began the use of the so-called dangerous percentages of oxygen with mingled doubts and hopes. In 1923, 100 per cent oxygen was given for three minutes out of every five to a moribund pneumonia patient. The treatment was begun on the sixth day of the disease and the patient died on the eleventh. Apparently the oxygen prolonged life.

In 1925, continuous 80 to 85 per cent oxygen was given to 2 apparently hopeless cases of pneumonia for ten and fourteen days, respectively. Both recovered ²¹. One of these cases had marked abdominal distension, and enemas had been unsuccessful. Twenty-four hours after oxygen therapy was begun, the distension had disappeared and the bowels again became active.

In 1926, a patient with complete post-operative collapse of the right lung was given continuous 100 per cent oxygen for seven days with recovery. The expiratory valve was so regulated that there was a slight positive pressure during exhalation. X-rays taken every other day showed increasing aeration of the lung ²¹.

Since then 100 per cent oxygen has been the percentage of choice and none of the predicted disastrous effects have ever resulted. When pure oxygen is given by means of a properly fitting mask there

is little, if any, air dilution. Tests show the concentration to vary from 90 to 98.8 per cent, when the oxygen is taken from under the mask.

Over 800 cases of anoxemia have been given continuous 100 per cent oxygen. These included pneumonia, pulmonary emboli, asthma, atelectasis, empyema, cardiac decompensation, coronary thrombosis, and many other conditions in which anoxemia is a complicating factor.

There were 510 cases of pneumonia, only a small percentage of which were given oxygen by the tent method. When it was necessary to use the tent, 70 per cent oxygen was given, which is the maximum concentration possible with this method unless a wasteful amount of oxygen is used.

The difference between the clinical results of 70 per cent and 100 per cent oxygen has been demonstrated in many cases in which the 70 per cent oxygen failed to abolish cyanosis. The increased oxygen not only abolished the cyanosis and made the patient more comfortable, but usually had a pronounced beneficial effect on the temperature, pulse, and respiratory rates.

Some of the cases were given 100 per cent oxygen continuously for from two to three weeks, the longest being twenty-eight days. Many of the patients were so desperately ill that two oxygen machines were used so that the treatment was not interrupted while the cylinders were being changed.

The best results in pneumonia have been obtained when 100 per cent oxygen was given continuously from the very beginning of the disease whether cyanosis was present or not. In many, the course of the disease seemed to have been shortened.

There are several reasons for routinely giving 100 per cent oxygen, rather than only that percentage which will restore the blood oxygen to normal.

It is a safeguard against any sudden increase in the anoxemia. It gives the greatest reduction in heart²² and respiratory rates and keeps the bronchial tubes free of secretions than the lesser per-

centages. In our experience the sedative action of oxygen on cough is more marked as the concentration is increased. Some of the patients stopped coughing altogether after the first hour. During this first hour the cough was more productive, but when the mucus was once removed, it did not often return. Kidney function is maintained at its maximum.²³

Apparently these advantages help nature in building up an immunity. It is probable that the deleterious effect of oxygen on certain bacteria increases as the percentage of oxygen is increased, which also applies to the oxidation of toxins.

The importance of instituting oxygen therapy at the onset of the pneumonia cannot be too strongly emphasized.

In a previous paper²⁴ it has been shown that the mortality rate apparently increases in proportion to the delay in starting oxygen therapy, it was also pointed out that the death rate in 77 cases where oxygen therapy was begun on the first day of the disease was only 3.8 per cent.

Oxygen for Pneumonia Uncomplicated by Cyanosis

In some of the cases, continuous 100 per cent oxygen was given from the beginning to the end of the pneumonia, during which time cyanosis was not at any time a complicating factor. The good results obtained in these cases have convinced us that pneumonia in itself is an indication for oxygen therapy.

A natural question to ask is "Why give oxygen when the arterial blood oxygen is already normal?" The answer is to conserve the energy and vitality of the heart.

Benedict and Huggins²⁵ found "no material change in the pulse rate of normal individuals when the oxygen inhaled was raised to 40 per cent, a slight though noticeable slowing occurred when 80 per cent was inhaled and a very positive slowing when 90 per cent was administered."

When 100 per cent oxygen is inhaled the blood plasma contains five times the normal amount of oxygen, and the normal

96 per cent saturation of the hemoglobin is raised to 100 per cent. The lessening or abolishing of the cough is another important factor in conservation of energy.

It may also be asked "Is it safe to give continuous 100 per cent oxygen to pneumonia patients when there is no anoxemia?" There are two factors in pneumonia which increase the patient's tolerance to oxygen, namely, the increase in the metabolic rate and the lung pathology. For every degree of fever there is a 5 per cent increase in the metabolic rate. Smith²⁵ in 1899 showed that mice whose lungs were damaged could tolerate markedly higher tensions of oxygen than those with normal lungs. Clinically, we have found it not only to be a safe procedure, but also markedly beneficial and appreciated by the patients.

The prognosis in a disease such as pneumonia is dependant upon many factors, such as the previous health of the patient, age, type of infection, bacteremia, and complications. It is possible in nearly all cases to prevent one of the most serious of these complications, namely anoxemia.

The serum treatment of pneumonia is not a contraindication for the use of oxygen. We have found that the same reasons for using oxygen apply whether serum is given or not.

Subcutaneous Oxygen

There was a small percentage of our cases in which the lung involvement was so extensive that even 100 per cent oxygen failed to abolish all of the cyanosis. In some of these we supplemented the inhalation oxygen by the injection of large amounts of oxygen under the skin. We found that the subcutaneous oxygen was usually helpful in abolishing the residual cyanosis, provided that the circulation had not begun to fail.²⁶ Apparently good peripheral circulation is necessary for the absorption of the oxygen.

It is true that the amount of oxygen absorbed per minute by the subcutaneous method is so small that its beneficial effect on cyanosis cannot be explained,

yet there is abundant clinical evidence in its favor.

Methods of Administration

We use the McKesson oxygen apparatus in administering 100 per cent oxygen for two reasons. First, it economizes on oxygen because the flow automatically shuts off during exhalation, and second, the interruption in the oxygen flow is appreciated by the patient, as a constant flow may be annoying. In order to administer oxygen successfully by this method the mask must be properly fitted to the face, the volume of oxygen correct, and the spring on the expiratory valve regulated so exhalation is easy. In cases of pulmonary edema or atelectasis slightly increased pressure is indicated. The best way to gain the necessary knowledge to operate the apparatus is by the physician himself inhaling oxygen daily for several days. When continuous oxygen is given, a check up on the apparatus should be made two or three times a day.

Tent

If for any reason it is not possible to employ the mask method, we use a small tent which we have made for our use. There is good visibility and because of the small space the oxygen concentration is quickly built up to 70 per cent. Circulation is maintained in the tent by the oxygen being forced under high pressure through very small holes, and then diverted to the patient's face by means of a deflector.

Very rarely have we found it necessary to use an ice-cooled tent. It is questionable whether the low temperatures in these tents are desirable, especially for patients at either extremes of life or where the fever is not high.

Three large cylinders of oxygen connected by a manifold is usually enough for twenty-four hours, regardless of the method employed.

Conclusions

1. For the successful treatment of severe anoxemia "40 to 60 per cent oxygen" is inadequate dosage.

2 The generally accepted dosage of "40 to 60 per cent oxygen" is based on a fallacious theory

3 Continuous 100 per cent oxygen can be safely administered in pneumonia with gratifying results regardless of cyanosis.

4. Subcutaneous oxygen may sometimes be a valuable adjuvant to inhalation oxygen in the treatment of anoxemia

In closing, I wish to express my appreciation of the valuable services of my partner Dr C J Durshordwe, who, during the past ten years, assisted in this clinical research, and also for those of Dr George M. Shearer, who assisted during 1926 and 1927

I also wish to thank the Linde Air Products Co for their generous contributions of oxygen which made the early part of this work possible.

A SHORTAGE OF SYPHILOLOGISTS

Approximately 1 per cent of the 100 000 prospective brides and bridegrooms examined since July 1 under the Desmond Breitbart premarital medical examination law were found to be infected with syphilis, State Senator Thomas C. Desmond announced at the National Social Hygiene day dinner in Schenectady

"It is also a reasonable belief" Senator Desmond said that other thousands, aware of their infection delayed marriage until they could be certain of passing the required tests.

Senator Desmond said, in part

The next steps in the fight on syphilis should be establishment of more public health clinics,

better training of doctors in new methods of diagnosis and cure of syphilis, and continuance of educational programs to prevent the spread of venereal disease.

Despite marked progress in general medical practice, a lamentable fact is that far too many doctors are unfamiliar with the most modern methods of either diagnosis or treatment of venereal disease

"The work that the New York State department of health is doing to educate doctors in the technical aspects of syphilis is commendable and should be extended. There is a shortage of competent syphilologists"

PRACTICAL EPIDEMIOLOGY OF GONOCOCCIC INFECTIONS IN CHILDREN

THEODORE ROSENTHAL, M D and JOSEPH WEINSTEIN, M D , M S P H ,
New York City

*(Director and Medical Consultant, Respectively, Bureau of Social Hygiene, Department of Health,
New York City)*

THERE has been a growing appreciation recently by public health authorities in the United States of the importance of gonorrhea as a public health problem. The Advisory Committee to the United States Public Health Service¹ strongly recommended that gonorrhea be given a place with syphilis in any effective program for venereal disease control. Among other provisions, the need for research on the epidemiology of gonococcic infections was pointed out. In a round-table discussion,² the Advisory Council of the Milbank Memorial Fund, devoted much attention to the importance of epidemiologic investigation in the control of gonorrhea. Special consideration was given to the methods of spread of the disease in female children, and the prevention of gonococcic ophthalmia in the newborn.

Gonococcic infection in children has long been recognized as an epidemic disease. Atkinson,³ in 1878, one year before Neisser discovered and described the gonococcus, reported an institutional outbreak in Baltimore in which 6 cases of vulvovaginitis in children, all of whom slept in the same dormitory, occurred. Investigation disclosed the fact that during the night the girls would creep into bed occasionally with one another, the spread of the infection was ascribed to this intimate contact. Coincident with the occurrence of these vulvitis cases, there were also 3 cases of ophthalmia, which had prevailed in the institution for eighteen months preceding the appearance of the vulvovaginitis. The origin of the latter cases was accounted for by the ocular discharge being

conveyed to the genitals of the younger children, most probably by the fingers of some of the older girls.

Prevalence and Distribution of Gonorrhea in Children in New York City

It is impossible to state definitely, from case reports alone, how much gonorrhea exists among children in New York City. Generally speaking, the disease occurs endemically with a tendency to spread in localized epidemics. It is undoubtedly more prevalent among children of tenement households, where unhygienic and overcrowded conditions co-exist. Wehrbein,⁴ in her study of 721 reported cases of gonorrhea in children under 16 years of age, stated that 16.36 per cent occurred in boys and 83.64 per cent in girls, 75.59 per cent were classified as vaginitis, 15.25 per cent as urethritis, and 9.16 per cent as gonorrheal ophthalmia. The highest peak (32.35 per cent) in the vaginitis group occurred in girls 6 to 10 years of age.

It is interesting to note that, while in Wehrbein's study the incidence of gonorrhea in girls was more than five times as high as in boys, data compiled by the United States Public Health Service⁵ indicate that of the total number of cases of gonorrhea under treatment in the population as a whole, 74 per cent occurred in males and 26 per cent in females. The higher incidence of gonorrhea in males as compared with females in the total population probably prevails also in New York City. Thus, the number of recognized cases of gonorrhea is higher in female than in male children, while the reverse condition exists

in adults. Of 12,935 reported cases of gonorrhea in New York City for the calendar year of 1938, 75 per cent were males and 25 per cent females. In the age group 1 to 14 years, there were 81 males and 343 females.

Clarke⁶ has pointed out that numerous cases of gonorrhea in little girls are yearly reported to the Department of Health, and that there are probably many unreported and undiagnosed cases among the poor in New York City.

Berens⁷ quotes statistics from the Woman's Hospital in New York City showing that out of a total of 6,918 infants born in that institution during a five-year period (1933-1937), 1.5 per cent developed ophthalmia neonatorum, 3.85 per cent of these cases were due to gonococcus infections.

In a group of 113 cases of gonorrhea in female children studied by Brunet and others,⁸ where family contacts were examined, positive infections of more than one person in the household were discovered in 92 per cent of the cases. Sixty per cent of the mothers of these children showed positive evidence of gonorrhea, the remaining mothers had signs of chronic leukorrhea, 75 per cent of the fathers examined were infected. Thus, in the vast majority, i.e., 92 per cent of the cases in this study, the presumed source of infection was found in the family, in a small minority, i.e., 8 per cent of the cases, it was found outside the family.

Case Investigation

Nelson⁹ has pointed out that the epidemiology of gonorrhea should be much simpler than that of syphilis. The incubation period of the one is a few days, while that of the other may be several weeks. With a fresh infection, a short incubation period of gonorrhea limits the number of persons to one or two who must be approached and examined as possible sources of infection. The confinement of infectious lesions of gonorrhea to the genitalia limits case finding to sex contacts, whereas, an extragenital

primary or secondary syphilitic lesion may demand the observation of several nonsexual as well as sexual contacts.

The importance of gonorrhea as a major public health problem was duly recognized by Health Commissioner Rice in planning the venereal disease control program in New York City. With reference to case finding, definite procedures were established whereby, like early syphilis cases each newly diagnosed case of gonorrhea reported to the Bureau of Social Hygiene is carefully investigated as to the possible source of infection and other contacts within and outside the household and family. Special efforts are directed toward the discovery of gonococcal infections in children. When an adult is found to have gonorrhea, search is made for infection of children in the home. When a child has gonorrhea, infection is sought in other members of the household and in closely associated school contacts.

Generally, cases of gonorrhea are investigated by public health nurses acting as nurse-epidemiologists or by trained male investigators. Special problems, however, such as outbreaks of gonorrhea in public and parochial schools, or in children's institutions and camps, as well as cases of ophthalmia neonatorum, are assigned to physician-epidemiologists for proper study and follow up.

Each original patient is personally interviewed by an epidemiologist or social worker for the purpose of ascertaining the identity of the person from whom he may have contracted the disease, and the identity of the individuals to whom he may have transmitted his infection. In the case of children, they, as well as the parents, are very tactfully interviewed for the necessary information.

Home visits are made to induce the suspected source and other contacts to submit to examination, and to treatment if found infected. They are advised to go to a private physician, or referred to a hospital or the nearest Health Department treatment center, if unable to pay for private medical services. Tact, kind-

ness, and a sympathetic attitude are essential in order to gain the confidence and cooperation of the patient and others concerned. By the use of persuasive methods it is usually possible to secure the desired information and to induce the contacts to submit to examination and treatment if needed.

The same procedures apply to all cases of gonorrhea in the course of epidemiologic investigation, whether referred by private physicians, Health Department clinics, municipal, and/or voluntary hospitals and clinics. In the follow-up of patients at the request of private physicians, nurses present themselves as coming from the doctor. Medical epidemiologists usually obtain the best results with both physicians and patients by representing themselves as agents of the Health Department.

Cases involving sex offenses against children are referred to the police authorities for investigation and action from the criminologic point of view. Search for suspected sources of infection and contacts is continued.

Case Reports

The following case reports are offered as illustrations of the practicability of epidemiologic investigation of gonococcic infections in children in New York City.

Case 1—A colored man, 40 years of age, was admitted to a Health Department social hy-

giene clinic with a diagnosis of acute gonorrheal urethritis. He gave a history of two previous infections and stated that each time the symptoms of gonorrhea followed exposure to a clandestine prostitute. His wife was examined and was found to have a gonorrheal endocervicitis. Two of his daughters, aged 4 and 5 years, respectively, were found to be suffering from gonorrheal vaginitis. Two other girls in the family fortunately presented no evidence of infection on repeated examinations.

The father had apparently infected the mother, while two of the children had probably contracted the disease through indirect unhygienic contact with their infected parents.

Case 2—A 13-year-old white boy was admitted to the clinic because of a gonorrheal urethritis. He denied sexual intercourse, and the source of his infection could not be determined. About six weeks later, two of his sisters, aged 7 and 9 years, respectively, were brought under treatment for gonorrheal vaginitis. The mother, two older sisters aged 14 and 18 years, and a 12-year-old brother, were each carefully examined and found to be apparently free from infection. On careful inquiry, it was revealed that all the children in the household were sleeping together because of a shortage of bedding. It was, therefore, assumed that the infection in this case had probably spread from one child to another through the medium of bedclothes freshly soiled with gonorrheal discharges.

Case 3—A colored boy, aged 13 years, developed an acute gonorrheal urethritis following exposure to an 8-year-old school girl. The latter was examined and proved to have a gonorrheal vaginitis. A brother and sister of the boy, 9 and 12 years of age, respectively, were also found to be infected with gonorrhea. A

Two of the above infected children lived in the same tenement house, and all three of them attended the same public school

Summary

1 Gonorrhea in children is believed to be most prevalent among dwellers of overcrowded tenements under unsanitary conditions. Little girls are more frequently infected than boys.

2 The disease has a tendency to spread in localized outbreaks, especially among children in the same family. The source of infection is thus often traced to one or other member in the household, quite often an adult.

3 It is important to note that indirect spread of gonorrhea in children is apparently not strictly limited to little girls. Certain cases of gonorrhea in little boys are difficult to explain on any basis other than that due to contact with infected persons under overcrowded and unhygienic conditions at home.

4. Energetic efforts at case finding are successful in bringing to light new and unrecognized cases of gonorrhea. Any program for control of gonorrhea must employ such direct methods of epidemiologic investigations to ensure effectiveness.

ANNUAL SCIENTIFIC ASSEMBLY

"The eyes of the medical world are on Washington," according to an announcement from the Medical Society of the District of Columbia, which states that the Annual Scientific Assembly will be held April 25, 26, and 27, in the Mayflower Hotel in Washington.

Gastroenterology in all its phases will be the subject covered in the three-day postgraduate course, offering about fifty-two papers, panels, and round tables on the subject. The program lists, in addition to many prominent physicians of the faculties in Washington, the following from elsewhere: Dr. Lewellys F. Barker, Baltimore; Dr. Fred W. Rankin, Lexington, Kentucky; Dr. L. M. Hurxthal of the Lahey Clinic, Boston; Dr. R. J. Coffey, formerly of the Mayo Clinic; Dr. B. B. Vincent Lyon, Philadelphia; Dr. E. H. Gaither, Baltimore; Dr. P. P. Vinson, Richmond; Dr. Eloise B. Cram, National Health Institute.

Luncheons, stag meeting, banquet, and entertainment for visiting wives are provided by the Society.

Reservations are being taken by Theodore Wiprud, Secretary of the Society, 1718 M St., N W., who will forward full information on request.

"DEATH AND TAXES"

An old adage has been upset. We used to speak of the certainty of "death and taxes," and perhaps remarked sagely that we could reduce taxes, but couldn't check death. Well, says the *Washington Review*, "just the opposite is happening." Here are the facts.

In 1900 our national tax rate—the ratio of taxes to national income—was 8 per cent. Now it is more than 22 per cent.

Meanwhile, our death rate has gone down from 17.6 persons to 1,000 of population in 1900 to 11.2 persons today.

The burden of taxation is nearly three times as high as it was a generation ago. The death rate is one third less. In other words, we have accomplished the impossible while failing to do the possible.

Unless the national income shall spurt upward soon, taxes in the United States will be higher, much higher than they now are, for government is continuing to spend far more than it collects. Even social security tax collections are covered into the federal treasury and paid out for current disbursements.

The medical profession has greatly improved the death rate, while the political profession has discarded the natural laws on wealth.

DELAYED PHOTOSENSITIZATION OF THE SKIN DUE TO SULFANILAMIDE

A Case Report

WILLIAM VERNON WAX, M D , Catskill, New York

MUCH literature has been written recently on the use of sulfanilamide. Because of the relative newness of this drug little has appeared in the literature as to the possible toxic and other deleterious reactions

I wish to report a very striking case of *delayed* photosensitization of the skin due to sulfanilamide therapy. Newman and Sharlit¹ and Brunsting² independently report that sulfanilamide may contribute toward photosensitization of the skin in certain individuals. They report that the skin eruptions may develop upon exposure to sunlight. The rash disappears from two to six days after withdrawal of sulfanilamide, according to these reports. This was reported in 1937. The literature does not disclose any other cases to date. The case in question is that of an unusual *delayed* photosensitization of the skin. Therapy with sulfanilamide was started on November 15, 1936, and the reaction of photosensitivity of the skin did not occur until *three months* after the drug was discontinued. Further, more after *twenty months* the rash is still present.

This patient, G S, is an adult white male, age 38, well developed, well nourished, who was admitted to the Memorial Hospital of Greene County following a serious automobile accident in which he sustained a compound fracture of the left femur on September 13, 1936. He developed a severe streptococcus hemolyticus osteomyelitis. Sulfanilamide, both in solution for injection, and by mouth in tablet form, was used to combat the infection with an apparent good result. Due to a general debilitated condition, following the severe injury described, sunshine and an artificial sun lamp were a part of the therapy used after the drug

was discontinued. In the accompanying photograph, it should be noted that a large area of the photosensitization of the skin which is a deep brown, is also on the nonaffected leg and covers an even wider area than on the affected side. The areas on the previously fractured leg occasionally break down and form deep skin ulcers. These ulcers are difficult to heal, but in healing, the pigmented regions remain the same. The photograph was taken on July 20, 1938, twenty months after photosensitization was

Photograph showing areas of photosensitization of the skin due to sulfanilamide. Note sharp line of demarcation on right leg where stocking protected skin.

noted, and twenty-three months after the drug was withdrawn

Conclusions

1 Photosensitization of the skin due to sulfanilamide is a relatively rare occurrence, but should be carefully guarded against because of the increased use of this drug

2 The case reported is unusual because it illustrates *delayed* photosensitivity of the skin brought on many months after therapy was started and discontinued, due to exposure to sunlight and artificial sunlight

3 These photosensitized areas are

large deep dark brown patches, apparently fixed in the skin, with a sharp line of demarcation, occurring *after* withdrawal of the sulfanilamide.

4 These areas may break down and form troublesome ulcers

5 Patients taking sulfanilamide should be strictly warned against exposing themselves to sunlight or artificial sunlight during or after the taking of sulfanilamide

HOW STATE MEDICINE LOOKS ON THE SPOT

A Nebraska physician, Dr A L Miller, recently visited some of the lands of Europe that have state medicine and discovered a few facts on the spot. He said, in an address before the Wyoming State Medical Society

"I have viewed state medicine in England, Germany, and Hungary. I know that in those countries, the initiative, as far as the doctor is concerned, is gone. The patient is merely treated as a number, a cog in a vast machine. Some of the poorest work in surgery I observed in Munich, once the center of the best in medical technic, and also in Budapest, where due to the lack of material and the hope of progressing, surgical and medical care is indeed on a low scale. The doctors in Budapest, Hungary, told me that they were getting about 49 cents for a call in town. They might have to make eight or ten

calls on this patient, but the limit that they could be paid for was three calls. Dr Lund told me that he was getting about \$30 a month in our money, and the doctor had completed a fellowship in the Rockefeller Institute in New York City and is the head of the neurosurgical department in one of the clinics in Budapest. The chief surgeon was getting the magnificent sum of about \$70 a month in our money and he spent all of his time doing surgery. When I visited with him he threw up his hands in despair and remarked 'Doctor, we medical men in Austria and Hungary have no future. We have nothing to live for. We are just a cog in the machinery of the state.' Truly, gentlemen, this type of state medicine means a lower grade of medicine than we have in the United States where men act as individuals, doing the thing they feel is right for their patients."

OPENING FOR INTERNS

The California State Personnel Board is anxious to recruit the best qualified persons for student intern and senior intern for service in a state mental hospital. The salaries are \$50 a month and maintenance for the senior intern, and \$25 and maintenance for the junior.

There is no residence requirement for these examinations and no written test will be given. Applicants will be rated on education, experience,

and appraisal of scholastic record. Applications may be filed at any time during 1939 and will be rated immediately.

If a candidate's qualifications, after investigation, are acceptable, his name will be placed on the list of those eligible for employment in accordance with his rating.

For information, address L J Kroeger, State Personnel Board, Sacramento, California.

SUMMARY OF REPORT OF THE NEW YORK STATE LEGISLATIVE CANCER SURVEY COMMISSION

MORTON L. LEVIN, M D , Buffalo, and RUSSELL S FERGUSON, M D ,
New York City

(Associate Director and Director Respectively of Survey)

THE New York State Legislative Cancer Survey Commission was created by Chapter 718 of the Laws of 1937, which directs that the commission "make a comprehensive study and survey of the existing facilities, public and private, in this state, for the study and treatment and the prevention or amelioration of cancer and for care of persons afflicted or threatened therewith, the prevalence of such disease within the state, and any other pertinent facts relating to cancer of which the governor and legislature should be informed for purposes of legislation, if needed, relative to the above matters."

Members of the commission were Frank A Gugino, chairman, member of Assembly, Dr James Ewing, vice-chairman, Memorial Hospital, New York City, Jacob J Schwartzwald, secretary, member of Senate, Dr Floyd S Winslow, ex president, New York State Medical Society, Dr Edward S Godfrey, Jr, State Health Commissioner, Frederic H Bontecou, member of Senate, William J Murray, member of Senate, Nicholas A Rossi, member of Assembly, Harry R Marble, member of Assembly

The commission appointed, as a sub-committee on survey Dr Russell S Ferguson, Dr Morton L Levin, and Arthur H. Estabrook, Ph.D , and designated as medical associates, Dr J Sutton Regan, Dr Samuel Varco, and Dr Karl F Eschelman. A preliminary survey was begun in November, 1937, and a Preliminary Report presented on March 7, 1938. At the 1938 session of the legislature, the commission was continued by Chapter 506, Laws of 1938. The commission was reorganized in May, 1938, and a Final Report rendered to the legislature and the governor on February 15, 1939.

The report of the commission consists of material regarding (a) the general principles of cancer control, (b) cancer mortality, (c) cancer incidence, (d) undergraduate and postgraduate professional education, (e) hospital facilities relating to cancer, (f) hospital admissions for cancer (for the year 1936), (g) facilities for tissue diagnosis, (h) facilities for roentgen ray diagnosis, (i) facilities for deep x ray treatment, (j) facilities for radium treatment, (k) tumor clinics, (l) facilities for terminal care of cancer patients, (m) social service and follow-up of cancer patients, (n) public education in cancer control, (o) cancer control programs in other states, (p) recommendations, and (q) proposed legislation.

A brief summary of salient features of the report is here offered, omitting detailed tables and other data which will be available when the report is published.

General Principles of Cancer Control

Cancer control may be defined as comprising all efforts to obtain maximum application of existing knowledge regarding prevention, diagnosis and treatment of cancer. Efforts to supplement individual resources of patients and physicians in attaining this end through some form of organized communitywide program constitute public health measures, whether carried on by voluntary or official agencies. The generally accepted view that control of cancer requires, for various reasons, an organized communitywide program to supplement individual resources makes cancer a public health problem. Aspects of the cancer problem supporting this view are (a) the usually mild mode of onset, calling for special efforts to induce patients to seek medical care early, (b) the difficulty of early

diagnosis, often necessitating special facilities not generally available, (c) the specialized character of treatment, both radiologic and surgical—requiring in many communities personnel and equipment to supplement existing facilities, and (d) the high cost of treatment, making aid to the low-income group necessary, this necessity enhanced by the fact that the low-income group apparently suffers a higher mortality from cancer than does the rest of the population

The basic argument for the probable effectiveness of a cancer control program rests on the relatively higher cure-rate attainable in cases treated adequately before metastasis has occurred. The four-year cure-rate in cancer of various sites among patients admitted to the State Institute at Buffalo in 1932–1933 was for Group I (early) cases 46.5 per cent, and for all others 16.6 per cent (adjusted to the same site-distribution). Applying the rates in the two groups to the yearly incidence of cancer of various sites as determined by incidence survey reduces these cure-rates to 40.9 per cent for Group I cases and 12.2 per cent for all others. On the same basis the average cure-rate now obtained, as determined by study of over 8,000 cases admitted to various hospitals in this state in 1932 and 1933, is 18.6 per cent. The difference between this figure and 40.9 per cent applied to the number of deaths from cancer in this state in 1937, represents a possible salvage of 2,500 lives per year.

It is only fair to point out that even if all patients sought medical care immediately after the onset of symptoms, they would not all be found to have early lesions. Other factors are of importance here, particularly the type of cancer concerned, since some forms of cancer metastasize early, while others do not, and some forms rarely metastasize at any time. However, it is certain that more prompt action on the part of the patient would greatly increase the proportion of cases treated at an early stage.

Detection of early cancer before symptoms develop, by means of periodic physi-

cal examinations, is a principle of cancer control which receives much discussion, but little application. Its practical value has yet to be tested adequately and at present its place in the cancer control program is not well defined. It would be highly desirable to have the various county medical societies organize local demonstrations of the value of periodic examinations, not only in cancer control, but as a general health measure.

Knowledge regarding specific carcinogenic agents cannot as yet be applied to the prevention of human cancer, except cancer of occupational origin. Although there are in this country some 238 different occupations involving potential exposure to possible carcinogenic agents (radium rays, x-rays, ultra-violet rays, arsenic, anilin, extreme heat, petroleum, and tar), the number of occupational cancers reported is negligible. The long period between time of exposure and onset of cancer, which often occurs after employment has ceased, may in part account for this.

Other factors in the causal genesis of cancer which have possible application in prevention are (a) in skin cancer overexposure to sunlight, skin tuberculosis, (b) in mouth cancer syphilis, use of tobacco, poor oral hygiene, (c) in breast cancer chronic mastitis, failure to nurse, duct-blockage, (d) in uterine cancer repeated pregnancies, cervical lacerations. These causal factors, not all equally well substantiated, are at present of importance chiefly in directing attention to persons most exposed to risk of developing cancer. The same may be said of the available data regarding heredity in human cancer which would indicate that certain families are predisposed to cancer of particular organs or tissues. Of similar import is the excess mortality found, among males in the unskilled worker class, from cancer of certain sites (skin, larynx, mouth, esophagus, stomach), to which fact the higher mortality observed among urban populations and among the foreign-born is perhaps related. All of these clues to the epidemiology of cancer are of significance.

chiefly as indicators of where cancer control measures can best be applied. These measures are still directed for the most part toward early detection and adequate treatment, rather than prevention, of cancer

Cancer Mortality in New York State

The upward trend of the crude death rate from cancer (all forms) in New York State has followed that of the original registration area quite closely. From 1900 to 1936 the death rate in New York State more than doubled (increase 115 per cent) and the number of deaths almost quadrupled (increase, 294 per cent). The increase has not been uniform for all sites of cancer, the death rate from cancer of the skin and buccal cavity has not increased during the past fifteen years.

Approximately 30 per cent of the observed increase in death rate from cancer of all forms can be accounted for on the basis of increased population in the older age groups, the remainder is associated with increased death rates among these age groups. The extent to which this increase is attributable to improved diagnosis remains debatable. It seems highly doubtful that all of the increase can be accounted for in this way. If age-specific death rates remain at their present level, the number of deaths from cancer, in this state will have increased in 1960 by 50 per cent. If in addition age specific rates continued to increase, the increase in number of deaths will be approximately 122 per cent.

When adjusted for age, the death rate from cancer among females shows, for recent years, a downward trend in Massachusetts and in the experience among industrial policyholders (Metropolitan Life Insurance Company), but not in New York City or the rest of New York State. However, the accuracy of these age adjusted rates, based on estimated population by age, must remain in doubt until the next census is taken. In this connection it should be stressed that the magnitude of cancer as a cause of death is probably understated rather than over

stated by mortality statistics, since numerous autopsy studies show that more cancer is missed than is diagnosed erroneously.

Incidence of Cancer

The commission first conducted an incidence survey of cancer in six counties (Steuben, Monroe, Franklin, Nassau, Otsego, and Ulster) by questionnaire to physicians, asking for initials, age, sex, residence, and diagnosis of all cancer patients under care during a year (July 1, 1936 to June 30, 1937). Eight hundred and fifty-one physicians (out of 1,240) reported 2,183 resident cases. Assuming that the physicians who did not report had a proportionate number of cases, this would give 3,178 cases, or slightly under 2 cases alive during the year for each of the 1,544 resident deaths from cancer which occurred in these counties during the same period. In a second survey, undertaken in Dutchess County, it was possible to obtain a higher percentage of returns from physicians (88.9 per cent) and, in addition, information on cases from hospital records and pathologic laboratory records, as well as death certificates. From the latter 3 sources were obtained 31.8 per cent of all reports not otherwise reported by physicians. In this survey, the indicated number of cancer cases was 463 (for the calendar year 1937), or slightly more than 3 for each of the 153 resident deaths. This represents a yearly incidence of 450 cases per 100,000 population. This figure is undoubtedly minimal, since in most cases there is considerable delay before diagnosis is established and thus possibly a third of the cases may not be known at the end of the year.

Hospital Admissions for Cancer in 1936

Information on hospital admissions, x-ray facilities, radium facilities, and other pertinent data was obtained by questionnaires sent to 409 hospitals and related institutions considered of significance in the care of cancer. Returns were received from 256 of these institutions (62.6 per cent), having 78.6 per

cent of the bed capacity* of the total 409 institutions. However, some of the returned questionnaires were not complete, so that information regarding any one item is based on a somewhat smaller number of hospitals.

Two hundred and twenty-six hospitals and related institutions (44,913 bed capacity) reported 26,439 admissions for cancer in 1936, or 2.9 per cent of all admissions (907,350). Of admissions to general hospitals, 2.2 per cent were for cancer. Of all hospital deaths reported, 13.4 per cent were from cancer, of deaths in general hospitals, 10.7 per cent were from cancer. The number of cancer deaths was 25.5 per cent of the number of cancer admissions reported. Autopsies were reported in 30.7 per cent of cancer deaths, as compared with 27.4 per cent of all other deaths.

Excluding admissions to cancer homes, homes for incurables, and similar institutions, there were approximately 30,000 hospital admissions for cancer in 1936, 19,000 to New York City hospitals, 11,000 to upstate hospitals, 78.5 per cent of these admissions were to general hospitals, 19.6 per cent to the four special cancer hospitals in New York City and Buffalo. Data from a questionnaire addressed to physicians who signed death certificates of over 10,000 cancer deaths indicate that approximately 73 per cent of all cancer cases enter a hospital at some time during their illness. Similar data from the incidence survey in Dutchess County give 70 per cent hospitalization. In New York City 55 per cent of all cases enter a hospital *during the year*, in the rest of the state, 38 per cent.

Of 6,965 cancer admissions reported by 93 general voluntary hospitals, 55 per cent were classed as "full pay" and stayed an average of 16.2 days, 45 per cent were classed as "not full pay" and stayed an average of 21.7 days. Data from upstate general hospitals showed that for each "not full pay" cancer patient, the hospital incurred a deficit of \$1.24 per hospital day's stay, and that

outside agencies (city, county, town, community chest, old-age relief, etc.) paid \$2.32 per hospital day, in addition to the amount paid in by the patient. On this basis, it is estimated that the hospital care of "not full pay" cancer patients in upstate New York now costs general hospitals and relief and welfare agencies \$342,000 a year.

Hospital Facilities for Diagnosis and Treatment of Cancer

Facilities for x-ray diagnosis were reported as adequate by over 80 per cent of the hospitals reporting. Facilities for embedded tissue and frozen section tissue diagnosis were reported available by 87.7 per cent of the hospitals reporting. However, of 67 hospitals which reported on the number of tissue specimens diagnosed malignant tumor, 1 out of 3 were not approved for surgical pathology (in upstate New York). There are facilities for deep x-ray treatment in 51 New York City hospitals and in 42 upstate hospitals. Eleven upstate hospitals and 22 New York City hospitals own varying amounts of radium, but only 3 upstate hospitals and 15 New York City hospitals own as much as 200 milligrams of radium. In upstate New York, 44 per cent of all reported cancer admissions† were to hospitals which had no facilities for deep x-ray treatment, owned no radium, and had no physician on the staff who owned radium. In New York City 32.2 per cent of the admissions were to hospitals lacking deep x-ray treatment facilities and only 13.5 per cent to hospitals not owning radium.

Radium and X-Ray Therapy Facilities in Physicians' Offices

The total amount of radium owned by hospitals, other institutions, and physicians in the state is 43,844 grams,‡ of which 31,658 grams are in New York City and 12,186 grams in the rest of the

† Based on 19,914 cancer admissions to 214 general hospitals (84 New York City hospitals, 130 upstate hospitals).

‡ Based on data received from hospitals, radiologists, and commercial companies selling x-ray machines and radium. Does not include radium owned by commercial companies.

* Exclusive of bassinets.

state. In New York City there are 20 units of radium in amounts of 200 milligrams or over (hospitals and physicians), in the rest of the state, only 4 such units. Sixty three physicians in New York City own 5 138 grams of radium, in all but 4 instances the amount owned being considerably less than 200 milligrams. In the rest of the state, 39 physicians own a total of 2 935 grams, in all but 2 instances the amount owned being less than 200 milligrams. X ray machines used for deep therapy (180 kv or over) are available in 94 physicians' offices (93 machines) in New York City, in 31 physicians' offices (32 machines) in the rest of the state. For the most part, both radium and deep x ray therapy facilities are concentrated in the larger urban centers, but many of these lack sufficient radium. As a partial measure of distribution of skilled personnel, there are 111 physicians who are diplomates of the American Board of Radiology accredited for x ray therapy, radium therapy, or both, in New York City and 38 such physicians in the rest of the state (as of January 1, 1939). The amount of radium available in upstate New York is obviously inadequate to meet the local needs in most sections of the state, the number of x ray machines would possibly be adequate were they properly distributed and if no economic barriers to maximum utilization existed.

Terminal Care of Cancer Patients

The care of the cancer patient during the terminal stages of illness, which usually means a period of three months but often is six months to a year or more presents a difficult problem. These patients require much attention and often could be made more comfortable by special radiation or surgical therapy, yet their care is in many instances neglected. By the time the cancer patient reaches this stage of the disease, his financial resources are usually exhausted, while facilities for free hospital care of such patients are difficult to secure. Most general hospitals will not tie up a free bed for a terminal cancer patient. In

New York City there are approximately 530 beds in various institutions available for the terminal care of indigent cancer patients. There is usually a waiting list of about 150 patients for admission to these beds. Outside of New York City there is but one institution, of 115 beds, specifically designated for the care of indigent terminal cancer patients. In 1936, 104* cancer patients in upstate New York, died in some county, city, or town public home—institutions in adequately equipped to care properly for such cases. In New York City 58.6 per cent of all cancer deaths occur in a hospital or related institutions, in other cities of 100,000 population or over, the figure is 41.4 per cent, while in the rural areas, the figure is 29.0 per cent.†

The commission has recommended that aid to the terminal cancer patient take the form of extension of facilities for home nursing care and has suggested that local communities make the provision of such care a part of their general public health nursing program. Such a plan would enable the terminal cancer patient to remain under the care of his or her family physician and considerably reduce the need for hospitalization of these patients.

Public Education and Cancer Control

Public education in cancer has been carried on in this state by the Division of Cancer Control of the New York State Department of Health, by the American Society for the Control of Cancer, the New York City Cancer Committee, and by various county medical societies. From 1933 to 1937, inclusive, all agencies in upstate New York reached, through public lectures, approximately 68 000 persons, whereas the Massachusetts cancer educational program is estimated to reach 100,000 persons in a single year. The method pursued in Massachusetts is that of concentrating effort on having public education done in each locality by local physicians. This achieves the

* Data from 31 county, city and town public homes.

† Data from 10,330 cancer deaths during six months ending June 1937.

double effect of reaching many more people than can be done through the individual efforts of a few full-time workers and at the same time stimulates the interest and encourages postgraduate education of the physicians themselves. The commission accordingly has recommended that the Division of Cancer Control endeavor to stimulate and encourage the medical profession to carry on public education in cancer and that the services and experience of the Division of Cancer Control be placed at the disposal of the medical profession to this end.

Tumor Clinics

In view of the great importance of early diagnosis in cancer and the key position of the general practitioner who first sees the average patient with symptoms which may mean cancer, the commission recommends that "for the present the guiding principle of cancer control in New York State be that of improving local diagnostic and treatment facilities by establishing tumor clinics and through the utilization of already existing hospital facilities."

The standards for tumor clinics set by the American College of Surgeons represent the minimum required for satisfactory service to cancer patients. Although adequate facilities may exist in the absence of an approved clinic, it is nevertheless true that where such facilities exist, the hospital concerned usually seeks and obtains the stamp of approval of the American College of Surgeons.

At present there are in New York State 49 tumor clinics, of which 23 are in New York City and 26 in the rest of the state. Of these 49 clinics, 24 are sufficiently well equipped and organized to be fully approved (for diagnosis and therapy) by the American College of Surgeons. Thirteen of these fully approved clinics are in New York City, 3 in Westchester County, 1 in Nassau County, and 7 in five communities in the rest of the state (Buffalo, Rochester,

Syracuse, Albany, and Cornwall). There are 4 clinics approved for diagnosis only in three other communities (Watertown, Middletown, and Bay Shore).

A study of the records of 5 tumor clinics in this state indicates that the majority of patients come from within a radius of 25 miles from the clinic. Even on the assumption that a radius of 50 miles represents the area served, it appears that either all or the bulk of the population of 15 counties is now located more than 50 miles from a fully approved tumor clinic. These counties are St. Lawrence, Franklin, Clinton, Essex, Hamilton, Warren, Herkimer, Otsego, Broome, Tioga, Chemung, Schuyler, Steuben, Delaware, and Alleghany.

It is expected that organization of new clinics, or improvement of facilities in already existing clinics, will be undertaken as a cooperative effort of the hospitals, the county medical societies, and the Division of Cancer Control. The amount and kind of assistance to be furnished tumor clinics by the Division of Cancer Control would depend, of course, on the resources available. The experience gained by the commission in organizing two clinics in Dutchess and Suffolk counties and in discussing the question with hospital staffs elsewhere indicates that probably the most useful and welcome form of assistance would consist in furnishing, for varying periods, the services of consultants, to act in an advisory capacity in the organization and functioning of the clinics. The Massachusetts cancer program, now in operation for twelve years, provides consultants for the purpose of holding teaching sessions of clinics and provides other aid in the form of clerical services, record forms, services of a part-time social worker, and payment for diagnostic x-rays in the case of (medically) indigent patients. Varying local needs and conditions in this state will call for different forms of aid, the paramount aim being in every case to develop local facilities, to stimulate the interest of practicing physicians in the early diagnosis of cancer, and to make

expert treatment available through the maximum utilization of the resources at hand.

Reporting of Cancer

Information regarding the incidence of cancer in the population at large over a period of years would make it possible to verify or disprove many of the apparent facts regarding cancer, some of great practical importance, which appear from analysis of death records. Death records are unsatisfactory for many purposes since their accuracy is uncertain and the case fatality of different forms of cancer varies widely. Whether cancer incidence is actually increasing or simply being diagnosed more accurately, whether the increase is confined to some forms of cancer and differs in extent among these forms as mortality statistics would indicate, whether the observed differences in mortality in the two sexes, in married women as compared with single women, in males of different social status, in urban as compared with rural populations, are real or only apparent, are questions of more than academic interest. The indicated facts, if substantiated, have important implications as indicating where cancer control measures need to be applied and in what directions investigations of human cancer should proceed. A comparatively simple reporting form of current cases as they come under observation would furnish a large volume of material in which the reliable data could be separated from the less reliable. With the exception of a few large hospitals and laboratories (where special provision will need to be made) the amount of labor entailed in current reporting would be small. The average physician sees fewer than 10 cases a year, probably less, the average hospital admits less than 20 patients with cancer each month. The great majority of pathologic laboratories receive less than 300 tissue specimens of cancer a

year, or less than 1 a day. Reports from all of these sources would furnish information not obtainable from any one alone and lead to increased accuracy of the data. The experience of the commission in making incidence surveys in 7 counties indicates that the profession is not unaware of the value of cancer reporting and is quite willing to undertake it. The Council of the State Medical Society has officially approved the measure.

The commission has accordingly recommended that cancer be made reportable in this state, as it already is in several other states.

Legislation

The proposed Cancer Control bill specifies that cases of cancer be reported by physicians, hospitals, and laboratories, and provides for an appropriation of \$50,000 to the Division of Cancer Control for the purpose of carrying out the recommendations of the commission regarding the cancer control program in this state. In proportion to the population of the state, the sum named is considerably less than that expended in other states for similar purposes. (The appropriation in 1937 for the Division of Cancer and Other Chronic Diseases of the Massachusetts Department of Health was \$97,502, exclusive of the appropriation for the State Cancer Hospitals at Pondville and Westfield.) Compared also to the cost of building and equipping one or two additional state cancer institutes the sum named for the Division of Cancer Control is quite small. Nevertheless, the facts gathered by the commission indicate that a program such as that planned for the Division of Cancer Control, directed toward improved local facilities rather than increased centralized facilities and stimulation of post graduate education of physicians, is the most important need and offers the greatest hope of effective control of cancer.

A lecturer tells us that prehistoric men were never bow legged nor round-shouldered. Still

we would rather be bow-legged than prehistoric.—*Montreal Star*

Public Health Notes

J ROSSLYN EARP, L R C P , Dr.P H
New York State Department of Health

Oral Hygiene

OUR State Health Department is one of the few that employs a dentist on its staff Dr David B Ast, who was formerly instructor in periodontia at the New York University College of Dentistry, is now working in the Division of Maternity, Infancy, and Child Hygiene Although his immediate preoccupation is with the expectant mother and the child of pre-school age he is fully conscious of the relationship of his work to that of other divisions He draws my attention to an article by Dr James Ewing* which teaches us that "the patient coming in with an early diagnosis of cancer all too often fails completely of a cure any plan of successfully meeting the problem of cancer control must lean heavily upon cancer prevention "

"Badly decayed teeth with projecting, jagged edges against which the tongue and mucous membrane of the cheek and lip are constantly rubbing, must act as chronic irritants," says Dr Ast.

"Pyorrhea from the standpoint of being a chronic focus of infection and also due to the irritating influence of mobile teeth, may be responsible for neoplasms, especially in the floor of the mouth

"Malocclusion due to habits such as thumb sucking, lip biting, resting cheek on hand, etc produces an irregularity of the teeth whereby projecting cusps and food impaction areas may act as extrinsic irritating factors

"Failure to replace missing teeth permits a shifting of the remaining teeth, which likewise produces malocclusion and food impaction areas

"Faultily constructed dental restora-

tions, particularly of the partial and full denture type, come under the heading of extrinsic irritating factors and are in some mouths contributing factors in the etiology of cancer With ill-fitting dentures which are continually bobbing up and down in the mouth, we have the irritating influence of the denture rubbing against the mucous membrane of the palate, lip, cheek, and gingiva of the supporting teeth Also we must contend with the excessive pressures exerted in certain areas "

Dr Ast warns against the continued use of escharotics, particularly silver nitrate, for the treatment of soft tissue lesions, and gives Dr. Solomon† as authority for the danger of this practice

Dr Ast works in cooperation with the county dental societies Some subsidy is available for the treatment of indigent patients in the dentists' own offices Preventive dentistry of the pre-school child is combined with a program of professional postgraduate education With its present staff the department does not expect to abolish all dental defects in the state, but in the groups of expectant mothers and pre-school children it may be possible to prevent gross rampant caries with resulting loss of many teeth, shifting and malposition of remaining teeth, and finally artificial dentures The latter will remain a cancer hazard so long as wearers fail to realize that once fitted they are not permanently adapted to the mouth but must be occasionally readapted to the changing alveoli

Undoubtedly the medical profession can do much to ensure the success of this campaign by urging upon their patients the value of preventive dentistry to the health of the individual

* Ewing, James Prevention of Cancer, Surg, Gynec., and Obst., 44. 164-184 (1927)

† Solomon, H Oral Hygiene in Cancer Control, Clin. Med and Surg, 41 275-277 (1934)

Which Ought Not To Be Spoken Abroad

It is perhaps unusual for a public health man to be asking his colleagues in private practice to respect the confidential relationship between physician and patient but this is what I must do. For once, there is something which the State Department of Health does *not* want you to report. It is the result of the serologic test made in compliance with the prenatal examination law. This law requires that the test be made and that a statement be made on the birth certificate as to whether the test has been made, and if no test has been made, the reason therefor, but the law adds "*in no event shall the birth certificate state the result of the test*"

The State Department of Health must

observe the law and, therefore, when the result of the test is stated on the birth certificate, the Division of Vital Statistics is obliged to return the birth certificate to the doctor who signed it and request him to make out another certificate, omitting the result of the test. Dr De-Porte tells me that it is not possible for him to erase or obliterate a statement on the certificate because this also would be a violation of the law. During January, the first month in which the law has required a statement to be made on the certificate, some fifty certificates have had to be returned to the doctors signing them on account of this excess information.

BRITISH AIR RAID SHELTERS TOO FLIMSY

British doctors are protesting that the air raid shelters now being constructed are too shallow and too thinly covered. A letter from London to the J.A.M.A. reports that the present steel shelters might protect against the blast and fragments from shellbursts, but not against direct hits. Twenty-one London hospital physicians have sent a joint letter to the press pointing out that air raids would produce an enormous number of casualties. Great numbers of civilians would be killed or injured by the high explosive bombs disabled by the shock or concussion, or buried beneath fallen buildings in which the danger of fire would be considerable. The morale of even highly trained troops cannot be maintained against continuous bombardment

without adequate protection. How can women and children be expected to endure similar trials? British physicians probably could not cope with the number of casualties under the present conditions. The signatories hold that fully efficient medical and surgical treatment cannot be given unless adequate bomb-proof shelters are provided for those who cannot be promptly evacuated from danger areas. These shelters must be deep enough to prevent penetration and sufficiently numerous to be quickly reached. They could be constructed beneath buildings as well as under squares and open spaces. Some should be designed for medical purposes, as the hospitals may be so damaged as no longer to provide facilities for the treatment of casualties.

ARS LONGA VITA BREVIS

The practicing physician is not a scientist. He is, if he really practices medicine more, far more, than a scientist. He is an artist. He does not deal with the controlled and limited matters of the laboratory, he deals with human beings. So long as the human mind in its full ramifications remains beyond an evaluation with

scientific precision then the practice of medicine must remain an art.

So long as medical practice involves the personal contact of physician and patient then it is the art of the physician which must establish the necessary bond

—Howard W. Haggard

The Woman's Auxiliary

To the Medical Society of the State of New York

TIME marches on And it brings closer to hand our Fourth Annual Convention to be held in Syracuse, April 24-26, in conjunction with the Annual Meeting of the Medical Society of the State of New York Let us try to have a record attendance this year Why not plan to attend with your friends and show your interest in your auxiliary and demonstrate your support of its activities?

Many enjoyable events have been planned, and from indications a grand time is assured all who attend Our Hobby Show will again be a great attraction Auxiliary members and their friends will exhibit many interesting and unusual things If you missed seeing our Hobby Show last year, you have a treat in store Our president, Mrs Daniel Swan, will be happy to welcome all doctors' wives and we are looking forward to the best convention we have ever had

*Convention Headquarters, Onondaga Hotel,
Syracuse*

April 24, 25, 26, 1939

County News

Kings

Mrs Milton Bergmann presided at the meeting of the Woman's Auxiliary to the Medical Society of the County of Kings held at the County Society Building on February 28 Dr Frederick E Elliott, the guest speaker, gave an interesting talk on medical legislation This was followed by a paper on "The History of Medicine in Brooklyn" written by Mrs Dimon Fruchs Mrs Valentine Bourke was hostess at the tea which followed

Onondaga

A meeting of the Woman's Auxiliary to the Medical Society of the County of Onondaga was held on March 7 at the Crouse-Irving Hospital Mrs Dwight

Needham, chairman of legislation, was in charge of the meeting and had invited Dr John J Buettner to address the members Mrs Samuel Stewart, chairman of hostesses, arranged a delightful social hour following the business session

Queens

A meeting of the Woman's Auxiliary to the Medical Society of the County of Queens was held on February 28 Mrs Miller Sanders, first vice-president, presided in the absence of Mrs Lavelle who was ill The guest speaker, Mr Dwight Anderson, Director of the Public Relations Bureau of the Medical Society of the State of New York, explained the difference between the Voluntary Medical Indemnity Expense Insurance and Compulsory Health Insurance He showed how important an auxiliary can be in acting as a liaison between the medical profession and lay organizations and how valuable an auxiliary is to its medical society

A resolution was passed creating the Carl Boettiger Memorial Book Fund in honor of the late Dr Boettiger who had organized and directed the library of the Medical Society

Schenectady

A meeting of the Woman's Auxiliary to the Medical Society of the County of Schenectady was held on February 28, in the auditorium of Sunnyview Hospital Mrs Herman Galster, chairman of program, introduced Miss Laura Lorensen of New York, writer and lecturer on decorative arts Miss Lorensen gave a stereopticon lecture in full color on "The Romance of Pottery in Every Time and Every Clime" In her story of pottery and porcelain Miss Lorensen included symbolism, folklore, mythology, people, places, and events from which the romance of this art has been woven.

Medical News

General

OF INTEREST and import to all members of the State Society are two paragraphs in the annual report of the Special Committee on Illegal Practice of Medicine of the Medical Society of the County of New York. After paying tribute to "the efficiency of the Attorney General and of the State Education Department in their enforcement of the Education Law," the committee proceeds to say

"It seems to the committee, however, that although the laws against illegal practice, as they stand now, are adequate in every way, and despite the efficiency and zeal of the Attorney General and of the State Education Department, the Court of Special Sessions is not in entire sympathy with the aims and purposes of the medical profession in its efforts to protect the public against illegal practitioners. This statement by your committee is based on the fact that during the year 1937 there were fifty individuals convicted in the Court of Special Sessions for violations of the Education Law, as it applies to medicine. (See Attorney General's report, 1937, pp 2-16) Of these fifty, eighteen were sentenced to prison for terms varying from thirty days to one year, which they served, one of these was fined \$500 or thirty days in the workhouse, and one \$200 or sixty days in the workhouse, both of them served their respective prison sentences. Of the remaining thirty two, *sentence was suspended altogether in three*, one of these being a third offender, two were given a two months' prison sentence, *with execution of sentence suspended*, eleven, a three months prison sentence, *with execution of sentence suspended* three, a six months prison sentence, *with execution of sentence suspended*, one a penitentiary sentence *with execution of sentence suspended*, six, a fine varying from \$100 to \$500, and in default thereof, a prison sentence, *these all paid their fines and, accordingly, served no*

prison sentence, five, a fine, and, *in addition, a prison sentence with the execution thereof suspended*

"Your committee feels that there is no justification for such leniency by the Court of Special Sessions toward convicted violators of the Education Law. It seems to us that such light punishment can be no deterrent to violators of the law and is probably accountable for the many cases of recidivism that are constantly coming up. Furthermore, it defeats the valient efforts of the law-enforcing agencies to obtain convictions, being a grave injustice to the medical profession and, what is more important, to the community for whose protection the Education Law was primarily intended."

Albany County

Dr Arthur G Root, nose and throat specialist of Albany, and former president of the New York State Medical Society, died on February 26 at his home from a heart attack. He was seventy-five.

Bronx County

The class of 1919, Fordham University Medical School, held its twentieth anniversary class reunion dinner at the Metropolitan Club, 60th Street and Fifth Avenue, New York City, on February 18. Dr Joseph J Eller was toastmaster.

Broome County

Dr Mark Williams read a paper on "Post Pneumonic Empyema in Children," before the Broome County Medical Society on February 14. Discussion was opened by Dr S D Molyneaux, Dr U S Kann, and Dr R. J Wharton.

A plan for supplying medical service under a system of voluntary prepayments was tentatively mapped at a special meeting on February 28.

Dutchess County

Dr James E Perkins, director of the Division of Communicable Diseases, State Department of Health, Albany, was guest speaker at the annual luncheon meeting of the Poughkeepsie Committee on Tuberculosis and Public Health on March 2 at the Nelson House in Poughkeepsie. His subject was "Pneumonia Control."

Erie County

A nonprofit medical indemnity assurance corporation definitely will be launched by the Medical Society of the County of Erie and by physicians of the Eighth Judicial District providing the Piper bill is passed, Dr George R Critchlow, president pro tem of the contemplated body, announced on February 24.

Representatives of eight counties shaped details for its incorporation at a meeting on February 23 in the Buffalo club. Dr Harvey P Hoffman, chairman of the organization committee, presided. About fifteen physicians attended.

The new organization will be controlled by the medical profession "with a minority representation of lay members as the board of directors," Dr Critchlow reported.

Dr Critchlow said any physician in the Eighth Judicial District will be eligible to serve as a member of the service and all subscribers to the service will be free to choose their own doctors. The scheme provides for a payment covering medical fees as follows:

- 1—Single men, \$3 a year
- 2—Man and wife, \$4 a year
- 3—A family, including any number of children under 19, \$5

Fees will be regulated by the corporation and a grievance committee will iron out any differences arising in the operation of the scheme.

Unalterably opposed to the consolidation of hospital service and medical service into single corporations, the Medical Society of the County of Erie is on record as disapproving the Downey bill, now pending in the legislature, which would legalize such combinations.

The action was taken at the society's monthly meeting in the Hotel Statler on February 20.

The society instead endorsed Section 9-C of the Piper bill which in its provisions for the recodification of insurance laws allows the incorporation of medical and hospital service organizations but specifically provides that they be distinct units.

Dr Critchlow read a resolution adopted by the Hospital Service Corporation of Western New York likewise opposing such combinations.

"If these two services were concentrated in one corporation, the doctors would be under the control of a lay corporation, and the medical profession is opposed to that," Dr Critchlow declared.

Fearing "mass medicine practice by the government" unless the county medical societies are prepared to assume their responsibility, Dr Critchlow urged unanimous support by local physicians of a local medical expense indemnity organization which would become legal with the passage of the Piper bill.

"When the bill is passed we must be ready to jump into the field to forestall the Farm Security administration or any other governmental agency entering this phase of medical practice," Dr Critchlow warned.

The assertion of Buffalo Health Department officials that Buffalo's present outbreak of mild scarlet fever is "a good thing" for the city was challenged at the health board's meeting on February 16 by Dr Herbert H Bauckus, chairman of the board.

Health Commissioner Francis E Fronczak, Dr Barton F Hauenstein, the department's laboratory director, and Dr Edward Durney, director of child hygiene, had insisted that an outbreak of the character of the present one will be beneficial. They said it would provide thousands of persons with a "natural immunization" to protect them from more virulent strains of the disease germ in the future.

Dr Bauckus' two fellow physicians on the board—Dr Louis W La Mantia and Dr Stephen L Walczak—indicated agree-

ment with the views of the commissioner and laboratory head.

The matter came up when Dr Bauckus declared he was disturbed by the large increase in scarlet fever cases.

"We practically have an epidemic on our hands," he asserted. We haven't had such an outbreak since the epidemic of 1909, which took 168 lives."

"But the present outbreak is not an epidemic," Dr Fronczak countered. "And furthermore, the strain of the disease is the least virulent we have ever had. There hasn't been a death and there are no complications. Thousands of persons are being immunized naturally and they are being immunized for all time. The next outbreak might be highly virulent and these persons will escape."

Citing economic loss to families and possibility of ear and kidney complications, Dr Bauckus declared he disagreed with the view expressed, and said he favored a program of immunization by inoculation.

On February 22, Dr H M Zimmerman discussed "Cerebral Hemorrhage and Infarction" before the section of pathology of the Buffalo Academy of Medicine, on February 24, Dr Clark W Heath spoke on "Diagnosis and Treatment of the Blood", on March 1, Dr Donald Guthrie addressed the surgery section on "Cancer of the Breast", on March 8, Dr C A. Aldrich addressed the section of medicine on "Chronic Nephritis and Nephrosis in Children", on March 7, Dr Willard M. Allen spoke on "The Corpus Luteum Hormone," and on March 15, Dr Otto S. Crebs addressed the section of obstetrics and gynecology on "Sterility."

Essex County

A community meeting on "Guard Against Syphilis, Enemy of Youth," was held at Memorial Hall, Mineville, on March 1.

Mr Donald Charles, Supervising Principal of the Mineville high school, presided at the meeting, which was preceded by a musical program. Dr Thomas J

Cummins, health officer for the town of Moriah and superintendent of the Mineville Hospital, presented Dr Joseph P Garen, District State Health Officer, who spoke on "Guarding Against Syphilis."

One of the new photographic exhibits of the American Social Hygiene Association had been loaned to the Essex County Tuberculosis and Public Health Association, and was on display at the Mineville meeting. The talking film "For All Our Sakes" was also shown, through the co-operation of the Essex County Y.M.C.A.

Dr Violet McCasland of Moriah, President of the Essex County Medical Society, assisted in the discussion.

Franklin County

Dr J Woods Price was re-elected president of the Saranac Lake Society for the Control of Tuberculosis at the 32nd annual meeting in the John Black room on February 24 and all other officers of the society and members of the executive committee were also named to serve for another year.

Re-elected with Dr Price, were Dr E N Packard, vice-president, Ernest H Wood, secretary, and Mrs Lawrason Brown, treasurer.

Fulton County

Dr Frank van der Bogert of Schenectady was guest speaker at the monthly meeting of the Medical Society of Fulton County held on February 16 at Hotel Johnstown.

The subject of Dr van der Bogert's lecture was "Variation of Temperature in Children."

There were about 30 members present. The meeting was followed by a luncheon.

Genesee County

Dr C F McCarthy, Auburn physician and former health officer of Batavia, addressed a special meeting of the Genesee County Medical Society on February 23 at the courthouse in Batavia, on "The County Laboratory as an Asset to the Community." Since the recent death of

Dr Frederick Dorr Carr, for years head of the Genesee County Laboratory, a movement is on foot to take over this laboratory and reorganize it along the lines of the Cayuga County Laboratory and ask for state aid

Dr Carr, fifty-six, well-known Batavia surgeon and roentgenologist and director of the Genesee County Laboratory since its establishment nearly twenty-seven years ago, died on February 12 at the Batavia Hospital. He was stricken with a coronary embolism while apparently making a normal recovery from an emergency throat operation.

The directors of the Batavia Hospital adopted resolutions saying "Every department of the Hospital has received the impact of Dr Carr's constructive suggestions in the years past, and we learned to value his judgment when for several years he was a member of this board, and gave unsparingly of his time and energy.

"Vital in word and deed, essentially a man of action, he spurred all who came in contact with him to improve and increase our various facilities and services."

Kings County

The program of the Medical Society of the County of Kings on February 21 included these addresses "Clinical Aspects of Hypertension," William Goldring, M. D., F. A. C. P., Manhattan, "Surgical Approach of Hypertension," Frederic W. Bancroft, M. D., F. A. C. S., Manhattan.

The Friday afternoon lectures in March were

March 3, "Recent Contributions to the Aid of the Clinical Cardiac Examination," by Dr William Dressler,

March 10, "Errors in Diagnosis and Treatment of Heart Diseases," by Dr William Dressler,

March 17, "Modern Approach to the Early Diagnosis of Pulmonary Tuberculosis," by Dr James Alexander Miller,

March 24, "Sub-Deltoid Bursitis—Its Pathology, Differential Diagnosis and Office Treatment," by Dr Joseph E. Milgram.

Addresses on gland disorders, heart trouble, and asthma featured a meeting of the Brooklyn Society of Internal Medicine in Kings County Hospital on February 24. Speakers were Dr Henry Fernblatt, Dr Henry Wolfer, and Dr George A. Merrill. Dr Henry Monroe Moses is president of the group.

Dr Soma Weiss, professor of medicine at Harvard Medical School, spoke at the scientific session of the meeting of the Williamsburg Medical Society at the Leon Louria Memorial Auditorium of the Jewish Hospital, St. Mark's and Classon Avenues, on March 13.

Officers are Dr Irwin Siris, president, Dr Charles Goldman and Dr Henry Louria, first and second vice-presidents, Dr Jesse M. Levitt, treasurer, and Dr Samuel Millman, secretary.

Dr Lawrence J. Morton, who died of a heart ailment after a brief illness at his home, 8802 Fort Hamilton Parkway, on February 26, at the age of seventy-eight, was long identified with civic activities. He had practiced medicine in Brooklyn for more than half a century. Born in Truxton, N. Y., he graduated from the Long Island College Hospital in 1884. He served as intern in the Kings County Hospital and for several years was superintendent of the medical division of that institution. He finally became a specialist in neurology and from 1903 to 1918 maintained a private mental sanitarium at his Fort Hamilton Parkway home. For thirty-three years he was a member of the St. Mary's Hospital staff.

Dr Wilbur L. Rickard, seventy-one, one of the oldest physicians in the Stuyvesant section, died on February 15 of pneumonia in his home, 390 Stuyvesant Ave., after a short illness. Dr Rickard had practiced for the last forty-nine years and during all but a few years of that period he practiced in his home area.

Dr Lottie A. Cort, one of Brooklyn's oldest women physicians and a founder of Chiropean, died in her home, 89 Division Ave., after a short illness, on February 14. She practiced medicine in Brooklyn fifty-five years. She also was a prominent

suffragist in the early days of the movement, and was one of the founders of the Elizabeth Cady Stanton Political Equality League.

Monroe County

Physicians of Monroe County plan to guard against all dangers in the use of sulfapyridine. At a meeting of the pneumonia committee of the County Medical Society at the University Club on March 3 there was a discussion regarding measures to avoid harmful effects.

Remarkable results in curing pneumonia with the use of sulfapyridine in hospitals of Rochester and other cities are told.

But unless extreme care is taken to guard against injurious effects the life of a patient may be endangered by the drug itself.

Dr. David Rutstein of the State Health Department's pneumonia bureau led the discussion.

While advising caution in handling the new drug, Dr. Edward G. Whipple indicated that the proper course for medical men is to continue use of serums which have been proved effective in treatment of five of the thirty-two types of pneumonia.

Because of the surprising success of the new drug the public is clamoring for its use in all pneumonia cases. Since there is also danger of bad effects from it, serums of undoubted efficacy will be used for the types in which they have been proved successful.

At the same time physicians will use sulfapyridine guardedly, gaining the benefits of discoveries concerning use of the drug as they are made.

The regular meeting of the Medical Society of the County of Monroe was held March 21 in the new Academy Home at 1441 East Avenue, Rochester. The speaker was Dr. Thew Wright, Assistant Professor of Surgery, University of Buffalo Medical School, Buffalo, and his subject was "The Treatment of Diffuse Peritonitis due to Perforative Appendicitis."

This was the first meeting in the new Academy building. In the business sessions, consideration was given to the reports of chairmen of special and standing committees, including those on legislation, public relations, public health, anesthesia, and self-medication.

Cost of medical care of Rochester's welfare clients increased more than \$44,000 in 1938 over 1937, figures show.

Incomplete figures issued by Dr. Arthur M. Johnson, health officer, and Dr. Sol J. Applebaum, medical director, Welfare Department, include operation of Municipal Hospital, care of the indigent sick in their homes, and money advanced to other city hospitals for care of welfare patients either in the outpatient departments or in the hospitals.

Gross total of the expenditures in 1938 exceeded \$705,000. In 1937 the same gross was a little more than \$659,000.

Dr. Samuel Case Jones, eighty-three, a practicing physician in Rochester for fifty-three years, died March 1. He had been in ill health for more than three years.

Montgomery County

The Medical Society of the County of Montgomery participated in a scientific program at a meeting in the Elks Club in Amsterdam on February 28. The program was on "Dry Clinic" and consisted of papers on "Charcot Joint" by Dr. Martin F. Geruso, "Hodgkin's Disease" by Dr. A. J. Townley, of Fonda, "Acute Osteomyelitis" by Dr. George C. Ferguson, "Calculus Anuria" by Dr. C. A. Spence, "Hypernephroma" by Dr. Lew H. Finch.

Nassau County

The Nassau County Medical Society has endorsed legislation restricting licensing of professional men to citizens.

Dr. Eugene H. Coon of Hempstead, chairman of the society's legislative committee, approved the stand taken by the legislative bureau of the state medical

society, supporting the bill recently introduced in the assembly

The program of the Nassau County Medical Society on February 28 included a paper on "The Prophylactic and Therapeutic Uses of Convalescent Measles and Convalescent Scarlet Fever Serums," by William Thalheimer, M D, Manhattan Convalescent Serum Center, New York City

The Medical Society of Nassau County is established in new and larger quarters on the ground floor at 1551 Franklin Avenue, Mineola. For ten years, the society maintained its business office on the second floor at 1527 Franklin Avenue. Dr Louis H Bauer of Hempstead, president of the society, said that the headquarters of the Nassau County cancer committee which have been in the society office will continue in its new offices.

Moving operations were directed by J Louis Neff, executive secretary. Martha T Ackerson will remain as office manager of the society, and Barbara Heusner as clerical assistant, it was announced.

New York County

A large gathering of New York physicians attended on February 27 a symposium on the proposed national health program, recently transmitted to Congress by President Roosevelt. The meeting, held at the New York Academy of Medicine under the auspices of the Medical Society of the County of New York, was addressed by various physicians on the pros and cons of the proposals for health insurance, as follows:

(1) "A Review of the National Health Program Proposed by the Interdepartmental Committee to Coordinate Health and Welfare Activities"—Martha M Eliot, M D, Chairman, Technical Committee on Medical Care, by invitation. (2) "The Responsibility of the Physician Toward a Health Program"—John P Peters, M D, Secretary, Committee of Physicians for the Improvement of Medical Care, by invitation. (3) "Compulsory Health Insurance"—Samuel J Kopetzky, M D. (4) "Medical Indemnity

Insurance"—Frederic E Elliott, M.D., by invitation. Discussion: Haven Emerson, M D, Harry S Mackler, M D, George Kosmak, M D, Kingsley Roberts, M D, Peter M Murray, M D.

A reorganization of the New York City Department of Education Medical Board will take place soon, it is learned.

Assurance that the board will be revised to include "qualified psychiatrists," was given to 400 teachers attending a conference of the Teachers Guild on March 6 by Dr Jacob Greenberg, associate superintendent in charge of personnel.

Dr Greenberg said he wanted to "debunk" reports that there are 1,500 "insane" teachers in the school system. Over a period of fifteen years, he declared, 1,080 teachers were found to be suffering from mental and physical disabilities.

Of that number, 60 per cent "are mental and emotional cases," Dr Greenberg disclosed, adding that this indicated "the maximum number of suspected mental cases per year was twenty-four."

The Society of Medical Jurisprudence devoted its meeting on March 13 at the New York Academy of Medicine to a consideration of the "lie detector" and the detection of deception, with addresses by Joseph F Kubis, Ph D of Fordham University, and E P Caffey, of the Federal Bureau of Investigation.

The Bureau of Social Hygiene of the Department of Health, New York City, announces Part Two of the course in "Social Hygiene" for physicians, nurses, teachers, and other interested persons.

Lectures are being given on Saturday mornings at 10 30, in the Department of Health Building, 125 Worth Street, conference room, second floor. Each lecture is repeated on Tuesday afternoons, at 4 00, at 130 Leonard Street, in the Department of Health Building, clinic waiting room. Two opportunities to hear each lecture are thus offered.

PART TWO

April 1 and 4, The Social Worker, the Nurse, the Investigator, by Kathryn A Loughrey.

April 8 and 11, Nonsyphilitic Venereal Skin Diseases, by Dr Boris Kornblith.

April 15 and 18, Gonorrhea—in Adults and Infants, by Dr Michael Wishengrad

April 22 and 25, Diagnostic Laboratory Procedures, by Mr John Koopman

April 29 and May 2, Treatment as a Means of Control, by Dr George Hogan

May 6 and 9, Prostitution and Community Syphilis, by Dr Walter Clarke.

May 13 and 16, Discussion

The following lectures will be given on Friday afternoon at 4 30 at the New York Academy of Medicine

April 7, The Endocrinological Basis for Gynecological Organotherapy, Emil Novak, M.D., Baltimore,

April 14, Hemorrhagic States—Recent Clinical and Therapeutic Developments, Paul Reznikoff, M.D.,

April 21, Chronic Nontuberculous Pulmonary Infections, Louis Hamman, Baltimore, and

April 28, Status Hypoplasticus its bearing on all fields of medicine and a discussion of the automatic compensatory mechanisms involved, Walter Timme, M.D.

The Bureau of Social Hygiene, with the approval of the Section of Dermatology and Syphilology and the librarian of the Academy of Medicine, will prepare an exhibit for the cases in the library. The subject is "Contributors to the Knowledge of Congenital Syphilis."

The exhibit will officially open on April 28. This is the date of the open meeting of the section of Dermatology and Syphilology, to the physicians of the city on noncutaneous manifestations of syphilis.

Sanford V. Larkey, M.D., of Johns Hopkins, will speak at the New York Academy of Medicine at 8.15 on April 13 on "Health in Elizabethan England."

Dr Angenette Parry, formerly a leading obstetrician in New York City, and long a leader among women physicians, died on March 1 of a cerebral hemorrhage at the Massachusetts General Hospital,

Boston, after a two-weeks' illness. She was eighty-one.

Dr Parry was personally decorated by the Greek government in 1931 with the Silver Cross Chevalier Savior for her work among refugees as head of the American Woman's Hospital at Kokina, near Piraeus, port of Athens, Greece. She was decorated by the French government as a member of the executive committee of the American Women's Hospitals.

Dr Parry was a past president of the American Medical Women's Association and of the Women's Medical Society of New York State. It was while she was president-elect, in 1917, of the former organization that it founded the American Women's Hospitals, an organization with headquarters here that has done philanthropic work in many nations, operating hospitals and clinics and cooperating with the Near East Relief, the Red Cross, and other groups.

Niagara County

Dr Jesse G. M. Bullowa, of New York City, addressed the Niagara County Medical Society at a meeting on February 16 on serum treatment and other newer phases of the attack on pneumonia.

Onondaga County

The program of the Onondaga County Medical Society, on March 7, included these addresses: "Recent Advances in Pneumonia Therapy," Dr E. C. Reifstein, discussion open by Dr H. Van Zile Hyde, and "Diverticulitis with Perforation" by Dr Fred L. Ritter, discussion opened by Dr Lee A. Hadley.

Features of the meeting of the Obstetrical Society of Syracuse Hospitals on March 14 were

- (1) Anonymous Case Reports of Maternal Mortalities—1939,
- (2) Paper: Cesarean Sections in Syracuse 1937–1938, Dr Raymond J. Pieri,
- (3) Election of officers.

The 20th birthday of the Onondaga County Health Association was celebrated

at a luncheon on February 27 at the Hotel Syracuse. Approximately two hundred citizens gathered for the occasion to hear Mr Homer Folks, Secretary of the State Charities Aid Association, deliver the principal address. Mr Folks reviewed briefly the control of tuberculosis in Syracuse and Onondaga County.

After reviewing some of the principal public health achievements in Syracuse, including the demonstration of public health administration which was carried on by the city with the assistance of large grants from the Milbank Memorial Fund, Mr Folks said:

"The most important thing that can be asked, perhaps is: What has all this effort to prevent tuberculosis amounted to? Has it had any effect on the volume of tuberculosis in Syracuse? On the number of deaths? That question can be answered convincingly. In a word, the death rate from tuberculosis in Syracuse, after making all corrections as to Syracusans dying from tuberculosis outside of the city, is as follows:

"In 1907, it was 143 per 100,000 population, in 1938, it was 30, slightly more than one-fifth that of 1907.

"Still more encouraging, perhaps, is the fact that in the past decade, from 1929 to 1938, it has been reduced by slightly more than one-half."

Ontario County

Use of protamine insulin in the treatment of diabetes was explained by Dr George B. Andrews, of Syracuse Memorial Hospital, in a talk before the Geneva Academy of Medicine at the Geneva Country Club on February 16. Dr Andrews filled in for Dr William A. Groat, president of the Medical Society of the State of New York, who was ill and unable to fulfill his speaking engagement.

Discussors of Dr Andrews' talk were Drs T. W. Maloney and P. W. Skinner, of Geneva, G. E. Welker, of Dresden, and E. M. Wellbery, of Waterloo.

Orange County

"A new method of informing its mem-

bers of current happenings of interest has been instituted by the Orange County Medical Society. It consists of a monthly bulletin presented in an attractive folder, and mimeographed sheets of letter-size, suitable for filing. The initial number, Vol 1, No 1, January 39, gives officers, committee members, and roster of the society for 1939. Later issues featured, for February, the President's message, and for March, a symposium on Tuberculosis in Orange County, as well as the scientific programs projected by the staffs of the various hospitals of the county for the ensuing month. This new departure of monthly news letters should prove stimulating to the interest in county medical activities, and the cost of the undertaking has been assured by advertising obtained for the publication."

Dr Martin Cole, 89 years old, of Hanesville, died on February 25 after a fall. He had practiced medicine in that region all his professional life.

Oswego County

Dr Jeremiah T. Dwyer, 68 years old, who died in Oswego on February 27, had practiced medicine there for nearly 48 years.

Queens County

State Superintendent of Insurance, Louis H. Pink, in an address before the Queens County Medical Society in Forest Hills on February 28, urged physicians to give careful study to compulsory health insurance and socialized medicine wherever it is in operation so they could learn both its weaknesses and its strong points.

Refusing to take sides in the controversy, Mr Pink related facts and figures showing advantages and disadvantages of voluntary hospitalization and medical plans.

"Both the governor and the legislature have indicated that the problem is one which requires further deliberation.

"Every effort should be made to develop voluntary action among our citizens before the state or the nation embarks

upon a program of compulsory insurance," he said.

As a climax to the antituberculosis campaign of the Medical Society of Queens, plans are being furthered for provision of rapid, low-cost x-ray service at the society's exhibit in the Medicine and Public Health Building at the World's Fair.

A contract for 500 square feet of space in the building has been signed by Dr Joseph Wrana and Dr Frank Mazzola, president and secretary of the society, respectively, and Grover Whalen, president of the Fair Corporation.

It is expected that an average of 1,000 radiographs, including x-ray pictures and brief case histories, will be sent daily to the personal physicians of applicants for the service, which will cost \$1. No diagnoses will be given at the Fair grounds.

Dr Chas. Gordon Heyd spoke at the Queens County Society Building at 430 on February 17 on "Disease of the Gall bladder and Bile Ducts," and Dr James T. Gwathmey, on March 3, on "Anesthesia in Labor."

Rensselaer County

Physicians from Rensselaer and neighboring counties met at Troy Hospital on March 2 to hear national authorities on the treatment of pneumonia.

The all-day institute was conducted by the Medical Society of the State of New York through the Rensselaer County Medical Society in cooperation with the New York State Department of Health. Dr Maxwell Finland, of the Harvard Medical School, and chief of the pneumonia control division of the Boston City Hospital, discussed the new remedies.

The morning program was opened by Dr A. J. Hambrook, chairman of the public relations committee of the New York State Medical Society. Greetings from the Troy Hospital staff were given by Dr J. J. Quinlan.

A talk on the early diagnosis of pneumonia was given by Dr Norman Plummer of New York City, associate professor of medicine at Bellevue Hospital Medical

College. Dr A. H. Harris of the division of laboratory and research of the State Department of Health spoke on "Bacteriological Diagnosis of Pneumonia."

The state's pneumonia control program was described by Dr A. D. Langmuir of Albany, pneumonia consultant of the State Department of Health.

Through such programs the pneumonia mortality rate has been reduced in the last ten years and the disease is now under much better control.

During the afternoon a panel discussion of the morning's topics was held, followed by sound moving pictures on pneumonia.

Luncheon was served for the group by the Troy Hospital.

Rockland County

As guests of the Secretary, Dr William J. Ryan, approximately fifty members of the Medical Society of the County of Rockland attended a medical meeting which was held at the Summit Park Sanatorium (recreation hall), Pomona, New York, on Monday evening, February 27. Dr Julius Pomerantz, president of the Society, presided.

The principal address of the evening was given by Dr Ryan, his subject being "Modern Medical and Surgical Methods in the Treatment of Pulmonary Tuberculosis" (illustrated with lantern slides, and demonstration of cases).

To illustrate the importance of scientific rest in the treatment of pulmonary tuberculosis, Dr Ryan showed slides of 'before' and 'after' the rest treatment was established. Other slides, giving graphic evidence of how the disease was cleared up by the institution of artificial pneumothorax and thoracoplasty, were also shown. Patients who had undergone surgical methods were introduced to illustrate the results of this form of treatment.

Preceding Dr Ryan's address, a sound movie film on "Diagnostic Procedures in Tuberculosis" was shown.

Discussion was opened by Dr Joseph R. Morrow, superintendent of Bergen Pines, Oradell, New Jersey.

Dr Douglas R. Gordon, superintendent

of the O'Dell Memorial (Orange County Tuberculosis Sanatorium) at Newburgh, New York, and Dr Harry L Chant, District State Health Officer at Middletown, New York, both commented on the work done at Summit Park

The evening's program also included a brief talk regarding "Volunteer Free Blood Donors to the Indigent," which was given by Mr C Ray Ackerman, president of the Rockland County Emergency First Aid Council

Following the meeting, a steak dinner was served in the main dining room of the hospital

Warren County

Dr E F Roberts, of the Lederle Laboratories, presented a film on "The Management of Pneumonias" at the meeting of the Glens Falls Academy of Medicine on February 23

Westchester County

The meeting of the Westchester County Medical Society on February 21 at New York Hospital, Westchester Division, White Plains, was one of the largest and best meetings in the society's recent history. More than two hundred members were in attendance to hear the address of Dr Samuel A Levine of Boston, on "The Value of Auscultation of the Heart." Seldom has a more comprehensive and thoroughly practical review of a subject of general interest been offered to the society.

Discussion of Dr Levine's paper was opened by Dr Arthur F Heyl of New Rochelle, others who took part included Dr William J Vogeler of Yonkers and Dr Reginald A Higgons of Port Chester.

The Public Relations and Medical Economics committees announced that they are jointly making a study of contracts existing or contemplated between mutual aid associations, lodges, etc., and individual members of the society. These committees reminded members of the society that they are expected, under a resolution adopted in April, 1938, to submit new contracts to the society for approval as to their ethical aspects before

accepting them, and that failure to do so is tantamount to unethical conduct.

A special address was given by Mrs Grace S Woods, R N, Executive Secretary of District 13, the New York Counties Registered Nurses Association, on "A Central Nursing Bureau for Westchester County." The plan for a Central Nurses Registry is expected to overcome many of the difficulties reported in recent years by doctors and residents in Westchester County, in securing adequate nursing service.

Through the cooperation of alumni associations, directors of nursing service in the hospitals and institutions, as well as visiting nurse associations, more than 2,200 nurses in the county have recently been circularized and a large number have indicated their wish to be affiliated with a Central Professional Registry.

The registry will be located in White Plains and will give a twenty-four-hour service. The telephone exchange will be set up on a countywide hookup, and service will be available from all parts of the county at the cost of a local message.

The objectives of the registry are to supply directly or indirectly adequate nursing service to all who need it, in home or hospital, by providing the services of registered nurses for private duty service, hourly nursing service, institutional nursing service, and for doctors' offices and other positions. The registry will supply practical nurses, nurse attendants, technicians, dieticians, and other medical workers.

A notable forum on "Control of Cancer" was held in Yonkers on March 1 and 2, with a distinguished array of speakers, under the sponsorship of the City Health Department, Yonkers Academy of Medicine, Board of Education medical department, all Yonkers hospitals, the Yonkers Tuberculosis and Health Association, Yonkers Visiting Nursing Association, City Welfare Department, Yonkers Council of Social Agencies, Yonkers Coordinating Council, Yonkers Council of Parents and Teachers, Mothers Clubs of the parochial schools and the Westchester Cancer Committee.

A dinner meeting was held by the New Rochelle Medical Society on February 13 at the Wykagyl Country Club. Dr Charles Hendee Smith, pediatrician, of New York City, spoke on "Hygiene and Diets in Children," and an interesting discussion on general pediatric subjects followed.

The Yonkers Academy of Medicine held a stated meeting at the Amackassin Club on February 15. Dr Henry C

Folk of New York City presented a paper "Management of Infected Abortions."

The Yonkers Visiting Nurse Association has announced a series of classes open to all married men at which instruction will be given in the duties of an "Expectant Father." The class teacher is Dr James T Gorton, Surgeon Emeritus of St. John's Riverside Hospital, who will discuss the various duties and responsibilities of daddies-to-be.

Correspondence

To the Editor

In number 6 of the Journal is an error in the Editorial "Prevention of Deafness" that might puzzle the less expert in otology. Speaking of middle ear deafness it obviously should read "impairment of hearing for the low tones and good hearing for the high tones."

Paul G Frank, M D

Kew Gardens L. I

Mar 22, 1939

In their article, Crowe and Baylor demonstrate the early loss of hearing acuity for the high tones as measured by the 1 A audiometer and emphasize that this finding controverts all prior conceptions of the type of hearing loss in early conduction deafness in children. For details, refer to their publication in the *Journal of the American Medical Association*, Feb 18 1939, page 585.—Editor

I DO NOT LOVE YOU DOCTOR FELL YOU CARVE TOO FLUENTLY AND WELL

I do not love you, Doctor Fell the reason why, I'll briefly tell

The doctor of the olden days had kindly words and pleasant ways and though his pills were on the bum and sent folks off to Kingdom Come, and though he liked to swell the hosts of skeletons and sheeted ghosts it never was his foolish plan to use a saw on every man. Unlike the modern maniacs, who carve their patients with an axe, he dealt out calomel or mix and soaked us for a pair of bucks and if he killed us—good old soul! he left us to be planted whole.

When I am sickly and unstrung you ask me to unfurl my tongue you feel my pulse and prod my back, and say my liver's out of whack and then you shed your vest and coat, and push a lantern down my throat and say "Great Caesar! What a heart! I'll have to take you all apart. And on your table I am laid while you go out to hunt a spade, to dig around among

my works and find the blamed old germ that lurks around the angles of my frame—the way you carve me is a shame.

When winter comes with frost and snow I have a chilblam on my toe and when for liniment I beg you want to amputate my leg and when my throat gets sore and raw you want to cure it with a saw to cure my baldness you I ween would run me through a guillotine. A leg of mine is now at rest among the doctors of the West an Eastern doctor has in brine about eight inches of my spine the jaw that once adorned my mouth, is kept in pickle in the South.

I do not love you Doctor Fell you carve too fluently and well I fear you and your edged tools I'll send to correspondence schools for absent treatment when I'm ill—or hit the good old-fashioned pill.

Walt Mason in the *Emporia Gazette* and *Ill Med J*

The Women's Medical Society of New York State

Welcomes all Medical Women—City, State, National, and International

THE Annual Meeting of the Women's Medical Society of New York State will be held on Monday, April 24, 1939, at the Onondaga, Syracuse

There will be a Councillors' Meeting in the morning from 9 30 A M until 12 M , which will conclude with the election of officers Luncheon will follow at 12 30 P M

The afternoon will be devoted to a scientific program by women outstanding in their lines, from various sections in the state

Distinguished speakers will give us important messages at the dinner on Monday, April 24, at 7 00 P M at the Onondaga

On Sunday afternoon, April 23, from five to seven o'clock, at the Onondaga, there will be a reception to Dr William A Groat, the officers, delegates, and members of the Medical Society of the State of New York and their ladies A moving picture by Dr Dyer of "A Trip Around the World" will be shown

We are looking forward to greeting our many distinguished medical women and their friends Dr Clara Pierce and her committee of arrangements will be most happy to be of service to this end

Hospital News

Motor Service for Needy Outpatients

QUEENS GENERAL HOSPITAL cares for the sick in the hospital buildings, and visiting nurses help the sick in their homes

But until Mrs Hendrick Hendrickson of Laurelton organized the Queens General Hospital Motor Corps, says *The Long Island Press* (Jamaica), there was no way in which many needy outpatients could be transported between their homes and the clinic

It meant that some patients who could otherwise have gone home after operations or illnesses had to be kept in the hospital for treatment, occupying beds that others were waiting to use

It also meant hardships for many who had to mount the high steps on buses, wait in the cold or rain and arrive home after their clinic visit so exhausted that their treatment was less effective

How It Began

Mrs Hendrickson, who has done voluntary social work all her life, was a member of the Committee for Queens of the New York City Visiting Committee when the new Queens General Hospital was opened November 18, 1935

Known by hospital attachés for her untiring work for others, it was soon after the hospital opened that Mrs Hendrickson was called upon. A patient who had undergone a major abdominal operation and had gone home had not returned to the clinic for treatments. Because there were several drains still in the patient's body, the Social Service division of the hospital sent a postcard telling the patient she must come. She sent a card saying she had no way of getting to the clinic. She didn't live near a bus stop, there was no car in her family, and she could not afford a taxi.

Mrs Hendrickson said she would act as chauffeur and drove to the home and brought the patient to the hospital

While Mrs Hendrickson was waiting to bring her home, she received another SOS. A patient in the hospital was discharged and could go home if she had her clothes. There was no one at home to bring them to her, and no one knew what to do. Mrs Hendrickson said she would get them, and the problem was straightened out at once.

More Drivers Enlisted

When she returned with the clothes, Mrs Hendrickson waited and then drove the second person home.

It was then that Mrs Hendrickson conceived the idea of the Motor Corps. She knew women who had cars and some spare time. She looked around in the clinic and saw the crutches and casts that bore testimony to the hardships the patients went through to get to the clinic.

It wasn't long before she enlisted a few of her friends and their work started. The names and addresses of patients who were to be transported were supplied by the Social Service, and the women, under the supervision of Mrs Hendrickson, divided the list.

Mrs Hendrickson soon found that the ride to the hospital and back represented more than a clinic visit to most of the patients. For most of them, the trip was their only fresh-air jaunt between long and dreary shut-in periods. It was an adventure, a pleasure trip, and a rare holiday, all in one.

The women in the corps devote as much time to the work as they please. They may volunteer for only one morning or afternoon a month or for part of every day. They may choose the communities from which they are to take patients and they may choose the type of patients they wish to drive.

"We're not expected to be anything more than drivers," Mrs Hendrickson explained. "The Social Service gives us

their names and takes care of their problems. There is no expense, other than gas and oil, involved."

There is nothing, however, which prevents the women from providing extra services, and one who never refuses a favor is Mrs. Hendrickson. When her patients are too ill to go to the clinic, she gets their prescriptions and cuts yards of red tape to get their medicines and bring them to the homes. She drives miles out of her way to let her patients see the World's Fair grounds.

She knows instinctively when a patient, through no fault of his own, is becoming a burden to his wife or children and keeps him in the car while she calls for others, in order to let his family see a moving picture or otherwise spend a free afternoon.

Hospital Grateful

Not only the patients and their families but the hospital authorities realize fully the benefit of the corps.

"This service is invaluable," Dr. Marcus D. Kogel, superintendent of the hospital, told the reporter.

"Their work is so valuable that I have mentioned the corps twice in my annual reports to Commissioner of Hospitals, S. S. Goldwater. Especially important for cancer cases, it allows many sufferers to come for radiation treatments where they might not otherwise be able to make the trips.

The work saves beds for the hospital. It also makes it possible for patients to come the easy way instead of the hard way."

Many grateful letters are written to the hospital from patients and their families.

One Richmond Hill woman wrote after her husband's death that so thankful was the family for the help extended to him that his seven children had taken a vow to help the Motor Corps and the hospital in any way they could. One boy had

started to donate blood to the hospital blood bank.

No Contagious Cases

Not one of the cases of the clinic or hospital are contagious. Contagious cases are not accepted at the hospital, much less the clinic.

Because Queens was forced to get along without a city hospital for so many years, the clinic is crowded with patients who suffered without proper medical attention for years, making the work of the clinic heavier than it would be had there been a hospital here before.

Mrs. Hendrickson finds herself devoting at least a part of every day to work of the corps.

"If a patient lives in Glendale, for example, he must take two trolleys and a bus to get to the hospital," she pointed out. "This means not only physical torture but thirty cents fare for the trip there and back. Usually the patient is accompanied by another member of the family, making the cost sixty cents. By automobile it is only a twelve-minute run. Most of these people are on relief, and the cost of their fare sometimes means that they will do without food or other necessities."

Patients Cheerful Company

"Some women may think the patients they drive are unpleasant sights, but you'd never know anything was wrong with most of them. Besides, they're so happy to be out that they're usually very cheerful company."

"I've had women tell me they would like to do this work but are afraid of having accidents. I always tell them it's no more of a risk than driving friends home from a bridge party. Besides, I sincerely believe that there is very small chance of anything happening to people bound on errands of mercy. The women are not expected to work during weather that is dangerous for driving."

The new Welfare Hospital for Chronic Diseases, on Welfare Island, New York City, will be opened on July 1, at a cost of almost \$8,000,000.

Substandard Hospitals

THE American Medical Association shows 6,128 hospitals in the latest list of registered hospitals. The American College of Surgeons has approved 2,664 of these, leaving 3,464 which are below standard, which means that they are honest but are not rendering adequate service, observes the editor of *Hospital Management*. Practically all these are below standard because pathologists and radiologists are not available to give the necessary service or because they are so short of funds that they cannot provide proper facilities. In almost every instance, hospitals are doing their best to give a service which will be approved, but find it impossible for one or other of the two reasons stated above. What is the answer?

Pathologists and radiologists are not available in sufficient number to supply all the hospitals and they are not needed. Large or small groups of hospitals in any given territory can combine to secure laboratory service from a trained pathologist and radiologist but it is expensive. The plan has been shown to be a success and where it is not adopted the reason is usually that money is not available.

Money is not available because of the enormous amount of free work which must be done. Bills for food and other supplies have to be met and the hospital has nothing left for anything that is not absolutely necessary to existence. Diagnostic and therapeutic facilities are therefore not made available.

The question then narrows down to the hospital receiving from one source or another the cost of caring for the indigent. In the days of prosperity, philanthropy took care of this class of patients, but apparently those days are gone forever. Profits from paying patients do not suffice to meet the deficit created. The only answer appears to be for the governmental authorities to meet their recognized responsibility of caring for these patients. With federal and other governments concerning themselves with the betterment of hospital care, a great deal of thought should be given to improvement of the 3,464 hospitals which are not rendering approved service because of financial difficulties. There could be no better place to expend any federal or state funds that can be made available.

"A Little Knowledge Is a Dangerous Thing"

THAT "a little knowledge is a dangerous thing," is the conclusion of Dr LeRoy F Hollis, superintendent of Oswego County Sanatorium at Orwell, as applied to self-diagnosis of physical condition by patients.

The observations and opinions of Dr Hollis are expressed in the leading article of *The Bug*, bimonthly publication of the patients at the sanatorium.

"The most difficult patients to treat are those who think, they know more than the physician or nurse and want to make their own diagnosis and suggest the treatment to be followed," the doctor states. Continuing, he writes

"They may have read some old family 'doctor book,' or had some old rumor handed down as to what to do for this or that ailment.

"You often hear the remark, 'it must be difficult to treat children and babies.' This is not so. Children and babies do not try to deceive you, they do not exaggerate their symptoms, they do not make a diagnosis of their troubles, they do not suggest treatment or tell you what John Smith's doctor did for him when he was sick. They have no opinion as to what their trouble is or how it ought to be treated. They themselves are very easy patients to treat, but alas, too often they

may have an old maid aunt or grandmother who have 'a little knowledge' and are prepared to impose it on the physician."

Where the Trouble Arises

"When a patient consults a physician it is evidence of itself that they have some confidence at least in the physician consulted or they would not consult him. After consulting the physician they should be guided by the advice of the physician and submit absolutely to the suggestions and treatment outlined. Right here is where the trouble often arises. The patient has or thinks he has some knowledge of his trouble. He may have a thermometer and can take his temperature, possibly his pulse and what few symptoms he is able to recognize he puts together and makes a diagnosis of his own—sometimes right, often wrong. He may dwell on these symptoms until he really believes he has some serious trouble which the physician may have difficulty in getting out of his mind."

"When the patient comes to the physician with his diagnosis all made up, if he is wrong, the physician should try to explain his error. On the other hand, if the patient is on the right track the physician should collaborate with the patient in making a diagnosis and suggesting treatment. In this way he will gain the confidence of the patient, which will materially help in the treatment—in fact no treatment will be of any great benefit to the patient unless there is mutual confidence between patient and physician," Dr Hollis states. He suggests if this confidence ceases to exist and cannot be re-established, the patient should either be discharged to some other physician, or he should consult some other physician in whom he has absolute confidence.

A wise man, be he patient or physician, never thinks he knows it all. It is often better for the patient to know nothing than know too much. This is the reason a baby or child is often easier to treat than an adult. That is why a little knowledge may be and often is a dangerous thing.

SERVING ON COMMITTEES

Serving on a committee of a county medical society is a task which should be taken seriously or not accepted at all, says *The Milwaukee Medical Times*.

Each committee member is under an obligation to serve faithfully and contribute something of real worth to his organization. Many do not realize this and are perfectly willing to let one or two members on the committee do all the planning and the work that is necessary. Are you that kind of a committeeman?

It might be interesting to consider the ideal member of a committee. What are his qualifications and how does he meet his responsibilities?

First he should have the interest of the medical profession at heart.

Second, he will give thought and study to the subjects which come up before the committee and will not just be one of those present. No committee can do much on behalf of the profession which is not made up of members genuinely

interested in the tasks to which they have been assigned and willing to give the time necessary to put through the plans evolved.

Third, he will make it a point to be on hand for all meetings unless his professional duties require him elsewhere. Nothing is so demoralizing to a committee as to have two or three out of ten or fifteen members present. There is no quorum therefore, no action can be taken. Those on hand become discouraged and unless interest is somehow stimulated they also drop out and the committee becomes dormant.

Fourth he will not allow one or two members to assume the entire burden for developing plans, but will contribute ideas of his own.

Committees can do much to improve the efficiency of medical societies because most of the planning is in their hands. Their personnel however should be carefully selected from among those men who will meet the qualifications here described.

Medicolegal

LORENZ J. BROSNAN, ESQ.
Counsel, Medical Society of the State of New York

Licensing of Foreign Physicians

IN TWO proceedings which came before the Appellate Division of the Supreme Court of this state for the Third Department, an important ruling has just been handed down by that Court which sustains the action of the Board of Regents in the action taken by them dealing with foreign physicians attempting to obtain licenses to practice their profession in this state *

The first of the petitioners who instituted the proceedings claimed that he had begun the study of medicine in 1912 and had continued it at various German universities until the fall of 1914. After the War he continued his studies and received a German medical license in July, 1922. The second petitioner claimed that at the beginning of the War he had completed certain medical courses in German universities entitling him to serve as an assistant physician in various hospitals until the end of the War, and that he received his license in June, 1919.

In 1937, both petitioners, attempting to obtain a license to practice medicine in this state, passed an examination in English and applied for admission to the January, 1938, medical licensing examination. Such examination was taken by one petitioner who received a passing mark in but two of the nine subjects, the other petitioner failed to achieve a passing grade in a single subject. The former was re-examined in the fall of 1938 and received a passing mark in but three of the subjects.

Subsequent to the January, 1938, examination, both applicants presented to the Board of Regents applications for endorsement of their German medical licenses in an attempt to be permitted to

practice without the requirement of passing the New York State licensing examination. The Regents denied the applications and indicated the reason as "because the evidence submitted

is not satisfyingly sufficient to warrant such indorsement, but that such denial shall be without prejudice to the right of the applicants to continue taking the medical licensing examinations."

The two foreign physicians thereupon instituted a proceeding in the Supreme Court in the nature of a mandamus proceeding applying for an order to compel the Board of Regents to indorse their foreign licenses without requiring them to pass the New York examination. The Court, at Special Term, after hearing the parties, ruled that questions of fact relating to the qualifications of the applicants were involved and directed that those questions should be tried at a Trial Term of the Supreme Court. From that ruling made at Special Term all parties appealed to the Appellate Division, the Board of Regents contending that it had properly denied indorsement to the two foreign doctors and they in turn claiming that they were entitled to automatic indorsement upon the papers they had presented.

As a preliminary proposition, the Appellate Division decided that the lower court had erred in directing a trial of the question of the qualifications of the two physicians, since such procedure would be an unwarranted review of the decision of the Board of Regents on proof which was not necessarily before the Board of Regents at the time it made the rulings complained of. The Court thereupon determined that the real problem before it was whether the action of the Regents in denying the applications was "arbitrary, unfair or capricious."

* In the Matter of the Application of Erlanger and Levi v. the Regents of the State of New York, *et al* decided March Term, 1939, by Appellate Division, Third Department.

The pertinent provisions of the Education Law under which the petitioners claimed they were entitled to indorsement of their license provides as follows:

"3 And the Regents shall have further power to indorse a license issued by a legally constituted board of examiners in any other state or country upon satisfactory evidence that the requirements for the issuance of such license were substantially the equivalent of the requirements in force in this state when such license was issued, and that the applicant has been in the lawful and reputable practice of his profession for a period of not less than five years prior to his making application for such indorsement. When the evidence presented is not satisfyingly sufficient to warrant the indorsement of such license, the Board of Regents may require that the candidate for indorsement shall pass such subjects of the licensing examination specified by statute or Regents' rule as should be required of the candidate to establish his worthiness to receive such indorsement."

The Court, in a well considered opinion written by Mr. Justice Heffernan, commented upon the purpose and effect of said statute as follows:

"The obvious purpose of the statute was to permit the Board of Regents to indorse a license issued by the licensing board of another state or country in those cases in every profession in which the applicant is unable to meet the letter of the requirements of the statute governing admission to the profession in which a license is sought but possesses essentially the same or equivalent qualifications necessary for a license. The power herein granted is a limited one, remedial in its nature, and must be exercised by the Regents with caution and with due regard to the statutes regulating the practice of medicine in this state. Certainly the Regents may not through the exercise of the power granted by this statute indiscriminately indorse foreign medical

licenses. The legislature has provided a way for these applicants to practice medicine. It was never intended that they should be allowed to enter by indorsement. Before the Regents can legally indorse a foreign license they should be satisfied that the applicant has substantially met all requirements. The Regents may not legally, through the exercise of the remedial power conferred by this section, admit to the profession those who have not met the requirements the legislature has established. If they err at all, it should be on the side of the protection of the public from unworthy and inefficient practitioners. This section was only intended by the legislature to apply to exceptional cases where the merit of the applicant is clearly established to the satisfaction of the Regents. The burden of proof is upon the applicant. He must not only prove that he graduated from certain institutions but he must also prove to the satisfaction of the Regents that these institutions are substantially the equivalent of the New York schools. He must not only prove that he has a foreign license but he must also prove to the satisfaction of the Regents that the requirements for that license were substantially the same as in New York.

The Court pointed out that Section 1256 of the Education Law provided a way by which foreign practitioners could by passing the licensing examination, become qualified to practice in this state. The fact situation was reviewed and it was pointed out that the petitioners had failed to sustain their contention that they possessed the necessary qualifications to be licensed to practice medicine in New York and in the course of the opinion the Court said:

"None of the institutions from which the petitioners graduated has ever been registered by the Regents or by the Department of Education as maintaining proper medical standards. In neither petition is there any allegation

that the German standards at the time the petitioners received their licenses were substantially the same as those existing in the state of New York. There is no proof whatever as to the equality of the German institution, including faculty, length of courses of study, curriculum, or equipment. There is no proof that petitioners ever passed a licensing examination as required in this state. As a matter of fact what little evidence there is before the Regents indicates that the standard of the German schools was lower than the standards in the State of New York and the requirements for the license were far from being essentially the same as those in New York."

In ruling that the Board of Regents had not acted arbitrarily or capriciously the Court stated

"It cannot be seriously argued that the Board of Regents acted either arbitrarily or capriciously in requiring petitioners to pass a satisfactory examination before indorsing their licenses. The State has the right to demand that those who seek to practice medicine and surgery or to diagnose and treat human diseases, ailments or deformities shall pass a satisfactory examination as evidence of skill and competency. Such a requirement is neither unreasonable nor discriminatory. Surely the best method to determine the skill and ability of an applicant is by direct examination. The relation of physician and patient is of such a confidential and serious nature that not only the skill but also the moral character of the physician is of great importance to the interests of the patient and the State. The object sought in requiring applicants to practice medicine to submit to examination is the protection of the home, of the sick and distressed from the intrusion therein in a professional character of those destitute of the proper qualifications. The preservation of public health is one of

the duties devolving upon the State as the sovereign power and the discharge of this duty is accomplished by means of the exercise of the inherent police power of the sovereign. We know from our own experience that practically all persons are obliged to consult a physician at some period of life and but few are able to judge of his qualifications in point of learning and skill and, because of the importance of the interests committed to his care involving life and death, it is imperative that the State should be vigilant in passing upon his qualifications. The field should only be open to those who possess the prescribed requirements. No one has a vested right to practice medicine free from State regulation and control. The right of a person to practice medicine is subject to the paramount power of the State to impose such regulations within the limitations of the Constitution as may be required to protect the people from ignorance, incapacity, deception or fraud in the practice of that profession."

As to one of the arguments urged by the petitioners, that it is not fair to subject a practicing physician to pass a technical examination which a medical student fresh from academic training would be better prepared to pass than a man in actual practice, the Court said

"We appreciate that there are physicians of standing in every community who perhaps might not be able to make ready answers with the same glibness as a tyro fresh from his books. Unquestionably, however, an examination would readily disclose a comprehensive knowledge of the fundamentals on their part. The results which petitioners attained in their examinations clearly spell inferiority and incompetency in the profession. A statute requiring itinerant physicians to submit to examination is justified by every consideration of public policy. Physicians who have

no fixed place of business, who are unknown to those to whom they tender their services and medicine, and who have no reputations for professional skill, honesty and fair dealing to maintain, should not be free to travel about the state in order to prey upon the fears and hopes of the afflicted and the unfortunate. The solicitation of patients by such physicians certainly is harmful to any community because of the opportunity it gives to them to discover ailments where none exist.

The Court also said

"To sustain the contention of petitioners would mean that any foreigner who can speak our language and who has been licensed to practice in a foreign country and who actually practiced there for a period of five

years could upon the moment of his arrival at the port of New York, demand the issuance of a license to him to practice his profession in this state. Surely that was never the intent of the legislature. Our own citizens must pursue a rigorous course of study and supply evidence of good character in order to practice medicine (Education Law, sections 1256, 1257), and yet, if petitioners are correct, any foreigner who was authorized to practice medicine in his native land can come into the State of New York and be immune from such requirements."

It should be noted that this decision was made by the Appellate Division and that it is possible that the matter may be carried to the Court of Appeals for its final determination.

Treatment of Injury to Hand

A MAN who had been engaged in work on a construction job was referred to a general practitioner for the treatment of an injury to his hand sustained by him when he was struck in the hand with a pick. The doctor found a deep irregular laceration 1 inch long on the dorsal surface of the right hand with severe hemorrhage. Examination gave no evidence of dislocation or loss of function and for that reason no x ray was taken. Tetanus antitoxin was administered and the wound sutured and dressed. The doctor saw the man from time to time for a period of about two weeks and on each of those occasions the wound was sterilized and dressings applied.

It seems that later x rays were taken which revealed a fracture of the second metacarpal bone of the hand. Another physician treated that condition with splinting and physiotherapy and he was

discharged as being able to work at the end of about six weeks after the original injury.

The patient not only made claim for workmen's compensation payments but also instituted a malpractice action against the physician who first treated him based upon the claim that the defendant had negligently failed to diagnose the fracture. The defendant denied that he was in any way negligent and also set up as a special defense the fact that the plaintiff had obtained compensation for his injuries under the Workmen's Compensation Law.

The action never actually came on for trial as before it could be reached, plaintiff's counsel was persuaded that he would be unable to succeed, both because of the merits of the case and because of the special defense that payments of compensation had been received.

Claimed Burn Following Treatment of Acne

A MIDDLE-AGED woman consulted a general practitioner with respect to a condition of acne which affected her face and forehead. The doctor found extensive eruptions of the pustular type and suggested the use of an ultraviolet lamp. She was given a four-minute exposure at a distance of 24 inches and a few days later was given a similar treatment, the exposure then being three minutes at a distance of 28 inches.

While later the doctor received a telephone call from the patient complaining that she had been burned by the treatment, he never saw her professionally thereafter. A malpractice action was instituted against the doctor charging him with negligently having caused the plain-

tiff to sustain serious burns leaving permanent scars.

A physical examination was made of the plaintiff and while certain scars were found on her face, in the opinion of the examining physician none of those scars could properly be attributed to ultraviolet treatment, but rather appeared to be the result of infection from the condition of acne.

Plaintiff's attorney, finding that no settlement of the case would be made on behalf of the doctor, failed to bring the action on for trial and in due course the action was dismissed by reason of the failure of the plaintiff to diligently prosecute the case.

MORBIDITY RISES UNDER BRITISH INSURANCE

"The National Health Insurance Act was designed principally as an instrument to improve the standard of curative medicine in general practice by replacing the old club system of contract practice," said Dr. A. B. Walker, regional medical officer, Department of Health for Scotland, in an address at the 1938 health congress at Portsmouth, published in the *Journal of the Royal Sanitary Institute* (59: 511 [Jan.] 1939), and quoted in the *J. A. M. A.*

"It was reasonable to hope that this act, together with the improved environmental services, by providing early and effective treatment would have some effect, not only in diminishing the amount and duration of disabling illness, but also an important preventive element. Yet,

whilst sickness insurance on a national scale is a social service of proved value, it has not had these effects. Morbidity data available during the past few years show that incapacitating illness has tended to rise and with yearly fluctuations remains today at a new high level. This persistence of incapacitating illness amongst the insured population at a high general level, in spite of advances in preventive and curative medicine, is indicated in the successive Annual Reports on Incapacitating Sickness in the Insured Population, published by the Department of Health for Scotland. It is a fact which deserves the serious consideration of all interested in the public welfare."

A Spring course on general medicine has been arranged for the Sullivan County Medical Society. "Nephritis" and "Pneumonia," the subjects of the first 2 lectures on March 22 and 29, were given by Dr. John D. Lytle and Dr. Russell L. Cecil, respectively. On April 5, Dr. David D. Moore will speak on "Diabetes Mellitus" at the Woodbourne Institute in Woodbourne, N. Y., on April 12, at the Monticello Hospital in Monticello, there will be a general discussion of "Anemia, Both Primary and Secondary" by Dr. K. R. McAlpin, and on April 19, at Liberty, Dr. Albert Vanderveer will lecture on "Asthma." All of the speakers are from New York City.

The program for the Genesee County Medical Society course on general medicine is listed below. These lectures are given at the courthouse in Batavia, New York, on Wednesdays at 5:00 P. M. The first, on March 22, was on "Pneumonia" and the speaker was Dr. Henry V. Heyde of Syracuse. Dr. Charles B. F. Gibbs of Rochester delivered the second lecture on March 29, and his subject was "Diabetes Mellitus", on April 5, Dr. Clayton W. Greene of Buffalo will speak on "Nephritis", on April 12, Dr. Ellery G. Allen of Syracuse, on "Anemia", and on April 19, Dr. Will Cook Spain of New York City on "Asthma."

Across The Desk

California's Plan

SO MUCH discussion is rife about California's new medical plan that it may be worth while to take just a few minutes and see exactly what it is. Some seem to think that the Golden State has gone a bit unorthodox or heretical. But over against any such view we have the address of President W. W. Roblee, who told the delegates of the California Association on December 17, at Los Angeles, that Dr. Roscoe G. Leland, Director of the Bureau of Medical Economics of the American Medical Association, is here to advise with us," and "informs us that there are some 3,000 plans being sponsored in this country having to do with the problem of medical care." So the California plan may be said to have a pretty orthodox godfather. And *California and Western Medicine* reprints this United Press dispatch from Chicago:

'Chicago, December 18—(UP)—Dr. Morris Fishbein, editor of the *Journal of the American Medical Association*, said tonight that the California health insurance plan was in accordance with action taken by the American Medical Association's House of Delegates in Chicago last September.

'The delegates approved a plan for voluntary nonprofit cash indemnity insurance against the cost of sickness for people of the low income group,' Fishbein said.

'The California plan falls within this pattern.'

Right or Wrong?

A medical scheme that looks right to some and wrong to others is worth scrutiny anyway. It is launched as a new and separate corporation named "California Physicians' Service," with "control of administration and policy of the plan to be vested in the medical profession through its representatives." The first board of trustees has elected Dr. Ray

Lyman Wilbur, president. Any Doctor of Medicine holding a valid certificate from the State Board of Medical Examiners may apply to be listed as a "professional member," so it will be in no sense a closed corporation. The "beneficiary members" have complete freedom of choice in the selection of any Doctor of Medicine who serves under the plan. The organization is to operate on a nonprofit basis, and beneficiary membership is "to be open to all falling within the restricted income groups, as rapidly as arrangements can be made therefor." Hospital as well as medical care is included.

Medical Fees on "Unit Basis"

An interesting feature is the remuneration of the doctors on a "unit basis." All the prepayments will be pooled, and when a doctor renders a service he will be paid by the number of "units" rendered. This is explained as meaning that a treatment for a minor illness would constitute a single unit, with ascending scale of units for a more serious illness or operation.

In adopting the program, the Association struck at so-called "chiselers" in the field of health insurance by voting to set up a special committee to pass on other health insurance plans with power to forbid members to affiliate with disapproved plans, but not to interfere with reputable groups.

President Roblee explains:

There will be absolutely no change in the traditional and ethical relationships between doctors and clients that now exist.

'A member of the group who is ill will go to his regular family doctor, who is a professional member. If upon diagnosis he is discovered to have appendicitis, for instance, he will be taken to the hospital of his choice and operated on by his physician in the regular manner.'

"The only difference is the doctor will collect his money from the corporation and the patient will have paid his fee automatically by his monthly insurance premiums "

The council disapproved a suggestion that the medical profession enter into an agreement with a group insurance company or a single company to carry out the plan. The report stated that to enter into such an agreement "inevitably subjects the medical profession to the domination of business capital "

Not an Insurance Plan

The scheme is "not an insurance plan," insists *California and Western Medicine*. It explains

"Rather, it is a method which aims to make it possible for citizens of certain income classes, through periodic payments, to secure for themselves the professional services of physicians of their own choosing, exactly as they make such choice today, through payments rendered to the California Physicians' Service instead of to the doctors of medicine who gave the services. The California Physicians' Service, in turn, will then pay the physicians on what is called the unit basis

"The schedule of charges—or so-called fee table—to be used as the basis for payments will probably be one that is in accord with the averages in vogue for services rendered in California, and certainly not lower, and the payments to the physicians who have rendered service in a particular month will be on the 'unit basis.' Thus, to illustrate, if a certain service is rated as being entitled for remuneration, say, to the amount of five dollars, and the unit selected should be one dollar per unit, then the physician who had rendered and submitted a statement for five dollars

would be credited as eligible for repayment on the basis of five units. Whether the unit would measure up to 100 per cent (one hundred cents on the dollar) would depend upon the amount of money remaining in the fund after administrative and hospitalization services had been covered "

A sketch of the California plan printed in the San Francisco *Examiner* reveals further interesting features

"1 A provision that monthly fees to be charged may vary for the same medical and hospitalization service, according to the differing abilities of beneficiaries to pay

"2 Authorization to enter into contracts with the federal government, the state or any city or county for provision of medical and hospitalization service

"The provision for differing fees will enable the service to extend health insurance into the very lowest income brackets as the plan develops, in the opinion of analysts of the plan. The contract authorization will enable the service to extend service even to indigents, by arrangement with governmental authorities

"Medical service now provided to SRA clients and to migrants and farm workers through various federal agencies may be taken over by the State Association organization, under this authorization, the governmental agencies responsible now for their care footing the bill

"Fixing the upper income limit beyond which persons may not be eligible to the insurance rests with the service's board of governors, still to be elected. Although \$2,500 has been discussed, informed observers believe the limit will be set as high as \$3,500 or \$4,000 when finally determined in order to extend the benefits of the plan as widely as possible "

"The Medical Board told me to leave the hospital on account of the manner in which I spoke to that patient in the O P D, I suppose. I

merely said, 'You needn't open your mouth any wider. When I examine your tonsils I expect to stand on the outside.' "—*The American Interne*

Books

Books for review should be sent to the Book Review Department at 1313 Bedford Avenue Brooklyn N Y. Acknowledgment of receipt will be made in these columns and deem sufficient notification. Selection for review will be based on merit and the interest to our readers.

Roentgen Diagnosis of the Extremities and Spine By Albert B Ferguson, M D Volume 17 of a series of monographic atlases of the "An-

nals of Roentgenology" Quarto of 435 pages, illustrated New York, Paul B Hoeber, Inc, 1939 Cloth, \$12 00

Oh, Doctor! My Feet! By Dudley J Morton, M D Duodecimo of 116 pages, illustrated New York, D Appleton-Century Company, 1939 Cloth, \$1 50

The Language of the Dream By Emil A Gutheil, M D Octavo of 286 pages New York, The Macmillan Company, 1939 Cloth, \$3 50

Refraction of the Human Eye and Methods of Estimating the Refraction By James Thorington, M D Third edition Octavo of 412 pages, illustrated Philadelphia, P Blakiston's Son & Company, 1939 Cloth, \$3 50

Iodine Metabolism and Thyroid Function. By A W Elmer, M D Octavo of 605 pages New York, Oxford University Press, 1938 Cloth, \$10 00

Landmarks in Medicine Latty Lectures of the New York Academy of Medicine. Introduction by James A Miller, M D Duodecimo of 347 pages, illustrated New York, D Appleton Century Company, 1939 Cloth, \$2 00

Whitla's Dictionary of Treatment Including Medical and Surgical Therapeutics Eighth edition by R S Allison, M D, and C A Calvert, M B Octavo of 1,285 pages Baltimore, William Wood & Company, 1939 Cloth, \$9 00

Symptoms and Signs in Clinical Medicine An Introduction to Medical Diagnosis By E Noble Chamberlain, M D Second edition Octavo of 435 pages, illustrated Baltimore William Wood & Company, 1938 Cloth, \$8 00

A Synopsis of Medicine By Henry Letheby Tidy, M D Seventh edition Duodecimo of 1,187 pages Baltimore, William Wood & Company, 1939 Cloth, \$6 00

Surgical Treatment of Hand and Forearm Infections. By A C J Brickel, M D Quarto of 300 pages, illustrated St Louis, The C V Mosby Company, 1939 Cloth, \$7 50

REVIEWED

The Treatment of Diabetes Mellitus By Elliott P Joslin, M D Sixth edition, thoroughly revised Octavo of 707 pages, illustrated Philadelphia, Lea & Febiger, 1937 Cloth, \$7 00

Joslin's book on *The Treatment of Diabetes* is one of the classics of modern medi-

cine, the successive editions marking in a general way the successive advances in the treatment of the disease. The fifth edition summarized the author's wealth of experience in the use of the original insulin of Banting and his collaborators, but a note announced the discovery of

protamine insulin by Hagedorn. The sixth edition reports the experience in the treatment of more than 1,200 cases with this agent. Even as this sixth edition came off the press, crystalline zinc insulin and, more recently, protamine zinc insulin and histone and globin insulins have been reported. The medical profession, while welcoming the present volume, will look forward to the time when Dr Joslin's experience with these latter products will warrant the presentation of the seventh edition.

CARL H. GREENE

Surgery of the Ear. Samuel J. Kopetzky, M.D. Editor. Quarto of 466 pages, illustrated. New York: Thomas Nelson and Sons, 1938. Cloth, \$12.00 (Loose leaf).

This reference work on surgery of the ear, by a group of distinguished otologists, under the editorship of Kopetzky, represents a fine assembly of our present-day knowledge of this subject.

Otologists will feel that such a work is incomplete without a chapter by Egleston, who is recognized as a foremost thinker and contributor in the field of otologic surgery.

Endauricular mastoidectomy, which has not yet proved its worth, is given more space than it deserves. This is also true of acute hemorrhagic mastoiditis, which is treated at length, out of proportion to the frequency of its occurrence.

The chapter by Ersner on diagnosis constitutes a fine monograph in itself. Other sections worthy of special mention are those on Surgical Anatomy of the Temporal Bone by Batson, Surgery of the Facial Nerve by Tickle, and Surgery of Brain Abscess by Davidoff.

The chapter dealing with otosclerosis by Holmgren deserves special mention, particularly because of his clear presentation of every aspect of the subject. There is no element of evasion or misrepresentation when he frankly admits that the surgery of otosclerosis is still in the experimental stage and when he states the story of his failures.

This book will serve as a guide for post-graduate teaching and study, and will be

a valuable source of reference for the otologist and cranial surgeon.

The paper, the printing, and the illustrations are of high quality.

M. C. MYERSON

The Single Woman and Her Emotional Problems. By Laura Hutton, M.R.C.S. Second edition. 16 mo of 173 pages. Baltimore: William Wood & Company, 1937. Cloth, \$1.50.

This little book is unique in that it may be read with equal profit by the physician as well as the single woman. Dr Hutton is a psychologist, whether she is a single woman or not; the reviewer is in no position to say, yet it is apparent that she understands fully the single woman's problems.

Loneliness, the result of frustration of the deep instinctive need of marriage and motherhood, is the crux of the problem. Woman's work does not meet her need. The difficulties and emotional conflicts of her life are thoroughly discussed in the most gentle, sympathetic manner imaginable. This book is highly recommended. Every physician will certainly grow in understanding by reading it.

CHARLES A. GORDON

The Occupational Treatment of Mental Illness. By John I. Russell, M.B. Octavo of 231 pages, illustrated. Baltimore: William Wood & Company, 1938. Cloth, \$2.50.

This book, by the head of one of England's outstanding psychiatric hospitals, deals with the problem of occupational therapy from a practical and technical point of view. There is little in the book to indicate the psychologic needs for it, the medical basis for diversity or any particular kind of therapy, or the measurement of the effect in some way on the patient or the community. The value of occupational therapy is taken for granted traditionally and otherwise. Once accepted, the author proceeds to a detailed discussion of the organization of hospital wards and types of patients into work therapy units, kind and training of personnel, types and details of the occupations exploited.

Whatever value occupational therapy has been, it has lifted psychiatric hos-

pitals out of the custodial class Facility in keeping patients unobtrusively and cheaply herded behind bars was formerly the hallmark of institutional heads Today, psychiatric hospitals are neither too small nor too large to be examples of community activity Accordingly, the author considers almost every form of pleasurable as well as nonpleasurable activity as a form of therapy, and rightly so The idea is to keep individuals, as members of groups, adapted to whatever form of reality suits their condition and station Another specialist in such therapeutics will some day show what insight it affords into the actual problems of the individual patients and thus disclose means of further treatment.

SAM PARKER

Food and Physical Fitness By E W H Cruickshank, M D Duodecimo of 148 pages Baltimore, William Wood & Company, 1938 Cloth, \$2 00

In his introduction the author cites that 50 per cent of the people of the United Kingdom are living on an inadequate diet, and that in the United States, despite the consumption of much milk, large sections of the population have been existing on a deficient dietary He proceeds in a systematic way to give a clear elementary conception of nutrition and the utilization of foods in relation to physical fitness There are a few simple tables that can be used by any physician or layman

While the book is of a small pocket size, there is a lot of worthwhile information The last three chapters on vegetarianism, food economics, and undernutrition and its relation to diet are a worthy conclusion to this volume

MORRIS ANT

Electrotherapy and Light Therapy By Richard Kovács, M D Third edition Octavo of 744 pages, illustrated Philadelphia, Lea & Febiger, 1938 Cloth, \$7 50

The third edition of this work is, as the author states in his preface, almost encyclopedic in character

The author attempts to make a com-

plete exposition of the old as well as the new in electrotherapy and light therapy It is not a book which one can run and read It requires careful perusal and sustained thought

His chapter on electrodiagnosis is up to the minute The book is a worthwhile contribution to medical literature

JOHN J HAUFF

Text-Book of Nutrition By J A Nixon, M D, and Doreen G C Nixon, M B Octavo of 219 pages New York, Oxford University Press, 1938 Cloth, \$2 75

The object in compiling this book is to correlate the established facts on nutrition from the physiologic, clinical, and economic standpoint. It is an effort to present consideration of what the body does with food

The book is well written in an easy and interesting style The subject matter covers the field of nutrition adequately for doctors in general practice, nurses, dieticians, and students in domestic economy For this group there is much valuable information This work may be recommended to the lay reader, as the subject of diet prescription is only on general principles which are sound

This book is decidedly English and will appeal especially to British subjects It is recommended particularly because of being one of the few books on nutrition to present the extremely important factor of what the individual does with the food he eats and not the usual mass of material on the chemistry and caloric values of the foodstuffs as determined in the laboratory

PAUL C ESCHWEILER

Industrial Surgery, Principles, Problems and Practice By Willis W Lasher, M D Octavo of 452 pages, illustrated New York, Paul B Hoeber, Inc, 1938 Cloth, \$6 00

This work contains in comparatively few pages a surprising amount of helpful medical knowledge and hints It deals with a relatively new subject, which it comprehensively covers, and should be in the hands of all those who are interested in the care and management of the in-

jured worker The first chapter gives an ideal setup for the medical department of an industrial plant, and should be of help to those contemplating such a department. Valuable suggestions of interest to industrial surgeons, such as tables for figuring percentages of functional losses resulting from injuries, are found throughout the book. The subjects of joint injuries and fractures are taken up in such a manner as to make the book a reference for the profession. It is a book which cannot be too highly recommended.

PIERRE A. RENAUD

The American Illustrated Medical Dictionary By W. A. Newman Dorland, M.D. Eighteenth edition, Octavo of 1607 pages. Illustrated Philadelphia, W. B. Saunders Company 1938. Cloth, \$7.00 Plain and \$7.50 with Thumb Index.

New revisions of this standard medical dictionary are always welcomed. With developments in medicine come changes in its language. New terms are constantly appearing in medical literature, hence the necessity for frequent revisions of a work of this type.

More than 3,000 new words have been included in this edition as well as improved definitions necessitating an increase of sixty pages. The Editorial Staff of the American Medical Association, under the direction of Dr. Morris Fishbein, has cooperated in this revision. With its many excellent features and abundance of illustrations and portraits, it maintains its place after thirty-eight years of continual use as one of the outstanding reference works in the field of medicine.

CHARLES FRANKENBERGER

Clinical Laboratory Methods and Diagnosis. A Textbook on Laboratory Procedures with Their Interpretation. By R. B. H. Gradwohl, M.D. Second edition. Quarto of 1607 pages, illustrated. St. Louis, The C. V. Mosby Company 1938. Cloth, \$12.50.

This single volume of 1,607 pages, each measuring $10 \times 6\frac{1}{2} \times 3\frac{1}{4}$ inches, is truly an encyclopedic collection of information in the field of clinical laboratory

methods and diagnosis. The first edition of this work is indeed small by comparison. Yet the increase in size in the second edition is due to the inclusion of many valuable items, and indicates the rapid and important progress that is being made in the laboratory specialty.

This work, like the first edition, is a compilation of directions for the laboratory director and clinical laboratory technician alike. Not only are the methods most desirable in the opinion of the author described, but in many places the interpretations and comments of authorities on the subject are given, frequently verbatim. References to original and key articles are frequently cited, and in the place where they are most conveniently located—at the foot of each page. The criticism offered in the review of the first edition bears repetition, namely, the too frequent use of the personal pronoun. Somehow, it robs the text of its greatest effectiveness.

The book, as a whole, deserves commendatory praise. It surely is complete, and certain sections are outstanding. Thus the chapter on parasitology is beautifully illustrated, and supplies a long felt need to the laboratory technician in the identification of parasites and their ova. The illustrations as a whole are of a high order, and clearly picture and support the text. Of especial interest are the colored plates, those of blood cells, cultures, bacteria, and parasites being exceptionally true to the originals.

The book can be recommended to all students and workers in clinical laboratories as a ready reference handbook unusually valuable in its completeness and scope. Certainly no laboratory, doing everyday medical laboratory work, should be without it.

MAX LEDERER

A Diabetic Primer for Children. By Alfred E. Fischer, M.D. Second edition. Octavo of 55 pages, illustrated. New York, Dr. Alfred E. Fischer 1938. Paper, 75¢.

The doctor has carried out his intentions very well. These are indicated by

the title. It would seem that this gives a diabetic child all the general advice he should have provided. The rest is personal and individual.

W D LUDLUM

Chemistry of the Brain By Irvine H Page, M D. Quarto of 444 pages, illustrated. Springfield, Charles C Thomas, 1937. Cloth, \$7.50.

The author, in this comprehensive review of the chemistry of the brain, has approached the subject from a broad biochemical and physiologic viewpoint. This is particularly welcomed at a time when a voluminous literature on problems pertaining to diseases of the nervous system makes it nearly impossible for the average practitioner to keep abreast.

The first chapter of the book is devoted to the older literature on the subject with special reference to the life and works of Thudichum (1828-1901), "father of brain chemistry." Subsequent chapters deal with each of the major chemical constituents of nervous tissue: sterols, phosphatides, fatty acid metabolism, carbohydrates, nitrogenous metabolism, electrolytes and gases, physical chemistry, enzymes of the brain, comparative and developmental neurochemistry, metabolism as measured by gas interchange, pathologic gaseous metabolism, degeneration of the nervous system, and a chapter by J H Quastad on oxidations in the brain. Added to this is a short final chapter on "The Brain and Thought."

The material has been well selected and appraised. The book should serve as a useful reference for anyone desiring orientation in this particular field.

JEFFERSON BROWDER

Emergency Surgery By Hamilton Bailey, F R C S. Third edition. Octavo of 852 pages, illustrated. Baltimore, William Wood and Company, 1938. Cloth, \$14.00.

In reviewing this book, one is impressed by the large number of conditions described and the emergency treatment outlined.

It must be remembered that in a book of this size details of a procedure are often lacking.

The treatments described have been brought up to date in view of our advanced knowledge.

JOHN M SCANNELL

The Heart in Pregnancy By Julius Jensen, Ph D. Quarto of 371 pages, illustrated. St. Louis, The C V Mosby Company, 1938. Cloth, \$5.50.

This book is exactly what it purports to be, "a thorough review of existing evidence." The functional state of the heart is, of course, held to be of far greater importance than organic defect. The author has thoroughly combed the world literature, reduced it to its simplest forms, and drawn conclusions which are never dogmatic. The text is amazingly comprehensive and written in clear and simple style. One is surprised to find that so many things which we all accept have not yet been proved, as, for instance, the low blood pressure of pregnancy. The obstetrician who has access to a large amount of clinical material will find this book very stimulating and valuable. David Barr, in his foreword, says that "even those with relatively extensive organic damage may, by adequate protection and medical care, complete pregnancy and bear children without evident permanent damage."

An excellent book—we have never had anything like it up to now.

CHARLES A GORDON

Diabetes Insipidus and the Neuro-Hormonal Control of Water Balance. A Contribution to the Structure and Function of the Hypothalamico-Hypophyseal System. By Charles Fisher, Ph D, W R Ingram, Ph D, and S W Ranson, M D. Quarto of 212 pages, illustrated. Ann Arbor, Edwards Brothers, 1938. Cloth, \$5.00.

This book is of infinite importance from a scientific point of view. In the first place, it offers original experimentation and proof of the cause of diabetes insipidus. It is so convincing it leaves no doubt that diabetes insipidus is a disease caused by the deficiency of one of the hypophyseal hormones. And secondly, it brings the entire literature of diabetes insipidus up to a last-minute critical analysis. The authors are to be

congratulated upon their addition of another specific factor in fluid metabolism.

MORRIS ANT

The Development of the Vertebrate Skull
By G. R. deBeer, M.A. Quarto of 552 pages with 143 plates, illustrated. New York, Oxford University Press 1938. Cloth \$10.00

This volume will be hailed among comparative anatomists as the most systematic and thoroughgoing work dealing with the development of the vertebrate skull. The theoretic, descriptive, and experimental aspects of embryology have been aptly combined with contributions from paleontology in considerations which begin at the lower end of the animal scale, among those forms possessed of a notochord and of a strictly cartilaginous skull (Cyclostomes and Elasmobranchii), continuing through to the combined bony and cartilaginous skull represented in the highest forms, including man.

The thread weaving its way through the entire volume is the systematic support of the segmental hypothesis of the origin and structure of the skull. The historical introduction will prove of great value to the student of anatomy. The illustrations are clear and illuminating and provide an adequate graphic supplement to the text proper. Altogether, the volume will receive wholehearted endorsement from those interested in the more academic aspects of embryology and morphology of the cranium.

RUSSELL MEYERS

The Rheumatic Diseases. A Course of Lectures arranged by the Medical Staff of the St. John Clinic and Institute of Physical Medicine. Edited by Sir Leonard Hill, M.B. and Philip Ellman, M.D. Octavo of 270 pages, illustrated. Baltimore: William Wood and Company, 1938. Cloth, \$4.00

This book consists of a course of lectures arranged by the Medical Staff of the St. John Clinic and Institute of Physical Medicine, England. Fifteen contributors of considerable eminence have made this a worthwhile summary of our present knowledge on the subject of rheumatic infection, chronic infectious arthritis, osteoarthritis, menopausal arthritis, and

allied states. The etiologic and clinical features are excellently given. The economic aspects are stressed. The importance of focal infection in the nose and throat and, what may be a great surprise to the average reader, the uterine cervix are thoroughly gone into. The chapters on pathology, x-ray, bacteriologic and chemical aspects come in for their share of attention. About 40 per cent of the book is devoted to treatment, particularly physiotherapy, light therapy, local and general ultraviolet irradiation, hydrotherapy, orthopedic and surgical treatment. Occasionally, the individual authors are not in complete agreement, particularly as to etiology and pathology. There is much with which the reader may not be in full accord. However, all of this acts as a stimulant to the interest excited by this fine little volume on diseases which are of so much importance to the medical profession and community.

M. A. RABENOWITZ

Mental Therapy Studies in Fifty Cases
By Louis S. London, M.D. Volumes I & II. Octavo of 774 pages illustrated. New York: Covici Friede, 1937. Cloth \$12.50

The recent surge of successful biochemical treatment methods in psychiatry, particularly for the psychoses, has taken some more wind out of the sails of the dynamic psychologists and spoiled the effectiveness of such works as Dr. London has labored to produce. The net value of exhaustive case histories then appears to be as illustrative material for psychological theories, rather than as examples of adequate diagnostic or treatment systems. Notwithstanding, Dr. London must be credited with a painstaking job of piecing together the actual workaday material of psychoanalytic therapy. This alone appears worthwhile as an indication of what complicated obstacles and symptoms face the mental therapist in those cases where psychotherapy is definitely a method of choice. Otherwise, the two volumes are reminders of Stekel, but without Stekel's interminable and exhausting details.

SAM PARKER

Diseases of the Blood By Cyrus C Sturgis, M D, and Raphael Isaacs, M D Edited by Morris Fishbein, M D (National Medical Monographs) Duodecimo of 302 pages New York, National Medical Book Co, Inc, 1937 Cloth, \$3 00

This is an excellent monograph for the general practitioner—excellent because it deletes the illustrations and technical data of an atlas or laboratory manual, and devotes its content to practical diagnosis and treatment.

The interpretation of blood data is as lucid and admirable a chapter as has been reviewed The emphasis upon the various diseases of the blood or hematopoietic organs has been properly stressed, and is noted by the parallel existing in clinical importance and chapter length Suggested for practical value rather than as source material are the references from English-written books and journals The entire book is authoritative, complete but concise and factual It well deserves its place among the most useful books of any practitioner

IRVING M DERBY

Hemorrhoids By Marion C Pruitt, M D Quarto of 170 pages, illustrated St. Louis, The C V Mosby Company, 1938 Cloth, \$4 00

The author of this monograph is well qualified to undertake a description and evaluation of the electric, injection, and operative methods of treating hemorrhoids The chapter on differential diagnosis is worth special note.

The book is recommended to the proctologist as well as to the general practitioner

CHARLES GOLDMAN

Massage and Remedial Exercises in Medical and Surgical Conditions. By Noël M Tidy Third edition Octavo of 456 pages, illustrated Baltimore, William Wood and Company, 1937 Cloth, \$5 25

This work is a complete text for the advanced student of physical education

It combines a review of fractures, dislocations, and diseases and injuries of the muscular, nervous, and osseous systems

with their aftercare, including emergency and physical methods of treatment.

There is also a short description following each type of injury of the surgical technic to be employed In the extensive chapters on diseases of the bones and joints, fractures and dislocations there is no question left unanswered though in very concise form

Of the many books reviewed, one would be attracted to this work in particular because of its clear presentation and its numerous illustrations It might serve well as a handy reference to those prescribing aftercare in orthopedic and traumatic surgery, not overlooking its importance to the internist.

JOSEPH I NEVIMS

Clinical Chemistry in Practical Medicine By C P Stewart, M Sc, and D M Dunlop, M D Second edition Duodecimo of 372 pages, illustrated Baltimore, William Wood and Company, 1937 Cloth, \$4 00

This book deals with various chemical tests which have proved to be of value in the diagnosis, treatment, and prognosis of disease The circumstances in which a chemical examination may be of service, the interpretation and significance to be placed on the result of such an examination, and the technic of obtaining the specimens to be sent to the laboratory for analysis are clearly presented It explains the various chemical analyses, and gives in detail many of the simpler tests which do not require much time and equipment There are chapters dealing with basal metabolism, hydrogen ion concentration, sugar tolerance, and other chemical tests in the treatment of diabetes Various stomach disorders with the findings on gastric analyses, renal function tests, liver function tests, and their interpretation are clearly described, and make interesting reading

EDWARD H NIDISH

A Textbook of Pathology An Introduction to Medicine By William Boyd, M D Third edition, thoroughly revised Octavo of 1,064 pages, illustrated Philadelphia, Lea & Febiger, 1938 Cloth, \$10 00

The arresting style of Dr Boyd as well as the scholarly content of his pathologic texts are too well known for elaborate exposition. Reclassifications (a new section), and much new material has been added in this edition without material increase in size. This has been possible by reduction of type size in some sections, notably those relating clinical symptoms to pathologic lesions—one of the most commendable features of the work.

It is a full but well balanced presentation of general and special pathology brought well up to-date—a pathology not merely of the dead but of the living individual with clinical symptoms. The many illustrations are original, mostly photomicrographic, and nicely reproduced. Those illustrating the grading of carcinomas are particularly selected for approval. Intended primarily as a text book for students of medicine, it will prove a valuable asset to the practitioner's library for personal clinicopathologic conference, for references, and just for reading.

IRVING M. DERBY

Heart Disease in General Practice By Paul D. White, M.D. Edited by Morris Fishbein, M.D. (National Medical Monographs) Duodecimo of 838 pages, illustrated. New York, National Medical Book Co. Inc. 1937. Cloth \$3.00.

This pocket-size volume is a vade mecum of cardiology. Whether we like the question-and-answer type of book or not, this text is a remarkable presentation of modern cardiovascular concepts. For both family physician and consultant it will serve as a valuable review.

White emphasizes the value of a complete and thorough history, stating that a diagnosis reasonably accurate and complete can be made from history alone in 50 per cent of all heart cases. To the physical examination he attaches a 35 per cent value, to the electrocardiogram 10 per cent, and to the x ray revelations 5 per cent. He thinks palpation of least importance, but believes in percussion in the routine examination, and advises paying heed to all murmurs.

We quote as follows: "One may derive much more information from the character of the heart sounds than from the finding of heart murmurs, yet it is astonishing how often the doctor rests content if he hears no murmurs, even with valuable information about the state of the heart from the sounds alone right at hand." This implies skillful use of the stethoscope, and surely with the more complete study of murmurs and heart sounds today than at any time since the electrocardiograph was developed, it is proper to say that the stethoscope is in its renaissance.

Treatment is most excellently handled in a section of sixty nine pages, six being devoted to the therapy and management of coronary closure. The book closes with forty three pages dealing with cardiovascular emergencies.

FRANK BETHEL CROSS

The Psychology of Speech. By Jon Eisonson. Octavo of 280 pages. New York: F. S. Crofts & Company 1938. Cloth, \$2.25.

Speech is of great social significance, and its psychologic implications are of major importance. Eisonson in this book attempts, as he states in his preface, to present the principles of psychology which underlie the problems of speech.

The author is a psychologist and, as a result, he frequently uses a good deal of space describing detailed experiments which illustrate such psychologic concepts as development of learning, memory, thought, etc. Too little space, however, is devoted to the relationship between these processes and that of speech.

There seems too great a simplification of the problems of speech pathology. For example, the author cites a case of neurotic hoarseness in a child which was cured in one session by "magic incantation."

It can be said that the book offers a thorough review and collection of psychologic data which the author applies to the subject of speech.

NEW YORK STATE JOURNAL *of* MEDICINE

VOLUME 39

APRIL 15 1939

NUMBER 8

Editorial

Stock-Taking Time

On April 24, 25, 26, and 27 the Medical Society of the State of New York will hold its annual meeting at Syracuse. The 1939 session assumes added importance in the light of current events.

The Annual Meeting of the State Society is on the not-to-be-missed list of thousands of practitioners who look to it to keep them abreast of the medical times. The program this year will more than fulfill their expectations. Emphasis on early diagnosis and preventive therapy gives genuine practical value to the lectures scheduled. The exhibits and demonstrations that will supplement the formal program have the same end in view. From the purely scientific point of view the meeting should be highly stimulating and instructive.

The unprecedented medico-political events of the past twelve-month give serious overtones to the executive councils. The monopoly action against the District of Columbia Medical Society and the A.M.A., the National Health Program and the ambiguous Wagner National Health Bill now before Congress, hold serious implications for medical practice as now constituted and the continued development of organized medicine. Every physician who is aware of the social and economic forces that are exerting almost unbearable pressure on the medical profession will desire to participate in the formulation of a medical policy for the coming year.

An essential prerequisite for intelligent understanding of administrative activities at the annual meeting is familiarity with the annual reports. These were published in the March 15 issue of the JOURNAL and should be read by all who plan to attend the Syracuse meeting.

Inescapable Facts

The defeat of the chiropractic bill in the Assembly leaves the profession freer to combat the Milmoë osteopathy bill. The latter has passed the lower house by one vote. It is now with the Senate Education Committee, where every effort should be made to defeat it.

Physicians can help to administer a decisive defeat to this undesirable measure by explaining its full implications to their representatives in the State Senate. To many legislators, the difference between medicine and osteopathy is vague and unessential. They do not understand the dangers involved in granting osteopaths prerogatives for which they are not trained.

The designation of a surgical procedure as "minor" does not mean that it is devoid of risk or may be performed safely by untrained operators. Every surgical procedure, no matter how seemingly slight, requires complete asepsis and expert operative technique. When these are lacking the smallest operation—even the opening of a pimple—is dangerous and may cause serious complications.

Osteopaths, from the very nature of their theory, are not taught surgery. Neither are they trained to administer anesthetics—a procedure that is always dangerous unless the anesthetist thoroughly understands the potentialities of the products employed and the normal and abnormal physiologic reactions thereto.

The use of narcotic drugs is one of the gravest responsibilities entrusted to physicians. Dosage must be carefully regulated, both to obtain maximum results with minimal physiologic reactions and to prevent the development of addiction. To place these potent and dangerous drugs at the disposal of a profession without training in materia medica is to open the door to increased narcoticism from faulty prescribing.

Similar dangers exist with respect to biologic products. For the most part they are valuable because of their specificity. Accurate diagnosis is essential if they are to be employed to advantage. This is well illustrated by the serum treatment for pneumonia, which depends on recognition not merely of a pneumonic condition but of the particular type of pneumonia present. The indiscriminate use of biologic products is not only without benefit but risky to boot. Osteopaths are not qualified to employ these preparations safely or beneficially.

In weighing the osteopathy bill, the legislature should ask itself why osteopaths receive a different degree from that conferred on regular physicians. The answer to this question—essential differences in theory and training—furnishes an unanswerable argument against the Milmoë bill.

Absorbic Acid in Whooping Cough

The prevention of pertussis is a major problem confronting all pediatricians. Isolation has not afforded the solution, since, during the most infective period—the catarrhal stage, accurate diagnosis is almost impossible because of the nonspecific character of the cough.¹ Vaccination, since its introduction by Meyer, Kristensen, and Sorenson,² has been followed by numerous conflicting reports as to its efficacy. The encouraging work of Sauer³ could not be substantiated by Siegel and Golberger,⁴ among others.

Consequently, until such time as preventive measures can be advocated with the certainty that attends those employed against typhoid fever, diphtheria, and smallpox, the shortening of the paroxysmal stage of whooping cough and the relief of the symptoms remains the foremost concern of the practicing physician. Clinical studies indicate that this can be achieved. The experiences of Otani⁵ and of Omerad, Unkauf, and White⁶ with the beneficial effects of large doses of absorbic acid have recently been confirmed by Vermillion and Stafford.⁷ Using as much as 225 mg. of absorbic acid in some instances, and as little as 75 mg. in others, they were able to materially decrease the duration of the paroxysmal stage in 24 of 26 cases of whooping cough. The average duration of this stage of the disease in the patients so treated was one week. In addition, the daily number of coughing spells typical of pertussis was reduced in some instances to but one or two a day.

From this it appears that despite the patient's age or the duration of the whooping cough, absorbic acid may prove effective in both shortening and checking the symptoms of the disease. Dosage, of course, must be individualized from the standpoint of the severity of the pertussis and the age of the one afflicted.

Cortical Extract in Marasmus

It has long been recognized that marasmus is associated with severe infectious diseases, and results from an improper utilization of the food intake, eventuating in a negative nitrogen and mineral salt balance. The essential indication in the treatment of this condition is the removal of the primary cause whether it be infection, degenerative disease, or improper nutrition. Often, however, this alone is not sufficient to bring about a cure, and, according to

Hislop,¹ the failure can be attributed to an adrenal insufficiency. Postmortem findings, in cases of intestinal intoxication wherein diarrhea and vomiting had been prominent, showed hyperemic and occasionally hemorrhagic changes in the adrenal glands.

Experimentally, it has been demonstrated that adrenalectomized rats do not gain as much weight per unit of food ingested as do normal rats. Furthermore, diets deficient in Vitamin A and B produce definite pathologic changes in the adrenals. Hislop concluded from all this that correction of the hypoadrenalism was necessary before the ordinary therapeutic measures could be rendered effective. Fourteen cases of marasmus were treated by this observer with intramuscular injections of cortical extract, after suitable dietary and hygienic measures alone had failed to produce the desired results. One minim of the extract was given for each two pounds of body weight. In 11 of the cases, a satisfactory response was apparent in the greatly increased gain in weight during the period when the cortin was administered, and the persistence of weight gain after this form of treatment had been discontinued.

From this report it would appear that the condition responsible for the marasmus also produces a hypoadrenalism which must be corrected before the usual therapeutic measures will take effect. Cortical extract supplies the deficiency and tides the infant over this period until its adrenal glands have returned to normal function.

Current Comment

"The doctors themselves, through their organizations, have suggested an answer to the medical problem.

First. Let the State continue and even extend its public health work to educate and guard people in the field of preventive medicine.

Second. Arrange for that part of the population which is clearly unable to pay doctors' and dentists' fees to be taken care of by local authorities or possibly by representment, never by distant Federal authorities. Under this plan the doctor would not have to do too much charity work nor overcharge his paying patients.

Third. Leave the rest of us alone to run our own lives, choose our own physicians

and pay him a reasonable fee. Then we can continue to stand on our own feet, keep our self-respect, and maintain the splendid and helpful relationships that have existed in the past between the doctor and his patient." An excerpt from *The American Farmer* of recent date.

"The nub of the matter—of basic interest to every citizen who cares a hoot for the Bill of Rights and the principle of government by law rather than by men—is the significance of this invitation presented to the A M A—to accept from the executive branch of the Federal Govern-

ment a purchase of immunity from criminal prosecution by 'consenting' to proposals 'going beyond the elimination of illegal practices' When an executive can dictate a course of action *beyond* the requirements of law, as a *quid pro quo* for avoiding criminal prosecution, what becomes of our cherished 'due process of law'? A 'consent' decree under such circumstances differs from the decrees simple of Hitler or Mussolini only in one respect: it is a form of blackmail from which one may escape, simply by refusing to submit—and accepting the consequences" 'S Q Lapius in the *Westchester Medical Bulletin* for March

" But against any allegation of a vested interest of organized medicine in present methods the evidence that politicians have vested interest in 'socialized medicine' should be weighed. And against the case for those who want medical care being able to obtain it easily and cheaply must be weighed the fact that state medicine tends toward excessive 'doctoring' and dependence. And the experience with politically controlled group plans is that the pressure for compulsion becomes stronger and stronger

Possibly the most vital consideration for the individual is the question of freedom

To us it seems that the values of freedom, either in the usual patient physician relationship or in the genuinely voluntary group medicine plan, are so precious that they should not be surrendered lightly. To us it seems also that the present enthusiasm for federalized medicine is moving with excessive speed under political pressures. A plan which has not even been approved on a state basis has been pushed toward nationwide application. The plan dangers from it are excessive financial burdens, regimentation, obsessive medication and political abuses.' Opinions to be found in *The Christian Science Monitor*

"I think that they (the doctors) have had some serious lessons of late, with threats of state medicine, owing to public dissatisfaction with results, if they fail to meet the economic requirements of modern practice, and their collective affairs have got into better hands

'I believe that it would not be just to them to put control of the prepayment for their services practically out of their hands and into hands that have a record that gives them justified misgivings

'The weakness of the whole medical system, so far as I have been able to observe, has been in heading things up too much in centers of control and leaving out the man in the front line trenches who has the actual first contacts with the enemy (I mean the practicing doctor) Of late, a great deal of progress in some states has been made by getting out and starting at that end, backing up the practicing doctor, and helping him to take his proper place in the whole health system When treated that way he responds and is equal to the occasion "

The foregoing are 'Opinions Seasoned by Practical Experience'—those of Mr Richards M Bradley, lay manager in connection with the Brattleboro, Vermont, plan for the delivery of medical care under a voluntary insurance system

'Perhaps the most American of our many Americanisms is the tendency of the American people to ride bobbies and to rush off frantically in the direction of the current fad. As we look back upon them such crazes although slightly ludicrous, were relatively harmless A little extra money was put into circulation, thousands of people got a new if temporary thrill, and, although the bursting of bubbles left manufacturers and dealers with unsaleable stock on their hands, no great amount of damage was done

'But today the American public is in danger of being swept up into another

fad which has serious implications and from which we could not recover as painlessly. Books, magazines, newspapers, radio, and the movies are combining in a campaign to discredit the medical profession and to blame the doctor for the financial burden of illness, even though the doctor's bill is seldom more than one-third of the total cost which he shares with the hospital, the laboratory, the nurse, and the druggist.

"Although we are all ready to admit that changing social conditions must be recognized as indicating the need for solving this ancient problem, we must be very careful to make certain that the remedy adopted will not prove worse than the condition we are trying to correct.

"So before we rush blindly into a scheme which has universally been proved expensive and inefficient, before we upset our entire system of medical practice, before we change our doctors into job holders, let us ask ourselves seriously if the admitted problem cannot be solved in an orderly fashion through our existing machinery?" The *Nassau Medical News* of March asks "Is State Medicine a Fad?" and we have quoted in part from its discussion of the situation.

. . .

"Since the Bill of Rights was adopted as the first amendment to the Constitution, these people (propagandists of one sort or another) have ranted practically without restriction, on paper, on soapboxes, in hired halls, even in churches—and generations of Americans have listened to them.

If any one of those generations had lost its head and gone whooping down the trail pointed out to it by any one of those ranters, our present generation would most likely be living thinly off the husk of a once great country—if there was a present generation of Americans.

No such thing happened. What did happen in every case was that the American people gave the current spellbinders a fair hearing, talked over and thought

over what they had to offer, perhaps committed one or two of the barrel of mistakes the spellbinders wanted committed, and then decided against the spellbinders and snapped back to horse sense.

We've been kidded by experts, down the years—by Greenbackers, Know Nothings, Fenians, Populists, Free Silverites, Ku Kluxers, Inflationists, Technocrats. But none of these has kidded the shirts off us.

Are we in any more danger of being led into lunacy now than we ever were? It seems most unlikely. "We sincerely hope that the editors of *Collier's* are correct in their final statement, especially in regard to the "spellbinding" that the "socializers" are attempting in regard to the delivery of medical care.

. . .

"We just don't know our own strength. The doctor can be a community leader anywhere, for his very title is a pass key that opens almost every door. Thus he has a unique opportunity which, through modesty or indifference, he too seldom accepts. conferences of pedagogues and parents have, for the most part, been hearing only one side of the medical care story. The doctors can give them the other side. Why don't they?" The March issue of the *Essex County Medical Society Bulletin*.

. . .

"The American Medical Association is made up of men, and as such, they may err in wisdom or judgment as do other men. The American Medical Association, however, is simply an incident in this case. If the methods practiced against them are to become the settled practice of Federal criminal law, the same methods can be used and, no doubt, will be used against any other American citizen who may be so unfortunate as to be the defendant in a criminal proceeding. A vitally important inference, brought to our attention by *America's Future*.

MATERNAL MORTALITY

Report for 1937 in Buffalo, New York

LOUIS A. SIEGEL, M D , Buffalo

IN THE past ten years, maternal mortality studies have occupied a prominent place in American medical literature. Comparison of our statistics with those of other countries has led to severe criticism on the part of both medical and lay authorities to the point where the latter group has published articles in popular home magazines denouncing the former for their inactivity with regard to this state of affairs. The awakening came in 1933 when the New York Academy of Medicine published the results of its investigation of maternal mortality in New York City. Their conclusions were startling and led to country-wide discussion.

As a result of this report, the national obstetric societies and the medical schools of the country embarked on an educational program to improve conditions within the profession. In some states close cooperation between the obstetric societies and the State Hospital Association members led to more careful regulation of the obstetric services. Buffalo became very conscious of its record, and in 1935 the Medical Society of the County of Erie authorized a committee to study maternal mortality. The original committee was composed of a steering committee (nonobstetric) and an obstetric study group. The latter group studied intensively, with the aid of a professional investigator (physician), all maternal deaths occurring in Erie County, beginning in January, 1935, and published its report in the *New York State Journal of Medicine*, September 1, 1937.

This original committee was then dismissed, and at its suggestion a permanent Obstetric Council was set up to continue this work. This council is composed of a representative from each hospital appointed by the superintendent of the

hospital.* This brought into action a group of eleven men and women especially interested in obstetrics, each one ready to protect the record of his hospital. This procedure was based upon the fact that practically all deaths occurred in hospitals and that, therefore, the problem was essentially a hospital problem. Form CB 122 was continued as its chart and meetings were again held throughout the year. The following report was made to the Society at the end of its first year.

With the cooperation of the health department of the city we were able to investigate thoroughly all maternal deaths. In the course of the investigation we found discrepancies between hospital and health department records with regard to maternal deaths. In some instances the hospital was charged with deaths which were not maternal. This fact was determined by the council. In other instances the hospitals admitted in their yearly report certain maternal deaths which the health department had classified as non-maternal. These conditions led to confusion with regard to the actual number of maternal deaths in the city. The secretary of the council discussed with the head of the Vital Statistics Department the confusion that exists, and he admitted the difficulties in classification of these deaths. The council has suggested to the health board the appointment of a physician to consult with the department head, who is not a physician, in order to correct the existing evil.

* The members of the Obstetric Council are:

| | Total | 44 |

The council feels that there is and always has been some question regarding the high maternal mortality rate in Buffalo. This can also be said of other cities where maternal deaths and hospital reports are not investigated. In spite of these irregularities, the council wishes to report a marked improvement in the maternal mortality rate of Buffalo.

In the calendar year of 1937, the maternal death rate was 0.004, as compared to 0.006 in 1935, and 0.007 in 1936, (Table 1), a distinct improvement. These deaths include those from abortion and ectopic pregnancies, both of which should be excluded from obstetric figures. These number 12 out of the 44 deaths, and excluding them would bring the mortality rate down to less than one-half of the deaths of the previous year. The council earnestly appeals to the Erie County Medical Society to set in motion a state-wide movement to change the state

TABLE 3b—THREE YEAR SUMMARY—1935 1936, 1937

| CAUSES OF DEATH | | | | |
|---------------------------|------|------|------|-------|

classification of abortion and ectopics by excluding them from maternal mortality rates.

In the calendar year of 1937, there were 44 deaths. Forty-three of these were in hospitals. This figure represents the City of Buffalo statistics and not those of Erie County. The 1 death in the home as compared to 43 deaths in the hospitals again emphasized the need for careful supervision of obstetric departments.

In discussing the causes of death (Tables 2 and 3a, 3b), the council found that infection again rates highest as the outstanding cause, being 29.5 per cent. In analyzing this further we found that 9 cases, or almost 70 per cent, occurred in the section group. The council felt that in spite of the reduction in number of cesarean sections in Buffalo in 1937, proportionately the number of deaths was approximately the same. It was very disturbing to find that many of these sections were elective and theoretically should not have become infected to any greater extent than any laparotomy. This emphasizes to a greater extent the seriousness of cesarean sections. It should discourage those who feel it is the easiest way out.

Hemorrhage was the second highest cause of death in 1937, accounting for 20.4 per cent, as compared to 9.8 per cent in 1936. Most of these deaths were due to postpartum hemorrhage. The deaths from toxemias have been greatly reduced and reflect the effect of prenatal care. In 1937 there were 2 in 44 deaths, as compared to 3 in 69 in 1936. Three anesthetic deaths, 2 as a result of chloroform, and 1 from ether should serve to call attention to the importance of the anesthetic

TABLE 4—MATERNAL MORTALITY RATE IN THE CITY OF BUFFALO ACCORDING TO TYPE OF DELIVERIES—1937

| | |
|------------------------|------|
| Spontaneous | 0017 |
| Forceps | 0003 |
| Version and Extraction | 007 |
| Cesarean Section | 016 |
| Breech | 003 |

Methods of Delivery

According to statistics of 1937 (Table 4), the patient is endangered most by cesarean section, there being 46 deaths per 1,000 sections. Version Extraction is next highest, with 7 deaths per 1,000 versions. Breech Extraction has 3 deaths per 1,000 extractions, and spontaneous deliveries, 17 per 1,000 deliveries, the last being forceps with 0.8 per 1,000 forceps deliveries.

These figures (Tables 5 and 6), again tend to show that major operative deliveries carry a much higher incidence of death than normal or forceps deliveries. Seventeen deaths occurred in the major operative group. Of the 9,917 deliveries in 1937 (Table 8), there were 7,842 spontaneous and low forceps cases. This means that 11 deaths, or 0.1 per cent occurred in this group, while 17 deaths or 0.3 per cent occurred in the remainder of deliveries, an incidence eight times greater in the operative deliveries.

It is gratifying to report, however, that there has been a distinct reduction in 1937 in both major operative procedures (Table 7). Sections in 1937 number 26, as compared to 31 in 1936, resulting in lowering the mortality rate in sections from 7.5 per cent to 4.6 per cent in 1937. In version and extraction there has been a reduction from 7.2 per cent to 5.7 per cent in 1937.

Abortions and extrauterine pregnancies, which must be considered in maternal mortality figures, according to the health

department, make up the remaining 12 deaths. The council feels that these are extrinsic obstetric figures and should be classified separately. The health department admits its difficulty in classifying them, as they fall into two groups, obstetric deaths or homicides, depending on whether or not self induction is admitted. The council feels that this is very arbitrary and confusing, as we know

the difficulty encountered in obtaining the cause and method of infected abortions when patients are admitted in a serious state to our hospitals. There should be some other way of classifying abortions, excluding them from obstetric figures. Many times it depends on the temperament of the medical examiner on a particular day.

Comment

The Obstetric Council after completing its first year's investigation feels that there are many points which require serious consideration on the part of the Society.

1 Forty-three out of 44 deaths occur in hospitals, making the problem a hospital one. Each hospital is aware of the fact that obstetrics must be conducted in a carefully supervised way. Obstetric delivery rooms are as important as operating rooms and should be conducted accordingly. The question of asepsis in the technic of the delivery room is granted. As a result of its investigation, the council has concluded that major operative procedures produce the greatest incidence of mortality. It therefore behooves each hospital to carefully guard the privileges of the delivery room. Any hospital allowing major obstetric operations to be done by those not qualified is directly responsible for the results. The reputation of the hospital should guarantee the patient as safe a hospital experience as it can give her. This means the regulation of its delivery rooms to exclude those not qualified to do major operative obstetrics. Two or three local hospitals have already adopted measures to safeguard their patients, without interfering with the good will of the attending physician. If this is made general there can be no question of a lowered mortality rate.

2 The question of properly evaluating statistics in the city has not been satisfactorily solved. The health department has been handicapped by lack of funds and help, which has interfered with the collections of statistics. Formerly,

federal aid in the form of WPA workers was of great assistance to this work. This year, a special investigator was obtained through Dr. Dean, of the State Department of Health, who has helped in the collection of information from birth records. There are very few counties in New York State which have the benefit of the supplemental information as it appears on our birth records, and without sufficient help in our local health department these cannot be utilized. We would urge the Society to appeal to the board of health for additional funds and help.

3 The confusion and difficulties in classifying records have been mentioned. After carefully reading over case reports, the council found conflicting causes of death, that is, the cause of death did not coincide with the case report. This means that causes of death as recorded by the health department would not represent the actual causes, which leads to misleading statistics. This probably is true of other cities and of course in other branches of medicine. It means that statistics of this kind cannot be used to describe conditions in a community. An investigation of this kind many years ago would probably have spared Buffalo its poor obstetric record.

The council also urges the Society to use its active influence with the hospitals in the matter of postmortems. Correct diagnoses are possible only by autopsy. In the investigation of maternal deaths for 1937, out of 47 deaths, 11 were autopsied. A final diagnosis is almost impossible in some cases without this examination. The medical examiner's office should be asked to cooperate with the Society in obtaining autopsies. In the past this cooperation has been lacking. In the discussion of case reports deductions are only possible, but a postmortem examination would be final.

From the new birth-record supplement, which records the type of delivery as well as the weight of the child (Chart 1), we were able to study those patients who had had deliveries without any mortality. Heretofore, the mortality rate was studied

| 11 | 0 | Porro | Ruptured ? |
| 12 | 0 | Porro | Unruptured |

only from the recorded death records Erie County can now show the rate based on the figures of each type of delivery. From Table 9 we can see that there were 9,917 total births in 1937, of which 2,641, or 26.6 per cent were delivered in the home, and 7,276, or 73.4 per cent were delivered in hospitals. All but 53, or 0.7 per cent of the latter group had

for a supposedly safe procedure (as compared to the accepted less than 0.5 per cent in normal deliveries) required further investigation. Our analysis of these section deaths shows that 9 out of 12 deaths were caused by infection. Elective sections should be comparable to any laparotomy, which procedure carries a very low incidence of mortality. De-

TABLE 9—MORTALITY AND METHODS OF DELIVERY—1937

| 9,917 | TOTAL DELIVERIES | SPONTANEOUS | FORCEPS | VERSION | SECTION | BREECH |
|-------------------------------|------------------|-------------|---------|---------|---------|--------|
| Maternal Mortality | | 5,793 | 2,373 | 563 | 257 | 261 |
| Maternal Mortality Percentage | | 9 | 0.8 | 4 | 12 | 1 |
| | | 17 | | " | 4.6 | 3 |

completed the supplement, while 512, or 10.4 per cent of the home group, failed to cooperate in this manner. This now has been corrected by the health department. All certificates must be completely filled in or else returned to the physician. Of the total deliveries, therefore, 5,655, or 5.6 per cent failed to fill in the supplement. On this basis we find that there were 9 deaths out of 5,793 spontaneous deliveries, or 0.17 per cent, in the forceps group there were 2 deaths in 2,373 deliveries, or 0.08 per cent, in the version and extraction group 4 deaths in 563 deliveries, or 0.7 per cent, in the cesarean section group, 12 deaths in 257 deliveries, or 4.6 per cent, and in the breech extraction group, 1 death in 261 deliveries, or 0.3 per cent.

One can readily see the group which is responsible for the increased maternal mortality. Cesarean section was responsible for 12 out of the 44 deaths, 27.3 per cent of the obstetric death rate for 1937. A 4.6 per cent mortality rate

layed sections, after a lengthy test of labor, naturally increase the rate unless they are supplemented by hysterectomy or extraperitoneal procedures. In the 12 section deaths (Table 10) there were 4 elective sections. The remaining 8 had been in labor from five to sixty-one hours, some with ruptured membranes. These facts, combined with the following statistics on type of operation used, should help to emphasize the need for proper judgment in the choice of operation. There were 8 high, 2 low, and 2 Porro sections in this series. It is an accepted fact that the high section is not the procedure of choice in an infected case unless it is accompanied by a hysterectomy. This has been proved by various clinics in the country. There can be no doubt that herein lies our greatest difficulty.

Conclusions

The Obstetric Council would like to make the following conclusions:

1. There has been a definite improve-

ment in maternal mortality in the City of Buffalo in 1937

2 There has been a distinct reduction in the number of major operative procedures in obstetrics, which is probably the basic cause of improvement.

3 Prenatal care has been of distinct advantage as shown by the reduced number of deaths from toxemia of pregnancy

4 Infection still remains the greatest cause of death The council finds it difficult to express itself as to the preventability of this condition In some instances other procedures than those used were suggested by the council but no one can foretell their outcome The greatest offender in infections was cesarean section, a major operation, and if we continue to reduce the number of sections or use better judgment in the choice of procedures, there should be an even greater improvement

5 Deaths from hemorrhage are theoretically preventable The council questions this when it comes to practice However, we cannot stress too much the need for quicker and better emergency measures in obtaining blood for transfusion There should never be any question about giving blood in a depleted case A delay of a few minutes might cost the life of a patient The Society should encourage the establishment of "blood banks"

6 The presence of several physicians on the health board should lead to closer cooperation between this council and the department of health A member of the health board is now a member of the council as a representative of his hospital This coincidence has led to a better understanding

7 Maternal mortality in Buffalo is a hospital problem More careful supervision in the delivery rooms to eliminate those not qualified to do major operations and consultations before major operative procedures are done would help in the reduction of this type of delivery This in turn would naturally lower the mortality rate.

8 Yearly appointments to the Obstetric Council by the superintendent of each hospital would eliminate those men who are not interested in this work Some of these hospital representatives attended very few meetings and could not have been of helpful service either to the hospital or to the council It is suggested that the Society communicate with the hospital superintendent in this matter

. . .

The Obstetrical Council would like to take this opportunity to thank Dr Harry G LaForge for his conscientious work as investigator for this Committee

"MY DEAR, SHE'S IMPOSSIBLE TO LIVE WITH SINCE THE SURGEON'S JOURNAL PUBLISHED AN ACCOUNT OF HER OPERATION!"

LET THERE BE LIGHT!

I knew a child whose blind eyes sought the stars
And met no light, whose finger tips were eyes
Seeking the color of rosebuds She faced blank
skies

To feel the wind upon her face, while bars
Of darkness sealed her prisoned days She knew
Voices, but saw no laughing eyes, knew pain
And warmth, but saw no sun or silver rain,
Nor knew when leaves were green, and skies were
blue

And then you came and clasped her groping hand,
With patient hope you led her faltering feet,
Calling all science and skill to your command—
Till she saw the stars—and living was complete!
Dear God, how can we rest, we who know light,
While one child stumbles through a starless night?

—Grace Maddock Miller in *Hygeia*

A SYNDROME SIMULATING TABES DORSALIS

MAURICE J. COSTELLO, M.D., New York City

THE purpose of this paper is to call attention to a syndrome which, though simulating tabes dorsalis with its Argyll Robertson pupil and absent tendon reflexes, is essentially different from it. The myotonic pupil, in what has recently been called Adie's syndrome, is also known as the pseudo- or the nonsyphilitic Argyll Robertson pupil and pupilotonia. A knowledge of this condition is of importance to the physician who assumes the responsibility of diagnosing and treating syphilis. It is frequently mistaken for the true Argyll Robertson pupil because of ignorance of its existence or because of an inability to differentiate between these distinct entities. Errors in diagnosis have led to serious errors in management and treatment.

This condition was first brought to my attention in 1923. A medical student had a pseudo Argyll Robertson pupil which was mistaken for an Argyll Robertson pupil and caused him much concern until subsequent examinations proved that he was not infected by syphilis. During the past ten years I have observed this pupillary abnormality in a number of patients who were not infected by syphilis. On the other hand, I have recently observed the nonsyphilitic Argyll Robertson pupil in a patient with syphilis.

The normal pupil varies in size in the different periods of life. In infancy and old age it is small, while in early adult life and middle age it is larger. In farsighted persons it is contracted, in those with myopia it is somewhat dilated. The light and accommodation reflexes cause constriction of the pupil, the sensory and psychic stimuli (pain and fright) cause dilatation.

Argyll Robertson¹ in 1869 reported 4 cases of spinal miosis in which he clearly described the characteristic features of the pupil of tabes dorsalis, now known as the Argyll Robertson pupil.

The Argyll Robertson pupil is miotic, less than 2 mm in diameter. It is constant in size and does not react to light or shade, directly or consensually, but it does contract promptly and excessively to convergence accommodation for near objects and dilates immediately and fully when the effort is discontinued. It dilates slowly and imperfectly to mydriatics and painful stimuli. It is occasionally irregular in shape and unequal in size. In 70 to 90 per cent of the cases it is bilateral and in an overwhelming majority (90 per cent) of the cases it is an absolute evidence of tabes dorsalis.

The pseudo Argyll Robertson pupil of Adie's syndrome does not react to light either directly or consensually and in this way is identical with the true Argyll Robertson pupil. It contracts very slowly during the effort of accommodation convergence for near objects and remains small for thirty seconds or longer. After the effort to converge is relaxed, it regains its original size only after dilating sluggishly. It is unilateral in 80 per cent of the cases and is usually on the left side. The pupils are unequal, the affected one is frequently somewhat dilated, larger, and is usually oval in the horizontal or vertical plane. It varies in size from time to time. When very large it cannot be used for close work. It dilates readily, rapidly, and completely to the mydriatics—such as homatropine, atropine, and cocaine—and to painful stimuli. It contracts in a similar manner to miotics such as eserine.

The condition is benign and is not rare. It is important only because it is to be differentiated from the Argyll Robertson pupil of syphilis. It holds a position analogous to that of pityriasis rosea in dermatology. The importance of that condition is its differentiation from the macular syphilitide. In this syndrome that is, pupilotonia with absent tendon

POINTS OF DISSIMILARITY

| PSEUDO ARGYLL ROBERTSON PUPIL | ARGYLL ROBERTSON PUPIL OF TABES DORSALIS |
|---|---|
| 1 Women affected (80 per cent of cases) | Both sexes affected |
| 2 Unilateral and left sided (80 per cent of cases) | Bilateral in the majority of cases |
| 3 Somewhat dilated, round, occasionally oval in the horizontal or vertical plane | Contracted, less than 2 mm |
| 4 Inequality striking | Inequality if present may escape notice because of small size and bilateralism |
| 5 Varies in size | Stationary for months and years |
| 6 Contracts slowly to accommodation, remains stationary for many seconds, then dilates sluggishly | Contracts promptly to accommodation and assumes original size immediately after |
| 7 Dilates rapidly and completely to mydriatics | Dilates slowly and imperfectly to mydriatics |
| 8 Manifestation of a benign condition | In 90 per cent of cases an infallible sign of tabes dorsalis |
| 9 History of severe shock, emotional instability | History of syphilis |

reflexes, there is no evidence of syphilis and there are no signs of organic nervous disease. It is seen more frequently in women and in those of neurotic temperament who have undergone some recent disturbing emotion, such as shock or bereavement. There is a familial tendency and many of these patients exhibit dermographism.

There are only two points of similarity between these conditions: first, that the pupils do not react to light or shade directly or consensually, and second, that there is almost invariably an associated loss of the deep tendon reflexes. A milder form of this disorder is rarely seen. It is represented by similar pupillary changes but the deep tendon reflexes are present.

The points of dissimilarity are many and are shown in the above table.

For years the pseudo Argyll Robertson pupil of this nonsyphilitic syndrome must have been mistaken for the true Argyll Robertson pupil of tabes dorsalis because it was not reported until 1902 by Saenger² and by Strassburger.³ Marcus⁴ in 1906, Axenfeld⁵ in 1919, and Gehrcke⁶ in 1921 contributed to our knowledge of this interesting condition. The articles in recent years by Moore,⁷ Holmes,⁸ and Adie⁹ adequately describe and stress the importance of this entity.

Before the complement fixation test was

discovered, at a time when the treatment of central nervous system syphilis was determined largely by physical examination, this entity was of greater practical importance than it is today. Such an abnormality, although not recognized as the pseudo Argyll Robertson pupil, might be mistaken for the Argyll Robertson pupil, but the modern physician would try to confirm his suspicions by adequate blood and spinal fluid studies before recommending treatment. It is still of importance to those who might label a person with this condition as having central nervous system syphilis without confirmatory evidence and to those who feel that a person with an Argyll Robertson pupil, whether true or false, should be treated in spite of negative tests. They should know that a syndrome, with a myotonic pupil and absent tendon reflexes, exists, which may simulate tabes dorsalis.

Case Reports

M. L., a woman, aged 30, was first observed by me in 1930, suffering from bilateral pulmonary tuberculosis with a right pneumothorax and tuberculous enteritis. She stated that she had noticed an inequality of her pupils for the past three years, since she was first told that she had tuberculosis. The left pupil is about twice the size of the right pupil. It does not react to light and contracts and dilates slowly to accommoda-

tion convergence reflex. The left pupil showed further dilatation when she was seized with the cramps of intestinal tuberculosis. When the patient was seen last in September 1937 the condition had not changed. Her deep reflexes are absent.

E. L. a woman aged 62 has had a right sided facial paralysis since childhood. About ten years ago at the time of her mother's death she noticed an inequality of her pupils which has persisted. The left pupil is twice the size of the right it is round, does not react to light, but does react sluggishly to accommodation and dilates leisurely when the effort is relaxed. There is no disturbance of vision. Her deep reflexes are normal.

H. O. a man, aged 38 accountant now under treatment for syphilis has had unequal pupils for twenty years. They appeared prior to his syphilitic infection. The left pupil measures 8 mm the right 4 mm. The left is oval in the vertical plane. It does not react to light but contracts slowly on accommodation and dilates in a similar manner. His reflexes are absent. The patient states that he does most of his close work with his right eye. At the onset of his syphilitic infection his Wassermann reaction of the blood was four plus with both the alcoholic and chol-

esterinized antigens. His spinal fluid studies have always been negative for syphilis. The Wassermann reactions of the blood in recent years have been negative.

I have briefly described a syndrome simulating tabes dorsalis and the simple method of differentiating it from tabes dorsalis by observing the pupillary characteristics of size, shape, and reflex action, especially the behavior of the pseudo Argyll Robertson pupil to convergence accommodation. Knowledge of this condition should prevent errors in diagnosis and treatment and the serious consequences that may follow in their wake.

QUACKS POSING AS PSYCHOLOGISTS

Quack psychologists, comprising an "under world" as vicious as that of the gangster and murderer are permitted to thrive under the defective laws of many states, declares David Spence Hill Ph.D., Washington D. C. in the March issue of *Hygeia The Health Magazine*.

Such impostors not only exploit the public but also damage the reputations of legitimate psychologists, who are falsely identified with them. Dr. Hill points out:

Although authorities in psychologic fields have sufficiently exposed the fallacies and the techniques of psychologic impostors nevertheless the exploitation of the public continues in a score of cities every winter.

Such quacks flourish under numerous schemes and cults which claim to help the credulous or troubled. While not all of them pretend to be psychologists all offer some method of benefiting people by means of appeal to the mind.

Astrology palmistry spiritualism telepathy and graphology (an exaggerated emphasis on the significance of handwriting) are examples of the methods they use.

Other forms of psychologic quackery include mesmerism associated with the falsities of animal magnetism mnemonics, consisting of memory devices that enable one to perform seemingly amazing stunts phrenology which professes to reveal a person's capacity and mental traits by feeling the humps on his head, and vocational chemistry which claims to classify applicants for positions according to their membership in the carbon, sodium and sulfur classes of mankind.

Endocrinology a legitimate field of research has as yet yielded meager knowledge about the effects of the ductless glands on personality but this knowledge is being profitably magnified by quacks.

Dr. Hill points out that the flourishing of psychologic quackery is due partly to the confusion on the part of the public with regard to the nature and methods of psychology. The wide publicity given special doctrines promulgated by well known persons interested in psychology contributes to this confusion.

EPIDEMIC DIARRHEA OF THE NEWBORN—A NEW DISEASE?

SAMUEL FRANT, M D and HAROLD ABRAMSON, M D , New York City

(From the Bureau of Preventable Diseases, New York City Department of Health)

IN RECENT years, more and more attention has been given to the problem of lowering infant mortality. Wide-spread intensive campaigns have been initiated in attempts to prevent avoidable infant deaths during the first year of life. In particular, these campaigns have been directed toward the reduction of the persistently high incidence of death in the neonatal period, and have proceeded along three main lines of attack. The first phase comprises the general problem of maternal welfare, determining the causes of stillbirths and those neonatal deaths directly attributable to hazards of delivery. The second takes due cognizance of the important problem of premature births and includes a more careful investigation of the true causes of death of prematurely born infants. And lastly, the third line of approach aims at lowering that neonatal morbidity and mortality resulting from infections peculiar to the newborn period of life.

The situation in New York City during the past ten years is shown in the accompanying chart (below), which presents

both the trend of infant mortality in babies under one month of age and the trend in those from one month to one year of age. Throughout this decade, it is evident that there has been a steady decline in the death rates of the older group of infants as compared with a very slight decrease in the neonatal period. For example, the rate in infants from one month to one year has dropped from 35.5 to 17.8 deaths for each 1,000 live births, while that in infants from birth to one month has decreased only from 32.3 to 27.7 for each 1,000 live births. Although a considerable part of this outstanding lag in neonatal mortality rates can be attributed to such conditions as birth injury, congenital malformations, and marked prematurity, yet the highly significant role played by infections of the newborn as a cause of morbidity and mortality has not been sufficiently emphasized. Prominent among these infections are the diarrheal disorders.

For the past four years we have been actively engaged in the investigation of outbreaks of severe diarrhea among newborn babies in the nurseries of lying-in institutions. These outbreaks have been accompanied by an unusually high incidence of death (Tables 1 and 2). In collaboration with Rice and Best,¹ our early experiences with the problem were presented before the Section of Pediatrics of the American Medical Association at its annual meeting in June, 1937. At that time the opinion was advanced that we were probably dealing with a new clinical entity of undetermined etiology. The disorder showed a specific predilection for infants of the newborn period of life, and its essential clinical expression was that of severe diarrhea, intense de-

CHART Trend of death rates in infants from birth to 1 month compared with trend in infants from 1 month to 1 year, 1926-36

Read at the Annual Meeting of the Medical Society of the State of New York, New York City, May 11, 1938

TABLE 1. SUMMARY OF 27 OUTBREAKS OF EPIDEMIC DIARRHEA OF THE NEWBORN IN NEW YORK CITY JULY 1934-DECEMBER, 1937

| | |
|--|-------|
| Total number of exposed live-born babies | 5 082 |
| Total number of babies attacked | 750 |
| Morbidity rate | 14.7% |
| Total number of deaths | 356 |
| Mortality rate | 7.0% |
| Case fatality rate | 47.5% |

hydration and intoxication, and rapidly ensuing death. The syndrome was descriptively designated "Epidemic Diarrhea of the Newborn."

Since our preliminary studies, the investigation of subsequent outbreaks has afforded us the opportunity of gaining a clearer insight into the nature of the disorder.^{2,4} Likewise, the weight of accumulated evidence has tended further to substantiate our initial impression that

outbreaks and their clinical and epidemiologic features strongly confirms our original impressions. Likewise, additional evidence for the intimate connection between the outbreaks is obtained from bacteriologic and pathologic studies.

It should be emphasized that epidemic diarrhea of the newborn is a highly virulent communicable disease whose clinical course may be divided into several overlapping but recognizable phases. Considered in this manner in conjunction at all times with its epidemiology, the complete and unique picture of the disorder is readily revealed. The first concrete evidence of the singular character of the disease is derived from a review of its symptomatology, not of course by a mere enumeration of the individual signs, but rather by a consideration of the inter

TABLE 2. YEARLY MORBIDITY AND MORTALITY IN OUTBREAKS OF EPIDEMIC DIARRHEA OF THE NEWBORN IN NEW YORK CITY JULY 1934-DECEMBER, 1937

| YEAR | NUMBER OF EXPOSED LIVE BORN BABIES | NUMBER OF BABIES ATTACKED | PERCENTAGE MORBIDITY | NUMBER FATAL CASES | PERCENTAGE MORTALITY | CASE FATALITY RATE |
|------|------------------------------------|---------------------------|----------------------|--------------------|----------------------|--------------------|
| 1934 | 386 | 72 | 18.0 | 32 | 8.3 | 44.0 |
| 1935 | 1,649 | 205 | 12.4 | 96 | 5.8 | 46.8 |
| 1936 | 1,751 | 245 | 13.9 | 121 | 6.3 | 49.4 |
| 1937 | 1,295 | 228 | 17.6 | 107 | 8.2 | 46.9 |
| | 5,082 | 750 | 14.7 | 356 | 7.0 | 47.5 |

the disease is a newly recognized syndrome whose clinical and epidemiologic characteristics serve as points of differentiation from the general group of diarrheal disorders of infancy. Moreover, by reason of its virulence and widespread occurrence, it is a disease occupying a position of importance as a cause of neonatal mortality.

During the course of our studies we were confronted with several pertinent questions. What evidence did we have that the disorder was a new and distinct clinical entity and that the outbreaks were of common etiology? Was it not possible that we were concerned with outbreaks caused by a variety of pathogenic organisms, each similarly giving the well known symptom train which characterizes severe diarrheal disorders of early infancy? Close analysis of the various

relationship of these signs. Depending upon the time of exposure, the period of incubation of the illness is about six days, varying exceptionally from one to twenty-one days. Similarly, the postnatal age at which the baby is attacked is seven days, but may vary from two to fourteen days.

At times, the stage of invasion of the disorder is marked for one or two days or more by insidious symptoms such as cessation of weight gain, or loss in weight, refusal of feedings, drowsiness, some regurgitation and distention, and change in the character and frequency of stools. Early temperature rise is unusual. These prodromes may be readily overlooked or confused with mild gastrointestinal states caused, for example, by faulty feeding, prandial diarrhea, or the indirect effects of medication administered to the mothers of nursing infants. This slow onset is

particularly evident early in the course of an outbreak. Later, as the outbreak swings into full activity, the stage of invasion assumes a brief, more acute character, and merges quickly with the toxic phase.

In the stage of toxicity, unlike infections caused by parenteral disease or by primary enteritis induced by the typhoid-dysentery group of organisms, temperature reactions are still but slight, rarely exceeding 101 F. The stools increase greatly in number, are very watery and yellow, but surprisingly free of the mucus, blood, or pus which characterize cases of bacillary dysentery. Abdominal distention is prominent, vomiting is inconstant, drowsiness rapidly deepening into coma and intense dehydration, toxicity and shock complete in brief the clinical picture. Physical examination for general or localized signs of parenteral infection shows little. Aside from extremely low carbon dioxide values in the blood, laboratory investigations reveal the usual results of marked intestinal intoxication. The complications of the disorder, essentially pulmonary and otitic, are late or terminal events and are frequently heralded by an abrupt rise in temperature. Secondary invasion by pyogenic organisms may induce terminal septic phases.

In grave cases, death occurs in from one to twenty-five days, the median day of death being seven days. Thus far, despite vigorous attempts at treatment, the outcome has been fatal in 1 out of every 2 newborn babies attacked. In those babies fortunate enough to weather the infection, recovery takes place in from three to twenty-six days, the median day of recovery from the acute stage falling at nine days.

In our search for the etiology of the disorder, bacteriologic examinations of nasopharyngeal secretions and of the stools, and agglutination tests of the blood have proved of significance only by reason of consistently negative results. Nor have virus cultures revealed the causative agent. It can be seen, therefore, that these results differ totally from the usual

experiences encountered in laboratory and epidemiologic investigations of outbreaks of diarrhea caused by organisms of the dysentery, typhoid, or *Salmonella* groups. Postmortem examinations have likewise failed to identify specific pathologic lesions. Any abnormal tissue alterations have been those customarily found complicating the rapid wasting induced by severe infectious diseases of early infancy.

More positive evidence of the distinctive nature of epidemic diarrhea of the newborn is derived from a consideration of its epidemiologic features. Most outstanding is the limitation of the infection to infants of the neonatal period, that is, the first month of life. In sharp contrast to outbreaks of other enteric diseases, no instances have been brought to light indicating a spread of the disease to older children or to adults caring for the sick babies. The factors of sex and of race play no role in the incidence of the disorder. Nor are there any significant differences in its occurrence among artificially fed or so-called breast-fed infants. However, the problem of bottle feeding and its attendant preliminary techniques of formula preparation have by no means been ruled out as possible factors contributing to the spread of outbreaks. The seasonal variation is of interest insofar as the rates of incidence appear roughly comparable for the spring, summer, and fall seasons (Table 3). It will be noted, however, that the infection shows somewhat greater percentages of morbidity and mortality in the winter months.

As a final note, it should be added that characterizing each outbreak of epidemic diarrhea of the newborn is a rather typical mode of onset. The primary case usually occurs undetected and is followed at irregular latent intervals by several secondary cases during the course of one or two weeks or more. The epidemic then suddenly swings into full activity and is marked at this stage by a daily succession of new cases and deaths.

In recapitulation, then, what are the points of differentiation that stamp epi-

TABLE 2. SEASONAL MORBIDITY AND MORTALITY IN OUTBREAKS OF EPIDEMIC DIARRHEA OF THE NEWBORN IN NEW YORK CITY JULY 1934-DECEMBER 1937

| | SPRING | SUMMER | COMBINED SEASONS | FALL | WINTER | COMBINED SEASONS |
|--------------------|--------|--------|---------------------|-------|--------|---------------------|
| Babies exposed | 1,085 | 1,873 | 2,959 | 1,237 | 555 | 2,123 |
| Babies attacked | 160 | 262 | 422 | 128 | 200 | 328 |
| Per cent morbidity | 14.7 | 13.9 | 14.3 | 10.3 | 22.6 | 15.5 |
| Per cent mortality | 7.1 | 6.9 | 7.0 | 8.3 | 9.4 | 7.1 |
| Case fatality | 48.1 | 49.6 | 48.9 | 81.5 | 41.5 | 45.5 |

demic diarrhea of the newborn a new disease entity and that set it apart from other diarrheal disorders of infancy? Essentially, we have described a severe and highly fatal form of intestinal intoxication specifically attacking infants of the neonatal period of life. It exhibits furthermore the characteristics of a very virulent communicable disease causing outbreaks having a typical mode of inception and spread. Its rapid clinical course is marked by several merging phases, a period of incubation, a stage of invasion, a toxic stage, and a terminal stage of complications and death. Outstanding in the clinical picture are the lack of evidence of parenteral infection and the early absence of temperature reactions. The very watery and yellow stools containing no blood, pus, or mucus are characteristic, as well as the progressive intenseness of the intoxication. In addition, the failure of extensive bacteriologic and pathologic investigations to reveal the inciting organism constitutes negative but highly significant evidence of the intimate relationship between the various outbreaks, and of the uniform nature of the cases. As an added note, it should also be borne in mind that reports of outbreaks similar to those which we have been observing have appeared in the literature only within recent years.

During the course of our studies, it became evident that the failure to effect a satisfactory reduction in that part of neonatal mortality primarily due to infection was related to certain inherent deficiencies in present methods of obstetric, pediatric, and nursing care of newborn infants in hospitals. In the modern customary mass care of newborn babies

in open nurseries, a situation has developed which permits and may even promote the rapid spread of infection from baby to baby.

As our knowledge of epidemic diarrhea of the newborn grew, broad plans were formulated in New York City for its control and prevention, and for the prevention of the spread of infections in general among newborn babies in hospital nurseries. The first measure instituted was an amendment to the sanitary code of the city adding to the customarily reportable diseases and conditions all cases of 'diarrhea in the newborn up to three weeks of age occurring in a hospital giving maternity service.' This amendment placed under the jurisdiction of the Bureau of Preventable Diseases all instances of diarrhea which might possibly be outbreaks of the epidemic type, and allowed us to enforce stringent isolation and quarantine measures similar to those used in the control of any other communicable condition. No reference was made to a specific disease entity. The condition made reportable was designedly left broad to include all types of diarrheal disorders, so that the existence of the epidemic form of disease could be detected at its onset. As a result, the true extent of diarrheal disorders among newborn infants has become apparent, and early measures of control can be instituted immediately. These procedures include the closing of such maternity institutions to new admissions, and the isolation of all cases and exposed babies.

A study of all reported deaths under one year of age was next instituted. Questionnaires were sent to all hospitals and physicians reporting infant deaths, requesting the circumstances of birth,

illness, and death of the babies, and the results of postmortem examination. The information obtained is carefully checked against the filed death certificate to verify the accuracy of diagnoses previously listed as being the primary and contributory causes of death. These records are filed separately for each institution and constitute a continuous picture of that institution's experience.

In our next step, the base of attack was greatly broadened. We realized that for the control and prevention of infections in hospital nurseries, very fundamental changes in the conduct of obstetric and newborn services were essential. The uncontrolled and haphazard expansion of lying-in institutions with inadequate facilities for proper care of the mother and her newborn baby could not be permitted to continue. It was necessary to have certain minimal requirements for the conduct and maintenance of such services. The task was complicated, for only such regulations could be set up as could be readily adapted to the physical arrangements of maternity and newborn services as they exist today. Furthermore, the factor of operative economy without the impairment of efficiency required careful consideration, and the procedures had to be flexible enough to apply with equal force to institutions with small maternity services as well as to those with more extensive facilities.

In a previous publication² we advanced suggestions for the prevention and control of infection in newborn nurseries. These proposed procedures embodied the principles of surgical asepsis as applied to the aseptic nursing and medical care of newborn babies. With certain modifications these procedures were submitted to a special advisory committee composed of representatives of the obstetric and pediatric profession, the five county medical societies of New York, the municipal Department of Hospitals, and the voluntary and private hospitals of the city. As a result of these concerted efforts, an amendment to the sanitary code was submitted to the Board of Health and adopted on December 14, 1937.⁵

This amendment includes established nursing technics which have long been so advantageously used in contagious disease hospitals and in certain child-caring institutions. In the plan of organization the maternity service is made as self-contained as possible. Separate nurseries are provided for normal full-term and for premature babies, as well as isolation facilities for sick babies. The formula suite and its staff are divorced from any other diet kitchen in the hospital. The nursing personnel is likewise limited in duty to the maternity service. A minimum ratio is set, at all times during day and night, of one nurse to every unit of eight babies in a nursery. Additional regulations include provisions for the laundering of nursery linens, the conduct of ritual circumcision, the certification of maternity service personnel, and the limitation of visitors.

These regulations do not by any means represent the ultimate in obstetric and newborn nursery technic. However, they constitute a beginning in the proper direction toward the prevention and control of infection in hospital nurseries. For successful operation, their full significance and intent must be thoroughly understood, for any system of control requires the complete cooperation and untiring effort of the individuals responsible for the immediate care of the babies.

Summary

This paper is a summary of the present status of outbreaks of epidemic diarrhea of the newborn in New York City. The main clinical and epidemiologic features of the disorder are discussed, as well as points of differentiation from other diarrheal disorders of early infancy. Data are presented to show that epidemic diarrhea of the newborn is a newly recognized and distinctive disease entity of the neonatal period of life. In addition, a summary is appended of the measures which have been adopted by the New York City Department of Health in the control and prevention of outbreaks of the disorder.

Discussion

Dr William J. Orr, *Buffalo*—Diarrhea of the newly born is not a new disease. However the diarrhea, epidemic in nature and peculiar to the newly born infant, which Dr Frant and his associates have described is of recent origin. Instances of such epidemics have been reported only within recent years. The similarity of these reported outbreaks is so striking that it is apparent we are encountering the same disease in our respective communities.

It is a grave disease and its prevention and control presents a very serious problem. The gravity is best realized when one witnesses the fear and panic that seizes the hospital personnel during the throes of an epidemic. This experience is equalled only by the feeling of helplessness by the medical staff in its efforts to combat the infection.

Our first outbreak occurred in 1935. Two institutions were affected. Eighteen infants developed diarrhea all of whom were partially or entirely formula fed. No infants on complete breast feedings contracted the disease. This I think, is an important etiologic consideration.

The disease, as it progressed had several striking and peculiar characteristics which suggested one of a different entity from the average type of diarrhea seen in newly born or young infants. Only the newly born were affected. The period of invasion rarely extended beyond twenty-four hours. Two or three loose stools, refusal of feedings and drowsiness were the most constant of the prodromal symptoms. In some patients the drowsiness was so profound that they did not respond to any type of stimulation. Fever was absent or slight in most instances. The change from the early toxic stage to that of profound toxemia was usually very rapid. The drowsiness became even more profound, and the diarrhea more acute.

The most alarming of all symptoms was the marked degree of dehydration that developed. Some infants would lose as much as a pound in weight during a twenty four hour period despite every attempt to replace fluid loss.

This lack of stability in the water balance and dehydration was greater than could seemingly be

explained from the fluids lost in the frequent watery stools.

Death occurred in from two to ten days in 44 per cent of the cases. Recovery was rapid in those that survived.

Our endeavors to determine the etiology of the disease were as futile and unsuccessful as those of Dr Frant.

The epidemic was effectively controlled by closing the nurseries and establishing three emergency nurseries one for the old and new cases of diarrhea another for all contact cases and the third for all new admissions. In addition to these precautions, strict aseptic technic was carried out.

As a result of our experience three of the local hospitals now employ in their nurseries a technic very similar to that outlined by the New York City Health Department for the control of infection.

Unfortunately there are no compulsory regulations affecting all hospital nurseries.

Two months ago a similar outbreak occurred in one of our hospitals where the technic and supervision are inclined to be lax. Five of 9 cases succumbed.

The value of complete breast feeding as a safeguard from infection in the newly born cannot be overemphasized. If a more determined effort were made to have all newly born infants breast fed many of these dreaded infections could be avoided.

In formula feeding contamination of the food in its preparation and the possibilities of introducing infection to the infant at the time of feeding are more than a likely means of spreading disease.

The prevailing practice of giving accessory or supplementary feedings to normal infants to avoid an initial weight loss during the first few days of life can be pernicious.

The strides made by the New York City and Chicago Health departments in preventing the spread of infection in hospital nurseries are most commendable and should aid materially in the reduction of deaths in the newly born group. It is hoped that the health boards in other communities will introduce similar regulatory measures.

Dr Walter D. Ludlum, *Brooklyn*—It is manifestly impossible, in a five-minute discussion, to discuss all the phases of a broad subject, and it is the duty of a person participating to concentrate on what he thinks he can provide of most value. Therefore, I can say that I appreciate to the utmost the activities of the Health Department and its personnel in its efforts to control these

epidemics, and proceed to a couple of specific items

I am as much interested, commonly speaking, as anyone in the ultimate cause, be it ultra-microscopic virus or bacterium, but I am neither bacteriologist nor epidemiologist, it is not directly my affair

I want to know how the organism gets into the hospital. If we don't have a first case, we cannot have an epidemic, but this is not so much my duty and, besides, I have not even to myself, formed an exact opinion as to how to close the door of entry

What I do consider our concern as practicing pediatricists is the prevention of epidemics and the limitation of later cases coming from the first case or a common source

One can do aseptic obstetrics in an ordinary kitchen with a good stove and a little equipment, but it cannot be done in marble halls with unsterile hands uncovered. I do *not* advocate kitchen obstetrics, but I do observe that, in most of what is written about these epidemics, there can be read (and this applies to the regulations) much about material things, many rooms, equipment, spacing, and things of that kind, which can be seen by an inspector at any time, whereas, the fundamental item of procedure which goes on when he is absent, receives less consideration

By what channel, then, does this infecting material gain entrance into the individual? Obviously, I think we can say, though even the obviousness has been disputed, that the babies have skins and navels. At any rate I am going to claim obviously through the mouth or adjacent nose.

What enters here? The mother's nipple is not capable of sterilization, someone says. Agreed, but here we are considering the spread of infection, for one case does not an epidemic make, and one mother can thus directly cause but one case, unless she nurses more than one baby

A miasm from the circumambient air which the baby is quietly breathing is suggested. This seems a return to the Listerian era and the carbolic spray in the operating room. Do you really believe it is the cause of this kind of infection? Time prevents any discussion

Many items we must consider as adequately covered in ordinary good hospital housekeeping and in other papers and in regulations. We refer to such things as sterilization of linen, original sterilization of implements, bottles, nipples, and, in most places nowadays, the

babies' food. Many such items can cause epidemics, but do they now? I would not deny it, but proceed to my main theme

Most positively, I believe, such epidemics, or some similar, have been what I like to call "upper respiratory diarrheas," clinically a slight, perhaps unobservable throat infection, preceding and causing an intestinal infection. This type is to be prevented by throat masks, proper and properly worn. Whether and how this is possible gives room for a round-table discussion in itself

Naturally we approve of nurses' hands being clean, but does the repeated hand-washing called for in regulations (between handling each two babies) do what it is expected to do? Does it, in fact, accomplish anything to speak of in controlling this kind of infection? It is ideal, and to be carried out when possible, that separate persons, nurses or attendants, feed the babies and give them their other care. But when our nursery nurse embodies two functions in one person, she must complete one, change the clothing, diapers, and what not on all her charges, with such washing between cases as her sense of decency demands, then give her hands a real scrub, and feed the babies

And here is where what seems another queer misunderstanding comes in. It has been recommended that nurses wear gloves while "feeding the babies," i.e. while carrying them to their mothers and such. This would be analogous to requiring the nonsterile nurse in the operating room to wear them

When I was sitting in committee, I was so annoyed by protracted discussion of matters which seemed of slight importance, that I rose and emphatically announced it as my opinion that the enforcement of one sentence would be of more value than all the other regulations, however good and necessary, put together. Namely that "The bottle nipple shall be touched by nothing between its adequate sterilization and the time it is finally taken from the baby, except the sterile gloved hand." As a necessary concession was added "or forceps"

In a word, at present we believe that the medium of transference is the nipple, even in the best regulated hospitals where real nurses and not Sairey Gamps are employed. Until an aseptic sense, very closely resembling that of a good operating staff, is maintained throughout the nursery personnel, we believe that these epidemics will continue and the service must be closed to control them

"What do you do in a case of amnesia, doctor?"
 "I collect my fee in advance."—*Medical Record*

SPONTANEOUS PNEUMOTHORAX IN AN ASTHMATIC PATIENT TREATED WITH IODIZED OIL

ABNER M. FUCHS, M.D., New York City

(From the Allergy Clinic, Department of Medicine New York Post-Graduate Medical School and Hospital and the Allergy Clinic of the Metropolitan Hospital)

UNTIL recently, reports of spontaneous pneumothorax complicating bronchial asthma were seldom described. This may be attributed to the fact that the vast preponderance of cases of pneumothorax (approximately 80 per cent) exists as a complication of tuberculosis.¹ As a consequence of the highly improved methods of diagnosis, the stigma of tuberculosis has been removed from an increasing number of cases occurring in persons suffering from bronchial asthma. In these individuals, air enters more readily than it can be expelled, and rupture at any weak point is likely to occur because of the development of excessive intrapulmonary pressure.

The case here reported is of particular interest because the pneumothorax occurred subsequent to the treatment of the asthmatic condition by intratracheal instillation of iodized oil.

The patient, B. H., a young man aged 27, suffered from bronchial asthma of one year's duration. The attacks were seasonal in character with an interval of freedom during the winter months and were associated with other manifestations of allergy such as hay fever and urticaria. Eosinophilia was present. Intracutaneous tests gave positive reactions to the extracts of timothy, plantain, house dust, chicken, duck and goose epithelia, tobacco, pork, chocolate, tomato, pepper, and orange. Repeated examinations of the sputa were negative for tubercle bacilli. Intracutaneous tuberculin test with 01 mg. of old tuberculin gave no reaction. X-ray examination of the lungs showed increased hilar markings radiating toward the periphery. He was advised to at-

tend the asthma clinic for allergic treatment. This he failed to do.

Iodized oil treatment for the relief of his asthma was instituted on March 24, 1937, in disregard of the indications for allergic treatment. Six instillations in doses of 10 cc. weekly were administered, first into the lower lobe bronchus on the right side, a week later into the left lower lobe, the next three treatments into both lower lobes, and on May 11, 1937, the left upper lobe was injected.

On May 17, 1937, the patient experienced a severe asthmatic attack, accompanied by violent nonproductive coughing. While walking down the stairs, he was seized suddenly with a sharp pain in his right lower chest which radiated to the right shoulder. The dyspnea persisted and attempts at deep breathing aggravated the pain. He went to bed immediately but the pain and dyspnea continued throughout the night. The next morning, May 18, 1937, he was admitted to the hospital.

Examination showed a worried, markedly dyspneic young man sitting up in bed. His lips were cyanotic. The trachea was not displaced. There was a slight fullness of the right anterior chest with decreased respiratory movements. On this side tactile fremitus was absent, vocal fremitus and breath sounds were markedly diminished, and the percussion note was hyperresonant. Numerous sonorous and sibilant râles could be heard over the left side of the chest. The heart was normal in size and position, the sounds were clear and no murmurs were heard. The radial pulsations were full, regular, and synchronous. The tempera-

FIG 1 Iodized oil present in left lung field one year after instillation

ture was 97.3 F, pulse rate 103, respiration 24, and blood pressure $122/78$. The abdomen was negative. Reflexes were present and active. The x-ray examination at this time showed a right partial pneumothorax. Iodized oil was evident in the lower two-thirds of the left lung field and the lower one-third of the right lung field. No iodized oil was seen in the pleural cavity. Because the pain and dyspnea persisted, it was deemed advisable to expand the lung as rapidly as possible by subaqueous drainage. This procedure was continued until the pressure in the pleural cavity became negative. The x-ray examination now showed almost complete re-expansion of the right lung.

Two weeks later, June 1, 1937, following another severe asthmatic attack accompanied by strenuous coughing, the right lung again collapsed. Drainage at this time was deemed inadvisable. Progressive re-expansion brought about full recovery. The patient was discharged on July 25, 1937, after a ten weeks' stay at the hospital.

Incidental to the frequent physical examinations of the patient, x-rays were taken at monthly intervals to determine the extent of the retention of the iodized oil. These x-rays disclosed a very slow rate of disappearance of this oil, for after an interval of a year, an appreciable quantity of iodized oil was noted in the left lung field (Fig. 1).

Discussion

Pneumothorax rarely complicates bronchial asthma since the lungs are able to distend sufficiently to allow passage of the minimum air requisites. During an acute attack, the lungs cannot expel all the air because the diameter of the small bronchi is diminished as a result of the active congestion of the mucous membrane and an excess of mucus secretion, and possibly spasm of the muscular coat. When the intrapulmonary pressure becomes too great because of dyspnea and coughing, any weak point in the pulmonary system may rupture. The point of rupture may be (1) an emphysematous bleb on the visceral pleura, (2) adhesions between the pleurae, (3) abnormally thin pleura, (4) or an obliterative bronchiectasis in which the terminal bronchiole continues to dilate to the point of rupture.

Unusual interest is attached to this case because the pneumothorax occurred following the introduction of iodized oil as a therapeutic measure. No causal relationship between the development of the pneumothorax and the presence of iodized oil is here asserted. This condition at times occurs in apparently healthy young individuals,² as well as in untreated asthmatics.³ However, it must be admitted that the introduction of a viscid solution such as iodized oil, which is retained over an extended period, may result in an increased obstruction of the bronchi and bronchioles. This further reduces the vital capacity of the lungs and aggravates the increased intrapulmonary pressure, enhancing the likelihood of pulmonary damage.

A disregard of the deleterious effects incident to the use of iodized oil as a thera-

peutic measure in asthma has resulted in many serious complications.⁴ A recent survey of authoritative opinions revealed not only a lack of enthusiasm for this form of therapy, but direct opposition.⁵ Sequelae such as iododerma,⁶ atelectasis,⁷ traumatic bronchiectasis,⁸ pneumonia,⁹ and tuberculosis¹⁰ have been reported. Fatal terminations have also occurred.¹¹ Its use may be justified in the nonallergic cases of asthma, especially those associated with infection, such as bronchitis or bronchiectasis. The case here reported is definitely allergic in character. There is a seasonal occurrence of asthma, an interval of freedom from attacks during the winter months, an association of other manifestations of allergy, such as hay fever and urticaria, positive skin reactions, and the presence of eosinophils. Clinically and roentgenologically there is no evidence of any pulmonary infection. In this type of individual, the well proved allergic management is indicated.

The most probable explanation for the development of the pneumothorax is a rupture of an emphysematous bleb resulting from the strain placed upon the overdistended lung by the severe coughing and expiratory difficulty. It is quite possible that the presence of the iodized oil tended further to decrease the vital capacity in an already overdistended lung. Had the patient heeded instructions and received allergic treatment, the pneumothorax might not have occurred.

Summary

1 Spontaneous pneumothorax occurring in an asthmatic individual subsequent to treatment with iodized oil is reported.

2. The patient, aged 27, suffered from bronchial asthma of one year's duration. The attacks were seasonal in character and were associated with other allergic manifestations, such as hay fever and

urticaria. Intracutaneous tests gave positive reactions to the extracts of timothy, plantain, house dust, chicken, duck and goose epithelia, tobacco, pork, chocolate, tomato, pepper, and orange. Eosinophilia was present. X ray of the lungs showed increased hilar markings.

3 Iodized oil treatment was instituted in disregard of the indications for allergic treatment. Six instillations (10 cc. weekly) were injected into both lower lobes and the left upper lobe.

4 During a severe asthmatic attack a right partial pneumothorax occurred. Drainage became necessary. Two weeks later another severe asthmatic attack was followed by a second collapse of the right lung. After this progressive re-expansion brought about full recovery.

5 The pneumothorax was probably caused by the rupture of an emphysematous bleb incident upon the severe coughing and expiratory difficulty, a condition which occurs occasionally in cases of bronchial asthma.

6 The presence of the iodized oil in the lung tissues most likely further decreased the vital capacity of the already overdistended lung. Residual oil is still evident after an interval of one year (Fig 1).

7 Treatment by the accepted allergic management might have prevented the occurrence of the pneumothorax.

SYNDROME OF RETROPERITONEAL PELVIC ABSCESS

ALFRED P INGEGNO, M D , and SAMUEL SPITZ, M D , Brooklyn, New York

(From the Department of Internal Medicine, Long Island College of Medicine and Long Island College Hospital, Brooklyn)

THE cause of prolonged fever is often difficult to determine. A circumscribed suppurative process, if deeply placed and without clear-cut localizing signs, may tax diagnostic ingenuity to the utmost. Three cases of this nature, seen at the Long Island College Hospital in a relatively short period, were found to have retroperitoneal pelvic abscess. While their mode of origin differed, their nature and localization were such as to present, in review, a fairly characteristic symptom-complex. The syndrome seems worthy of recording to the end that diagnosis, and therefore adequate treatment, be not too long delayed. The case records are summarized in Table 1.

Report of Cases

Case 1—Mrs W W , white, aged 43, was admitted July 7, 1936, complaining of fever, chills, and sweats. She had had a heavy vaginal discharge twenty years before, relieved by bilateral salpingectomy and left oophorectomy. In March, 1936, she began to have yellowish vaginal discharge to which she paid little attention. One week after a normal menstrual period in May, 1936, bleeding recurred. This continued for ten days, culminating in a severe hemorrhage. Curettement at another hospital proved the presence of carcinoma of the cervix, for which she received radium treatment (75 mg \times 44 hrs). Five days later she developed fever, chills, and sweats which continued to the time of admission. Antimalarial treatment had been given without improvement. She complained of dull pain in both groins, particularly the left, vaginal discharge, constipation, and loss of weight. The patient was acutely ill, thin, and pale, temperature, 102 F, pulse rate, 112, respiration, 22, and blood pressure, 82/50. The abdomen showed

a well-healed suprapubic scar. Both kidney poles were palpable and somewhat tender. There was tenderness to deep pressure in both lower quadrants, with rebound tenderness, particularly on the left. Pelvic examination revealed a multiparous introitus with old laceration and purulent vaginal discharge. The cervix was fixed and tender, the uterus ante flexed, anteverted, fixed, and very tender. There was marked thickening of both parametria. The hemoglobin was 65 per cent, the white cell count, 16,300 with 81 per cent polymorphonuclears. The sedimentation time (18 mm) was ten minutes. Urinalysis, blood chemistry, icteric index, blood Wassermann and Kahn, and blood culture were negative.

Her condition was interpreted as post-radiation parametritis and endometritis with pelvic peritonitis, conservative treatment was instituted. However, her septic symptoms persisted and she complained of severe pain in the left groin and lower back radiating to the knee and occasionally to the toes. There were severe headaches, anorexia, and occasional nausea and vomiting. On August 10, 1936, the parametrial involvement was much diminished but still present in the base of the left broad ligament. A month of persisting symptoms followed, unrelieved by repeated blood transfusions and other supportive measures. On September 24, it was noted that the patient held the left thigh flexed and adducted. Any attempt at extension was resisted, movement causing acute pain referred to pelvis and genitalia. There was edema of the left foot and leg. An ill-defined, tender mass could be felt above the left Poupert's ligament, and the overlying muscles were resistant. A mass could now be easily felt along the left pelvic wall. Radiograph of the pelvis showed

TABLE 1 RETROPERITONEAL PELVIC ABSCESS—SUMMARY OF THREE CASES

| CASE | 1 MRS. W W 43 | 2 MRS. W W 61 | 3. MRS. F R. 45 |
|-----------------------------|--|--|--|
| General symptoms of sepsis | Present | Present | Present |
| Localizing signs: | | | |
| Pain | Left groin & back radiating down leg | Right groin & thigh | Right hip & knee |
| Spasm at hip | Present | Present | Present |

| Duration of illness | 3 months | 4 months | 2 months |
| Cause of death | Septicemia | Perforation & hemorrhage of gastric ulcers generalized peritonitis | Uremia, myocardial failure, bronchopneumonia |

relative osteoporosis on the left but the sacroiliac joints were normal. An incision was made above the left Poupart's ligament and two quarts of greenish pus were evacuated from a huge pelvic retroperitoneal abscess, culture showed hemolytic streptococcus. The next day patient had a severe chill, temperature rose to 100.4 F., and blood culture revealed streptococcus hemolyticus. She lapsed into coma and died on September 28, four days after incision of the abscess.

Autopsy both tubes and the left ovary were absent (old operation) and there were many fibrous adhesions about the remaining pelvic organs. The pelvic peritoneum was free of exudate. A retroperitoneal abscess was present on the internal aspect of the left ilium, extending 8 cm. along the left side of the vertebral column and into the pelvis to the level of the midportion of the body of the uterus. The wall of the abscess was composed of fairly firm scar tissue which, microscopically, showed an inflammatory exudate and Gram positive cocci. The abscess had no connections with any of the abdominal organs. The left broad ligament was thickened by fibrous tissue and edema. At the internal os of the uterus, the cervical canal was completely encircled by an area of ulceration 1 cm. wide with a yellow, necrotic base. Microscopically, the base of the

ulcer was composed of fibrous tissue, polymorphonuclears, and round cells. In the muscularis were a few nests of carcinomatous cells. There was a moderate hydronephrosis and hydroureter on the left, caused by partial obstruction of the distal 6 cm. of the left ureter by fibrous tissue. An acute cystitis was present. The remaining organs showed the usual parenchymatous changes and a mild generalized arteriosclerosis.

Case 2—Mr. W. W., aged 61, white, was admitted on August 25, 1938, because of fever and pain in the right groin and thigh. In 1911 he had contracted syphilis and gonorrhea. Eleven months before entry he had a sore throat with subsequent impaired hearing and intermittent draining from the left ear. The present illness had begun two months before admission with anorexia, nausea, and occasional vomiting. A few weeks later he began to have dull pain in the right groin and thigh with lumping and limitation. Fever, weakness, and loss of weight appeared, together with some constipation and frequency. Four weeks before admission he had an abscess of the throat which discharged spontaneously. The left ear became reinfected and began to drain. This subsided, but ringing in that ear persisted. The patient was pale and undernourished, temperature, 100.2 F., pulse rate, 100, respiration, 20,

FIGURE, CASE 2 Displacement of lower sigmoid and rectum by a retroperitoneal pelvic abscess on the right side

and blood pressure, 122/70. Hearing was impaired on the left, the drum reddened and perforated. The lungs were clear. The heart showed widened basal dullness and a systolic bruit at the aortic area. The abdomen and back were negative. The extremities were emaciated. The right leg and thigh were held partially flexed, attempted extension causing pain in thigh and groin. There was no discoloration or mass. The reflexes were hyperactive but equal and there were no objective sensory changes. The right lobe of the prostate was found to be markedly enlarged and indurated but not nodular, the left lobe was small and soft. The hemoglobin was 94 per cent and the erythrocytes numbered 5,700,000. The white cell count was 16,800 with 87 per cent polymorphonuclears. The urine sediment showed an occasional pus cell and red blood cell. Blood culture, chemistry, and Wassermann and Kahn were negative. X-ray of the

chest showed aortic aneurysm, a film of the pelvis revealed chronic sacroiliac arthritis and prostatic enlargement with calcification. A gastrointestinal series was negative.

The patient's condition was interpreted as one of carcinoma of the prostate with regional metastases, although his urinary complaints were minimal. On September 6, cystoscopy showed a patchy cystitis and protrusion of the median lobe of the prostate into the bladder neck. Severe inguinal and leg pain persisted and the fever became more septic, going as high as 103.6 F. The white cell count went to 17,500 with 93 per cent polymorphonuclears, and the hemoglobin fell to 75 per cent. On September 15, a tender, nodular mass of deep inguinal nodes could be palpated. The prostate felt smaller and softer than previously. On the right side of the pelvis, extending laterally and anteriorly, there was a boggy, nodular mass, pressure upon which caused much local pain as well as pain referred to the right groin and upper thigh. The flexors of the hip were spastic. The right upper thigh measured 3 inches more than the left in circumference. A barium enema (see Figure) gave evidence of pressure on the upper rectum and lower sigmoid, with displacement of the gut to the left. On September 18, a right inguinal incision was made and 3 pints of thick pus were evacuated from a large retroperitoneal pelvic abscess. Culture yielded staphylococcus aureus. Subsequently, the patient's temperature fell to normal and his pain decreased. However, the operative wound continued to pour out pus. In spite of supportive therapy he became more cachectic, low-grade fever recurred. On October 31, he developed abdominal pain and rigidity, passed two large, tarry stools, lapsed into shock, and died.

Autopsy there were multiple ulcerations of the stomach with hemorrhage, perforation, and diffuse purulent peritonitis. The remainder of the gastrointestinal tract was negative. The operative wound communicated with a sinus

which extended into the adductor canal and continued distally about the femoral vessels to the middle of the thigh. This contained thick yellow pus. The tract also extended about the medial surface of the femur below the lesser trochanter and the inferior ramus of the right ischium and pubis. Microscopically, the tissues and lymph nodes (inguinal) showed acute inflammation. The prostate was enlarged and on microscopic examination showed adenocarcinoma and infiltration with round cells and polymorphonuclears. A number of glands were filled with purulent exudate. Syphilitic aortitis with aneurysm was present.

Case 3—Mrs F R, white, aged 45, was admitted October 21, 1930, complaining of pain in the right hip, thigh and knee, sweats, fever and drowsiness. Two months before entry she had fallen, injuring the knees, but not enough to keep her from continuing her housework. Subsequently, pain in the right hip and knee recurred intermittently, but finally became so constant and severe, three weeks before admission, that it confined her to bed. Fever to 101 F and sweats supervened, and five days before entry she had become very drowsy. At that time, too, she had had several watery stools. During the course of her illness she had been anorexic and had lost weight. The patient appeared chronically ill and drowsy, temperature, 98 F, pulse rate, 100, and respiration, 24. The pupils did not react to light. The tonsils were inflamed, the teeth pyorrheic. There was cystic enlargement of the right thyroid lobe. The peripheral arteries were thickened, the heart enlarged and fibrillating. A few scattered pulmonary râles were heard. The abdomen was flabby and mildly distended and had a tympanitic note except in the right upper quadrant and right flank. The liver and spleen were not felt. There was marked pain in the right hip on moving the extremity but no atrophy, redness, or swelling. The deep reflexes were absent. Rectal examination was unsatisfactory and vaginal examination showed tenderness in both fornices, more marked on the right. The hemo-

globin was 89 per cent, the red cell count, 4,580,000. The white cells numbered 13,650 with 90 per cent polymorphonuclears. The sedimentation rate (18 mm.) was twelve minutes. A voided urine specimen showed a faint trace of albumin with 20-50 pus cells per h.p.f. and an occasional red cell and cast. The blood urea was 160, the blood sugar, 100. The blood Wassermann and Kahn were negative. X rays of the hip and pelvis showed no fracture.

The patient's temperature rose to 101-104 F with pulse of 90-120. Her abdomen became more distended. The uterus and adnexa were considered free of disease but rectal examination revealed a tender, cystic mass in the pelvis to the right of the rectum. A slightly tender mass was later felt in the right flank and right lower quadrant. The patient's condition was such as to contraindicate any surgical procedure. In spite of supportive measures she became progressively worse. The white cell count rose to 17,400 with 85 per cent polymorphonuclears. Twitchings appeared and the patient lapsed into coma. She died in pulmonary edema on October 24, 1936.

Autopsy there was a fluctuant retroperitoneal mass in the right fossa displacing the cecum and ascending colon anteriorly and extending over the pelvic brim to a point slightly above the right ischial spine. It also extended along the iliac and femoral vessels to a point 10 cm below the inguinal ligament. The abscess contained 1,500 cc. of blood tinged pus which gave a pure culture of staphylococcus aureus. The entire gastrointestinal tract, including the appendix, was normal. The lungs showed areas of bronchopneumonia. There was hypertrophy and dilatation of the heart, and, microscopically, the myocardium showed large areas of fibrosis and muscle cell loss. The pelvic organs showed no significant abnormality and there was no evidence of involvement of the pelvic bones. The spleen was enlarged (450 Gm), soft, and deep purplish red. The left kidney was of normal size and showed mild cloudy swelling. The right kidney

was the same except for slight hydro-nephrosis and hydroureter. An aortic lymph node showed acute inflammation.

Comment

In all 3 cases, in spite of a differing pathogenesis, the retroperitoneally situated pelvic abscess dominated the clinical picture and produced a syndrome having rather consistent features. There were general manifestations of sepsis, i.e., fever, chills, sweats, weight loss, anorexia, nausea and vomiting, anemia, leukocytosis, and rapid sedimentation rate. The localizing findings were pain in the region of the groin, lower back, and hip, radiating down the extremity, spasm, flexion, and limitation of the hip on the affected side, a tender boggy pelvic mass palpable rectally. In Case 1 the mass also became palpable above Poupart's ligament, and lymphatic block caused edema of the foot and leg on the side of the abscess. In Case 2 the deep inguinal nodes were palpable and tender, and extension of the suppurative process along the femoral vessels into the adductor canal resulted in a relative increase in circumference of the thigh on the affected side. In this patient, too, displacement of the lower sigmoid and rectum was demonstrated by barium enema.

The abscesses in these cases were apparently the result of acute inflammation and suppuration in the external iliac and hypogastric group of lymph nodes. These nodes receive afferents from the various pelvic organs and structures as well as from the deep subinguinal group of glands which drain the extremity. In Case 1 a hemolytic streptococcus infection, complicating carcinoma of the cervix, spread laterally through the broad ligament to produce the abscess. In Case 2 the focus of origin was in the prostate, where acute inflammation and adenocarcinoma were demonstrated microscopically, although direct symptoms of prostatic involvement were minimal during life. The causative organism was the staphylococcus aureus. In Case 3 the pathogenesis of the abscess remains obscure. The only definite factor concerned seemed to relate

to her injury two months before. There was no evidence of fracture, but a soft tissue injury which had subsequently cleared may have served as a focus for lymphatic spread of staphylococcal infection to the pelvic nodes.

The only consideration that this type of pelvic suppuration has received in the literature of the present century has come from workers in the various surgical specialties, under circumstances where its pathogenesis has usually offered little diagnostic difficulty. Herman and Stuart¹ reported on abscess in the extraperitoneal retrovesical or perivesical spaces in the male. In the cases reported by these authors the genitourinary complaints were outstanding and the immediate focus of origin was perivesiculitis or periprostatis (venereal and non-venereal). Pugh,² discussing pelvic cellulitis in the male, reported 9 cases of pelvic suppuration, most of which followed transurethral prostatectomy. Genitourinary symptoms predominated both in the antecedent history and in the symptomatology of the abscesses themselves. Savitz³ gives detailed consideration to prevesical abscess or "abscess of the space of Retzius." According to this author, chronic bladder infections (on the basis of intravesical calculus, tumor, diverticula, tuberculosis, etc.) more often cause pericystitis and lead to prevesical suppuration than do acute vesical inflammations. Trauma, operative or instrumental, as well as metastasis from a distant focus, may lead to abscess of Retzius' space. The symptoms found in this condition are mainly those of bladder irritation. Physical examination reveals a suprapubic painful mass, a pelvic mass anterior to the bladder, signs and symptoms of a septic process, and cystoscopic evidence of bladder inflammation.

The gynecologic literature on pelvic abscess is confusing in that the reports so often consider the intraperitoneal and extraperitoneal varieties together. The extraperitoneal intraligamentous type is usually puerperal in origin. It may extend widely up under the lateral pelvic peritoneum and may point in the groin,

lumbar, or kidney regions, or may even extend over Poupart's ligament down the thigh or into the subcutaneous tissues of the abdominal wall. Wharton⁴ notes that the focus of infection in the broad ligament may clear up making it difficult to establish the etiology of the purulent collection. In such cases it is necessary to have careful study, including x rays of the spine, hips, and bony pelvis, to exclude a distant focus for a burrowing abscess. As distinguished from this retroperitoneal extension of puerperal infections, nonpuerperal pelvic abscess has its chief focus in the Fallopian tubes and spreads into the pelvic or abdominal cavities. According to Gardner,⁵ the precipitating factors of pelvic cellulitis in the female are puerperal sepsis and infected abortions, repeated insertion of gold-stem pessaries, cauterization of the retroflexed uterus, carcinoma of the cervix, and as a complication of induced abortion. His observation that pelvic cellulitis is a frequent complication of carcinoma of the cervix, because most cancers of the cervix are infected with streptococci, is interesting in the light of the history of Case 1 in this report.

Suppuration in the hip joint may be the origin of retroperitoneal pelvic abscess. Freiberg and Perlman⁶ report 7 cases of this type occurring in children. The intracapsular structures of the hip joint are drained by lymphatics emptying into the group of glands situated about the external iliac and hypogastric arteries. In the 7 cases reported, iliac abscesses had formed as a result of secondary infection of the external iliac glands from acute purulent arthritis of the hip. Five of the cases had pre-existent or present otitis media, and of these 4 had streptococcus septicemia and 3 had mastoiditis. The children were feverish and sick looking, the affected hip abducted, externally rotated, and flexed. In most there was a visible fullness above and below Poupart's ligament. All hip motions were restricted by spasm and pain, the inguinal glands were enlarged and prominent, and a firm semispherical mass could be felt above Poupart's ligament.

TABLE 2. RETROPERITONEAL PELVIC ABSCESS
Classification as to Origin

| | |
|--|--|
| 1. Intestinal | |
| a. Retrocecal or subcecal appendicitis | |
| b. Sigmoidal diverticulitis | |
| c. Perforation of colonic carcinoma | |
| d. Perforation of colonic ulcer | |
| 2. Orthopedic | |
| a. Suppurative arthritis of hip | |
| b. Suppurative sacroiliac arthritis | |
| c. Caries of spine—tuberculous or nontuberculous | |
| d. Traumatic (particularly fractures of pelvis) | |
| 3. Urologic | |
| a. Pericystitis (due to calculus diverticulum uroplasma, tuberculosis, etc.) | |
| b. Periprostatitis and perivesiculitis (venereal and nonvenereal) | |
| c. Instrumentation or operation (particularly transurethral prostatectomy) | |
| d. Complicating lymphogranuloma venereum | |
| 4. Gynecologic | |
| a. Postpartum and postabortal endometritis | |
| b. Secondary infection of uroplasma (malignant or benign) | |
| c. Operation or instrumentation (cauterization, curettage, insertion of gold-stem pessaries, air and oil insufflation, etc.) | |
| d. Laceration of cervix or perineum | |
| 5. Hematogenous (from some distant focus e.g. otitis or mastoiditis) | |
| 6. Unknown | |

X rays showed the abnormalities of the hip joint in each instance, and in most cases a soft tissue shadow of the iliac abscess.

Bloom⁷ notes that suppuration of iliac and pelvic glands may occur as a rare complication of lymphogranuloma venereum. One of his patients had bilateral suppurating inguinal adenitis. This subsided, but a pelvic mass subsequently appeared followed by discharge of much pus through the wound of the previous bubo.

In Table 2 retroperitoneal pelvic abscess is classified as to its various modes of origin. It is obvious that in the majority the abscess occurs as a readily diagnosable complication of a pre-existing lesion. However, in many instances the abscess itself dominates the picture and the focus of origin may give few or no symptoms, or be entirely unknown. In such cases particularly, knowledge of the clinical manifestations of retroperitoneal pelvic abscess will aid in early diagnosis and prompt surgical treatment.

Summary and Conclusions

Three cases of retroperitoneal pelvic abscess which came to autopsy are reported. One was of gynecologic, one of genitourinary, and the other of ques-

tionable traumatic genesis The various origins for this condition are mentioned, but stress is laid upon the fact that cases occur in which these origins are subordinate or indeterminate in the clinical picture. Recognition of the general and localizing features of the syndrome produced is essential for early diagnosis and adequate treatment. The condition is characterized by general manifestations of sepsis, i e, fever, chills, sweats, weight loss, anorexia, nausea and vomiting, anemia, leukocytosis, and rapid sedimentation rate, the localizing features consist of pain in the groin, lower back, and hip radiating down the leg, spasm, flexion, and limitation at the hip and a tender, boggy pelvic mass felt rectally Other signs which may be present are palpable deep inguinal nodes or mass, increase in circumference of the thigh on the affected

side, edema of the ipsolateral leg and foot, and displacement of the gut demonstrable by barium enema

REFUGEE PHYSICIANS AND CITIZENSHIP

The influx of refugee physicians has focused attention on the question of citizenship in the granting of licenses to practice medicine.

J E McIntyre, M D, Lansing, Mich, secretary of the Michigan State Board of Registration in Medicine, in *The Journal of the American Medical Association* for March 18 says

"It is interesting to note that most states have already required either United States citizenship or first papers as a condition precedent to taking the state board examinations Only the following states require neither full citizenship nor first papers at the present time California, Illinois, Massachusetts, New Hampshire, New Mexico, New York, Ohio, Texas, Utah, and the District of Columbia Either by state law or by a ruling of the state boards of registration in medicine, the following states now require full United States citizenship Alabama, Arkansas, Delaware, Florida, Georgia, Indiana, Kansas, Kentucky, Michigan, Missouri, Montana, Nevada, Nebraska, North Carolina, North

Dakota, Oklahoma, South Carolina, South Dakota, West Virginia, Wyoming, and, except in the case of Canadians, Arizona, Iowa, and Minnesota

"States now requiring that first papers for United States citizenship must be taken out are Colorado, Connecticut, Idaho, Louisiana, Maine, Mississippi, New Jersey, Pennsylvania, Rhode Island, Virginia, Washington, and Maryland except in the case of Canadians In addition to these requirements there is a great variety of other restrictions

"In some states, such as South Carolina and Wyoming, foreign graduates are not accepted under any circumstances In some other states there is a requirement of a senior year's work in an approved United States medical school and a one year rotating internship in a United States hospital approved for internship training Still others require that the candidates pass the National Board examination and apparently there is no uniformity whatever as to these special requirements "

One candle power of intelligence applied in early diagnosis or in the elimination of the known precancerous situation will be far better than any million volts of irradiation for late cancer displays —E H Skinner, *Radiology*

MALIGNANT MANIFESTATIONS OF BOWEN'S DISEASE

ARTHUR PURDY STOUT, M D , New York City

(From the Surgical Pathology Laboratory of the College of Physicians and Surgeons, Columbia University and the Department of Surgery of the Presbyterian Hospital, New York)

BOWEN'S disease is a lesion involving skin and certain mucous membranes which is considered by some as a pre-cancerous dyskeratotic process and by others as a highly specialized form of superficial epithelioma which has a lateral intraepithelial spread. It is only occasionally that it manifests the more usual phases of malignant tumors, namely penetrating growth and metastasis. After a rather careful perusal of reported cases, it was possible to find accounts of only 32 patients whose tumors exhibited these signs of clinical malignancy. In 24 this was limited to penetrative growth, while in 8 others there were metastases. Cancerization in Bowen's disease produces tumors which differ morphologically from the commoner epidermoid cancers and which sometimes metastasize without easily demonstrable evidence of local violation of the basement membrane. This last feature is a rare peculiarity also exhibited among the epidermoid growths by melanomas, extramammary Paget's disease, and the erythroplasia of Queyrat. The 2 cases to be presented illustrate these peculiarities.

From the literature it is not possible to estimate the frequency with which Bowen's disease becomes clinically malignant because no large groups of cases have been reported. The combined material of the surgical and the dermatological pathology laboratories of Columbia University includes 57 cases of Bowen's disease during the past nine years. Of these, 55 were in the skin, 1 was in the anterior nares, and 1 in the floor of the mouth. One of the skin cases and the lesion on the floor of the mouth were malignant—about 3.5 per cent of the total number. This bears out the im-

pression that mucosal Bowen's disease is more frequently malignant than when the lesion is in the skin. Twelve of the 32 reported cases of malignant Bowen's disease were mucosal in origin—a cancerization rate of about 40 per cent for mucosae compared with only 2 or 3 per cent for the much more frequent skin lesions.

Before describing cancerization in Bowen's disease it will be well to review briefly its salient features. On the skin the lesions may be single or multiple. They may be associated in the same individual with other varieties of skin tumors such as senile keratoses, angiomas, pigmented moles, sweat gland adenomas, and basal and squamous cell epitheliomas. They may begin spontaneously or follow radiation dermatitis, experimental skin tarring in animals or arsenic (Anderson, Bloch, and Guggenheim) or they may develop in senile keratosis (Hockey). The lesions appear in the senile type of skin and usually run a very long course up to forty years (Danel). The very early lesion is usually a scaly or crusting papule which is dull red, slowly thickens and spreads peripherally without induration, forming multiple agglomerated patches or discs. If the crust or scale is removed the exposed dull red surface may be finely papillary and moist. If it involves a flexion crease or body fold it may be macerated or even superficially ulcerated. Some lesions undergo spontaneous cicatrization in one part while progressing in another. The lesion may also affect certain mucous membranes, especially the vulva, vagina, pars vaginalis of the cervix uteri, the glans penis and prepuce, and the ectodermal portions of the oral

and nasal mucosae.* The appearance of the mucosal lesions depends upon whether or not keratinization of the surface occurs. In one type it forms an intensely red, velvety, slightly thickened patch which cannot be distinguished from the erythroplasia of Queyrat. If there is surface keratinization, the reddish color is masked by white patches of leukoplakia.

The diagnosis of Bowen's disease depends upon the histopathologic changes. The epidermal layer is thickened and sometimes made papillary by a multiplication and disorientation of the Malpighian cells. The cells vary in size and shape, there are many mitoses, and some of them are apt to be abnormal. Monster cells with several nuclei centrally clumped together were originally described by Bowen and are important diagnostic features. Darier coined the word "poikilocarynosis" to describe this cellular variation and unrest. Foam cells with vacuolated cytoplasm, first described by Kreibich, are frequently found and sometimes isolated cell nests, which were first reported by Grzybowski. Many of the cells have vacuoles partly surrounding the nucleus, while in a few the vacuole completely surrounds it giving a double contoured effect—these are Darier's "corps ronds." Intracellular fibrils are usually lost although intercellular bridges are often retained. The corneal layer is thickened, shows parakeratosis and sometimes small hyalinized balls or granules which are assumed to be the final transformations of the clear cells. The basal membrane remains intact but the palisade arrangement of the basal layer often disappears. The papillary layer is heavily infiltrated with a variety of mononuclear cells including lymphocytes, histiocytes, mast cells, and plasma cells. The deeper part of the corium is free and the lesions do not, as a rule, involve the sweat glands and sebaceous glands, although occasionally the superficial part of a hair shaft may show the changes.

The superficial elastic tissue disappears (Civatte).

In the mucous membrane the picture varies depending upon whether or not there is any hyperkeratosis. The other changes are often not as clear-cut and distinctive, but unless poikilocarynosis is present the diagnosis is not valid.

When this intraepithelial growth becomes clinically cancerous it does so rather insidiously and in two different ways. In one group may be placed the cases which form malignant tumors which have been classified with the better known and commoner epidermoid cancers. Thus we find squamous cell epitheliomas reported by Delbanco, Fuhs, Goldsmith, Königstein and Mondain and Cailliau, basal cell tumors by Dubreuilh and Magimel, Goldberg, and Mount, sebaceous gland epithelioma by Flarer, and sweat gland epithelioma by Grzybowski. In all of these cases there is a heaping up of cells with the formation of a tumor nodule which may either fungate or ulcerate. It must be remarked, however, that all of these tumors were atypical or metatypical so that the reporters had difficulty in classifying the tumor type—indeed I question whether any of the reported basal cell tumors belong in this group at all, it would seem that they are either not cases of Bowen's disease or else they are Bowen epitheliomas and belong to the second group described below. The sweat gland and sebaceous epitheliomas are each single case reports which are possibly simply fortuitously associated with Bowen's disease. In any event, the only tumor form which can be accepted without reserve is the atypical squamous cell epithelioma. In this group the tumors are locally infiltrative but they do not metastasize. Case 1, reported below, is an example of this class.

The second group should properly be called Bowen epitheliomas because they reproduce the poikilocarynosis of the intraepithelial lesion and do not resemble any of the other classical types of epidermoid epitheliomas. All of the cases

* Since completing this paper, we have also observed a case involving the vocal cord which will be described in a subsequent communication.

which metastasized belong to this group.* In the 10 cases of Grütz, Gutmann, Jorno, Noguer Moré, Richon and Gougerot, and Burnier and Eliaschew, there was only infiltration of the subepithelial tissues as an indication of malignancy, but in 8 other cases reported by Danel, Darier (1920), Dufke, Kuznitzky and Jacoby, Massia and Rousset, Molesworth, Pautrier, and Postma and In singer, in addition to more or less local changes there were metastases. Five of these are known to be dead, 1 was reported well seventeen months after roentgen therapy of the vaginal lesion and excision of the inguinal lymph nodes, and in 2 others the result is unknown. The striking feature of these malignant forms of Bowen's disease is the relatively slight degree of local infiltration. In Massia and Rousset's case there was no infiltration beneath the basement membrane in the biopsy, and in Postma and In singer's tumor the infiltration was microscopic. The cases of Danel, Darier (1920), Molesworth and Pautrier showed only insignificant ulceration and infiltration and only in Dufke's tumor was there deep ulceration. This fact is stressed because Case 2 of the present report showed complete absence of local infiltration in the sections studied although the tumor metastasized. Jorno found in his case that there was evidence of penetration beneath the basement membrane in only 2 of 100 serial sections. These facts demonstrate beyond question that the cells may metastasize while there is still no demonstrable clinical evidence of malignant change in the primary lesion. Civatte remarks that cancerization in Bowen's disease in his experience has occurred only in cases that have been traumatized by ineffectual attempts at local destruction. This was true of Case 2 in the present report.

Case Reports

Case 1—J W male, 68 years old (P&S 15510) This patient had had a lesion char

* I was unable to consult the report of Kuznitzky and Jacoby so that I can only surmise that it belongs with this group because of the title which calls it "Bowen's epithelioma."

FIG 1 CASE 1 The lesion in front of the left ear showing the elevation caused by the tumor with its necrotic center and the senile changes in the skin of the cheek

acteristic of Bowen's disease on the dorsum of the right wrist for the past fifteen years and during that period a number of senile keratoses had appeared on both hands. There was no history of arsenic ingestion or other definitive etiologic factor. Three months before admission a small reddish 'pimple' appeared in front of the left auricle (Fig 1). This spread rapidly, itched and soon broke open in the center after which there was soreness in it. When examined there was a rounded area of reddening and in duration 2 cm. in diameter with the central 5 mm. ulcerated. After treatment with wet compresses for several days much of the surrounding redness diminished. No adenopathy was recorded. The lesion was biopsied on February 18, 1938 and the whole area was excised on March 4.

The tissue excised consisted of an elliptic area of skin and subcutaneous tissue 42 × 15 mm. in area, and 8 mm. thick. In the center of the skin was a slightly elevated area 1 cm. in diameter the central 2 mm. of which were ulcerated. The surrounding skin appeared slightly reddened and scaly (Fig 2). Microscopic examination showed that the tumor is composed of cords of cells which spring from the epidermis

FIG 2, CASE 1 Cross section of the excised tumor showing the extent of penetration to the depths of the corium, the thickening and hyperkeratinization of the overlying epidermis and the undifferentiated arrangement of the tumor cell cords

and infiltrate to the depths of the corium. The cells forming the cords are of large and sometimes monster size but always with single nuclei. No stratification is seen and no intercellular bridges, but a few tonofibrillae and some intracellular keratin can be recognized in some of the cells. Occasional imperfectly formed pearls are seen. Mitoses average one in every 2 or 3 high power fields and some are atypical. The tumor is covered with a thick layer of keratinized epithelium and its center is slightly depressed and ulcerated. Many of the tumor cells have large cytoplasmic vacuoles and others have foamy cytoplasms (Fig 3). The skin on one side of this tumor shows marked epidermal poikilocarynosis. The various epidermal layers are no longer distinguishable—instead there is a confused mass of large and small cells, some giant forms with clumped nuclei, many mitoses, cells with vacuoles partly surrounding the nucleus, "corps ronds," and occasional foam cells. Hyperkeratosis is not marked and parakeratosis is found occasionally (Fig 4). The process sometimes involves the epidermal sheaths of the hair shafts. As one approaches the tumor, the rete pegs affected by this process become enormously thickened and lengthened. Externally the process gradually fades out but nowhere in the excised tissue is there perfectly normal epidermis. The papillary layer and to some extent the underlying corium are infil-

trated by many lymphocytes, plasma cells, monocytes, and occasional polymorphonuclear neutrophils.

Comment—This case is unusual because of the short duration and the lack of the more characteristic gross appearances of Bowen's disease. However, all writers agree that the diagnosis of Bowen's disease is dependent upon the histopathology, and the epidermal changes immediately adjacent to the infiltrating tumor fulfill the important criteria. The malignant tumor itself, while decidedly unusual, is unmistakably a poorly differentiated squamous cell epithelioma.

Case 2—Male, 63 years old (S P 52749). Eighteen months before admission, when cleaning his teeth he noticed a small red spot to the left of the frenum in the floor of the mouth. It gave no symptoms. Previous to this he had smoked 5 to 6 pipes per day but after noticing the spot he changed to cigars. In spite of mouth washes the spot grew slowly larger without pain or bleeding. On examination in September, 1932, a slightly thickened, intensely red patch was found on the floor of the mouth anteriorly, chiefly to the left of the frenum but also extending slightly to the right side. It measured

2.5 X 2 cm and was very slightly elevated. It was velvety and barely palpable. There were just palpable upper cervical nodes on both sides of the neck. The possibilities of superficial epithelioma and phenolphthalein eruption were considered and a biopsy taken on September 23 1932 on which a diagnosis of Bowen's disease was made. It was decided to treat him with interstitial radium but this could not be started at once because he at first refused to allow his carious teeth to be extracted. When this was finally accomplished he was given interstitial radium by means of five short needles between

FIG. 3 CASE 1—X 1700 (reduced) Detail of tumor cells showing the variation in size hyperchromatism of nuclei with their prominent nucleoli and intracellular fibrils. The faintly stained ones are tonofibrillae and the deeply stained thicker ones are keratin.

November 9 and November 15 receiving a total of 500 mg. hours. When the reaction had subsided on December 20 no trace of the lesion could be found. However by February 19, 1933 three months after treatment an area of redness appeared on the left side immediately posterior to the original area and this spread slowly backward along the left alveolingual gutter. He returned to the hospital when the lesion measured 2 X 1.3 cm. and the whole area was excised on November 13 1933 one year after treatment. It was still superficial without any induration

FIG. 4 CASE 1 Detail of the epidermis at one side of the tumor showing marked poikilocarynosis with the formation of many atypical cell forms including a cell with clumped nuclei at the right. The basement membrane is preserved and the marked subpapillary inflammatory cell infiltration is seen below.

and no cervical node enlargement was noted. He remained well for two and one half years and then on May 27, 1936 a hard node appeared deep to the sternomastoid in the left upper cervical region. An x-ray of the chest showed no evidence of lung or mediastinal involvement. After some discussion a complete radical upper and lower neck dissection including all of the lymph nodes was done according to the Semken technic. Examination showed metastases in the node palpated which lay at the apex of the posterior triangle of the neck and also in one of twelve supraclavicular nodes sectioned. He then received roentgen therapy. From July 30 1936 to August 19 1936 two 8 X 10 cm. right and left cervical fields received 1200 and 2400 r respectively with the factors 200 k.v. and either T.S.D. 50 25 M.A. and 2 mm. cu. and 1.25 mm. al. filter or T.S.D. 50 M.A. 25 and 1 mm. cu. plus 1 mm. al. filter. A daily dosage of 200 or 300 r was used. Following the subsidence of the reaction an almost board like induration of the entire left neck remained. Further roentgen therapy was given from October 22 to October 29 1500 r to a larger 10 X 15 cm. field in the left neck and finally from October 30 to November 4 1000 r to a low 8 X 10 cm. supraclavicular field. This made a total of 4900 r to the left side and 1200 r to the right side of the neck.

When last seen on March 9 1938, seven years

FIG 5, CASE 2 The lesion on the floor of the mouth excised after reappearance following failure of interstitial radium treatment. It shows the superficiality and sharp definition of the involved area and the marked inflammatory reaction in the papillary and subpapillary layers.

after the onset of his disease and twenty months after removal of the cervical metastases, he was in good general condition. There was no evidence of disease in the mouth and the left side of the neck was still almost board-like without any nodules in it so that it was impossible to say whether the induration was solely a postradiation effect or whether there was any persisting tumor.

Microscopic examination of the mouth shows the same picture both in the biopsy and in the lesion excised after failure of radiotherapy. The mucosal coat is everywhere thickened and profoundly altered (Fig 5). It is no longer arranged in definite layers, instead its cells are irregularly disposed and vary in size and shape. Several of them are quite large and some of these have 2 or more nuclei which tend to be clumped together toward the center of the cell (Fig 7). Many cells have a clear zone partly surrounding the nucleus. Mitoses are frequent, averaging 1 in every high power field, and some of them are bizarre and atypical. Except at the very margin of the tumor where it adjoins normal mucosa there are no intercellular bridges between the cells (Fig 6). A few of the cells show intracellular fibrils and some show traces of intracellular keratin. On the oral surface is a thin keratinized layer of flattened cells. No foam cells of Kreibich are seen, nor are there any cell nests of Grzybowski. There are no epithelial pearls. The basal layer as such has disappeared and is replaced by tumor cells. The basement membrane seems everywhere preserved. In the original biopsy the rete pegs are sometimes greatly elongated and tangential sectioning makes them appear like infiltrating cell groups. Careful inspection shows, however, that they all are surrounded by a clear-cut basement membrane so that nowhere is there definite evidence of invasion. The papillary layer and the submucosa show a great many

engorged capillaries and a dense infiltration chiefly of plasma cells and lymphocytes. The underlying striated muscle is not affected.

Lymph nodes—Both nodes are much enlarged and completely replaced by neoplasm. This consists of anastomosing cords of cells which are

FIG 6, CASE 2— $\times 625$ (reduced). Detail from Fig 5 showing a marked degree of poikilocarynosis with the formation of atypical cells, bizarre mitoses, and loss of stratification. There are many cells with vacuoles partially surrounding the nuclei. The basement membrane is intact.

quite large with hyperchromatic nuclei and a great many mitoses, averaging 3 in every high power field. Many are atypical. There are many gigantic tumor cells with multiple bizarre nuclei. In some the nuclei are clumped. There are no intercellular bridges, no intracellular fibrils or keratin and no pearls (Fig 8). The large cords of tumor cells often have necrotic centers. The stroma is fibrous and infiltrated with inflammatory cells. Only traces of lymphoid tissue remain. This picture reproduces the appearance of the primary tumor except that there is much less differentiation. There is no evidence of pigmentation either here or in the primary tumor.

Comment—This case fulfills the requirements for an unqualified diagnosis

FIG 7 CASE 2.—X 1700 (reduced) One of Bowen's clumping cells' with an incomplete vacuole about the nucleus. Note absence of intercellular bridges and intracellular fibrils.

of Bowen's disease with metastasis. It is apparent that the clinical appearance corresponds with that of erythroplasia. As many writers have pointed out, one form of mucosal Bowen's disease cannot be distinguished clinically from erythroplasia so that they can only be separated microscopically. Although about 75 sections were prepared of the mouth lesions, in none of them was there evidence that the basement membrane had been penetrated. One cannot doubt that the penetration must have occurred at some point, for otherwise metastasis would be inconceivable, but it is also evident that this must have been only microscopic in degree.

FIG 8 CASE 2.—X 825 (reduced) Detail of metastatic cells in a cervical lymph node. Extremely bizarre and often multinucleated cells, atypical mitosis, perinuclear vacuolation which in some instances is complete (corps ronds) and complete absence of epidermoid differentiation.

Discussion

Bruno Bloch, in his masterly discussion of the precancerous state, has pointed out that 'as long as we do not know the biochemical changes which characterize the cancer cell and differentiate it from the normal mother cell, we shall be unable to know wherein lies the essential characteristic of a precancerous change or, in other words, the problem of an unequivocal definition of precancerosis is at present insoluble.' Since those words were published in *The Cancer Review* in 1932, no further information has come to light to invalidate them, and therefore no attempt will be made to discuss the question as to whether Bowen's disease is a cancer from the outset or whether it is a precancerosis which only occasionally becomes cancerous.

It seems definitely established that the lesion called Bowen's disease is a disturbance of epidermal and certain ectodermal mucosal cells characterized by the production of certain bizarre cell forms, by a loss of the orderly arrangement of the epidermis or mucosa affected, and associated with a marked inflammatory reaction. It is quite distinct from all other lesions including

Paget's disease with which it is sometimes confused. The characteristic Paget cell is never found in Bowen's disease. Usually Bowen's disease occurs in the skin and oral, nasal, or genital mucosae of elderly people without known etiology but it can be induced by the well-known carcinogenic agents x-ray, tar, and arsenic. In 2 or 3 per cent of skin cases and in about 40 per cent of mucosal cases clinical cancer results. This may be of two morphologic types: first an atypical or metatypical squamous cell epithelioma, as demonstrated in Case 1, or a true Bowen epithelioma with reproduction of the bizarre characteristics of the Bowen cells without any other epidermoid features. This is a malignant cancer which metastasizes. An important feature of the true Bowen epithelioma is the occurrence of metastasis with a minimal amount of local penetration which may defy clinical detection and even escape ordinary microscopic study, so that only serial sectioning of the entire lesion will reveal it. Case 2 is an example of the Bowen epithelioma.

Whether or not Bowen's disease is a precancerosis or cancer from the start, it is evident that it may become a clinical cancer and therefore merits respect. Incomplete destruction of a lesion has several times been followed by the appearance of metastases and it must therefore be considered a dangerous practice to employ measures which may fail. These include irradiation and all chemicals. There is only one proper method for dealing with Bowen's disease and that is complete surgical excision. It is better to employ no treatment at all than to risk incomplete destruction.

Summary

Two cases of malignant Bowen's disease are reported, 1 an atypical squamous cell epithelioma in the skin of the face and the other a Bowen epithelioma in the floor of the mouth with metastases in the cervical and supraclavicular lymph nodes. The latter case illustrates the possibility of metastasis from a Bowen

lesion without the discovery of gross or microscopic evidence of penetration of the basement membrane. The importance is stressed of complete surgical excision of Bowen lesions rather than treatment by irradiation, chemicals, or any other methods.

ESTIMATE 48 000 000 CASES OF TRICHINOSIS HERE

The recent evidence from autopsies that 30 per cent of the inhabitants of Cleveland have trichinosis must not be interpreted as proof that the city is the most highly infested area in the United States, *The Journal of the American Medical Association* for March 18 says

Such evidence suggests rather that the routine diagnostic methods employed by earlier investigators are fallacious. *The Journal* points out. Routine examinations of the diaphragms of adult cadavers by the Baermann digestion method has led previous investigators to the conclusion that approximately 13.67 per cent of all persons in or around Washington, D. C. are infested with trichinae, 17.5 per cent in Minneapolis and Rochester, New York 24 per cent in San Francisco and 27.6 per cent in Boston.

The editorial states that C. H. Evans, M. D. of the Institute of Pathology, Cleveland supplemented this routine diagnostic method by ap-

plication of a newer technic. Combining all positive data Evans found 86 positive cases of trichinosis in the first 100 Cleveland autopsies studied by his double technic.

Applying the implied correction coefficient to the percentages previously reported from other cities, the editorial says one would conclude that there are presumably the following percentages of trichina infestation in other American cities: Washington, D. C. 24.6 per cent; Minneapolis and Rochester, N. Y. 31.5 per cent; San Francisco 43 per cent; and Boston 49.7 per cent; an average of 37 per cent infestation of the urban population of the United States.

There is no way of course, of estimating the resulting social or economic loss, but the estimated 48,000,000 cases of trichinosis in the United States are far from being a national asset.

SULFANILAMIDE AND PNEUMONIA

The future specific treatment of pneumonia probably will be with a combination of sulfanilamide and pneumococcus serum, especially in those cases caused by Types II and III pneumococci, Alvin E. Price, M. D. and Gordon B. Myers, M. D., Detroit, state in *The Journal of the*

American Medical Association for March 18

Although the results obtained from using the drug in the treatment of pneumonia are encouraging, the two men point out, the place of sulfanilamide in the treatment of the disease is not yet definitely established.

VACCINATION AGAINST TUBERCULOSIS

Comparative Results Obtained with Koch's Bacillen Emulsion, Calmette's B C.G. and the Caseous Vaccine of the Saranac Laboratory: Fourth Communication

HUGH M KINGHORN, M D , and MORRIS DWORSKI, B S , Saranac Lake, New York

IN PREVIOUS communications (1), (2), and (3), we stressed the fact that all tuberculins (including those of Robert Koch) have been a great disappointment therapeutically. Nevertheless, the old or original tuberculin of Koch in 1890 was a great discovery. Since then, that is in the past forty-eight years, there has been no generally accepted progress in vaccination against tuberculosis.

The therapeutic results of all tuberculins are pretty much the same. In composition these tuberculins have consisted of various varieties of extracts of the tubercle bacillus, or of the whole killed bacillus.

Of the many available, we regard Koch's bacillen emulsion as probably the best tuberculin. It consists of the whole tubercle bacillus in a dry, powdered state, and can be readily absorbed by the tissues without causing abscesses. Early in his work Koch discarded the whole killed tubercle bacillus because abscesses tended to develop.

Our investigations have attempted to prepare a better vaccine for the prevention and cure of tuberculosis than the tuberculins and vaccines which now exist.

One of the most dreaded conditions with which we have to deal in the treatment of pulmonary tuberculosis is cavity, chiefly because of the caseous material which it contains. This material is very toxic and may harbor large numbers of tubercle bacilli, and if it becomes disseminated into other parts of the lungs or elsewhere in the body, new acute foci may develop. We therefore do all in our power to obliterate cavity, for we know that as long as a cavity exists, it is a menace to the individual.

Microscopic examination of this caseous

material sometimes reveals no or few tubercle bacilli, and yet, if it be inoculated into a guinea pig, it will almost always produce generalized tuberculosis. Forms of tubercle bacilli are present which do not stain readily.

In the development of tuberculosis the implantation of the tubercle bacillus in the tissues is followed by the formation of an epithelioid or proliferative tubercle. If the disease progresses, coagulation necrosis begins in the center of the cellular mass, soon to be followed by caseation. If retrogression occurs, the caseous areas may become successively fibrocaseous, fibrous, and then calcified, sometimes, though less frequently, the lesion resolves, with complete disappearance of disease. If, on the other hand, the disease progresses, the caseous mass may soften and be discharged, and a cavity may result. The toxemia in tuberculosis is probably due not only to the disintegrated tubercle bacilli, but perhaps equally to the degenerated products of the destroyed cells.

The bacilli in the diseased area are constantly liberating toxins which are injurious to the host. Furthermore, the products of cellular degeneration add more toxic substances. The resulting caseation is the end product of cellular destruction in tuberculosis. It occurred to us that a vaccine consisting of caseating material containing tubercle bacilli in various stages of degeneration might prove efficacious. Such an agent might stimulate the formation of anticaseating substances. We have prepared such a vaccine and have tested it in animal experiments.

Source and Preparation of the Vaccine

Due to the wholehearted cooperation

of Dr E. T. Faulder, Director of the Animal Industry Bureau, Department of Agriculture and Markets, Albany, New York, and of his associates, Dr J. Woodward Claris and Dr F. E. Boyd, we were able to obtain exactly the material we wished. We take this opportunity to thank them most heartily for their interest and help.

When a tuberculous bovine is killed, the caseous material from the lungs or lymph nodes is removed under sterile conditions and immediately sent to us iced. It is kept in the ice chest and used as soon as possible as a source of the vaccine.

We have used two methods to prepare our vaccine. The first method consisted of the dried powdered caseous material. The second method consisted of the caseous material in suspension in normal salt solution. The caseous substance is usually semifluid pus, so that there is no difficulty in making a suspension of it.

All of our experiments on animals have been made with the dried powdered material. Experiments are under way to test these two methods of preparation against each other. The suspension has been used on humans, but not on animals.

Method of Preparing Dried Powdered Caseous Vaccine

1. The caseous material which was removed from the cow's lung or gland is spread thinly in large porcelain evaporating dishes, under sterile precautions.

2. It is then dried in a vacuum over H_2SO_4 until thoroughly dehydrated.

3. The dried caseous substance is broken into small pieces and ground in a mortar.

4. The triturated material is put into a porcelain ball mill, and ground for at least two weeks for eight hours daily. A fine palpable powder results. This powder is the basis for the suspension. It is kept in the ice chest and used when necessary as follows.

Place about 1 Gm. of the powder in a mortar and grind into a smooth paste, using 5 cc. $\frac{n}{10}$ NaOH. The hydroxide is added drop by drop. Distilled water is

then slowly added during the grinding process. The amount of water added depends on the concentration of the suspension desired. About 100 cc. of water to 1 Gm. of powder will give a suspension containing about 4 mg. per cc. It requires thirty to sixty minutes to prepare a proper mixture. The aqueous suspension is poured into a graduate and allowed to remain undisturbed for one hour. The supernatant fluid is decanted into a sterile flask. Twenty cubic centimeters are removed for total solid determination. The amount of fluid remaining is measured, and an equal quantity of glycerin is added. Ten cubic centimeter quantities of the glycerized suspension are put into test tubes, which are sealed with the aid of a blow torch.

The tubes are sterilized in a water bath at 56 C. for one hour on two successive days.

Sterility tests are made for tubercle bacilli and secondary organisms.

The amount of solid material in the suspension is determined by evaporating 10 cc. quantities of the aqueous suspension and drying to a constant weight at 110 C.

Varying doses are made by diluting the suspension with 0.85 per cent NaCl, or 0.85 NaCl in 0.25 per cent phenol.

Preparation of Caseous Suspension from Moist Caseous Material

We have done no experimental work on animals with caseous suspension, but have used it for the treatment of human tuberculosis. The work of C. H. Boissevain⁴ and others has shown that the antigenic properties of tubercle bacilli are changed by dry grinding in a pebble mill. The bacilli lose their acid fastness and their power to provoke hypersensitivity to tuberculin in guinea pigs after intraperitoneal injection. This may be due to the modification of the different proteins present in the bacillus.

1. Caseous material is removed from the lung or gland of a bovine and placed in sterile Petri dishes.

2. About 30 Gm. of the moist caseous substance are placed in a sterile flask,

and 100 cc of sterile 0.85 per cent NaCl pH 7.0 are added. The mixture is gently but thoroughly shaken and placed in the ice chest for seventy-two hours. The flask is gently shaken at intervals during the day.

3. Decant supernatant fluid into another sterile flask, and pour sediment into a sterile mortar. Grind until an even paste is obtained, removing any gelatinous masses that cannot be crushed. Return paste to the decanted fluid.

4. Mix gently but thoroughly and pour 10 cc. quantities into test tubes. The flask should be shaken gently and continuously while filling the test tubes. Seal and sterilize the tubes at 56 C for one hour on two successive days.

5. Sterility tests as described above are made for tubercle bacilli and secondary organisms.

6. Determination of the solid content is made by evaporating 10 cc quantities of the suspension, and drying to a constant weight at 110 C.

Varying dosage is obtained by diluting with 0.85 per cent NaCl.

Both with the powdered vaccine and the suspension the amount of the dose is estimated in terms of solid substance.

Preparation of Caseous Filtrate

As mentioned above, we sterilize our vaccine at 56 C on two successive days for one hour. We thus use a killed vaccine. It cannot produce tuberculosis, as the tubercle bacilli are dead. The potency of the vaccine, however, has probably been weakened by heating. We have endeavored to return to it the substances which were destroyed by heat. We do this in the belief that a living vaccine usually gives to an organism a greater protection than a killed vaccine, since the living germ keeps throwing out substances into the host which the dead germ cannot give. If, therefore, we can return these substances to the vaccine, we should have a better vaccine than that from the dead germ alone. The most likely place to get these important substances is in the caseous mass, because

here the combat between infection and resistance has occurred.

When the caseous mass reaches us we immediately divide it into two portions. One part is used to make our powdered vaccine and caseous suspension, and the other portion is utilized to obtain extracts.

To obtain these extracts we use the following procedure:

1. Place about 25 Gm of the moist caseous substance in a sterile flask and add 100 cc sterile 0.85 per cent NaCl pH 7.0. Shake gently. Place in ice chest for seventy-two hours and shake frequently but gently.

2. Decant and centrifugate the supernatant fluid for one-half hour at maximum speed (2,400 revolutions).

3. Filter supernatant fluid through two No. 5 Whatman papers, using a moderate suction.

4. The filtrate is sterilized by filtering through a Sertz bacterial filter.

5. Sterility tests are made as described above for tubercle bacilli and secondary organisms.

6. Sufficient phenol may be added to make a final dilution of 0.25 per cent phenol.

At the present time in treating humans we use this caseous filtrate with our vaccines, and think that we have probably put back into the vaccine many substances which were destroyed by heating.

Summary of Results of Previous Experiments to Test the Value of Caseous Vaccine and Koch's Bacillen Emulsion*

Four experiments were made, two on rabbits and two on guinea pigs. Fifty-nine rabbits and 117 guinea pigs were used. In all these experiments we obtained a very marked prolongation of life in the animals vaccinated with caseous vaccine over those vaccinated with Koch's bacillen emulsion and over the unvaccinated controls.

The prolongation of life in the animals vaccinated with Koch's bacillen emulsion over the unvaccinated controls was not

* These experiments were given in detail in our first three publications.

nearly so striking, and did not always occur

The immunity also, as evidenced by extent of disease, was much greater in the animals vaccinated with caseous vaccine than in those treated with bacillen emulsion and in the unvaccinated controls. This immunity in one experiment (#483, Series II) appeared to be so high that 75 per cent of the animals vaccinated with caseous vaccine showed no evidence of tuberculosis, and 25 per cent had only minimal tuberculosis. The disease did not extend beyond the minimal stage in any animal. With Koch's bacillen emulsion 16 per cent of the animals showed no tuberculosis and 50 per cent advanced tuberculosis. With the unvaccinated controls 5 per cent showed no tuberculosis and 74 per cent advanced tuberculosis.

Comparative Results Obtained with Caseous Vaccine and Calmette's BCG*

The experiment was divided into two parts (1) to determine what degree of immunity each vaccine produced with respect to extent of disease, and (2) to determine, if possible, in which group the immunity persisted the longest. The first part of the experiment continued for fifteen months, that is, from the time the vaccinated animals in both groups and the controls received their virulent inoculation until this part of the experiment was ended. The second part lasted one year,

* The results of this experiment were given in detail in our third publication.

that is, from the time the animals of all three groups received their second virulent inoculation until the entire experiment was terminated.

Very definite evidence of immunity as regards extent of disease was shown in this part of the experiment in Groups B (caseous vaccine) and D (Calmette's BCG) over the controls.

Group B no tuberculosis in 89 per cent—no advanced disease.

Group D no tuberculosis in 78 per cent—no advanced disease.

Group C, no tuberculosis in 10 per cent—40 per cent advanced disease.

Six animals survived in Groups B and D, and 5 rabbits in the control group.

Part II of Experiment 579—These three groups were reinfected 464 days after the first virulent inoculation with 25,000 bovine (BI) organisms in the left groin subcutaneously. These organisms were obtained from a twenty-one-day-old culture, glycerol broth flask.

One year later the experiment was terminated by killing all surviving animals in the three groups. The findings were as follows:

| GROUP | NO TUBERCULOSIS | MINIMAL | ADVANCED |
|----------------------------------|--------------------|--------------------|-------------------|
| B—Caseous vaccine 8 Rabbits | 1 Rabbit 12.5% | 4 Rabbits 50.0% | 1 Rabbit 12.5% |
| D—Calmette's B.C.G. 8 Rabbits | 3 Rabbits 37.5% | 2 Rabbits 25.0% | 1 Rabbit 12.5% |
| C—Controls 5 Rabbits | 1 Rabbit 20% | 0 | 4 Rabbits 80% |

A minimal tuberculosis was often determined only by the microscope, and even then was frequently difficult to decide upon. If there was any doubt, it was always interpreted as tuberculous. It

| | | EXTENT OF DISEASE | | |
|--|------------------------------------|----------------------|--|-----------------------|
| | | Minimal Tuberculosis | | Advanced Tuberculosis |
| Group B—Caseous vaccine 9 Rabbits | No Tuberculosis 8 Rabbits 88.8% | 1 Rabbit, 11.1% | | 0 |
| Group D—B.C.G. vaccine 9 Rabbits | 7 Rabbits, 77.7% | 2 Rabbits, 22.2% | | 0 |
| Group C—Controls 10 Rabbits | 1 Rabbit, 10% | 5 Rabbits, 50% | | 4-40% |
| Group B gave 88.8% free of tuberculosis, 11.1% minimal, no advanced. | | | | |
| Group D gave 77.7% free of tuberculosis, 22.2% minimal, no advanced. | | | | |
| Group C gave 10% free of tuberculosis, 50% minimal, no advanced. | | | | |

In Group B 11% of the animals were infected.
In Group D 22% of the animals were infected.
In Group C, 60% of the animals were infected.

usually consisted of one or a few tubercles 1 to 2 mm in diameter

The control group showed 4 out of 5 rabbits with advanced tuberculosis. Caseous vaccine and B C G had only 1 advanced in each.

Caseous vaccine and B C G produced practically the same degree of immunity, and it was very striking. In the first part of the experiment, caseous vaccine obtained a slightly higher degree of immunity than B C G. In the second part it seemed as though B C G produced an immunity which lasted longer—50 per cent no tuberculosis for B C G against 16 per cent for caseous vaccine. Both had 16 per cent advanced tuberculosis, but here the disease was much more extensive in B C G than with caseous vaccine.

At the outset of this communication we gave as our thesis the utilization of bovine caseous material as a vaccine to prevent the development of caseation in infected animals. The results of our work seem to indicate that our caseous vaccine decidedly limited the formation of caseation. For instance, in the rabbits of Group B (Experiment 579) which were vaccinated with caseous vaccine, only 1 animal in 15 had evidence of caseation, and this was not pronounced. This also occurred with Calmette's B C G. It also tended to prevent the development of caseation, for in the rabbits of Group D (Experiment 579) vaccinated with B C G, of 15 animals, only 1 showed advanced caseous disease. In the unvaccinated control animals of Group C of this Experiment 579, of 15 animals, 8 had advanced caseous tuberculosis.

Summary of Experiment 579—Parts I and II

15 Rabbits in Each Group

| GROUP | NO TUBERCULOSIS | MINIMAL | ADVANCED |
|------------|-----------------|----------|----------|
| B—Caseous | 9-60% | 5-33 33% | 1- 6 66% |
| D-B C.G | 10-66 66% | 4-26 66% | 1- 6 66% |
| C—Controls | 2-13 33% | 5-33 33% | 8-53 33% |

In guinea pigs also, caseous vaccine seemed to prevent the development of caseation, as shown in Experiment 483, Series II.

This experiment, 579, showed that caseous vaccine and B C G are about of equal value, that both possess high immunizing properties, and that both tend to prevent the development of caseation.

Infectiousness of B C.G. for Rabbits

As part of Experiment 579 we tested the infectiveness of B C G on 9 rabbits.³ Although the tissues of every animal were examined both microscopically and macroscopically, the only evidence of B C G infection was a focus in the inguinal glands of 2 animals. Inoculation of guinea pigs with material from these glands failed to develop tuberculosis. Seven rabbits were entirely free of infection. We feel, therefore, that B C G does not produce a fatal infection in rabbits. With humans and guinea pigs it does not produce a progressive tuberculosis. While it does seem to produce a mild grade of tuberculous infection, as evidenced by the tuberculin reaction that humans and animals infected by it usually show, yet the infection subsides, and the humans or animals do not develop tuberculosis.

The abscesses that developed in the groins of these 2 rabbits were due to the repeated large amounts of B C G that were injected.

Discussion

We have shown in five experiments with caseous vaccine, and in one with B C G, that they limit the development of tuberculosis to a marked degree. Caseous vaccine contains caseous tuberculous tissue, and heat-killed virulent bovine bacilli. B C G consists of attenuated living bovine tubercle bacilli. The question naturally arises why an attenuated living germ gives as much immunity as the killed virulent germ. There must be something elaborated by the living germ in the tissues of the host that the dead bacillus does not produce. We are endeavoring to obtain this valuable substance by extracting the unheated caseous mass, and then, after filtering the extract to render it sterile, using this filtrate with the heated caseous vaccine.

Although B C G has been given to over a million children, yet it has not been accepted and used in Great Britain and her colonies or in the United States. In these nations the preference is decidedly for a killed vaccine. The killed germ cannot produce tuberculosis. There still remains the suspicion that B C G may produce tuberculosis.

Summary

As a result of twelve years of work with our caseous vaccine we have reached the following conclusions:

Comparing it with Koch's bacillen emulsion, we have found in every experiment much more protection with our vaccine. In one experiment with guinea pigs we obtained 75 per cent complete protection and 25 per cent minimal tuberculosis. With bacillen emulsion we obtained 10 per cent complete protection and 50 per cent advanced tuberculosis. The controls gave 5 per cent complete protection and 74 per cent advanced tuberculosis. All the control animals except 1 were infected.

Comparing the potency of our caseous vaccine with B C G, we found that both gave practically the same degree of protection. We obtained 89 per cent complete protection with rabbits, and 11 per cent minimal tuberculosis—almost 100 per cent of protection, as the minimal tuberculosis required microscopic demonstration. B C G produced about the same results, namely, 78 per cent complete protection, and 22 per cent minimal tuberculosis. All the control animals except 1 were infected. 10 per cent

showed no tuberculosis, 50 per cent minimal, and 40 per cent advanced tuberculosis. Animals treated with caseous vaccine and B C G showed no advanced tuberculosis.

In this same experiment we also tried to determine which group would maintain the longest immunity. The balance seemed to be in favor of B C G over caseous vaccine.

Caseous vaccine and B C G seem to prevent the development of caseation, as only 1 animal in each group of 15 rabbits showed advanced caseous tuberculosis. In the control group, 8 animals had advanced caseous tuberculosis.

B C G does not cause a progressive tuberculosis in rabbits, although a mild local infection occurs from which they completely recover.

We regard B C G as a safe and good vaccine. While we have evidence that it does produce tubercle, yet this infection retrogresses and disappears.

Reliance should not be placed solely on any vaccine to prevent or cure tuberculosis, and if vaccines be used, the usual preventive and curative measures should be faithfully employed.

Caseous vaccine and B C G have a real value in tending to prevent tuberculosis.

CANCER CURABLE

There now are on record 29 195 cases of cancer which have remained cured over a five year period. 63 per cent of them women. Dr. Frank E. Adair, chairman of the cancer committee of the American College of Surgeons of New York, reported at the Northeastern Regional Assembly of the Women's Field Army of the American So-

cietly for the Control of Cancer in New York.

Dr. Burton T. Simpson, Director of the State Institute of Malignant Diseases of Buffalo, added that if the list of treatments by radiation were added to the list of surgical cures, the total number of cured cases now on record would be approximately 50 000.

ANESTHESIA PROBLEMS IN SMALL COMMUNITIES

CHARLES J. WELLS, M D , Syracuse, New York

ANESTHESIA needs in small communities are seldom stressed or provided for. In spite of improved transportation to larger medical centers, there will always be the need of the best possible agents, methods, and skill in the prevention and relief of pain in these localities.

The most fundamental reason for the lack of proper anesthesia service in some localities is the absence or insufficiency of instruction and practical experience in medical colleges and hospitals. The practical value of such knowledge is seen in every branch of medicine in varying degrees. The laity soon discover and patronize the doctor who carries out his procedures in a painless manner. Medical colleges are becoming alive to this need, and the better hospitals feel it is more to their credit to have their intern graduates proficient in such practical things as anesthesia and analgesia, if it comes to a choice, than in some seldom-used technic. The use of nonmedical instructors for this important branch of medicine certainly does not impress the intern with its importance or dignity. The science of anesthesiology is too complicated for those not licensed to practice medicine. The medical profession should cooperate to end this excuse of expediency, and give the public as good service in this branch of the healing art as in any other. For the doctor in the small community to be obliged to gain such experience on his own private patients without proper supervision and instruction is not only embarrassing, but frequently disastrous.

The problem as it exists today is best handled by the specially trained general practitioner, who becomes a part-time anesthetist in his community. The increase in county hospitals throughout the state as well as numerous smaller hos-

pitals is affording such opportunities in increasing numbers. Properly qualified physicians should fit themselves for this need. Several medical centers and hospitals have established refresher and modernizing courses, which give special graduate instruction in any phase the part-time anesthetist may desire. Such courses should be available in every large medical center and form a part of all post-graduate programs. Systematic visits to such centers keeps the part-time anesthetist abreast of the times, and enables him to give the surgeon and the community the best possible anesthesia service. Another aid is subscription to such anesthesia periodicals as *Current Researches in Anesthesia and Analgesia*, which serves to keep the reader informed of the latest advances in the specialty. Sectional anesthesia societies, with the occasional nearby meetings of the larger congresses of anesthetists, form occasions where technical knowledge and inspiration in the specialty can be obtained. The Anesthesia Section in the New York State Medical Society should become increasingly useful, and should be regularly attended. Much good may be accomplished by papers on some phase of anesthesia of general interest before the various county and other medical societies.

The ranks of the regular full-time anesthetist in the larger medical centers must occasionally be replenished and enlarged. With slight additional training coupled with his previous practical experience, the part-time anesthetist may sooner fit himself for such a position.

Complicated surgical cases and those requiring special anesthetic technic usually gravitate to the large medical centers where specialists are available to care for their particular needs, but the many

*Read at the Annual Meeting of the Medical Society of the State of New York,
New York City, May 11, 1938*

other cases which are being handled in the smaller communities should have the benefit of the best anesthesia service possible. The part time anesthetist has proved a practical solution of this problem.

Some of the older forms of anesthesia are used to advantage. *Ether* still holds a strong position among the general anesthetics, and is the most used synergist to the various gas anesthetics. Much of its disagreeableness is due to improper administration. *Chloroform* has been discarded because of its dangerous and toxic actions. Any mixtures containing chloroform should be used sparingly and with the same technic as chloroform itself. *Ethyl chloride* carefully administered is useful in short anesthetics, as an introduction to ether anesthesia, and for local purposes.

With proper instruction, study, and practice, the part-time anesthetist may become sufficiently skilled in local, certain forms of regional, spinal, and the more modern forms of circle filter gas anesthesia. The modern portable anesthesia gas machines are easily transportable, and very efficient.

The most important thing to emphasize in anesthesia is not the kind or method of the anesthetic, but the training, experience, and skill of the one administering the anesthetic. Adequate background in the basic sciences, experience under sufficient supervision, and technic developed by careful repetition produce the judgment so essential to the anesthetist.

The familiarity of the anesthetist with the various gases makes them especially useful in their therapeutic application. The use of oxygen, carbon dioxide, helium, etc., for their many indications is worthy of the consideration of every anesthetist in any locality. Instruction courses in this technic are available. Many medical anesthetists are now adopting this "orphaned" specialty, which no other branch of medicine seems to want.

Some of the newer types and methods of anesthesia, in trained bands, are convenient for the anesthetist of the smaller community.

Tribromethanol (avertin), if carefully administered in moderate doses, often forms a satisfactory preliminary or basal medication for almost any subsequent anesthesia. Overdose should be guarded against, and proper subsequent nursing assured before it is administered. Adequate airways should always be maintained.

Cyclural sodium (carpal sodium) may be used occasionally for short minor procedures by those familiar with intravenous technic, though there are few cases where other forms of anesthesia would not work as well. Inevitable precipitation in the blood stream and paralysis of respiration are real dangers, the latter especially in cases of liver insufficiency. It is wise, however, to have it handy for immediate injection where there is a possibility of cocaine poisoning.

Divinyl ether (vinethene) is a recently developed anesthetic, which readily lends itself to the use of the part time anesthetist. It is quite powerful, induces anesthesia rapidly, and is followed by quick recovery. It is excellent for short anesthetics requiring deep relaxation, and forms an excellent induction for ether anesthesia. It is highly recommended for obstetric use. It is best given by the open drop method in a closed circle filter, or may be used for dental procedures by forcing its vapor through a nasal catheter.

In many communities the part-time anesthetist has solved the problem of anesthesia needs. For those not properly prepared by previous training in medical colleges and hospitals, refresher and post graduate courses are recommended. The best work of the surgeon, as well as the welfare of the public of the small community depend upon the best possible prevention and relief from pain.

THE DIAGNOSIS AND MANAGEMENT OF SUBACUTE BLOOD STREAM INFECTIONS OF THE KIDNEY

HUGH CABOT, M D (*Division of Surgery, The Mayo Clinic, Rochester, Minnesota*)

THOMAS R MONTGOMERY, M D (*Fellow in Urology, The Mayo Foundation*)

AT THE outset we should perhaps indicate that we regard most of the blood stream infections of the kidney as properly classified as subacute. There is a small group of cases which are very acute, almost explosive in character, and in which the diagnosis is likely to be confused with that of an acute abdominal emergency. Most of the remaining cases, while they may show acute symptoms at the onset, are likely to drag along into an almost chronic stage. For instance, it is by no means uncommon to see a proved blood stream infection of the kidney that has ultimately resulted in massive abscesses and perinephritic abscesses going on over a period of many months. We also use the word subacute to indicate that, except for the group above specified, which has an explosive character, very few of these cases require emergency treatment and probably only a moiety of them will require operative treatment at all. We realize that this is quite different from the view that has been commonly held in the past in regard to the lesion here described. We think this difference of point of view is largely due to the fact that at that time only a small proportion of the cases were correctly diagnosed and the opinion was very widely held that, given a blood stream infection in which the kidney might be expected to be studded with small abscesses, nothing short of removal of the kidney would cure. Since that time we have come a long way and are well aware that lesions of this type frequently, perhaps generally, heal without surgical assistance. The two complicating conditions which regularly require surgical measures are (1) massive abscesses, whose recog-

nition we think has been confused rather than assisted by the term carbuncle, and (2) perinephritic abscess, which is much more frequent.

Diagnosis

The fact of the matter is that correct diagnosis in this condition is much less common than we should like to have it, largely because the lesion has no characteristic symptoms that it is likely to be confused with a variety of other conditions associated with more or less maintained fever, and that there is nothing to draw attention sharply to infection of the urinary tract. Too much have we become accustomed to regard infections of the urinary tract as synonymous with the appearance of pus in the urine. As a working rule this is true only for those cases in which the infection is of the so-called ascending type or when it is associated with an obstructing lesion of the kidney. At an earlier day, when typhoid fever was very common, when the Widal reaction was not available or was in its infancy, many of these cases were diagnosed and forsooth treated for typhoid fever, sometimes, it must be admitted, with better results than attached to the somewhat later period when typhoid could be excluded, a lesion of the kidney was suspected and, in our enthusiasm, we were likely to remove a considerable number of perfectly useful kidneys. Today the diagnosis of a blood stream infection of the kidney can be accurately made in the vast majority of cases if we have the luck to think of it. In a large number of cases there is a significant history of infection elsewhere in the body. On the other hand, we have

been interested to note, in going over the records of The Mayo Clinic, that such a history, though perfectly clear, was very commonly overlooked until somebody thought of the lesion and then thought to inquire of the patient whether he had had a previous peripheral infection of the furuncle, carbuncle, or infected wound type that he had often entirely forgotten to mention. In our experience it is possible to obtain unquestioned evidence of peripheral infection in something like 60 per cent of the cases. In another 20 per cent the site of origin appears to have been a recent acute infection of the upper respiratory passages, and there is a balance in which the point of origin is wholly obscure.

Symptoms

As already pointed out, the symptoms commonly associated with these lesions do not particularly suggest them. Pain is present in the great majority of cases but frequently occurs over the lower ribs, may often be associated with a chill, may last a few days, and is often confused with some infection of the lung. Fever is almost invariably present but again is not characteristic. Chills are common but, taken in connection with the pain that the patient often refers to in the chest, they are more likely to lead to an unconfirmed diagnosis of pneumonia than to suggest a renal origin. Leukocytosis of a relatively high grade is the rule rather than the exception but again such a leukocytosis would be expected in various types of pneumonia and, except for typhoid fever which is now a rare source of confusion, is not helpful.

Physical Examination

Here again the findings are often inconclusive or misleading. A handsome number of our recent cases have had symptoms early in the disease that led to a tentative diagnosis of pneumonia. Where the condition is not associated with chills, the diagnosis of flu—whatever that may mean—is unfortunately common. Physical examination of the chest may often give vague dullness over

the base of one lung and even occasional rales, particularly in the early days. The examination of the abdomen in the early stages, except in the explosive type, is generally negative. The urine is habitually normal. Thus, there is nothing to attract our attention to the site of the disease. It is true that careful and rather skillful examination for costo-muscular tenderness will show it in practically all cases but it is readily overlooked and the practice of punching patients in the back, more politely referred to as lumbar percussion, is more likely to be misleading than helpful. The greatest probability of successful diagnosis will come about when we persuade ourselves to include blood stream infections of the kidney as a possibility in all cases of what the British Army used to call "Pyrexia of Unknown Origin (P.U.O.)." If, when we are at a loss for a diagnosis in a patient whose chief symptom is fever with a largely negative physical examination, we will take the trouble to carry out certain careful studies, a correct diagnosis can almost invariably be arrived at. These methods may be arranged in order as follows.

1 In the early days of the disease, commonly the first four or five days but occasionally for many days, staphylococci can almost invariably be found in the urine if it be skillfully studied by centrifuge, for not less than half an hour at high speed, and smear. For years the observation has been common that the cocci thus found were peculiarly likely to refuse to respond to the guiles of the bacteriologist. In something like half of our cases, the smear of the centrifuged urine shows many organisms. The culture, carried out by experts, is negative. This may be due to the fact that precisely the right culture medium is not selected or, as suggested years ago by the late James H. Wright, that these organisms have been damaged in their stormy passage through the kidney and grow feebly, if at all.

2 We suggest for your consideration the possibility that the intravenous urogram may be of service at this period quite be-

yond what is ordinarily supposed. The evidence for which we should look is not that of deformity, which will not have developed at this time, but of diminished, irregular, or occasionally absent excretion on that side. We do not think that there is yet a sufficient body of evidence to warrant us in positive statements upon this point but we note, in a review of our cases, that variations in excretion, which might be interpreted as abnormal, are very common.

3. In a relatively early stage this lesion often gives rise to perinephritis. Perinephritis operates to limit the normal mobility of one kidney as compared with its fellow on the opposite side. This diminution or even failure of mobility can be demonstrated at the time when intravenous urography is employed by films taken with the patient almost literally standing on his head, in the horizontal position, and finally in the vertical position. Generally speaking, the normal kidney should have a mobility roughly equal to the vertical diameter of his lumbar vertebra.

Diagnostic Methods of Value in the Later Stages

In patients who are seen, as many of them are, from three weeks to six months after the initial symptoms, the following methods of diagnosis will be of great interest and value.

1. Obliteration of the psoas shadow and scoliosis with the convexity away from the involved side. This, of course, is suggestive not of a lesion of the kidney itself but of perinephritic suppuration.

2. The position of the kidney as shown by the intravenous urogram will not infrequently be altered again by the development of perinephritic suppuration. It may be pushed inward, outward, or downward, and occasionally, though rarely, upward. At this stage the test for lack of mobility will be almost invariably positive.

The Retrograde Pyelogram

It is at this stage, after the lapse of a few or many weeks, that the retrograde

pyelogram is at its best. It will regularly show massive abscess, if present. It will frequently show abnormality of a single calix. It may show complete obliteration of a calix either by massive abscess that is still shut off from the pelvis, or, as is not sufficiently recognized, by the compression of a calix by an encapsulated perinephritic abscess most common in our experience at the upper pole.

Illustrative Cases

We append now a series of recent cases in practically all of which the diagnosis had been long overdue and in which it could, we believe, have been satisfactorily made at a much earlier period if the possibility of the lesion had been entertained.

Case 1—A married woman of 39 registered at the clinic August 4, 1937. She came on account of recently developed hoarseness which proved to be due to a growth on the left vocal chord. Her general physical condition was excellent. Urine was normal. On August 7 she was operated upon by thyrotomy, the left vocal chord was removed, and a temporary tracheotomy done. Convalescence from this operation was smooth and satisfactory though with the slight amount of wound infection which is inevitable. Her fever, however, was never above 101 F and the temperature reached normal on the seventh day. On the eighteenth day she had an attack of pain in the right side and back. Examination at this time showed a palpable, apparently enlarged right kidney with marked costovertebral tenderness. The urine was normal in all respects. The hemoglobin was 72 per cent and the leukocyte count, 9,700. Her fever continued to rise and reached 104 F with a chill on the twentieth day, this was repeated on the twenty-second day, after which the temperature fell to normal on the twenty-third only to rise again on the twenty-fifth and reach 105 F on the twenty-seventh. At this time the leukocyte count was 9,200 and 9,800. The fever slowly declined and the temperature reached normal on the thirty-third day. During this period there was continued tenderness over the kidney. The urine was continuously normal except for the presence, in a centrifuged specimen, of many cocci. An intravenous urogram done on the eighteenth day after operation showed a normal excretion on the left with incomplete filling on the right that was in

FIG 1a

FIG 1b

marked contrast (Fig. 1a). It was noted that the shadow of the psoas muscle was clear on both sides. An attempt was made to catheterize the ureter on the twenty-second day but this failed through coiling of the catheter. The ureter was, however, satisfactorily catheterized on the twenty-seventh day just at the time of the second rise of temperature. Urine obtained from this kidney was normal and there was no evidence of obstruction. On the thirty-fourth day a retrograde pyelogram was done that showed a normal pelvis but with some possible irregularity in the middle and lower calices. At this time Gram positive cocci were obtained from the bladder. From this point she made a normal convalescence and was dismissed.

She returned on December 9 at which time the urine, though still normal, contained Gram negative cocci. An intravenous urogram taken at this time showed much better filling than three and one-half months previously and was probably within normal limits. (Fig. 1b)

It seems quite clear that this patient had an acute blood stream infection of the right kidney coming on as a complication of operation upon the larynx. This did not result in any marked perinephritis or perinephritic abscess. The pyelograms, both intravenous and retrograde, clearly demonstrated the absence

of massive abscess. As a result there was no indication for operation at any time.

Case 3—An unmarried woman of 22 registered August 23 1937. Two months before, she had had an attack of pain over the left lower chest. Cough was painful but unproductive. A diagnosis of pneumonia was made. She went back to work after two weeks but had not felt up to par and about August 1 began to have more pain in the left upper quadrant radiating into the back. This was followed by several chills.

On admission, physical examination was generally negative except for fever of 101.6 F and a pulse rate of 120. Examination of the chest showed dullness to percussion over the left lower lobe. Abdominal examination showed slight tenderness in the left upper quadrant. Examination of the urine on August 26 and on several subsequent occasions was persistently negative. Blood urea was 36. Examination of the blood disclosed moderate secondary anemia, an erythrocyte count of 3 670 000, a leukocyte count of 21,500 and 85 per cent of neutrophils. X-ray of chest was negative. A scout plate of the KUB tract was negative except for some scoliosis and rotation of dorsal and lumbar spine. X-ray of colon showed a filling defect in the dome of the splenic flexure, probably due to outside pressure. An intravenous urogram on August 26

FIG 2

FIG 3a

showed that the right kidney pelvis was not very well outlined but apparently normal, on the left side it showed some flattening of the middle and lower calices (Fig 2). Two days later a retrograde pyelogram showed slight clubbing of the upper and lower calices and slight dilatation of the ureter, the outline of the psoas muscle was a little vague on the right side. During the nine days in the hospital before operation she continued to have an irregular fever, the temperature varying from normal to 103 F. Experts differed in regard to the diagnosis, the urologist taking the view that there was no evidence of perinephritic abscess, while the internist believed that it was present. On September 2, ten days after admission, the left kidney region was explored and a large perinephritic abscess was found on the anterior and superior aspects of the kidney. Cultures from the pus showed *Staphylococcus aureus*. From this operation she made an uneventful convalescence.

This case illustrates the possibility of confusion between pneumonia and acute blood stream infections of the kidney. In view of the finding, we think there can be no doubt that she had a blood stream infection of the kidney some two months previous to her admission. This resulted in a perinephritic abscess that developed slowly but was of consider-

able size before the diagnosis was satisfactorily made.

Case 3—A man of 57 registered June 30, 1937. His wife had noticed that he had been slowly losing strength since Christmas and had had an irregular fever certainly during the last three weeks. He had been in bed for five weeks. His only complaint was pain in the abdomen, generally referred to the right lower quadrant, and he tended to relate it to the condition of his bowels. He had lost 30 pounds in the last six months, he weighed 117 pounds when he was admitted to the clinic.

Physical examination was negative except as below described. Heart and lungs were normal. Abdomen showed marked loss of weight with a mass in the epigastrium which was slightly tender, a sensitive area was present over the twelfth rib posteriorly. He was sent at once to the hospital. On July 1 and on many subsequent occasions the urine was always within normal limits. Blood urea was 28. His hemoglobin was about 60 per cent, the erythrocyte count was 3,800,000, the leukocyte count was 10,800, and the percentage of neutrophils was 80. Sedimentation rate was 90. X-ray of the chest was negative as was the study of the large intestine and terminal ileum. On July 2 an intravenous urogram showed that the left kidney was well visualized in five minutes and normal in all respects, in the right kidney the lower

FIG 3b

FIG 3c

calix was not well outlined but the upper calix was normal (Fig 3a and 3b). On July 8 a retrograde pyelogram of the right kidney showed slight dilatation of the calices but was otherwise normal. It was noted that the psoas muscle was obscured on the right side (Fig 3c). On this evidence of a kidney with possibly abnormal secretion but without evidence of massive abscess and absence of the psoas shadow on the right, a diagnosis of perinephritic abscess was made and drainage done on July 9. By this time the evidence of suppuration was clear as there was edema of the subcutaneous tissues and the abscess was found directly beneath the muscles. The cavity lay external to the kidney and extended downward for some distance below the lower pole. It was judged to contain about 150 cc. of pus. The abscess was drained with a rubber tube and convalescence was completely uneventful.

In this case the importance of the evidence obtained by the intravenous urogram and retrograde pyelogram is considerable as showing that, even with the long duration, there was no clear evidence of massive abscess of the kidney though the behavior of the kidney showed abnormal secretion except in the upper pole. The absence of normal psoas shadow made the diagnosis of

perinephritic abscess practically certain. Under these circumstances, there was no indication for exploring the kidney.

Case 4—A man of 34 registered at the clinic September 16 1937. On July 10 he had had a chill fever and had felt weak and tired. Several days later he discovered that he had a fever with a little cough. He went to another hospital on July 17 and remained for two weeks. He was told that he had pneumonia. Three weeks before coming to the clinic he had another chill which was followed by a temperature of 103 F. A little cough occurred at this time. He returned to the hospital where he remained until coming here. At the time he came to the clinic he had a dull pain in the right upper quadrant that was made worse by deep breathing. He has had slight dyspnea with moderate unproductive cough. Of late he has had nightly sweats.

Examination showed a flushed sick looking man. The heart was negative except for tachycardia. An area of dullness was observed at the base of the right lung which extended downward from the lower part of the scapula; no breath sounds were heard and tactile fremitus was absent or diminished over this area. The left lung was clear. The patient was sent directly to the hospital. The urine was normal on several occasions. Blood urea was 32. The blood showed moderate secondary anemia.

FIG 4a

FIG 4b

the leukocyte count varied from 17,700 to 19,900. X-ray of the chest showed elevation of the diaphragm on the right. The lungs were clear. A scout plate of the KUB tract was interpreted as negative. The medical consultant felt a mass in the upper right quadrant, which he thought was an enlarged kidney. An x-ray on September 20 showed that the psoas shadow was absent on the right but well marked on the left (Fig 4a). Intravenous urogram showed outline of a large right kidney, excretion on the left was normal in all respects, on the right side the renal pelvis and kidney were displaced laterally and there was poor visualization of calices. Three days later a retrograde pyelogram showed that the calices were essentially normal and that the kidney was displaced laterally. A diagnosis was made of right perinephritic abscess surrounding the upper pole (Fig 4b). At this time a history of "boils" previous to the onset of the disease was first obtained. During the first week, while examinations were being made, he had a fever varying from 100 to 104 F. On September 23, operation revealed a perinephritic abscess, as above suggested, with some apparent destruction of the renal cortex. Bacteriologic examination disclosed *Staphylococcus aureus*. Following operation his temperature was less high and returned to normal on the eighth day, though there was a slight rise on the eighteenth and nineteenth days. Previous to his dismissal on October 30 another intravenous urogram was

done. This showed continued absence of the psoas shadow on the right, excretion of the medium of normal amount, but with some failure of visualization of the middle calix (Fig 4c). The kidney was still displaced downward. The left kidney was normal in all respects.

This patient again illustrates the ease with which a blood stream infection of the kidney may be confused with pneumonia. It also shows the accuracy with which prediction of the nature of the condition and its position can be made.

Case 5—A man of 61 registered December 21, 1937. On the previous August 25, while driving his car, he had felt a sudden sharp pain over the lower portion of the left chest. This lasted but a few minutes but after it subsided he did not feel well. The next day he had a chill lasting forty-five minutes. Three days later he had further chills and pain developed in the upper quadrant of the abdomen, the pain persisted. Chills, however, did not return until the middle of December. There was no disturbance of the urinary tract. He had lost 10 pounds. There was persistent pain in the left upper quadrant.

Examination showed recent loss of weight. The heart was slightly enlarged. The lungs were negative. Abdominal examination was negative, but tenderness and muscle spasm were present in the left flank. The urine was normal.

FIG 4c

FIG 5a

The blood urea was 48. Examination of the blood disclosed slight secondary anemia, an erythrocyte count of 4,200,000, a leukocyte count of 12,800 and 89.5 per cent neutrophils. X-ray of chest showed old interlobar pleural thickening at the level of the fifth rib anteriorly on the right. A scout plate of the KUB tract was negative except for increased density over the lower portion of the sacrum. Intravenous urogram on December 24 showed scoliosis, with convexity to the right; neither psoas shadow was well visualized. Excretory urogram showed that the right kidney was normal but that the left kidney was pushed medially; the pelvis was within normal limits and the calices were fractionally outlined (Fig. 5a). Left retrograde pyelogram was normal except for displacement of kidney medially (Fig. 5b). On this evidence a diagnosis of perinephritic abscess without massive abscess of the kidney was made and operation done on December 24. A large perinephritic abscess was found and drained. Operation was followed by a chill. On the second day there was evidence of marked wound infection and drainage from the wound had a fecal odor. On the third day he had frequent desire to empty his bowels but without success. He went into collapse and died quite suddenly at midday with a subnormal temperature. Autopsy refused.

This case again shows the danger of confusion between a blood stream in

FIG 5b

fection of the kidney and some type of pneumonia.

It will be noted that all of this group of cases occurred during the second half of the year 1937 and are, therefore, recent. They were selected only in the sense that

they presented problems of some difficulty and were, therefore, carefully studied. A much larger group could have been used.

1 Case 1 is chiefly interesting as illustrating the possibility of blood stream infections of the kidney occurring during convalescence from some surgical operation and, we think, particularly in relation to operations upon the mouth and throat. This patient showed, during her convalescence, unexplained fever that could not be accounted for by the wholly satisfactory condition of her operative wound. Careful study demonstrated the nature of the lesion, the fact that it did not require surgical treatment, and that complete recovery would take place.

2 The other cases rather strikingly illustrate the common mimicry by blood stream infections of the kidney of a lesion of the lung. This is today perhaps the most common source of confusion. Fortunately we are now able to be very accurate in our diagnosis of pulmonary lesions by the use of x-ray films. These cases strongly suggest the importance of carefully entertaining the possibility of a blood stream infection of the kidney when the lung fields are found to be within normal limits though the clinical signs have suggested pneumonia.

3 These cases interestingly illustrate the slow development of perinephritic abscess and the tremendous waste of time which is commonly involved in their treatment. It is quite safe to say that in every one of the last 4 cases the diagnosis could have been made at a much earlier period if the patient had consulted a physician and if the lesion had been thought of.

4 These cases illustrate the possibility, by the use of the retrograde pyelogram, of excluding the presence of massive abscess of the kidney in the presence of perinephritic abscess. Where massive abscess can be excluded, then drainage of the perinephritic abscess should lead to recovery. Where massive abscess is present with perinephritic abscess, then some treatment of the

kidney itself, even its secondary removal, may be necessary.

5 We want to raise the question, which we think is as yet unanswerable from the evidence, of whether or not blood stream infections of the kidney, during their active stage and during the presence of perinephritic abscess, unfavorably affect the excretion of the substances used for intravenous urography. We have a small series of cases in which excretion was practically absent or very slight in a kidney which turned out to be substantially normal after drainage of a perinephritic abscess. The cases here reported suggest that excretion of these substances has been interfered with but not sufficiently to make the appearances of clearly diagnostic value in the present state of our knowledge.

Treatment

We do not propose to take up your time with any elaborate discussion of the problems of treatment. We do, however, want to voice again our complete conviction that these patients rarely, if ever, present a condition authorizing early exploration or removal of the kidney. Too much have we overlooked two important factors: (1) The on-the-whole large probability that lesions produced by the staphylococcus will heal of their own will and accord if given a decent opportunity, and (2) that the kidney has an unusual ability, perchance due to its large blood supply, ultimately to overcome extensive suppuration unassisted by the violence which we euphemistically call surgery. The criteria which should influence us to undertake operation are, broadly speaking, two.

1 Evidence that the patient is not showing ability to stand off the disease. This evidence will frequently consist in the development of a slowly progressive anemia, in loss of weight, loss of appetite, frequent occurrence of chills, or a maintained fever. Much reliance may be placed upon the pulse rate. If this rules within normal limits, we may, as a rule, hold our hand. If it shows a slowly progressive tendency to rise, it is strong

evidence that the patient is losing ground and requires our assistance

2 The development of evidence of perinephritic abscess One of us (H C) has voiced, elsewhere on several occasions, the conviction that perinephritic abscess is almost invariably the result of a blood stream infection of the kidney resulting in a cortical lesion, often in itself of no great moment, but which, breaking through the capsule and finding itself loose in the perinephritic fat, will continue to develop quite without symptoms though almost always with fever It is a striking fact that, though the onset of the kidney infection may be properly characterized as acute, this acute phase disappears giving place to a prolonged pyrexia with practically nothing to show for it Abscesses of literally enormous dimensions may develop without making themselves apparent on physical examination Perinephritic abscess probably always requires drainage I modify this statement from the absolute which I should have used two years ago because I have seen with my own eyes 2 patients, 1 of my own and 1 which I saw in consultation with a colleague in Great Britain, in whom all of the evidence of a healed perinephritic suppuration of large extent, namely scar tissue of recent origin, and inspissated pus were found The patient in both cases, however, had succeeded in conquering his lesion before we had made up our minds in regard to the diagnosis.

Discussion

Dr Leo E. Gibson, *Syracuse*—Dr Cabot has given us some very important points in his discussion of this interesting clinical group The majority of discussions involve a variety of terminology and views concerning the diagnosis and management There are those who claim that it is an easy diagnosis as well as those who consider it a difficult diagnosis The treatment has enjoyed a similar state of confusion Masterful inactivity is adhered to by some while early surgery is equally well supported

No generally accepted classification has been applied to this group of infection. They have been reported and discussed in the medical literature under a wide variety of names some

articles listing as many as fifteen different terms The infrequent occurrence of the very acute fulminating type demanding emergency nephrectomy for relief in my series of cases leads me to believe that more emphasis is placed on it than is indicated It is usually part of a general overwhelming sepsis and both kidneys as well as the lungs and other organs may be involved In sharp contrast to this type there is a mild group characterized by pain fever and tenderness of short duration. In this group cocci may be found in the centrifuged urine as described by Dr Cabot. These cases may belong to the group described as diffuse staphylococci nephritis and are probably often undiagnosed The patients recover without operation I believe this group is the one which Dr Cabot refers to more particularly Between these two groups occurs the single abscess in the cortex, multiple abscesses and the carbuncle. This last term I think is confusing In my experience these types require some sort of surgery for relief because they usually are followed by perinephritic infection

The diagnosis is difficult in some cases such as the single abscess in which the pain and tenderness are less than in the carbuncle. If the surgeon thinks of a blood stream infection of the kidney as a cause of long-continued pyrexia he may be inspired to dig out a history of a focal infection or abrasion as a result of which only a scar remains the whole process having been entirely forgotten by the patient. This history should suggest the application of all the methods of diagnosis so ably described by Dr Cabot All of these signs may not be positive but enough will be learned to direct attention definitely to the kidney area. To know just when a coccus kidney has become a perinephritic abscess unless the case is an advanced one, I believe is quite impossible

To emphasize the confusion in diagnosis and the vagaries in the clinical picture described by Dr Cabot I shall briefly mention 3 cases

A male aged 41 years with a complaint of cough duration six months, pain in upper right quadrant of the abdomen radiating across to the left. Three months before he was told he was suffering from pulmonary tuberculosis and was sent to a sanatorium for treatment He was x-rayed and finally sent home without a diagnosis On admission the temperature was 104.8 F and there was a leukocytosis of 16,000 On examination there was no pain or tenderness in the abdomen or costovertebral angle. Due to the presence of pus cells in the urine I was asked to cystoscope him The study revealed infection and decreased function of the right kidney

The urine showed a staphylococcus. An intravenous pyelogram showed decreased function and absence of the upper calix, which was confirmed by retrograde pyelogram. At operation a massive perinephritic abscess was drained. The patient recovered after a hospitalization of three months.

In this patient the condition was confused with tuberculosis. There was a prolonged chronic illness with no physical findings. Marked pressure in the costovertebral angle and abdomen produced no pain.

A female, aged 48 years, ill four weeks, two of which she spent in her bed. The complaint was left lumbar pain, worse on deep inspiration. There were slight chills with elevation of temperature to 102 F. The leukocytosis was 14,000. No history of previous infection could be elicited. The blood cultures and urine were negative. On examination there was tenderness over the left kidney. Cystoscopy and pyelography were negative. The x-ray did reveal a scoliosis away from the left side. A diagnosis of cortical renal abscess was made. Two days after admission the temperature became normal, the pain and tenderness disappeared, and the patient refused surgery. Twelve days later all the symptoms and signs returned, more severe than before. At operation a large perinephritic abscess was drained that did not heal completely for three months.

This patient was relieved of all subjective and objective symptoms when the cortical abscess drained spontaneously into the perineal space, all of which recurred upon the development of

a large perinephritic abscess. This patient, undoubtedly, would have been spared the discomfort of a perinephritic abscess and a long convalescent period involving many weeks of drainage from the incision if an early operation had been submitted to.

Entirely different is the case of a young male, aged 27 years, who three weeks following an infected laceration of the hand had a temperature of 102 F and pain in the right costovertebral angle. The wound on the hand had entirely healed and only a scar remained. There was a leukocytosis of 8,300. The pyelogram was normal, as well as the renal function. The urine showed a staphylococcus. There was a curvature of the spine away from the right side. At operation a single cortical abscess the size of a five-cent piece was found and drained. He was completely healed and well fifteen days after operation. From the character and position of this abscess I am sure that a perinephritic abscess with all its extensive morbidity and possible kidney damage would have resulted.

We all wish to be conservative in dealing with this infection. The problem is one of early and correct diagnosis. There are two questions which occur to me. Having made a diagnosis of blood stream infection of the kidney, are we able to tell how extensive it is, except when there is pelvic deformity? By delaying drainage until there is a rapid pulse, anemia, and signs of sepsis are we not permitting more extensive kidney destruction? We certainly invite the formation of a perinephritic abscess with all its complications.

HOW CAME THE STETHOSCOPE?

René Theophile Hyacinthe Laennec, medical pioneer, was inspired to experiment by watching some children at play in the Louvre gardens. They were testing the sound of their voices on a hollow piece of wood. So he made a tube of

rolled glued paper and applied it to the bare chest. That was the beginning of the stethoscope which, from the Greek derivation, means "chest" and "to observe" or "regard."

—Sedgwick Co (Kans.) *Medical Bulletin*

A total of 313,953 working days was lost in Ohio industries during 1937 as a result of 44,876 eye injuries, according to the annual report issued by the Industrial Commission of Ohio. One able-bodied laborer, working six days a week, would have to work over 1,000 years to accomplish the work that was lost through such injuries—many of which could have been prevented!—*Sight Saving Review*

The annual meeting of the American Laryngological, Rhinological and Otological Society, Inc. will be held at the Drake Hotel, Chicago, May 9, 10, and 11. The scientific program is distinctly practical, including symposia on the care of the patient following operations for sepsis of otitic origin, care of mastoid wounds, final results in operations for chronic suppurative paranasal sinusitis, and voice defects.

THE PATCH TEST

An Evaluation of Its Possible Dangers

PAUL E. BECHET, M D, New York City

ALLERGY in its relation to the skin is a comparatively recent contribution to the progress of medicine. Most of the investigative work accomplished to date has originated within the past ten years. Certain principles that govern youth, whether in men or manners, or accomplishment, are also true of allergy in its relation to dermatology. It is wobbly, and rather uncertain in its gait. Its proponents are self-contradictory and it presents a maze of theory couched in a technical language, which is difficult for the practical man to understand. We are told that a positive reaction to skin tests does not always mean that the substance causing the positive reaction is also the cause of the pre-existing dermatitis, nor does a negative test mean that the existing dermatitis is not caused by the substance showing negative findings. There is the bugbear of polyvalent sensitization to be accounted for. A quibbling matter, but nevertheless an irritating one, is the rather frequent reference by the allergist to "allergic dermatitis." I believe it was the late Dr. Walter Highman who correctly stated that it was the individual who was allergic, and not the dermatitis.

The allergist has another common fault of youth. I have not infrequently observed that in the presence of a severe, universal eczematoid dermatitis all treatment is directed to the allergic side, and little or nothing is done to relieve the patient. This is important, for we know that even in the instances in which a substance is definitely proved as the etiologic factor of the dermatitis, elimination of that factor does not immediately result in the amelioration of the symptoms, and that an appropriate topical application can prove of great benefit in accelerating

recovery. In the pre allergy days, some thirty years ago, patients suffering from what was then called eczema, and which we now recognize as dermatoses caused by hypersensitivity, were not infrequently cured with a combination of diet, internal and local treatment, and without any inkling whatsoever of anaphylaxis. However there is no question of a doubt that due entirely to the efforts of dermatologists, allergy in relation to the skin has proved itself the greatest advance made in our field in half a century, and I venture to prophesy that in the light of future knowledge it will revolutionize the etiologic facts of the eczematoid dermatitides, greatly diminish the incidence of contact dermatitis, and sweep away the present discrepancies, which, after all, are more apparent than real. The etiology of eczematoid dermatitis will be found to be entirely due to hypersensitivity, by either endogenous or exogenous substances, which will be definitely determined by skin tests. Much of the groundwork has already been done, and the distinct advance already made can be compared favorably with the emergence of dermatology from the benighted era of the darts diatheses of the earlier half of the nineteenth century.

The patch test was first introduced by that master in modern dermatology, Joseph Jadassohn¹. In 1895 he reported the observation of a generalized eczematous mercurial dermatitis following the injection of a mercurial compound. The entire surface of the skin was covered by the eruption with the exception of one area which was entirely free. On investigation it was found that on the area free from eruption a mercurial plaster had been applied some time previously. The observance of this phenomenon led Jadas-

*Read at the Annual Meeting of the Medical Society of the State of New York, New York City
May 10, 1938*

sohn to experiment by applying substances to the surface of the skin without scratch or injection and by this simple method he succeeded in getting positive reactions in sensitized individuals. Thus was born the patch or contact test. Bruno Bloch² of Zurich, a colleague of Jadassohn, greatly developed our knowledge of the test and its workings in a masterly paper read at the Fifty-First Meeting of the American Dermatological Association, Washington, D C, April 29, 1928. To him belongs the credit of elaborating and furthering the work of Jadassohn on the subject. In this paper, Bloch for the first time calls attention to the possibility of inducing sensitivity in a normal unsensitized person by means of repeated patch tests.

Arthur J Markley³ may be credited as being first in introducing the contact test in the United States, and also the first to prove experimentally in this country that a patch test can be negative in areas not affected by the dermatitis, while at the same time be positive on healed areas of the old pre-existing eczematoid dermatitis. He proved this conclusively in his celebrated case of "guinea-pig dermatitis." It is interesting to note that this epochal paper, read in 1920, apparently elicited no discussion. Sulzberger and Wise,⁴ in a paper read before the Section of Dermatology and Syphilology of the American Medical Association in 1930, renewed interest in the test and had much to do with popularizing it in America. The contact, patch, or percutaneous test is now extremely popular, and, among the uninitiated, perhaps too much so. It is unfortunately so simple that it can be done by anyone, but it cannot be interpreted intelligently by everyone. Its great value is incontestable, but it is not an open road to easy etiologic findings. There are numerous pitfalls easily avoided, only by the expert dermatologic immunologist.

Bray⁵ makes the following statement in his textbook: "Deaths have been recorded following skin testing from the intradermal injection of Le Page's glue (Cooke, 1922) horse serum (Lamson,

1924), egg (Baagoe, 1928), and buckwheat (Lamson 1929). No fatal result has, of course, been recorded from patch testing. The worse that we can expect are flare-ups on the sites of the pre-existing dermatitis at times sufficiently severe as to become widespread, or the incidence of a universal eczematoid dermatitis a few days after its appearance on the site of the patch test, or, as in the case of arsphenamine, a tremendous increase in the pre-existing arsenical dermatitis or the sensitization of the patient himself to the arsphenamines, with possible serious consequences following future injections of the drug. That these untoward occurrences are extremely rare is attested by the fact that they are apparently not recorded in the *Journal of Allergy* from its first number in November, 1929, to date, the only exception being a reference to a single case by Schwartz and Peck, quoted by M Golnick in the September number for 1936. Rostenberg and Sulzberger⁶ in 1936 reported patch testing 998 persons, 10,189 times with about 500 different substances, and do not mention any untoward results. Doctor Louis Schwartz of the United States Department of Public Health who has had a large experience with the patch test in industrial dermatoses stated in a personal communication that he had observed a few cases which showed a generalized dermatitis following a patch test, but that they were exceedingly rare. On the other hand, there is scattered evidence in the literature that hypersensitivity in an individual can be increased by the patch test to such an extent that a mild pre-existing dermatitis can become severe and widespread, or hypersensitivity can be induced by the patch test in a normal individual. This evidence begins with the observations of that remarkably clear thinker, Bruno Bloch, on primrose dermatitis. Bloch not previously affected by contact with *Primula obeconica* patch tested himself repeatedly with extract of primrose, whereupon he became so sensitive to the plant that if he touched a leaf or even passed through a room in which dried leaves had been pul-

verized, it caused an extremely annoying dermatitis of long duration. He repeated this experiment on other normal persons with the result that they also became hypersensitive to contact with primrose. This sensitivity covered the entire skin of the patient.

Dr H V Mendelsohn in a personal communication told me of a patient with a "hair tonic" dermatitis on the scalp, ears, and eyelids. When the eruption had practically disappeared, a patch test with the "hair tonic" was applied. After twenty four hours there was a marked local reaction, with rapid incidence and extension of a generalized erythematopapulo-vesicular dermatitis, covering most of the upper trunk, arms, face, and scalp, which did not subside until the tenth day.

Arsphenamines used in patch testing to determine the cause of a dermatitis in a patient under treatment with arsphenamine, or arsphenamine patch tests used to determine whether or not the patient is susceptible to the drug before it is begun, have on rare occasions given curious reactions. Schoch⁷ reports a generalized subacute dermatitis due to the arsenobenzol radical of Bismarsen. Neoarsphenamine 1:3 aqueous solution was applied to the right arm and Bismarsen 1:3 aqueous solution to the left arm. Twenty four hours after applying the drugs a vesiculo-hullos eruption appeared on the sites of application and a generalized severe scarlatiniform erythema became manifest, which subsided two days later. In order to determine whether the patient's skin showed a general hyperirritability subsequent to his pre-existing dermatitis, percutaneous tests were done with mercuric chloride (1 per cent in alcohol), formaldehyde (5 per cent), tincture of iodine (5 per cent), alcoholic solution of ether extract of leaves of *Rhus Toxicodendron*, quinine hydrochloride (1 per cent in alcohol), and potassium bismuth tartrate paste. They were all negative. The patient tolerated normally potassium bismuth tartrate 0.1 Gm. intramuscularly. Schoch believed that the generalized eruption was

due to the absorption of the drugs through the skin at the test sites.

On February 17, 1933, Herman Beerman⁸ presented a case before the Philadelphia Dermatological Society under the title of "Cutaneous Sensitization to Arsenic Through the Patch Test." The history follows: N W, a woman aged 28, presented on March 15, 1932, a primary vulvar lesion. She was given treatment with one of the arsphenamines. A patch test made on the day after the first treatment was negative. Following the tenth treatment, on May 8, a papular dermatitis of the neck and legs developed, which was considered to be a mild arsphenamine eruption. After four weeks of treatment complete involution of the eruption occurred.

"The apparent delay in the involution of the mild dermatitis was occasioned by the coincident occurrence of inguinal and crural dermatophytosis. Antisyphilitic treatment with bismuth was resumed, it was well tolerated. On November 16 another patch test was performed. On the night of that day the test sites became pruritic, and there was slightly generalized pruritus. The test in twenty four hours was strongly positive. On February 15, 1933, another patch test was made. Nine hours later the patient presented a marked erythema of the neck, thighs (with accentuation in the crura), and upper extremities. In addition there were marked edema of the left arm, and a flare-up at the site of the patch tests performed on November 16, 1932. Within twenty four hours the eruption was practically gone. The patient is presented mainly to call attention to the possible danger of performing routine patch tests."

Stokes in discussing Beerman's case stated "This case is presented because we have had occasion to suspect that in the routine testing of the patient for sensitization to the arsphenamines she may have become sensitized through the test itself. In our series we attempted to avoid inducing exfoliative dermatitis by testing each person who was to receive an arsphenamine preparation to see

whether he was sensitive to arsphenamine before he started taking it, and we obtained such a high incidence of exfoliative dermatitis that we suspected that we had induced more than an ordinary sensitivity to the drug

"The case is shown for another reason as well. We have for a long time suspected that exfoliative dermatitis occurs with particular ease in subjects susceptible to and carrying a focus of dermatophytosis. We suspected that they were sensitized as a patient with asthma, for instance, is sensitized by a focus in the sinus of infection. I think that it is possible that dermatophytic infections of the groin are at the base of the high susceptibility of some persons to exfoliative dermatitis."

The presence of dermatophytosis is the weak point in Beerman's case, as an arsphenamine dermatitis can well activate a latent dermatophytosis and vice versa. It has long been known that the combination of allergens, or their synergistic action can, by exceeding the level of tolerance, increase the severity of a pre-existing dermatitis, or cause it outright. In a paper read before the Section on Dermatology of the Medical Society of the State of Pennsylvania on October 1, 1935, entitled "The Patch Test in the Determination of Arsphenamine Sensitization" Beerman stated in his summary "The patch test may not be entirely harmless. It may cause an exacerbation of a subsiding dermatitis and repeated application of the test may induce cutaneous sensitization to the arsphenamine."

Ante Vuletic⁹ reports an arsphenamine dermatitis of severe character on the hands of an assistant which were frequently wet with salvarsan solutions, she also developed asthmatic symptoms. The symptoms did not appear until the third year of mass exposure. A few weeks later, Vuletic became similarly affected, but to a much less extent. The assistant became quite ill, the picture was that of acute arsphenamine hypersensitivity. Despite treatment the eruption was still present two years later, and there was a profound change in the structure of the

skin, which strongly resembled the precancerous condition described by Ebert of Chicago following long continued contact with the arsphenamines. Wise and Sulzberger¹⁰ in the *Yearbook of Dermatology and Syphilology for 1934* report the case of a young nurse who worked preparing arsphenamine solutions in the New York State Syphilis Clinic in Albany. She suffered asthmatic attacks, dermatitis, and gastrointestinal symptoms which were very severe and always worse on the days that she mixed the drug. They disappeared entirely after she was transferred to other work.

In this group of cases contact with arsphenamine is apparently alone responsible for the hypersensitivity to the drug.

In October, 1937, a young woman came to my office suffering from a typical contact dermatitis of three months duration. It was limited to both axillae, and as it had appeared only a few weeks after the frequent application of a patented deodorant, I naturally surmised that this preparation was responsible. On my advice she discontinued its use and within four weeks made a complete recovery. I then unfortunately conceived the idea of confirming my diagnosis with a patch test, which was strongly positive in twenty-four hours. To my dismay she called a day later with a generalized eczematoid dermatitis all over her body which did not disappear before two weeks, and in the first few days confined her to bed.

Another patient, a man aged 33, suffered from an extensive and almost universal vesiculo-papulo-bullous eczematoid dermatitis, which totally incapacitated him. This eruption did not disappear until four weeks later. The patient, an exceedingly intelligent man, gave the following history: for five or six years he had had a severe seborrhea sicca of the scalp for the relief of which he had run the gamut of the multitudinous nostrums on the market. Several druggists had favored him with both opinion and remedies. On May 8, 1931, he used a new nostrum which he had never before used. On the following day a severe dermatitis

appeared on his scalp and face but did not spread beyond those regions. Within two weeks it had practically healed. His physician then conceived the idea of soaking a piece of blotting paper with the "hair tonic" placing it on his arm and covering it with cellophane. After it had remained in place for ten hours the patient, suffering intense pain, had to remove it, he then discovered a severe bullous eruption on the site of the test, with much surrounding angry erythema. Within twenty-four hours the eruption had spread to both arms and chest, and a day later a generalized eruption appeared all over the body. It was at this stage that I first observed him. These two cases did not have epidermophytosis or any other skin disease, or antedating allergic phenomena.

Comments

It is the purpose of this paper to correlate some of the evidence for and against the theory of increased or induced hypersensitivity from patch testing. I am ready to admit that polyvalent or synergistic sensitivity greatly clouds the issue, as also the extreme sparsity of the literature on the subject. Again it may be perfectly possible that a dermatitis venenata can be induced by patch testing with such a strong concentration of substances as to induce a burn, even in normal subjects. This is particularly true of soaps and chemicals. On the other hand, sufficient evidence exists to warrant bringing the matter to your attention, and thus, I believe, is the first attempt to do so. I also wish to go on record as a firm believer in the patch test as a guiding light on the uncharted seas of allergy, and I am deeply grateful for the extraordinary amount of research done by our dermatologic immunologists. They have emulated in this field the pioneer work done by dermatologists in the therapeutic use of roentgen rays.

Discussion

Dr. Marion B. Sulzberger, *New York City*—When Dr. Bechet was kind enough to ask me to discuss his paper my "preview" of the manuscript soon convinced me that anything I might say would prove repetitious and would moreover be a repetition in less elegant language. The point that Dr. Bechet stresses is an important one and one which may well have significance in legal considerations and in possible lawsuits and claims for harmful effects subsequent to and ostensibly due to patch tests. Therefore, I believe it imperative that we present the actual status of this matter in unequivocal terms just as Dr. Bechet has done. I am sure that we all agree with Dr. Bechet that provided the physician possesses the necessary knowledge and training and provided that proper indications be established and adequate precautions be taken and correct technique be used with these provisions the dangers of the patch test are, to all practical purposes of negligible degree. It is my own opinion that the dangers of correct patch testing are probably less than the dangers in prescribing salicylates, or of using white ammoniated mercury ointment or of a host of other daily therapeutic and investigative procedures and perhaps less even than the dangers in the household use of iodized salt in geographic areas where additional dietary iodine is not necessary.

Since I could not express these conclusions more beautifully and clearly than Dr. Bechet has done, I thought it might interest this audience to hear what J. Jadassohn who in 1895 introduced this test, has last written on this subject. I quote from the recently published posthumous text from the sole textbook on dermatology from the pen of this great master (A. Weidmann, Vienna and Bern 1938). The poor but, I believe fairly accurate translation is mine.

From certain quarters the patch tests have received unfavorable comment on the one hand because they often fail to give conclusive results. Of course this cannot be denied in certain cases of eczema. But every positive result may be of the very greatest practical significance to the

patient, and it must be stressed again and again that the more careful the history, the more extensive the testing, the greater the number of successes

"From other quarters one has heard that the patient may be harmed by this method. This too must be admitted in principle—occasionally more generalized eczematous irritations may be provoked. But these are almost always easy to subdue

"It is also important in acute eczemas to wait until the most severe irritations have subsided, and even then to choose particularly weak concentrations

"Much more serious is the consideration that in testing with many substances a sensitization might be produced. This is surely correct theoretically. But when we ask what has become known regarding the practical occurrence of such sensitizations, we must answer in the negative. And this in spite of the fact that these tests have now been employed for a great many years and in an extremely large number of cases. It seems that such tests, carried out once or several times are, under ordinary conditions, simply incapable of sensitizing."

In this connection, and in regard to the last point, I should like to emphasize that there may be a way of determining whether a reaction to a patch test is based upon a sensitization produced by the test or whether it is due to a pre-existing sensitivity. A reaction due to a newborn, freshly created sensitivity does not as a rule appear until at least 5 to 9 days have elapsed. This is the usual incubation period of sensitiza-

tion (spontaneous "flare-up" of sites of sensitizing applications). Retesting a patient with such a flare-up reaction and using the same concentration originally employed, then generally produces a visible response with only the usual 24- to 48-hour period of latency—that is, after the expiration of the usual time necessary for development of manifest reactions in individuals previously sensitized. This fact has been repeatedly verified in the studies of Dr. Rostenberg, Jr., Dr. R. L. Baer, myself, and by Dr. Grolnick and others. These distinctions between "period of incubation of sensitization" and "period of latency—or of reaction time—in the previously sensitized" were, I believe, clearly pointed out by Dr. Wise and in our article* on sensitizations to butesin picrate and I believe that these distinctions are not only of theoretical interest but may often be of practical and even of medicolegal importance.

It is obvious that in Dr. Bechet's cases the sensitization was not due to the patch test. Nevertheless, we must not forget that such sensitizations may in other cases be produced, particularly when careless or improperly informed and inadequately trained individuals apply incorrect concentrations of such substances as arsphenamine, paraphenylenediamine, and line derivatives, nitrochlorobenzines, formalin, phenylhydrazine, and many others.

I wish to thank Dr. Bechet once again for asking me to discuss his presentation and particularly to congratulate him on his lucid and conservative exposition of this timely subject.

* Arch. Dermat. & Syph., 28, 461 (1933)

UTAH STATE MEDICAL ASSOCIATION PREPAYMENT PLAN

The House of Delegates of the Utah State Medical Association has endorsed a plan of combined hospital insurance and cash indemnity for a limited amount of medical care. The hospital plan follows the general lines of existing plans as reported in the *J.A.M.A.*, except that anesthesia and laboratory and x-ray services are provided for on a cash indemnity basis instead of being included in hospital care. The annual premium for the hospital plan is \$10 for an individual, \$18 when one dependent is included, and \$24 for an entire family regardless of size.

Only those who are covered by the hospital insurance plan are included in the cash indemnity plan for general medical care. The additional premiums are exactly the same as for hospital

care, making \$21.60 annually for an individual, \$36 for an additional dependent, and \$48 for a family for both hospital and medical care. The amounts to be reimbursed to the insured for various medical services are set forth in a schedule, and surgical services are limited to one major and one minor operation per member in a single year.

Enrollment is confined to employed persons and to groups which may be either employees of a common employer or "members of church and fraternal groups and their dependents agreeing to collect the necessary membership fees by assessment for subscription, remitting through a designated agent."

Public Health Notes

J ROSSLYN EARP, L R C P, Dr P H
New York State Department of Health

The Tuberculin Test in Case Finding

THE Department of Health has been so outspoken in its condemnation of the extravagance of seeking tuberculosis among children in the grade schools that some may have supposed that we have no use for the tuberculin test at all. At the recent annual meeting of the New York Tuberculosis and Health Association, Dr Robert E Plunkett had an opportunity to correct any such impression. We need a tuberculin of uniform potency. A positive tuberculin test is of value, first, as an aid in establishing a diagnosis, second, and from our point of view more important, as a clue leading to the discovery of the source of infection. In this sense the practicing physician will often use tuberculin to find cases of tuberculosis.

The question to which Dr Plunkett more especially addressed himself was in regard to the value of a wholesale use of the test in groups of people with a view to segregating the positive reactors for further study. Is this good public health practice?

In the first place it depends on how large the proportion is of positive reactors in the group. If from previous study or from a knowledge of morbidity and mortality in the group we have reason to believe that most of them will react positively, then we might as well proceed at once to use x rays on the entire group. The few x ray films that we might save by isolating a few individuals negative to the tuberculin test would not compensate us for the expense of testing all with tuberculin. Even though a slight saving in administrative costs to the state should be effected, the cost to the patient must also be reckoned. When the tuberculin test is used each positive reactor must make an extra trip to the clinic for further examination. He may have to lose time from

his work and travel some distance to do so. An x ray photograph of the chest has other values besides contributing to a diagnosis of tuberculosis. The group with which we most commonly deal is made up of individuals referred by the practicing physicians as suspicious cases. Not one in ten has tuberculosis. But many of them have diseases of the chest that will yield some information to the x ray and enable the clinician of the division of tuberculosis to return to the family physician something more useful than a mere assurance that his patient is not tuberculous.

On the other hand, in communities in which the administrative service is sufficiently well equipped to tabulate and evaluate the results, tuberculin tests may have an important value in research.

I should like to give Dr Plunkett's conclusion in his own words.

In conclusion therefore, may I again emphasize that the most profitable yield in tuberculosis case finding is realized by the examination of adult groups, particularly contacts, patients with suspicious symptoms, those in certain industries, and those found in the lower economic brackets. Whether the tuberculin test shall be used in such studies will depend upon the scope and extent of the tuberculosis problem as may be indicated by morbidity and mortality data, the convenient distribution of clinic service, and the type and extent of the diagnostic purposes of the service."

Ask Me Another

The medical editor continues to receive all sorts of inquiries from all parts of the state and sometimes from other states

as well. One teacher at a public school asks for booklets on the following:

"School hygiene, home hygiene, sanitary stores, proper ventilation, proper foods, proper clothing, how the police, sanitation and health departments help us, necessary measures for community health, how to obtain a birth or employment certificate, sterilization of water, prevention and curing of typhoid fever, protection against mosquitos, flies, removal of ice and snow, personal health or any other available booklets on health."

This schoolteacher is more considerate than certain of his profession who advise their pupils to write for pamphlets and so start an avalanche of immaturely decorated postcards.

Sometimes the inquirer fails to express his exact intention and thereby brightens the editorial office for a spell. "Please send me some booklets on different diseases which are free", "Please send me information on sugar and a diet to help get rid of it" and another, which I hereby dedicate to Dr. Alvarez, "Please send me free booklet on pernicious enema."

We try to respond promptly to all such requests. But the other day from Ozone Park we got an inquiry that seemed almost to call for telegraphic response. "Please send me information on breathing. Your immediate attention would be greatly appreciated."

A FEW FLAWS IN UTOPIA

The trumpeted "Group Health Association," of Washington, D. C., which was to be a sort of pattern or model for the Utopian era of state medicine, seems to have a few flaws, if we are to believe a report in a reputable neighboring newspaper that is being quoted in various medical journals. As one of them reports it:

"The *Baltimore Sun* of January 11 last, reports from its Washington Bureau that Group Health Association, Inc., has lost the services of its director of the department of internal medicine.

"Dr. Richard H. Price is quoted as saying that he was leaving the Association because it provided 'unsatisfactory medical service.' He is reported to have claimed that some members were required to wait as long as a week to see a doctor when they should have been seen at once, and that in general, members are 'treated like a herd

of sheep,' instead of receiving the sort of service available to private patients.

"Other complaints were that too many physicians were often sent to see one patient, rather than to arrange for one man to see the illness through. Many times the second and third doctors knew nothing of the case history. It was also stated that there was unnecessary delay before important surgery could be performed.

"All charges were denied by the president of the association.

"We do not know Dr. Price who is retiring after over a year of service with the organization and we do not know whether the charges are exaggerated or purely trumped up. We do not know whether personal jealousy or hatreds might be responsible for one to leave such employ. But here are the first whisperings of dissention behind the lines of the opposition and we would like to know so very much more about it."

ILLUSTRATED EXHIBIT

An illustrated historical display on "Contributors to the Knowledge of Congenital Syphilis" will go on exhibition in the library of the Academy of Medicine, 2 East 103rd Street, New York City, starting Friday, April 28. The exhibit has been prepared by the Bureau of Social Hygiene, Department of Health, in cooperation with the Section on Dermatology and Syphilology and the Librarian of the Academy.

The opening of the exhibit has been set for

April 28 to coincide with the Section's special meeting on "Manifestations of Late Syphilis," to which physicians of the city have been invited.

The meeting will be held at the Academy building at 8:30 P. M. An opportunity to observe cases will be offered and the physicians in attendance will have the opportunity of hearing a full discussion of diagnosis and treatment by members of the section. Open debate from the floor will be encouraged.

The Woman's Auxiliary

To the Medical Society of the State of New York

CALLING all doctors' wives to meet in Syracuse, New York, on April 24, 25, and 26, for the Fourth Annual Convention of the Woman's Auxiliary to the Medical Society of the State of New York.

Under the able chairmanship of Mrs. John Buettner and her committees nothing has been left undone to make this convention one long to be remembered. The finest of plans have been made for the entertainment of all who attend. All kinds of events have been arranged. The Delegates' Dinner on Monday the 24th will surely surpass anything ever planned before—"tops" in everything except price! The luncheon on Tuesday and the tea on Wednesday will offer opportunities to meet old friends and make new ones. The informality of the social functions is an attractive feature of this convention, and the members of the Woman's Auxiliary of the Onondaga County Medical Society will promote, with gracious charm, sociability among the many guests.

Our hobby show is a great attraction. Each county auxiliary has been invited to participate and send entries for the show. Visit the show and see how doctors and their wives utilize their leisure time!

Do plan to come. Our president, Mrs. Daniel Swan, is looking forward with great pleasure to meeting you.

The Woman's Auxiliary to the Medical Society of the State of New York welcomes the Woman's Auxiliary to the Medical Society of the County of Broome, organized on March 23, 1939, in the Empire Room of the Arlington Hotel, Binghamton.

Eighty doctors' wives attended this meeting and showed their interest and enthusiasm in auxiliary work. Mrs. Al

vin Carpenter presided and presented Dr. Charles Allaben, who spoke of the Medical Society's approval of the auxiliary, and Dr. Blinn Buell, chairman of the public relations committee of the Broome County Medical Society, who spoke highly of auxiliary work.

Mrs. Daniel Swan, our state president, and Mrs. Luther Kice, chairman of organization, addressed the women concerning the aims and prospects of the organization. Mrs. John H. Robertson was elected president. A constitution was adopted and signed by the women present who became charter members of the new auxiliary. The best wishes of all organized county auxiliaries are extended to Mrs. Robertson, her officers, and chairman for the success in their new organization.

Mrs. William Behan and Mrs. Charles Squires were hostesses of Mrs. Swan and Mrs. Kice.

County News

Albany County

A meeting of the Woman's Auxiliary to the Medical Society of the County of Albany was held on February 21, at 8:30 p.m. in the auditorium of the Joseph Henry Memorial Hospital. Mrs. Albert Vander Veer presented Dr. James F. Rooney, Past President of the Medical Society of the State of New York. Dr. Rooney's talk on socialized medicine was well received by an interested audience and was followed by an open discussion.

Mrs. Frank Coughlin, chairman of *Hygeia*, reported that a copy of *Hygeia* had been placed in every public, parochial, and private high school in the County of Albany as the year's project of the auxiliary.

A social hour followed the business meeting.

Cayuga County

Mr Willard W Seymour of Syracuse addressed the members of the Woman's Auxiliary to the Medical Society of the County of Cayuga at the meeting held in the Auburn City Hospital on February 16, 1939. The Blue Cross plan for hospital care was discussed.

Jefferson County

An essay contest on the subject of "Highway Hazards" was sponsored by the Woman's Auxiliary to the Medical Society of the County of Jefferson as the auxiliary's project for the year, for boys and girls of 12, 13, and 14 years. Three prizes (\$5, \$3, and \$2) will be given for the best essays on any phase of the topic "Highway Hazards". The subject was suggested by Dr J E McAskill, president of the Medical Society. The contest closed March 25. Winners will be announced sometime in April. Judges will be Dr Harold Gokey of Alexandria Bay, representing the Medical Society of the County of Jefferson, Mr Lyman L Goodrich, representing automobile salesmen, and Mr Alton H Adams, representing the *Times*. Auxiliary members in charge of arrangements for this contest are Mrs Sutherland E Simpson, Mrs Harry Righter, and Mrs J Hedly Atkinson.

Kings County

The fourth anniversary of the Woman's Auxiliary to the Medical Society of the County of Kings was celebrated at a luncheon and meeting held in the Medical Society Building on March 14, 1939. The president, Mrs Milton Bergmann, presided and welcomed the members. Mrs Valentine Bourke, chairman of hospitality was in charge of arrangements. The honor of cutting the birthday cake was given to Dr Adele Streeseaman, chairman of the Advisory Council, who addressed the auxiliary. Mrs John L Bauer, who was the first president of the Kings Auxiliary as well as the first president of the Woman's Auxiliary to the

Medical Society of the State of New York also addressed the auxiliary. The members then enjoyed an educational film.

The function in addition to celebrating the anniversary was held in honor of twenty-eight new members.

Orange County

Mrs Harry Pohlman of Middletown was elected president of the Woman's Auxiliary to the Medical Society of the County of Orange. Plans for the year work were made at the February luncheon-meeting of the executive board held at the Mitchell Inn, Middletown. On March 7 the executive board met at the home of Mrs Pohlman. Dr Stanley Quackenbush, a member of the advisory council of the auxiliary, spoke briefly to the members.

Queens County

The sixth anniversary of the Woman's Auxiliary to the Medical Society of the County of Queens was celebrated by a tea on March 17 at the Medical Society Building. In the absence of the president, Mrs Lavelle, Mrs Miller Saunders, first vice-president, greeted the members and guests. She read a letter of welcome from Mrs Lavelle and a congratulatory message sent by Mrs John Bauer, first president of the State Auxiliary. The members and guests enjoyed several piano and vocal selections. Mrs John W Mahoney and Mrs Thomas M d'Angelo, two past presidents of the auxiliary, were hostesses at the tea table. Among the guests were Mrs Luther Kice, Mrs Louis Van Kleeck, Mrs Bell, and Mrs. G Long of the Nassau Auxiliary.

The stated meeting of the auxiliary was held on March 28, 1939, in the Medical Society Building. The members enjoyed listening to Dr Bruno Gebhard, technical consultant of the American Museum of Health of the New York World's Fair 1939, who spoke of the Medical Building at the Fair and of the exhibits and lectures planned for the lay men. Mr G Starkman, director of exhibits of the World's Fair, showed pic-

tures of the many buildings at the Fair and explained the purpose of each one.

With deep regret the chair announced the death of Dr Albert Voltz, past president of the Medical Society and a member of the Board of Trustees. The secretary was instructed to send a letter of sympathy to Mrs Voltz and her family.

Rensselaer County

The Board of Directors of the Woman's Auxiliary to the Medical Society of the County of Rensselaer met on March 2, 1939, in the home of Mrs. Oney Smith. Plans for the activities and programs of the auxiliary were discussed.

Mrs. James Donnelly presided at the stated meeting of the auxiliary held on March 16 at the Troy Hospital. Mr O T Anderson, educational director of the Community Chest Campaign, spoke to the members of this project and asked for the cooperation of the auxiliary in its

work. Dr Joseph Lawrence, Executive Secretary of the Medical Society of the State of New York, also addressed the auxiliary. His topic was "The Legislative Side of Medicine."

A social hour followed the business meeting.

A delightful afternoon tea was given in honor of Mrs. Daniel Swan by Mrs Edwin Griffin, first vice president of the State Auxiliary at her home, 311 Garfield Place, Brooklyn, New York, on March 31, 1939. Many guests, members of the executive boards of the various county auxiliaries, attended the tea and enjoyed the musical program arranged by Mrs Griffin. Receiving with Mrs Swan was Mrs G Scott Towne, president-elect of the State Auxiliary. Assisting them were Mrs Louis Van Kleeck, Mrs Luther Kice, and Mrs Milton Bergmann.

LABORATORY AIDS IN THE DIAGNOSIS AND TREATMENT OF PUERPERAL INFECTIONS

Much of the obscurity of prebacteriology days regarding 'child bed fevers' has been dispelled by evidence that postpartum and postabortion fevers are usually due to infection of the placental site by pathogenic microorganisms. These infections are still a frequent cause of maternal deaths and occasionally blaze up in highly fatal epidemics, they remain a standing challenge to the medical profession. An elevation of the pulse rate and a severe chill are often the first symptoms. Fever is rarely absent. Lower abdominal pain and suppression of the uterine discharge may occur. Factors predisposing to infection are believed to be (1) prolonged labor, (2) extensive lacerations, (3) excessive hemorrhage, (4) instrumentation, (5) repeated vaginal examinations during labor or faulty technique by one of the attendants, (6) retained portion of placenta, (7) antepartum toxemia.

Two main groups of these infections are clearly recognized. (A) Hemolytic streptococcus infections (chiefly Lancefield's Group A). The cases occur either sporadically or in epidemic

outbreaks. The hemolytic streptococci are probably almost always introduced into the birth canal by one of the attendants, pelvic thrombophlebitis, peritonitis and bacteremia are frequent complications. The case fatality rate is high. (B) Anaerobic streptococcus infections. The best known habitat of these species is the female genital tract. While these infections occur only as sporadic cases they constitute one-third or more of all puerperal infections. The discharge is foul. Cultures of it and of the blood, unless grown anaerobically do not reveal the infecting agent. In these cases also thrombophlebitis, peritonitis, bacteremia and a fatal outcome are not uncommon. What was formerly called sapremia was probably this type of infection. The infecting agent was not demonstrated because the cultures were not grown anaerobically.

In addition to these two groups, a few cases are due to infection by staphylococcus, *B. coli*, *N. gonorrhoeae* and the anaerobic spore-forming microorganisms.

Medical News

Albany County

Dr G Emory Lochner, dean of Albany obstetricians, was honored at a dinner on March 15 given by the board of trustees of the Anthony N Brady Maternity Home, to celebrate his fifty years as a practicing physician

The jubilee dinner was a surprise to Dr Lochner, who has been chief of staff of Brady Maternity Hospital since its founding, and who helped inaugurate the old Elliott Austin Maternity Home in Elm Street, predecessor of the modern Brady Home

The dinner, arranged by the Sisters of Charity at the home, brought the Most Rev Edmund F Gibbons, Bishop of the Albany Catholic Diocese and president of the board, members of the hospital staff, and representatives of the Catholic Charities organization

A newspaper paragraph on March 14 related that "Dr Anna Perkins, of Westerlo, N Y, yesterday fought her way with two State troopers and twenty volunteers for fifteen hours through a snow-choked trail to give medical aid to two children, ill with influenza in a remote farmhouse. The woman doctor completed the last mile and a half of the trip on snowshoes and reported that Marion Shufelt, three, and her sister Ethel, six, had 'an excellent chance' of recovering from influenza "

Bronx County

The Bronx County Medical Society has sent a letter to Borough President Lyons protesting against any suspension of the Residence Law which would admit non-residents to appointment as local health officers

The Civil Service Commission, according to the letter, set up specific requirements designed to exclude local applicants, such as "a degree in public health " It said no member of the Health Department who is a doctor of medicine holds

such a degree. Of the hundreds of physicians in New York City, there are many who are perfectly competent to occupy the position of district health officer, the letter stated

Chenango County

The committee of the Chenango County Medical Society, appointed recently to discuss with the supervisors the fees paid for attendance in welfare cases, will ask that in cases where attendance necessitates a drive of several miles, mileage be allowed in addition to the fee. The question arose when physicians were notified by Welfare Commissioner Woodruff that the maximum fee upon which the county could seek reimbursement from the state was \$2 for home calls It is said that adjoining counties and some towns now allow mileage

Cortland County

Dr Howard Peter Johnson, eighty three years old, a practicing physician for more than fifty years and holder of the Cortland County Medical Society's cane which is kept by the oldest member of the society, died on March 4 at his home in Cortland

Dutchess County

Approximately seventy-five attended a meeting of the Dutchess County Medical Society at the Amrita Club in Poughkeepsie, on March 8, to hear an address by Dr John A Kelley, of Memorial Hospital, New York City

He discussed "A General Survey of the Diagnosis and Treatment of Gynecologic Neoplasm "

Dr Gilbert S Taber, vice-president, presided in the absence of Dr Scott Lord Smith A buffet supper followed

Fulton County

The regular monthly meeting of the Fulton County Medical Society was held

at the Hotel Johnstown, at Johnstown, on Thursday, March 16 President John A. Shanon presided.

The major part of the meeting consisted of a variety of business which included a report by Dr Alfred F Goodwin of Gloversville, chairman of a committee appointed in February to investigate the matter of inadequate fee schedules for county welfare cases Dr Goodwin reported on a questionnaire submitted to all the county societies in the state, the majority of whom replied immediately

An excellent cross-section of the various problems confronted in welfare work throughout the state was represented in this questionnaire.

The scientific program consisted of an excellent talk by Dr George V Taplin of the Strong Memorial Hospital, Rochester, on "Pneumonia." Dr Taplin outlined in detail standard procedure followed in the diagnosis, treatment, and management of all pneumonia cases at the Strong Memorial His observations on serum therapy were particularly interesting He also touched on sulfapyridine.

—Reported by Louis Tremante, M D,
Secretary

Jefferson County

The economics committee of the Medical Society of Jefferson County presented a plan for a nonprofit health insurance association at a regular monthly meeting of the society at the Black River Valley Club, on March 9

The plan, presented by Dr Willis W Young, chairman of the committee, is similar to the hospital service plan The society will discuss the plan at future meetings before taking definite action

The society directed its legislative committee to inform legislators in Albany that the society was in favor of enabling legislation making a health insurance plan legally possible under state insurance laws

The guest speaker was Robert Seacock, Ph.D, assistant professor of physiologic chemistry at the University of

Rochester, whose topic was "Vitamins from a Functional Viewpoint."

Kings County

The scientific program of the Medical Society of the County of Kings on March 21 included these addresses "Socialized Medicine," by Dr Joseph Slavitt, "Group Practice and Its Relation to the Future of American Medicine," by Dr Kingsley Roberts, "Medical Expense Indemnity Insurance," by Dr Chas Gordon Heyd, and "The National Health Program," by Dr Haven Emerson

Dr Harry M Greenwald spoke at the MacNaughton Auditorium on April 14 on "Splenic Enlargement."

The monthly meeting of the Medical Society of Bay Ridge was held on March 14 at the Shore Road Academy This meeting is known as "old home night" and is held once a year The entire program was rendered by members of the society The papers read at the meeting were as follows

"Septicemia Treated with Bacteriophage," by Dr William F Rexer, "Observation and Treatment of Pneumonia," by Dr Reginald J Blaber, "Infectious Mononucleosis," by Dr G Broncato, "Massive Intrapertoneal Hemorrhage," by Dr Anthony L Shelfo Experiences with Leprosy in China," by Dr Reginald J Blaber

Dr Thomas M. Rivers, of Forest Hills, has been appointed and sworn in by Mayor LaGuardia as a member of the Board of Health to succeed the late Dr Carl Boettiger

Strongly recommended by Health Commissioner John L Rice for a place on the policy-making board, Dr Rivers is a director of the Rockefeller Institute for Medical Research, chairman of the committee on scientific research of the National Foundation for Infantile Paralysis, and a member of numerous medical societies

He was born in 1888, was graduated

from Johns Hopkins in 1915 and lives at 163 Greenway South, Forest Hills His term is indefinite and he draws no salary as board member

Dr Rice declared "Dr Rivers will add outstanding strength to the membership of the Board of Health"

Monroe County

Five million young people who are now in this country will at some time suffer some form of mental illness

Dr George Kirby Collier, chairman of the Mental and Nervous Disease Committee of the Monroe County Medical Society, made this statement at a meeting in the Rochester Academy of Medicine, on March 12, illustrating the extent of mental illness

He called attention to the fact that there are accommodations for 3,300 patients at the Rochester State Hospital, and only 2,917 beds are available in twenty-two hospitals of other types in Monroe County

He continued

"In one year the number of persons in mental hospitals was about the same as in our colleges and universities, and in a more recent survey, the number of first admissions to mental hospitals was about the same as the number of young men and women graduated from our colleges and universities"

Dr John L Van De Mark, superintendent of the Rochester State Hospital, spoke on its history and work

The Rochester Pharmaceutical Society announces it will join the Monroe County Medical Society in the fight against "dangerous self-medication"

A committee will be named to work with the county society committee, headed by Dr David A Haller, which has been studying problems created by the sale of drugs which, the committee claims, are harmful when taken without a physician's advice It is expected that state and possibly federal legislation will be sought after physicians and pharmacists agree on a policy

Nassau County

The scientific program of the Nassau County Medical Society on March 28 included an address by John Edward Jennings, M D , F A C S , Director and Surgeon, Brooklyn Cancer Institute, Senior Surgeon, Brooklyn Hospital, on "The Management of Carcinoma of the Colon"

Dr Louis H Bauer, president of the Nassau County Medical Society, led a discussion on the "Economics of Medical Care" at the Long Island Regional Conference on Social Work in Garden City on March 21

New York County

With nearly two-thirds of the total membership of the Medical Society of the County of New York failing to vote, a poll completed on March 17 showed a margin of nearly three to one against compulsory health insurance, Dr B Wallace Hamilton, secretary, announced The poll is believed to be the first of its kind in the country

Of 4,800 members of the society, 1,718 cast votes Of these, 1,286 voted against compulsory health insurance and 432 in favor of it The question on which the vote was taken was as follows

"If under Proposition 4 of the national health program, money is made available to New York State to provide care for the low income-earning groups, do you favor the delivery of this medical care by means of compulsory health insurance?"

The meeting of the Medical Society of the County of New York on March 27 was devoted to the following symposium on mental health problems "Types of Depression and Some Aspects of Treatment," by Dr Gerald R Jameison, "Some Recent Progress in the Study of Convulsive Disorders," by Dr S Eugene Barrera, "The Treatment of Acute Mental Disorders, Including Organic Deliria and Delirium Tremens," by Dr Karl M Bowman, and "The Role of the Family Physician in the Psychoanalytic Treatment of His Patients," by Dr

Lawrence S. Kubie. Discussion Dr. Nolan D. C. Lewis (by invitation), Dr. Henry James Spencer, and Dr. Henry Alsop Riley.

The Committee on Cardiac Clinics of the New York Heart Association, Alfred E. Cohn, M.D., presiding officer, held a scientific session at the New York Academy of Medicine on March 28, with addresses by Dr. Harold E. B. Pardee, Dr. Cary Eggleston, Dr. Clarence E. de la Chapelle, Dr. Arthur C. De Graff, Dr. Robert L. Levy, Dr. Charles E. Kossmann, and Dr. John B. Schwedel.

A program to provide medical care for WPA workers in periods of illness has been devised by federal relief officials in New York City, but is being held in abeyance until the financial future of WPA is decided by Congress, Lieut. Col. Brehon B. Somervell, local Works Progress Administrator, discloses.

The program, similar in basic outline to the one used by the department of welfare in meeting the medical needs of home relief recipients, the aged and the blind, has been endorsed by representatives of the five county medical societies, Colonel Somervell said.

The lack of any provision for treating WPA workers who are ill, in their own homes, has long been deplored by social workers and public health experts. They point out that persons on WPA have no resources except their relief pay and that this pay stops when illness makes it impossible for the worker to report.

In the absence of a comprehensive medical program, the sick WPA employee must choose between asking a physician to treat him without fee or going to a city hospital at much greater cost to the taxpayer than would be involved in home treatment, advocates of WPA medical aid contend, adding that while the worker is away from his job his family often finds it necessary to turn to home relief for the necessities of life.

Colonel Somervell said he believed a medical program would be "a fine thing,"

but that this was deemed an "inopportune" time to start it. The plan under consideration would involve the establishing of a panel of physicians who would be paid by WPA for each home visit they made. Relief workers would be permitted to select any doctor on the panel. This is the system followed by the welfare department, with the active support of organized medicine.

The cost of the welfare department program, which embraces 600,000 needy men, women, and children, is about \$1,000,000 a year. This includes medication and nursing service, as well as medical care. The WPA employs 167,000 persons in New York City. Whether the projected program would apply to all of these and also to their families was not made clear.

Onondaga County

Dr. William A. Groat, President of the State Society, addressed the Association of Faculty Women of Syracuse University on March 24 on "The Medicine of Today." The meeting was held in the auditorium of the Maxwell School of Citizenship and about 250 were present.

Ontario County

The Ontario County Medical Society, through its public relations committee, has arranged with Station WMBO Auburn, to broadcast health subjects each Thursday evening at 7:15. "Pneumonia" was the subject of the first fifteen minute broadcast on March 16.

Present-day radio programs carry so many references to health that the Ontario County Medical Society felt that a program in which health topics were discussed entirely devoid of any commercial aspect, might be of interest. The public relations committee, therefore, was instructed to prepare material and to make arrangements with the broadcasting station that donates the time on the air as a part of its policy to use some of its facilities for educational purposes.

Coordinating these two elements, the result will be a series of ten broadcasts.

primarily for the information of the people of Ontario and adjoining counties. The last two programs will be given by the Geneva Dental Society.

Drs Francis D Leopold and Harry M Murphy were the guest speakers at the meeting of the Geneva Academy of Medicine at the Geneva Country Club on March 16. Dr Leopold spoke on "A Résumé of the Recent Advances in the Diagnosis and Treatment of Peptic Ulcer and Carcinoma of the Stomach," and Dr Murphy on "Gastroscoy Its Advantages and Limitations, Including a Demonstration of the Instrument and Model Stomach."

Oswego County

The regular meeting of the Medical Society of the County of Oswego was held at the Fulton Club, Fulton, on April 5.

There was a special meeting previous to the main meeting of all the officers and censors of the society. Drs Kent Wood Jarvis, Harrison M Wallace, Joseph B Ringland, John J Brennan, Le Roy F Hollis, Ross F Wolever, Sylvester D Kelher, and Olin J Mowry.

The program included two motion pictures "Human Sterility" and "Modern Surgical Treatment of Varicose Veins and Ulcers."

Queens County

A joint meeting of the Medical Society of the County of Queens and the Queens County Bar Association was held on March 28, with the following program:

"Disciplinary Proceedings Against Licensed Physicians" by Harold Rypins, M D, F A C P, secretary, State Board of Medical Examiners, "Don't Fracture Your Reputation" by Edward Adams, M D, author of "The Doctor-in-Law," "Medicolegal Aspects of Fractures," and others, "Firearm Identification" by Acting Sergeant Henry F Butts of the ballistic bureau of the Police Department of the City of New York, Remarks by Joseph P Rudden, Esq, president of the Queens County Bar As-

sociation, and a Scientific Exhibit by the Society's Committee.

The next meeting of the County Medical Society will be held on April 18, advanced one week to avoid conflict with the State Society meeting in Syracuse.

The Friday afternoon talk on April 21 at 4 30 P M will be on "Sacroiliac Disease" by Dr Charles Dwight Napier, Consultant Orthopedic Surgeon, Long Island College Hospital.

An open meeting of the Queensboro Surgical Society will be held on Wednesday, April 19, at 9 00 P M at the Medical Society building. The speaker of the evening will be Dr James A Cahill, Jr, Professor of Surgery at Georgetown University, Washington, D C. His subject will be "Trauma of the Abdomen and Chest." The annual dinner will be held the same evening at 6 30 P M at the Forest Hills Inn.

Rensselaer County

Eric W Gibberd, secretary of the Troy Community Chest, spoke on the "Community Chest Drive" at a meeting of the Rensselaer County Medical Society in Troy on March 14.

Dr William T Shields, Jr, president, was in charge of the session.

Other speakers were Dr Robert E Plunkett, whose topic was "Modern Emphasis in Tuberculosis," and Dr John J Randall, who spoke on "The Pawling Sanitarium and Its Needs."

Richmond County

The attending obstetricians at St Vincent's and Staten Island hospitals, Dr D Vincent Catalano and Dr Charles R Kingsley, Jr, spoke at the meeting of the Richmond County Medical Society on March 8 in the Health Center, St George.

Dr Catalano spoke on "Pelvic Pelvimetry by X-Ray," and Dr Kingsley discussed "Obstetrical Problems."

Tompkins County

A regular meeting of the Tompkins County Medical Society was held on March 21. Thirty two members were in attendance. A motion was carried to approve the bill of assemblyman Lawrence of Herkimer County to require full citizenship of registering physicians, dentists, and nurses. A motion was carried to place the Tompkins County Medical Society on record as favoring tubercular testing in our public schools.

A most instructive and interesting talk was given by Dr. Oliver Wendell Holmes Mitchell, of Syracuse, on "Health Insurance and State Medicine."

—Reported by Dr. Willets Wilson,
Secretary

Ulster County

An interesting address on "Classification of Morbid Conditions Giving Rise to Paroxysmal Cardiac Pain, Diagnosis and Therapy," was given before the Medical Society of the County of Ulster on February 7, by Dr. Harold L. Rakov, of Kingston. He discussed the use of various drugs in treating the condition and also showed many lantern slides of charts and electrocardiograph tracings taken from his own case histories.—Reported by Dr. Clarence L. Gannon
Secretary

Westchester County

The first major step in a nationwide movement for the protection of children from infection through contact with unhealthy adults was taken on March 21 by the Westchester County Medical Society in collaboration with the American Academy of Pediatrics when it launched a campaign for periodic health examinations of parents, domestics, and teachers throughout Westchester County.

Meeting at the New York Hospital, Westchester Division, members of the County Society agreed to have 500 physicians cooperate by providing x ray examinations and blood tests for adults to discover evidence of tuberculosis, syphilis, and other communicable dis-

eases that children might contract. An annual fee of \$10 would be charged to each adult submitting to the tests, it was decided.

Dr. Edward H. Marsh of the County Health Department, chairman of the Medical Society's public health committee, explained that the program originated in Westchester, having been operated on an experimental basis in New Rochelle for two years, and that it was approved last summer by the American Academy of Pediatrics in convention at Del Monte, Calif. Westchester will be the first county to use the plan on a large scale, he explained.

Standard printed forms for physicians to use in the examinations were distributed to the 200 physicians at the meeting. The forms call for one x ray examination of each adult annually and other tests semiannually. Every domestic passing the test will receive a health certificate from the examining physician.

Dr. Ralph T. B. Todd, president of the Society, presided at the meeting and Dr. Abraham H. Aaron, professor of medicine at the University of Buffalo and president of the Buffalo Academy of Medicine, spoke on gastrointestinal illnesses. Nine new members were elected to the society.

Diagnosis by x ray once was considered a black art by the medical profession, Dr. Lewis Gregory Cole, head of the radiography department at St. Agnes Hospital, asserted in a talk before the Rotary Club of White Plains on March 7, at the Roger Smith Hotel.

"When I tried to secure tuberculosis lungs for x ray examination," he said, "a fellow physician called me a quack and a charlatan and refused to let me have them."

That was back in the early 1900s when x ray was still toddling. Dr. Cole recalled he was "thrilled" when he first diagnosed cancer with x rays and realized what an effective weapon against the disease he had at hand.

Deaths of New York State Physicians

| Name | Age | Medical School | Date of Death | Residence |

AMERICA'S JUGGERNAUT

In the typical American family of three children the probability is that one will be killed or injured in an automobile accident before he has lived out his normal life span, we read in a booklet issued by the Travelers Insurance Company

True, the United States enjoyed in 1938 its second yearly decrease in motor vehicle fatalities in more than four decades of automobile transportation and its lowest traffic death total since the depression years of 1932 and 1933 This record is heartening

But the death total remains far too high No one can feel any complacency about a record which saw 32,000 human lives sacrificed on the altar of carelessness Nonfatal injuries also decreased from the all-time peak record of 1937, but the decrease was relatively much smaller than that registered for fatalities

It seems that exceeding the speed limit was responsible for 39.6 per cent of the deaths and 25 per cent of the injuries Despite a decrease in fatalities in 1938 compared with 1937, the percentage caused by speed went up Almost 94 per cent of the drivers involved in fatal accidents were male and only 6 per cent female More than 84 per cent of the fatal accidents occurred in clear weather, and 77 per cent happened when the road surface was dry More persons were killed on Sunday than on any other day of the week, while the heaviest injury toll came on Saturday More persons were killed between seven and eight P.M. than at any other hour Almost 43 per cent of all victims of fatal traffic accidents were pedestrians Almost half of all pedestrians killed were either crossing between intersections or walking on rural highways

And if you think the moral is to stay at home, other figures show that about as many are killed in accidents in the home as on the highway

THE EVER-BOILING WITCHES' BREW

Each week the Food and Drug Administration receives up to a hundred communications from butchers, bakers, housewives, automobile mechanics, Indian squaws, and other equally unqualified persons who are interested in marketing a new food or a drug, said Theodore G Klumpp, M.D., Chief Medical Officer of the U.S. Food and Drug Administration, in a recent address Each of them has a desire to get rich quick, or a yen for pharmacutic experimentation, or a crackpot notion that some weed growing in his garden has medicinal value He related that a short time ago he encountered a box of red pills sold as "Revivo" pills by a Chicago doctor Upon inspection of the pills it was noted that although they were supposed to be the same, there were slight variations in size, and shade of red When analyzed it was found that the package was an indiscriminate mixture of three different kinds of pills one was a cathartic, another was essentially thyroid, and the third contained strychnine When the physician was investigated, it was found that he bought stocks of salvaged drugs from various sources, mixed all the red pills together and called them "Revivo" Another collection of pills of a different color was labeled "Retardo"

"We encountered another drug manufacturer who had had on hand a large stock of miscellaneous salvaged liquid preparations The liquids were all dumped together into a large cauldron, mixed, bottled, and sold as a liniment. The old Food and Drugs Act had no provision for dealing directly with practices such as this In fact, our inspectors don't even have authority to enter the factory to see what's going on I'm glad to say, though, that most manufacturers do not stand upon a strict observance of their legal rights in this respect"

Hospital News

Sterilizing the Air in the Operating Room

THE killing of bacteria in the air in operating rooms by irradiation may prove an important addition to efforts for eliminating infections of wounds in clean primary incisions, *The Journal of the American Medical Association* for March 18 says in an editorial.

Pointing out that modern aseptic technique in the operating room has almost eliminated infection of wounds in clean cases, *The Journal* says, however, that the introduction of major surgical procedures involving exposure of large raw areas for a long time has again raised the problem of occasional infection.

"Recently," the editorial continues, Deryl Hart, M D, of the Duke University School of Medicine, has reported studies during the past five years of efforts to eliminate the occasional sporadic operating room infection. After carefully checking all possible sources of infection, Hart concludes that the least controlled source of infection was air borne bacteria. Most of the infections were caused by *Staphylococcus aureus-haemolyticus*. The organisms entered the wound from the air rather than from the skin of the patient. The air was contaminated by operating room personnel and patients.

Infection from Operating Personnel

"The personnel of the operating room and the general population were found at times to have *Staphylococcus aureus* in the nose and throat in as high as 78 per cent of the cases. In every case of infection in which cultures of the air had been taken, the organism cultured from the wound was identical with the one cultured from the air during the operation.

"The bacteriologic studies carried out daily convinced the author that the most important source of wound infection was not the bacteria present in the skin but the organisms eliminated from the noses

and throats of the operating room personnel. The wearing of thick gauze masks was not apparently an adequate protection against this source of contamination. To eliminate this source the author turned to air irradiation.

"At the request of the author, special radiant energy apparatus was designed and constructed which answers the requirements. An operating room was equipped with eight of these lamps, each 30 inches long. The author found that it was possible with eight tubes operating to kill a lightly sprayed culture of *Staphylococcus aureus-haemolyticus* on blood agar plates within sixty seconds or a heavily sprayed culture within less than five minutes. Practically all organisms exposed to the radiation from these tubes at a distance of 8 feet from the center of the cluster were killed within less than ten minutes, and at a distance of 10 feet within less than thirty minutes."

Mortality Cut One-Half

In a series of 132 individual stages of chest operations on fifty nine patients performed in a field of air sterilized by means of bactericidal radiant energy, Dr Hart was able to report a lowering to one-half of mortality due to infected wounds. There was an incidence of 3.8 per cent of skin infections as compared with 33 per cent in a previous series of 100 similar operations. The incidence of elevation of temperature after the operation was lowered so that more than two-thirds of the patients did not have more than two recorded elevations above 100.4 F as compared to one third of the patients without radiation in this group.

In a later report Dr Hart presents an analysis of the results obtained in 134 clean primary incisions and 86 ~~reoperations~~ clean incisions out of more than 500 operations performed in field of bactericidal irradiation. The analysis ~~shows~~

that the postoperative infections have been reduced more than 85 per cent. The occasional death anticipated from infection of a wound did not occur. The number of patients with postoperative temperatures above 100.4 F. has been reduced in chest operations from 68 to 30 per cent, in mastoid operations from 46 to 34 per cent, and in hernia operations from 36 to 22 per cent. The number of patients with a temperature above 99.2 F. for more than four days after operation has been decreased in chest cases from 78 to 22 per cent, in mastoid cases from 54 to 21 per

cent, and in hernias from 46 to 14 per cent. There has also been noted a more rapid wound healing, a lessened systemic reaction, and a shortened convalescence.

"The bacteriologic studies carried out by Hart and his co-workers, as well as the practical results obtained, seem to establish that air is an important source of contamination in every operative wound," the editorial concludes. "They demonstrated further that sterilization of the air in the operating room can be accomplished by bactericidal irradiation."

A "New Heart" for Roosevelt Hospital

Thomas S. McLane, president of the board of Roosevelt Hospital, 428 West Fifty-ninth Street, New York City, announces plans for a \$2,965,000 building to replace sixty-eight-year-old sections of the institution. He said the proposed addition would provide the hospital with a "complete new heart," helping it to meet the "growing demand for hospital care at rates within the reach of persons of moderate means."

The new structure, he explained, would increase the capacity of the hospital by 120 beds, to a total of 507. The increase would be composed chiefly of semiprivate beds and thirty ward beds through the establishment of a maternity service.

"The new project is not designed to replace all the hospital's buildings," the announcement said. "The present modern ward building and the nurses' residence

will be retained. The new building will be joined to the ward building so that its general facilities may be equally available to all patients. The present private patients' pavilion will be remodeled for the School of Nursing, now housed in buildings which will be torn down."

Mr. McLane, who said a campaign to raise \$2,000,000 or more this year would begin on April 11, declared the new building would provide new children's wards, more adequate diagnostic and research laboratories, an enlarged x-ray department, and other facilities.

"In addition to the building," the announcement said, "the program of the hospital includes endowments for the care of the sick, teaching and research, which raise the total to be sought over the next few years to \$5,667,000."

Record-Breaking Hospital Year

A number of records in hospital service were broken in 1938, it appears from the eighteenth annual presentation of hospital data by the Council on Medical Education and Hospitals of the American Medical Association, published in *The Journal of the Association* for March 11.

For the first time in eight years the number of registered hospitals increased over that of the previous year, births in hospitals passed the million mark, the

number of beds increased 36,832 as compared with the average annual increase of 24,677 beds for the previous thirty years. In 1938, hospitals admitted patients at the rate of one every 3.3 seconds.

The report lists 6,166 registered hospitals having a total of 1,161,380 beds, 56,747 bassinets, 1,026,771 births, an average census of 965,706, with 9,421,075 patients admitted. In addition, there are 136 hospitals opened and their registra-

tion pending, 67 under construction, and 185 planned and being developed

Supplementary to these facilities there are 2,529 institutions, emergency stations, clinics, and cottages designed to give emergency and other auxiliary types of hospital and medical care of which the Council on Medical Education and Hospitals has record

The rate of growth in registered hospitals is equivalent to 1 hospital of 101 beds for each day in the year, Sundays and holidays included

Commenting on the report, *The Journal* says

"The growth of hospital facilities has outstripped the advance in population. The increase of population in the United States from July 1, 1927, to July 1, 1938, was 8.9 per cent. In the same time the beds in all registered hospitals increased 36.1 per cent. The beds in all general hospitals increased 23.2 per cent, in nervous and mental hospitals, 58.5 per cent, and in tuberculosis hospitals, 20.3 per cent. Ratio of general hospital beds to population has increased during these years from 2.9 beds per thousand to 3.3 beds per thousand. Such increases in proportion to population cannot be maintained indefinitely."

Newsy Notes

An appropriation of \$30,597,393.95 for the New York City Hospital Department, an increase of \$4,240,864.45 over the 1938 allotment, is asked by Hospital Commissioner, S. S. Goldwater as a departmental budget estimate for the 1939-1940 fiscal year.

About half the increase, according to the estimate, is necessary to provide for approximately 1,500 new positions needed to staff additions to the city hospital system and to remedy existing shortages. Mandatory salary increments and "modest increases" for large groups whose wages are admittedly unsatisfactory make up the remainder of the increase asked for in personal service.

Of the total sought for the period beginning July 1, 1939 \$21,081,085 is for salaries and \$9,516,308.95 for other than personal service.

The Broad Street Hospital, New York City, which has been in financial straits and was slated to consolidate with the Beekman Street Hospital, will continue service, it is hoped, under a new plan.

The plan, which now must be submitted to a judge of the court for confirmation, was submitted for the hospital on March 3 by Hughes, Richards, Hubbard & Ew-

ing, the hospital's attorneys. It provides that Henry L. Doherty, founder and president of the Cities Service Corporation, shall waive \$1,749,000 in claims against the hospital, that other creditors are to receive 30 per cent of their claims, and that a group of physicians now associated with the hospital will advance \$50,000 without interest, to be used as working capital.

Cooperation between World's Fair authorities and hospital staffs of the city will be required to handle the case load requirements during the Fair season, Dr. S. S. Goldwater, Commissioner of Hospitals, declared yesterday.

"Repeatedly I have been asked what the city proposes to do about the matter of hospitalization for Fair visitors," Dr. Goldwater wrote to Dr. C. W. Munger, chairman of the Greater New York Hospital Association.

"Thus far, no definite steps have been taken."

Dr. Goldwater declared he felt the solution for caring for sick visitors must lie in the further utilization of private hospital facilities because bed occupancy in city hospitals now equals 100 per cent capacity.

The Memorial Hospital in Buffalo has been operating at a loss of \$600 a month, and has been compelled to close

. . .

A committee of the New York State agricultural conference board, meeting in Syracuse, gave its approval on March 10 to extension of nonprofit hospitalization plans into rural communities of the state

Hospital service representatives said the approval will make the plan available to an estimated 155,000 in the Syracuse area alone who previously could not enroll as individuals

. . .

A campaign to raise \$500,000 for the sustaining fund of St. John's Hospital, Brooklyn, has started. The fund is sought for a five-year program to enable the sixty-seven-year-old hospital to carry on its functions without curtailment and to eliminate yearly deficits

. . .

The annual memorial address on March 7 to commemorate the life and deeds of Dr. Henry W. Frauenthal, founder of the Hospital for Joint Diseases, in New York City, was given by Dr. Charles Rosenheck

. . .

More than fifty fellow doctors, including the entire staff of St. Francis Hospital, gathered at a testimonial dinner in the dining hall of the hospital, 142nd Street and Brook Avenue, the Bronx, on Febru-

ary 21, to honor Dr. John Dorning, 124 W. 81st Street, physician-in-chief of the hospital, on the completion of fifty years' service to the institution

. . .

A committee representing the voluntary hospitals, headed by John W. Davis, is asking the New York City government to adjust the rates paid for the care of indigent patients. The maximum paid by the city is \$3 a day, while the cost to the hospitals is \$5.53

. . .

Hospital officials of Herkimer, Ilion, and Little Falls are acting to eliminate a serious condition which has arisen over welfare patients' accounts and which threatens to become a peril to their financial structure. They announce more than \$10,000 is due from the county for care of patients treated between 1932 and 1939

. . .

A recent item in this department erroneously located the excellent Columbus Hospital, of Buffalo, in New York City. A courteous note from the Medical Director, however, reveals that it is still there. May Buffalo long continue to receive its ministrations. It is building a new \$100,000 addition, with three operating rooms equipped with the latest facilities, new electric elevators, and modernly furnished private and semiprivate rooms. The capacity of the hospital will be increased to 150 beds.

At the Helm

These hospital officials have been chosen

Mrs. E. J. Ashwell, to be president of the managers of the W. C. A. Hospital at Jamestown, re-elected

Dr. Ray Palmer Baker, to be president of the corporation of the Samaritan Hospital at Troy, re-elected for the fifth term

Frank N. Clinton, to be president of the directors of the Peekskill Hospital, re-elected

Dr. Edmund D. Colby, to have charge

of the Schenectady County Hospital

Dr. Henry C. Courten, to be president of the medical board of the Queens General Hospital

Dr. Harry S. Fish, to be president of the staff of the Tioga County Hospital

Milton J. Fletcher, to be president of the Chautauqua Region Hospital Service Corporation, re-elected

Robert G. Hamkin, to be president of the trustees of the Amsterdam City Hospital, re-elected

A Physician's Fee

RECENTLY an Appellate Court in California handed down an interesting decision in a case involving a dispute between a physician and a well known motion picture actor with regard to the amount of the fee for professional services.*

The plaintiff in the action was a physician who had been practicing his profession for about seventeen years, and at the time in question was practicing in a town of about 3,000 population. In June, 1936, he was called to attend defendant and found him to be a very sick man, suffering from bronchial pneumonia. According to the testimony on the trial, the patient also suffered from polyneuritis and Paget's disease and had been in the habit of consuming a quart or two of whiskey every twenty-four hours. His age at the time was fifty six years. Hospitalization was advised and agreed upon, and arrangements were made that the plaintiff physician would go with the patient to the hospital and remain there as long as the patient, and remain in charge of the case if consultants were called.

The patient was taken by ambulance to a hospital where he remained under the care of the doctor for nearly four weeks. During that time specialists in diseases of the chest and pneumonia were called in as consultants.

During that time the doctor occupied the room adjoining that occupied by the defendant and was in more or less constant attendance upon him. Upon the trial the plaintiff testified that his patient left the hospital cured of the pneumonia. It seems, however, that when he did leave the hospital he entered a sanitarium where he remained for a considerable period of time.

It seems to have been agreed upon at the trial that when the patient entered the hospital under the care of the plaintiff he had a very slight chance of recovery from pneumonia, considering his age, and less chance because of his drinking habits and his affliction with polyneuritis and Paget's disease.

The plaintiff brought an action against the defendant to recover the sum of \$12,000 which he alleged to be the reasonable value of the services rendered. The trial resulted in a verdict in favor of the doctor for the full amount sued for.

The defendant appealed, contending, among other things, that the Trial Court had improperly ruled upon the admission of proof, in that improper testimony concerning this earnings had been allowed, and urging that the Court had improperly refused to permit the physician to be examined as to customary charges made by him to other patients.

The Appellate Court reversed the judgment appealed from, saying in part in the opinion:

Testimony tending to show a patient's ability to pay is admissible. The value of professional services rendered by physicians is not a subject of general knowledge or within the scope of judicial notice. Proper proof as to the value of a physician's services requires evidence of those familiar as experts with such work in a particular locality. A physician is entitled to recover the ordinary and reasonable charge usually made for such services as he has rendered by members of the same profession of similar standing. There is a difference between ability to pay and annual net income. However, annual net income may be in such an amount that, when related to the amount claimed, proof thereof would establish

* *Citria v. Fields*
85 Pac. 2nd 824

the ability to pay the claim. Usually, annual net income is evidence only of ability to pay, and, therefore, as one element to be properly considered in the matter of determining what is the reasonable value of services performed. Fixing the value of services must be in the light of other elements than ability to pay, such as professional standing, capacity, and reputation of the person performing the services. In other words, his capabilities as measured by all of the elements that go into the demand for his personal services must be taken into consideration, as well as the difficulties of the problem presented and the amount of time necessarily occupied in the consideration thereof, etc.

"As can readily be seen, one who has just been licensed to practice could not have established within a community public opinion or demand for his services that would justify a charge equivalent to a charge that would be made by a Mayo, although he might in a given instance prescribe the same treatment and direct the same care of the patient. Nor could a surgeon who was performing his first operation be considered to have demonstrated his capacity to justify a fee therefore in an amount equal to one of the outstanding surgeons of the world, although the results of such operation might be entirely satisfactory.

"Furthermore, when a doctor possesses a rare gift in the matter of professional accomplishments and the demand for

his time and services becomes very great he is entitled to a greater compensation than as though such were not the fact. All of the elements that go into fixing the reasonable value of services must be considered by an expert in expressing an opinion relative to the reasonable value of the professional services performed. Respondent was a general practitioner, with no special training or experience proved in treating pneumonia.

"The professional standing of the respondent was one of the elements properly to be considered in determining the reasonable value of the services rendered. The earnings of the respondent and his customary charges were also proper subjects of inquiry to aid in determining his professional standing and the reasonable value of the services rendered. We think the testimony as to the earnings of the respondent and his customary charges during a reasonable time prior to the rendering of these services should have been admitted. The sustaining of the objection was prejudicial error.

"We regard these errors of refusing reasonable cross-examination of respondent on the financial returns from his practice and his usual charges as most serious, in view of the very large judgment given him which must shock the conscience until supported by more substantial evidence than now appears in the record."

The Annual Spring Clinical Day of the Alumni of the Medical School of the University of Buffalo will be held April 22, 1939, at the Hotel Statler, Buffalo, New York. The list of speakers who will appear on the program, which begins at 8:30 A. M., is as follows:

Dr. Elmore B. Tauber, Professor of Dermatology, University of Cincinnati, Cincinnati, Ohio; Dr. Horton Casparis, Professor of Pediatrics, Vanderbilt University, School of Medicine, Nashville, Tennessee; Dr. Edward H. Dennen, Clinical Professor of Gynecology and Obstetrics,

New York Polyclinic Medical School and Hospital, New York City; Dr. Harry E. Mock, Associate Professor of Surgery, Northwestern University Medical School, Chicago; Dr. E. Perry McCullagh, Director of Department of Endocrinology and Metabolism, Cleveland Clinic, Cleveland, Ohio; Dr. David L. Thomson, Professor of Biochemistry, McGill University, Montreal, Quebec.

At 7:00 P. M. the Annual Dinner of the association will be held in the main ballroom of the Hotel Statler.

Across The Desk

Truth Remains Truth Across the Years

PEOPLE are making a mistake if they think that socialized medicine is something new in our politics. A little rummaging among the medical essays and addresses of years ago reveals that it was all threshed out decades back, and its fatal weaknesses were made perfectly clear. And, what is of special interest this month, one of the most fearless and logical indictments of socialistic medical schemes was made by the then retiring president of the Syracuse Academy of Medicine, who now happens to be just closing a successful and distinguished year as president of the Medical Society of the State of New York—Dr. William A. Groat.

It was nineteen years ago, on January 6, 1920, to be exact, that he reminded the medical academicians of his home city that our democracy guarantees us life, liberty, and the pursuit of happiness, in that order, so that life, or health, comes first, and the socialistic wonder workers, in their roseate, or pinkish dreams of pursuing happiness, have no right to play hob with the health of the rest of us. The language was on a higher plane, but the underlying brass tacks, in our ruder verbiage of today, had the same points.

Picture Tells the Story

Another pungent statement that 'leaps to the eye,' as the British say, is his remark that "health preservation is a fundamental requirement of a successful government." Either the calendar is wrong, or that was about twenty years ahead of the much heralded declaration that the health of the people is a prime concern of the government—not a new idea, then, after all. And Dr. Groat drew a sharp distinction. He said that 'health preservation' was the business of the government. The government, with its splendid Public Health Service, has infinite possibilities in the field of preventive medicine

to preserve health, but it can never be the physician. "The sympathetic, somewhat sentimental, care of a physician, the sustaining presence of a trusted acquaintance, will always be required. If he is without sympathy or sentiment, he is not a physician. The State cannot become a sympathizing friend," said Dr. Groat.

There is the picture, clean-cut as an etching by Alma Tadema, that shows at one glance why the impersonal physician of a socialistic machine can never take the place of the family doctor at the bedside of the sick, and its lines were sketched nineteen years ago. Truth remains truth across the years.

Two Points Are Clear

Two more points rise as one reads this fine address. First, it is evident in every paragraph, every line, that the speaker is merely saying what seems to him self evident from his rich experience as a doctor. He speaks, as a medical man to medical men, what lies in the knowledge of speaker and listener alike. What is founded in universal medical experience is based too deep to be shaken by the winds of politics.

Next, it is no mere coincidence, no accident, that the best minds in medicine are taking the same line today. Why? Because the personal relation between doctor and patient is as vitally essential today as it was nineteen years ago, and as indispensable as it will be nineteen, ninety nine, or nine hundred years from now. Bring this basic fact home to the mind of the great public, and machine-made medicine will have no more chance than a snowflake in the Sahara. The truth is mighty and shall prevail.

On the following pages is Dr. Groat's splendid address of nineteen years ago. Every word of it is worth reading.

"THE INTEREST OF THE STATE IN THE HEALTH OF ITS CITIZENS"

By William A Groat, M D
Syracuse, N Y.

*(Address of the retiring president, Syracuse
Academy of Medicine, January 6, 1920)*

Before directly discussing this topic, it may be well to recall that the State or government of which we shall speak, our own, is a democracy. It is a representative democracy, and it was erected on the foundation principles of individual rights. The individual was declared to be entitled to life, liberty and the pursuit of happiness. The government was set up to insure these individual rights. It was calculated to safeguard his life, maintain his liberty of action and grant him opportunity to pursue happiness in his own fashion. It does not, by the way, assume to grant him happiness. Merely the right to pursue it, to obtain it is his own business. These guarantees, however, are equally bestowed. That all men are created equal was likewise declared. One man's life is not to be protected by the legal sacrifice of another. One man's pursuit of happiness must not be at the expense of a fellow's. Life, liberty and the pursuit of happiness are grouped. If there is any precedence, however, it is in the order in which they appear. Surely, therefore, the pursuit of happiness by one, or by the many, must not interfere with the health of another.

These are the great warranties of our constitutional government. They are to be put into effect by laws in accord therewith, such laws being made by representatives who are supposed to carry out the wishes of their constituents. Contrasting with this type on either side are two extreme types. First, the autocratic with its paternal care, now practically obsolete, in which there are no constitutional rights. The life, the liberty and the happiness of the individual come from what he is permitted or told to do.

On the other side, the socialistic. Here

we find as certain and complete loss of personal liberty and individual responsibility as one could wish. Individual property rights, the rights and the responsibilities of family, and the right to work or study for one's own benefit, seem to disappear into a common pool, supposedly for the common good. I am not speaking of anarchists, of bolsheviks, of I W W's. These are also despots. I am speaking of the theoretical socialist ranging from parlor to auditorium size, but scarcely larger. This incomplete and superficial discussion of governments would be out of place as my preface, were it not that, in a consideration of the interest of the State in the health of its citizens, one must touch upon various paternalistic or socialistic plans which some clean thinking, but not clear thinking people wish to have added to and enforced by a constitutional democracy. The fundamental interest of the State in the health of its citizens is that the State is to be perpetuated, defended and expanded, and that health and reproduction of a healthy race are the means to that end.

Governments have shown great and tremendously increasing interest in general education, the fundamental reason being similar—an intelligent citizenry is necessary for the perpetuation, defense and expansion of a government. Public health education is of equal importance, touching both.

The development of State medicine has been largely along a line perfectly sound, but of secondary status—that of public safety. It has developed defenses against epidemic disease as a method of protection superficially of the individual, but deeper of business, and deeper still, the development of the State and the conservation of defenders. It has developed along charitable lines. The State assumes care of the indigent sick, theoretically, at least, as a charity. It assumes almost wholly the care of the mentally incompetent. It looks to the health welfare of its citizens in a variety of ways not ordinarily associated in our minds with

State medicine, child labor, street cleaning, garbage removal, sewage, and the like, are all touched by, or touch upon, public health principles

As to treatment of disease, our New York State Department of Health has, ostensibly, at least, kept clear, except on a charity basis. As to diagnosis, it has kept to the so-called contagious diseases within the domain of public safety, except for certain laboratory methods which might be considered as a beginning

The interesting situation, directly my thoughts to this topic, however, is that brought out by the discussion of the health insurance legislation among medical men, the attitude of the State department of health to that legislation, and the proposals said to have been made by the State department to the committee of the State society appointed to consider the matter of health insurance.

There is proposed the alternative of developing medicine along one of two lines—either along the line of so-called health insurance or of State medicine. The former has been frequently discussed and at great length. The objection to it, its false basis and still more erroneous theories as to benefits granted, have been clearly put before you. You understand them as well as I. What I want to emphasize is that this unwieldy, expensive, and unproductive plan is the natural result of an attempt to adapt socialistic theories to everyday conditions, little by little, and bit by bit, beginning with the practice of medicine, such action requiring the making of laws by a democracy to enforce socialistic measures—a wholly ridiculous situation.

That the health and welfare of the populace may be greatly improved we as physicians know. That the State is indeed interested in the health and welfare of its citizens on a purely selfish basis, I believe is also clear. There is no need to arouse public sentiment by mawkish appeals for the downtrodden or submerged. There is need to arouse public opinion to the fact that public health pays, that health preservation is a fundamental requirement of a successful government.

Public sentiment and public opinion are not synonyms. A very good illustration of the necessity to a State of a sound public health policy is the fact that neglect of public health measures by either side alone in the World War would have brought it to disaster.

How should State medicine be expanded? Should it invade the field of medical practice, do general or special diagnostic work, or treat all the sick as a matter of public safety? If this would be for the public good, I would say yes, but I do not for one moment believe it would be. I do believe that there is a distinct tendency in that direction and that that tendency should be opposed. The reason for objection is not a selfish one. It is a practical one, a scientific one.

The important, the attractive, the productive side of medicine today is the prevention of disease, not the curing of it. It is impractical, expensive and unscientific for the State to start curing disease, or even to spend time studying how to cure disease until it has used its energies and its powers to prevent disease. That the State should so decide and so devote its energies is confirmed by the fact that the State is so selfishly concerned. The State has a right to be selfish. Its existence depends upon it. This, of course, is by way of argument only. The State can also afford to be lenient, forgiving, helpful, kind, but not weakly sentimental.

Prevention of epidemics and control of contagious disease is but a part of preventive medicine. The energies of the State must be more widely expanded. It is a question whether epidemics can ever be wholly eradicated until the peoples of the world are thoroughly homogenized, and perhaps not then. There are more important problems which, when solved, will yield greater fruits. The State should till the untouched fields and give proper cultivation to those already cleared but sadly neglected. The problem of prenatal care and birth control may be well appreciated by France. Premier Clemenceau urges large families to save France. Child hygiene, nutrition, dental hygiene

are now taught in the schools, but in the main imperfectly

Industrial hygiene and welfare should be a constructive study and movement to eradicate the evils and place responsibility where it belongs, rather than to compensate, in part only, for damage done. Waterways need not be polluted, breathing places and beauty spots need not be overrun, dust, noise and confusion are not essential to industrial progress. The venereal problem is not simply a disease problem. The free clinic for tuberculosis does not lay the dust in the pottery plant. Killing half the flies covers no cesspools. The only A B C's that influence malnutrition are the kind they put in soup.

There will always be sickness, disease, epidemics and parasites, if we get rid of what we have there will be new ones. The nurseryman who plants under glass, free to prune away, uproot, burn, spray and handpick at will, with quarantines far more rigid than any against human exchange, has disease to treat, scientific specialist though he is.

The frailties of human nature, the inherited and acquired weaknesses, will never be bred out. The sympathetic, somewhat sentimental, care of a physician, the sustaining presence of a trusted acquaintance, will always be required. If he is without sympathy or sentiment, he is not a physician. The State cannot become a sympathizing friend. The objection to a department of health under which all health activities, direct and indirect, are collected is the charge of paternalism, the invasion of personal rights, the loss of individualism. The objection appears not to be sound so long as preventive medicine alone is implied. The only objection to an autocrat is the fact that he may at times be wrong. The objection to communism is that the multitude seldom know what is right.

A certain amount of autocratic power under control and advisement is perhaps most practical. I am reminded of the man who had objections to the autocratic control of a business by another, overthrew him and assumed control himself. Soon it appeared to those under

him that he had a rather individual way of running things. They charged him with it and twitted him of the fact that he had objected to the same tendency in his predecessor. "True," he replied, "He ran things to suit himself and we kicked him out. But don't get the idea that I'm not going to run this to suit myself, the only difference is, I'm going to run it right."

There is much clear commonsense in that remark. There was considerable fear that the doctor would interfere with the art of war in 1898. Relegating him to the rear spoiled a perfectly good war. His greatly increased responsibilities and prestige, the multiplication of his numbers and his duties in the armies of the World War, gave vast returns in effectiveness and lessened wastage.

To the layman, the advocacy of disease prevention is, for the doctor, the limiting of his activities and the loss of business and prestige. The doctor has been glorified as the only one who is laboring to make his own services unnecessary. But this is not strictly true. As in the army, the use of preventive medicine as a State medicine or as an independent thing increases the scope and importance of medicine, opens new fields of thought and influence, calls for increasing numbers who must be scientists and educators. We may now reach that pinnacle where it will be considered worthy of a larger fee to protect an appendix from disease than to remove it! In any event, the subject of preventive medicine is inspiring and attractive, the prospect a bright one.

Therefore, let us have a national department of health for the principal reason that the nation's welfare demands it. Let the activities be along the broad educational lines of preventive medicine. Let it cooperate with the States and let them win back and take over the indirect and secondary health activities now scattered among bureaus, commissions, and boards which have no true scientific interest therein. Let it teach how to breed, feed and develop the child at least as well as the agricultural department teaches animal husbandry, and show

the cash values so created. Let it show from its seat in equality the value of health counsel to every other department of government. Let it teach the employer that unhealthy surroundings and improper requirements breed sickness, and sickness and the resulting labor turnover mean economic loss, and show him the cost, to him, in dollars and cents.

Teach the worker, he who labors with brain or hand, that his health is his greatest asset, that properly directed work is beneficial and brings prosperity, and prosperity happiness.

Teach that the human machine, like any other, requires frequent inspection, proper care, and lasts longest when kept at work under normal load.

Let it support medical education and medical investigation, and openly fight quackery. Let it carefully avoid undermining a people by relieving individual responsibility or antagonizing family ideals.

Let it direct its charities along broad lines, but on business principles, charity should give strength rather than breed weakness.

And, finally, let the medical profession measure and judge departments of health by what they accomplish for preventive medicine and public health, not by what they do for the profession. It will gain in the end.

BOILABLE AND UNBOILABLE INSTRUMENTS

Could the surgical instruments of the 'horse and buggy' days withstand boiling? Dr S. J. Banker of Fort Edward, who began practice in 1879 said in a letter printed in these pages on March 1 that in those days no instruments were ever so honored as to be boiled. Most of the instruments were made with hard rubber handles and would have been twisted out of shape if boiled.

This draws a reply from Dr Henry Wallace of New York City who began practice in 1890. He writes:

I remember well my Elliot Obstetric Forceps, purchased from the venerable house of George Tiemann were made with hard rubber handles and withstood boiling. This was in 1880. I also remember having a little later some beautiful knives which had belonged to my father set in metal as they were made of the marvelous steel made by Young of Edinburgh.

Of course wooden handles would be ruined. "The matter interested me so much that I wrote to George Tiemann & Co. for some information as to when hard rubber handles first appeared and I take pleasure in forwarding the reply to you."

The letter from Tiemann & Co. is interesting. It runs: During the Spanish American War and just prior to that, a great many of our sur-

gical instruments were supplied with hard rubber handles. This was about 1898.

Immediately thereafter and about 1900 hard rubber handles were in disfavor and consequently we started supplying our instruments made in either one piece or with metal handles attached.

The process by which the hard rubber handles were attached to our instruments was by vulcanizing the plastic stock directly to the steel shank of the instrument. This process made it possible to sterilize the instruments by boiling without having the handles become detached. Previous to that when instruments were made with ebony or bone handles the process of boiling would very soon damage the handles whereas the hard rubber attached as we attached them would stand indefinitely.

At that time there were many firms who would attempt to attach hard rubber handles by cementing them to the steel. This process was not good since the handles very soon became detached from the steel.

As you state in your letter there were numbers of cases where surgeons wished to retain their old knives and consequently had metal handles attached to those that previously had hard rubber handles.

nothing under compulsory health insurance should study the schedules of contributions under these two bills. The worker earning \$19 a week would pay only \$9 88 a year, it is true, but let us examine some of the other figures. Salaries of \$39 a week would be taxed \$40 56 annually, salaries of \$59, \$92 04. In addition, all three groups would have to pay their share of the state's and industry's "contributions." Obviously, not the rich, but the thirty- and forty- and fifty-dollar-a-week workers would make up the deficit growing out of the delivery of complete medical care to the lowest income class for \$10 a year.

Enactment of either the Wagner or the Boccia bill would deliver a fatal blow to the development of an efficient, inexpensive system of medical care in this state. Either one of these measures would immediately impose upon New York medicine the conditions that have stultified European panel practice and reduced medical care in insurance countries to a uniform level of mediocrity. The profession should immediately communicate its overwhelming opposition to these bills to the legislature at Albany.

Need for an Institute of Forensic Medicine

Forensic medicine has, until 1932, received but scant attention as a branch of medical practice that renders an important public service. It was in this year that the first chair in legal medicine in this country was established at the Harvard University Medical School. We like to feel that this first advance was largely the result of the activity of the Committee on Public Health Relations of the New York Academy of Medicine. It succeeded in abolishing in Greater New York the familiar "coroner system" which, unfortunately, is still in almost universal use throughout our country. One of the most instructive treatises on the scope of forensic medicine, and one that makes delightful reading, is that by Dr. Harrison Stanford Martland which he so intriguingly entitles, "*Dr. Watson and Mr. Sherlock Holmes*."

After first whetting our appetites by dissecting carefully our favorite detectives in fiction, and the reliance of their creators upon a coroner's verdict to throw the reader off the scent, he then clearly depicts the evils of the "coroner system." It is simple to pack a coroner's jury, for the coroner, rarely skilled in legal medicine, may at times be persuaded to supplement his incompetence with venality. It is this that is largely responsible for the prevalent attitude of the general public which looks down upon the coroner's physician as a politician who is not immune to graft. For this reason, reputable physicians have avoided specialization in this field of medicine be-

cause they realized that a career in this work was wholly dependent upon "politically minded" coroners for whom qualified men represented, in the main, a hindrance. In many parts of our land the law does not clearly define the right or duty of a coroner to perform an autopsy, and under such circumstances he and his designated physician may become subject to civil suit.

Under the "medical examiner system," the right to perform an autopsy rests solely with the medical examiner's office and so the performance of a postmortem examination need not be influenced by the fear of an action for damages. This is an important point, because in both Newark, New Jersey, and in New York City, one fifth of all the deaths are responsible to the medical examiner. Of this fifth, only 3 or 4 per cent are homicides, 8 per cent suicides, and 25 per cent are accidental deaths due to falls or automobile accidents. But in addition to these causes of death it is the duty of the medical examiner to investigate all deaths resulting from *occupational accident and disease*. Under the "coroner system" no attention is paid to these. Furthermore, sudden deaths resulting from unknown causes, which occur most frequently after forty five years of age, are medical examiners' cases. Martland* makes a pertinent observation, based upon his experience as a medical examiner, which an experimental pathologist could never make—namely, "that in ten cases of sudden death—seven die as a result of organic heart disease—one too old, acquired syphilis—one caused by old lesions of rheumatic heart disease."

It seems to us that our legal medical men are furnishing invaluable aid not only in the detection of criminals, but in the pointing out of industrial hazards of certain chemicals used in manufacturing, and from their practical experience with accidents and sudden death are giving us information that we can use to insure a normal span of life to all of us. His plea for an Institute of Forensic Medicine in New York City is ably supported by his brief. The *New York State Journal of Medicine* is whole-heartedly back of him.

The Dog Situation

In New York City particularly, the dog situation has reached such serious proportions as to require especial attention by the health department. The large dog population, estimated at 400,000 licensed and strays, has placed upon the health and police authorities responsibilities, the administration of which involves a great deal of money. Despite rigid regulations concerning muzzling and leashing,

* Martland, H. B. Landmarks in Medicine. Laffy lectures of the New York Academy of Medicine, D. Appleton-Century Co. N. Y. 1939. p. 63.

there were, in 1938, more than 27,000 reported incidents of injuries due to dog bites, and probably many more occurred that were not reported. In the same year, 93 people were bitten by rabid dogs, and 2,504 were given antirabic treatment ¹

This has stimulated a great deal of interest in the possibility of controlling the spread of rabies by the vaccination of dogs. The Rockefeller Institute is at present conducting an investigation of this problem under the direction of Dr Webster. He has been able to demonstrate that a successful prophylactic vaccination is possible, but as yet no material is available for the practical application of such immunization. Furthermore, all evidence seems to point to the fact that the commercial vaccines against rabies are, as a whole, ineffective. There is an imperative need therefore for a more stringent enforcement of the existing laws concerning the restraint of dogs in our communities. With school vacations approaching, doctors should caution their patients concerning the dangers of permitting their house pets to go outdoors except on a leash or with a muzzle.

The Past President—Dr. William A. Groat

The passing administration of Dr Groat has been one of change and progress. It would take us too far afield to detail the accomplishments of the administration. Suffice to point out the general satisfaction that has greeted the new format of our *JOURNAL*, and the fact that the Society is now publishing it. The legislative work, the continuing educational program, the improvements in Workmen's Compensation—all have progressed satisfactorily. Many intricate problems having medico-economic implications are under study and development. Every member should read and ponder the annual reports of their officers and committeemen, for it will give a comprehensive picture of what the State Society has done under the calm leadership of Dr Groat.

He leaves the high office that he has graced, with added friends and with a fine record of achievement.

We who have worked with him hope he will long be among us to advise and guide. His rich experience and maturity of judgment provide a source from which we can also draw good counsel.

TERRY M TOWNSEND, M D

President Townsend

In Dr Terry M Townsend, the Medical Society of the State of New York has a president who can be relied upon to defend with equal vigor the best interests of the profession and the public health. The present critical state of medico-governmental relations demands a high degree of patience, administrative ability, courage, and tact in those called upon to guide the course of organized medicine. Dr Townsend possesses all of these qualities to an unusual degree.

Born in a small Indiana city, educated in Louisville, Kentucky, Dr Townsend came to New York City in 1899 to start practice under the tutelage of the late Dr Ferdinand C Valentine. His metropolitan experiences were superimposed upon the background of a small-town boy, an invaluable combination for the leader of the Medical Society of the State of New York, who must understand the variegated problems of rural as well as urban practice.

Dr Townsend soon made a mark in his chosen specialty of urology, in which he was one of the pioneers. One of the founders of the American Urological Association, he served as its treasurer for its first three years.

Other organizations also recognized his executive and personal gifts and demanded his services. Years of work in the Medical Society of the County of New York, culminating in the presidency, gave him valuable preparation for his career in the State Society, which he has served as president of the First District Branch, as delegate to the A.M.A., and in other positions leading to his present office.

The executive duties of an organization like the Medical Society of the State of New York demand heavy sacrifices of the president and other members of the administration. Private practice, family life, and nervous equilibrium all suffer under the pressure of unceasing tasks and responsibilities. The membership faces the year to come in full confidence that Dr Townsend and his associates will not fall short of the demands made upon them, that they will bring a full measure of effort, ability, and good humor to whatever problems they are called upon to face.

Current Comment

"The entire state membership must keep constantly awake and aggressive as to all medical matters of legislative importance, if they would accomplish anything during this session of the legislature " *The St Louis County Medical Society Bulletin* of April 7, 1939, states that "We Must Be Aggressive," and what holds true for the doctors of Missouri certainly applies to those in New York State

. . .

"Both democracy and a very high standard of material living for all are new Man is by nature desirous of possession but he will not work for it if he can help it He looks more to what he sees in immediate prospect rather than to the ultimate good of himself, his family, and his group A man who does not bother to educate himself, who wants easy money regardless of how he gets it or of the consequences to others or himself, who declines to work if he can be supported by somebody else, who thinks he has a right to all he wants, is not likely to be successful, and neither is the democracy successful which encourages this parasitic attitude toward government.

"Democracy can be sustained only by concentrating on the progress of the initiative and effort of the individual for the advance of civilization The machinery of government works for its own destruction when it takes liberty from the individual

"The biological principle of the survival of the fittest is why dinosaurs do not inhabit the globe today, and no matter how much the individual is impeded in his progress by the necessity to drag his neighbor along with him, the principle still holds and will continue to apply to the governments of the future as it has in the past This principle may be opposed and modified temporarily by a generation of men, correspondingly retarding civilization, but it will survive long after a

better form of government has supplanted even a democracy"—Ernest L Shore, M D, who claims that "Man is Fallible," in the *West Virginia Medical Journal* of recent date

. . .

"A social worker is a broker between two kinds of human delusion He (or she) collects money from those who believe that they are generous, and disburses it (less a fair commission) among those who believe that they are deserving Unquestionably, there is progress The average American now pays out almost as much in taxes alone as he formerly got in wages"—H L Menden's "Thoughts on Current Discontents" in the April *American Mercury*

. . .

"Over in good old conventional England when one speaks of 'The Doctor' one refers to a highly educated practitioner of general medicine who diagnoses and advises The doctor in London does not as a rule practice surgery The surgeon is referred to as 'Mister' But over here in the land of the free, things are different 'The Doctor' in America is almost anyone from a third-rate horse drencher to the most celebrated member of the Mayo Clinic"—From the *Utah Medical Journal* of recent date

. . .

" the senator who fathered the National Labor Relations Board now makes the following optimistic statement 'We must take occasion now to conquer this last remaining frontier of social security in America' We cannot credit the senator with conscious irony in mentioning as this so-called frontier, *national health*, the single phase that has throughout the 'depressions' and 'recessions' since 1930 consistently shown almost spectacular improvement" From an editorial on "The Incurable Optimist" in the *Pittsburgh Medical Bulletin* of March 11, 1939

A RAPID BEDSIDE TEST FOR MEASURING SEDIMENTATION RATE

EMANUEL GOLDBERGER, M D, New York City

(From the Department of Medicine Open Division Kings County Hospital Brooklyn)

IF DROPS of blood obtained by pricking the finger tips of different individuals be placed on inverted glass slides, the slides righted, and the drops allowed to clot and dry spontaneously, the films, when examined macroscopically by holding them to the light, will show an interesting phenomenon

Some films will give the appearance of a uniform, coarse meshwork. In others the detail will be fine and there will be a concentration of red cells in the center. In all, four main types may be distinguished (Figs 1, 2, 3, and 4)

The character of the film depends on several interacting factors

- 1 Degree to which the red cells settle (sedimentation rate) before clotting occurs
- 2 Coagulation time.
- 3 Degree of agglutination of the red cells (rouleaux formation)
- 4 Rate of drying of the film

Under ordinary conditions, the rapidity of drying is unimportant.

The rate at which the red cells settle is directly proportional to the degree of their rouleaux formation¹. Thus a slow rate will produce a film fine in detail and uniform in the distribution of the cells (Fig 1), whereas, with a rapid rate, the rouleaux will be large and the general appearance of the film that of a coarse meshwork (Fig 4)

If the coagulation time be rapid compared to the sedimentation rate of the cells (rapid coagulation time, or slow sedimentation rate) there will be a tendency for the cells to be drawn to the center of the film. In actual practice, variations from the normal with respect to coagulation time are found in the direction of slower, not faster, rates. Thus, the picture described is seen with slow sedimentation rates (Fig 1)

A very slow coagulation time will merely cause a more uniform distribution of the cells

In short, then the character of the film may be said to depend directly on the sedimentation rate of the blood

A study of a large series of these films comparing the readings with the actual sedimentation rate determined by a modification of the Linzenmeyer² technic* gave values summarized in Table 1

| TABLE 1 | |
|---------------------|--------------------------------|
| UNSPREAD BLOOD FILM | AVERAGE SEDIMENTATION R. TEST* |
| + | One and a half hours |
| ++ | 45 minutes |
| +++ | 35 minutes |
| ++++ | 18 minutes |

The criteria for reading the films are as follows

- 1 Fineness or coarseness of general detail
- 2 Character of meshwork, if present
- 3 Presence or absence of central agglutination
- 4 Presence or absence of peripheral ring (Figs 3C and 4B)

With this in mind, the four groups may be described as follows

+ Normal, very fine detail, no meshwork, gradual transition from periphery to dark central agglutinated mass (Fig 1)

++ Moderately rapid, the detail is somewhat coarse but uniform throughout. Meshwork not noticeable particularly there may be the beginning of a central agglutinated mass (Fig 2)

*Modified Linzenmeyer Technic. A 5 mm bore tube calibrated to 6, 12 and 18 mm. is used. Add 0.2 cc. of 2.6 per cent sodium citrate to the tube. Withdraw blood from venipuncture and add the blood to the citrate in the tube until the 1 cm. mark is reached. Invert the tube three times to mix blood and citrate. Let the tube stand and note the time it takes for the red cells to settle to the 18 mm. mark

†Only about 3 1/2 per cent of the sedimentation rate readings according to this technic fell within the range of 30 to 40 minutes.

FIG 1 The film shows very fine detail, no meshwork and with a gradual transition to the concentrated mass of red cells in the center *

FIG 2 The detail is coarse and uniform meshwork not particularly noticeable *

+++ Rapid, coarse detail, the meshwork fine but easily observed, no central agglutinated mass (Fig 3)

++++ Very rapid, very coarse detail, definite meshwork, no central agglutinated mass (Fig 4)

Variations within each group will, of course, be found, but with a little practice in comparing the results with values from the quantitative test a surprising accuracy of prediction, correct within a few minutes, can be obtained

Technic

1 Clean the finger tip with alcohol and dry with a sterile gauze

2 Prick finger tip with needle (I use a No 19 gage Wassermann needle to insure a fairly large drop)

3 Gently express a small drop of blood (about 3 mm in diameter)

4 Touch it with the flat surface of a clean glass slide to produce a drop on the slide (about 5 mm in diameter) I employ the practice of getting several drops of slightly different sizes on the slide, expressing more blood from the puncture wound without wiping away the residual blood after each drop is taken The

* For the sake of clearness the blood films were drawn proportionately larger than the glass slides

reason for doing this is that if the blood on the finger as first expressed be small and globular in character, the first film produced will be thickly rimmed (Figs 3C and 4B), which distorts the picture somewhat, whereas successive films will show a uniform distribution

FIG 3 The meshwork is becoming prominent *

FIG 4 The film presents the appearance of coarse meshwork *

5 Right the slide and let the film clot and dry spontaneously in the horizontal position (I tried angulating the slide while the films were drying, but the results did not justify the use of this procedure)

6 Observe macroscopically when dry, by holding the slide to the light, note the type of film The slide may now be filed for future reference

It should take from five to seven minutes for the film to dry Smaller or larger drops may take longer

The red blood count of the patient has no influence on the character of the film

Discussion

It is not my intention to imply that the test described above be used to supersede regular methods of sedimentation rate Its place lies not so much in the hospital or research laboratory where facilities are at hand for complicated procedures, but rather in the office and at

the bedside where a simple and inexpensive and quick test requiring no special tubes, solutions, no syringes, and no graphs is of distinct value. Not only is my test of diagnostic value, but the fact that the slides can be filed and the results checked week by week in cases such as coronary thrombosis, rheumatoid arthritis, salpingitis, etc., places a good and simple prognostic guide in the hands of the physician *

* Blood films taken and filed by me more than a year ago still retain all their original clearness and characteristics.

Summary

1 Varying characteristics of the unspread blood film have been described

2 These have been shown to be dependent on sedimentation rate

3 A technic was described for utilizing this phenomenon as a simple qualitative measure of sedimentation rate

EXPERT WITNESS

Woldman's description of the medical expert on the witness stand is quoted thus in the *American Journal of Medical Jurisprudence*

"With an erudite profundity
And subtle cogitabundity
The medical expert testifies in Court
Explains with ponderosity
And keen profound verbosity
The intricate nature of the plaintiff's tort

Discursing on pathology
Anatomy biology,
Opines the patient's orbit suffered this
Contusions of integuments
With ecchymose embellishments
And bloody extravasation forming pus.

A state of tumescency
Producing lacrimosity
Abrasion of the cuticle severe
All diagnosed externally
Although he feared, internally
Sclerotic inflammation might appear

"The jury sits confused amazed
By all this pleonasm dazed
Unable to conceive a single word,
All awed they think with bated breaths
The plaintiff died a thousand deaths—
What agony and pain he had endured.

But then the counsel for the defense
Devoid of garrulous eloquence,
Asked Isn't it true that all you testified
Means merely from a punch or two
The plaintiff's eye was black and blue?
'Yes, that's correct, the doctor meekly sighed'

DIPHTHERIA DANGER SPOTS

At least seventeen communities in upstate New York will have to increase their number of diphtheria immunizations of children under five years of age if they are to feel reasonably secure from an outbreak of this disease according to the 1938 diphtheria immunization reports from sixty-eight places made public by Dr Edward S. Godfrey Jr. State Commissioner of Health

Health authorities say any community may feel reasonably secure from an outbreak of diphtheria only when 35 per cent or more of children under five years of age have been immunized. Dr Godfrey said however that while this will protect a community nothing will protect the individual child except actual immunization treatment and he warned against a feeling of false security on the part of parents who may reside in a community with a high percentage of immunization but whose own children have not been given the protective treatment.

The following communities as of January 1 1939 reported immunization percentages below the 35 mark: Elmira Jamestown Dunkirk Gloversville Rensselaer Hornell Oneida, Rockville Centre, Floral Park Oswego Watervliet Fulton Hempstead Glen Cove Lynbrook Valley Stream and Freeport.

Johnson City Middletown and Peekskill are tied for first place in the report with each place reporting 95 per cent. Second place honors go to Mamaroneck where 80 per cent was reported. Third place honors go to Hudson and Port Jervis each reporting percentages of 77, with Troy running a close fourth at 75 per cent.

TREATMENT OF TUMORS OF THE EYELIDS BY SURGERY

JOHN M. WHEELER, M.D.,[†] New York City

FORTUNATELY, relatively few lid tumors are prone to metastasize, so in general one may say that prompt local eradication with the best possible results is the thing that we are responsible for. In my opinion, radiation about the eyelids should be avoided. Disturbance of pigment, telangiectasis, and destruction of cilia are common from radiation, but especially important is the liability of cataract formation. After radiation, surgery may be called for anyway. Surgery offers the best means of getting rid

of tumors of the lids, but in most cases removal of tumors causes defects which should be corrected, so we should have schemes for operations that result in correction of the defects and good functional and esthetic results. The schemes called for may be made to apply to cases of lid tumor, no matter what their nature. They may be malignant or nonmalignant, pigmented or nonpigmented, radiosensitive or radioresistant. For me, surgery is the first choice.

Occasionally one meets with a tumor in an eyelid that does not involve the lid margin or the skin or the conjunctiva, and such a tumor may need only excision without subsequent plastic repair. Fig 1 shows such a tumor and it shows a good method of making it present itself for examination and for excision. In such a case the skin incision should be planned to fit in with the natural creases of the eyelid, and care should be taken to cause no mutilation of any of the tissues of the lid. For such cases, excision is preferable to treatment by radiation or by sclerosing solutions or any other compromising measures, and the surgeon has the satisfac-

FIG 1 Hemangioma of right lower eyelid not involving skin, conjunctiva, or lid margin. The growth is made to present by the introduction of a plate behind it into the lower cul-de-sac.

tion of an uninjured tumor specimen for laboratory examination

Some tumors are superficial and their excision is very simple, but their removal may cause distortion of one lid or both. Such a tumor is illustrated in Fig 2. It is a rather large hemangioma in an infant. In such a case the best means of eradication is excision with the placement of an upper lid graft. This method of handling the condition assures complete removal without subsequent deformity. Fig 3 shows the removal of the graft from the upper lid and Fig 4 illustrates the completion of the operation. A pressure dressing is required in order to insure a complete take of the graft and it is unsafe for the surgeon to apply a pressure dressing without being sure that the lid margins are in close apposition. A single suture or two sutures placed as shown in Fig 4 will hold the lid margins closely in apposition and assure complete protection to the cornea.

Epithelioma involving the skin at or near the margin of the lower lid is a rather common lesion and it should receive prompt excision after it is diagnosed. In many cases the excision can be performed before the entire thickness of the lid is invaded, so that the tarsus and the conjunctiva of the lid do not have to be disturbed. In such a case the eye lid can be split and flaps of skin with their cilia can be made to cover the area

FIG 3 Tumor near outer canthus in a child. Excision with graft from upper lid same side. Tumor has been excised, graft is being taken.

FIG 4 Tumor near outer canthus in child. Excision with graft from upper lid of same side. Graft has been placed. Wound in upper lid has been closed. A suture has been introduced through the margins of the lids to hold the palpebral fissure closed.

FIG 5 Epithelioma lower lid near margin, not involving the tarsus. Outline of incisions for removal of tumor and for splitting lid margin. Excision of tarsus not necessary.

FIG 6 Epithelioma of lower lid near margin, not involving tarsus. Skin flaps sewed in place.

FIG 7 Epithelioma involving the entire thickness of the eyelid. Excision and advancement of flap for reconstruction of lower eyelid.

of excision. Fig 5 illustrates such a case with a plan for the excisions and Fig 6 illustrates the completion of the operation. If the case is handled in this way there is no ectropion, and no disfigurement results.

For the patient's satisfaction it is really quite important that the line of eyelashes be uninterrupted and that there be no resultant deformity. For the safety of the eye it is important that there be no defect in the lid margin and that there be no ectropion.

If the tumor involves the deeper structures of the lid the entire thickness of part of the lid may have to be excised. In such a case, the plastic procedure necessary to furnish a good eyelid must be more or less extensive, depending upon the amount of eyelid removed. Fig 7 illustrates a scheme for correcting the

gap in a lower lid after excision of about the nasal half of its structure. Experience and skill are called for in the necessary dissection and repair. A thorough canthotomy should be made, and from the orbital margin backward and slightly upward an incision should be carried into the malar region and possibly into the temporal region. From the lower limit of the lid excision a second line of incision should be carried near the lower orbital margin and into the malar and possibly temporal region. The length of these incisions must vary according to the amount of advancement of the flap that is necessary to furnish lid substance, and no reliance should be placed on traction at the tip end of the flap. This should be thoroughly relaxed. As the two diverging incisions are carried back they should increase in depth, so that

FIG 8. Operation for shortening palpebral fissure and correcting a defect in the margin of the left upper eyelid. The completely denuded tongue at the outer end of the lower lid fits into a cleft in the upper lid.

FIG 9. Operation for shortening palpebral fissure and correcting a defect in the margin of the left upper eyelid. Shortening has been completed and graft from outer part of lower lid is being placed in position to correct defect in upper lid margin.

the flap will be not only wider toward the base, but thicker than it is at the apex. A careful halving of the end of the flap and the stump to which it is to be attached should be made. This halving will prevent subsequent deformity and it will provide secure union at the end of the transplanted flap. For proper advancement of the flap it may be absolutely necessary that the lower lid be thoroughly released from its attachment to the periosteum at or near the orbital margin. Such release is accomplished by thorough incision of the external canthal ligament below the canthotomy and of the tarso-orbital fascia below that. Success in sliding the flap is impossible unless the surgeon understands the necessity of accomplishing thorough detachment of the lower lid from the periosteum. When the surgeon cuts the canthal ligament and the tarso-orbital fascia, fat presents. Usually the presentation can be disregarded, but if it prolapses, excision of prolapsed fat may be necessary. It is thoroughly important that such a flap as described should have an epithelial lining, for any uncovered area will suffer subsequent contraction from new formed tissue that appears before the flap is completely covered with epithelium. Illustration B, in Fig. 7, shows an effective way of obtaining a complete conjunctival lining for the reconstructed lid. The

conjunctival epithelium is dissected from the fornix and from the surface of the globe, so that the surgeon borrows bulbar conjunctiva and makes it act as lid lining. It is important that the conjunctiva should be carefully closed with sutures, so that there will be no gap. Advancement of the flap is accomplished by working from the base toward the apex with sutures that are placed diagonally from the stationary flaps backward to the movable flap at its upper and lower borders. The traction on the flap in its basal part is considerable, and it causes puckering of skin above and below the movable flap. Thus, however, is only temporary. At the completion of the operation the outer part of the lid will have no cilia and the lid margin will be imperfect. The epithelial surfaces of conjunctiva and skin should be brought together with sutures.

Gradually, after the operation, the upper lid will be stretched through contraction of the flap, so the palpebral fissure will be too long. This increased length of the palpebral fissure and the defect in the outer part of the lid margin can be corrected later by an operation that shortens the fissure and involves the transplantation of a strip of cilia from the outer part of the upper lid to the outer part of the lower lid (Figs. 8 and 9). Such an operation gives a decided

gain in the appearance on the operated side. Rarely a tumor of the upper lid calls for a similar operative procedure. More rarely, the operation is called for both above and below.

Occasionally an epithelioma involves a large surface area without invasion of the conjunctiva. Such a tumor calls merely for excision and placement of a graft from one of the upper eyelids or from the retroauricular angle or both, but if the tumor involves all the structures of the entire lower lid, thorough excision of the whole lid is called for and the best reconstruc-

tion of the lid is by the method suggested by Hughes.*

Many variations of the schemes presented and other operations quite differently planned are called for to remedy defects following eradication of tumors of the lids by radiation and by excision. For good results it is absolutely necessary that the surgeon should be familiar with plastic surgery about the eyelids. This necessity exists no matter what means the surgeon may select to get rid of tumors.

IMPORTANT LABORATORY AIDS IN DIAGNOSIS AND TREATMENT

I. Cultures of the uterine discharge should be taken with a swab from the vagina, the most careful precautions against introducing microorganisms into the birth canal are essential.

II. Blood Cultures. Blood cultures should be incubated under anaerobic conditions, and also in an atmosphere containing about 10 per cent of CO₂. Since the bacteremia is often intermittent, it may be necessary to take more than one blood culture in order to demonstrate the invasion of the blood stream.

III. Urine Cultures. Cultures of clear specimens of urine may, even in the absence of a urinary tract infection, reveal the infecting agent when blood cultures, because of intermittence in the bacteremia, fail to do so.

IV. Blood grouping and compatibility tests of the bloods of patient and donor should be made if transfusion is indicated, as is frequently the case.

V. Blood Counts. Blood counts will reveal the severity of the anemia and the patient's leukocytic response to the infection. In patients with hemolytic streptococcus infections who receive sulfanilamide, blood counts will give warning of the occasional dangerous reactions to this drug—severe leukopenia or acute anemia.

Leaflet No. 11

EXPERTS SIDETRACKED FOR "OUR BOYS"

Many New York State communities still insist upon appointing 'one of our boys' as public health officials rather than to seek qualified men from other cities. Dr. George Bachr, chairman of technical advisory committee of the Committee on Neighborhood Health Development, said at a luncheon of the New York Tuberculosis and Health Association at the Pennsylvania Hotel. The luncheon followed the thirty-seventh annual meeting and conference on tuberculosis, held jointly by the association and the Tuberculosis Sanatorium Conference of Metropolitan New York.

"The public health field in many states and in most communities throughout the country," Dr. Bachr said, "is not yet in the hands of trained

experts who are appointed for reasons other than purely political ones. Here, even in the State of New York, where we pride ourselves as living in one of the most civilized parts of the country, as far as public health is concerned, there are only six county health departments in the upstate area manned by full-time, expert public health officers.

"We are still confronted with the fact that even in the State of New York our cities are unwilling to appoint trained experts if none are available in their own communities. They still insist upon appointing some one locally, 'one of our boys,' especially if 'one of our boys' is politically useful."

SOCIAL AND ASOCIAL ACCOMPANIMENTS OF INTENSE HORMONE MEDICATION

EDWARD LISS, M D , New York City

MATURATION is a complex process whether we use that term in one particular sphere of man's activities or another. The very yardstick that we utilize is in itself so variable that it adds further complexity. The term normal no matter how sharply it may be defined still includes many variables. It would seem somewhat more simple to be able to define a normal biologic picture than it would be to define a normal emotional pattern, yet we know it is any thing but simple.

Within recent years the developments in endocrinology have contributed to medicine an infinite number of valuable therapeutic procedures many of them still to be evaluated in terms of application. The literature is voluminous in investigations are multiple in number, and the pace of these findings is an accelerated one. We have become rightly sensitive to the consideration of human beings as psychobiologic entities, that these entities are different aspects of a whole, and that one cannot segment these components. They are closely interrelated and mutually influenced. And yet we see constantly in practice this knowledge unappreciated until the phenomenon of medication creates unsatisfactory situations in associated areas, although the immediate therapeutic focus responds successfully.

Human constitution is increasingly accepted as being not alone a biologic structure or architecture, but a framework upon which emotional patterns and human practices depend. If we are sensitive to the accompaniments of biologic changes when hormone therapy is instituted we must likewise realize that conduct, social practices, and intellectual processes are concomitant phenomena. And in the utilization of hormones our decision must necessarily be determined

by the potentialities in these allied fields. The literature implies this and utilizes this knowledge, but one would gather that these side effects are always of undoubted success. The unfavorable instances in these experiences are often overlooked because they are apt to fall into the realm of the psychopathologic. Within recent years and particularly within the last year, the literature has presented many instances of the successful application of male hormone in cases of biologic immaturity such as undescended testicle. The clinical result in children has been encouraging. The social implication of this therapy has received lesser notation—thus probably, for many reasons.

Over a period of three years of time we have had definite evidence of contrary emotional phenomena. This may be statistically within the normal expectancy of that age level (before puberty) that commonly comes for therapy because of variations from the expectant norm. This point is something that we cannot overemphasize. It is a responsibility that the therapist must be aware of when he undertakes intensive hormone administration.

When one is confronted with premature practices of an asocial nature in children who have undergone intensive hormone therapy one wonders (1) as to the timeliness of such a procedure (2) what precautions has medicine available at such a time to avoid these formidable and serious complications. Although our knowledge of the human psyche is comparatively limited, yet we have, through a merging of the findings of many fields of approach, certain practices that are utilizable for such crises. The organism accommodates its psychic patterns to physical variations either successfully or unsuccessfully.

In the first instance, biologic maturation, comparatively speaking, keeps pace with emotional growth. In the second instance, the psyche may overcompensate or undercompensate. Bizarre conduct practices are the resultants, with overcompensating precocious or regressive infantile manifestations. Modern science has expedited the utilization of hormones through subcutaneous medication, so that we see intense growth phenomena biologically within a comparatively short time. Can the human psyche keep pace with this accelerated physiologic maturation? This is a matter for careful deliberation. Our own feeling is that there are hazards and one must anticipate bizarre manifestations of conduct, if not of metabolism, with this intensive therapeutic technic. Clinically, we meet

through this intensive medication premature heterosexuality, homosexuality, and perverse infantile sexual practices. We meet with this frequently enough in a comparatively limited sphere of practice to warrant suggestions that this aspect is a hazard that must be evaluated in our decisions for intensive therapy. Should this be only a limited experience, not a fairly common accompanying phenomenon, still certain precautions must be instituted to make a definitely worthwhile clinical procedure safer to the individual and to society. Such precautions would necessarily imply a period of observation, during which period methods of re-education and guidance would be a definite accompaniment of intense hormone therapy.

"HELP FIND EARLY TUBERCULOSIS"

The 1939 "Early Diagnosis Campaign" for the purpose of reducing the tuberculosis death rate has been launched by the New York Tuberculosis and Health Association in cooperation with many other agencies throughout the country. Emphasizing the fact that 8 out of every 10 cases now being admitted to sanatoriums are advanced cases, the campaign is making a popular appeal for support with the slogan "Help Find Early Tuberculosis."

In promoting the campaign, which is of an educational nature, a twelve-page booklet entitled

"An Appeal to Leaders" has been prepared for free distribution. The booklet has an isotype chart showing gains made in the tuberculosis fight from 1925 to 1934, is illustrated with photographs of tuberculin testing, chest x-ray, etc.

Copies of the booklet as well as two new four page leaflets, "A Stitch in Time" and "A Heart to Heart Talk," are now ready for free distribution. Requests should be addressed to the Health Education Secretary in care of the New York Tuberculosis and Health Association, 386 Fourth Avenue, New York.

HE SAW THE STARS

"I don't want to go to bed yet, Mother. I want to stay out and look at the sky. It's so pretty!" Imagine the emotion of a mother on hearing these words from her little boy, who had never before in his life been able to see the stars! It is not often that The National Society for the Prevention of Blindness is able to trace the effects of its work so directly as in this case, reported by a teacher who had received instruction in eye hygiene for children from one of the society's staff members. Noting that one of her

kindergarten children stumbled about awkwardly and was poorly adjusted socially, she believed that his seeming dullness might be the result of poor vision. She urged his parents to have his eyes examined. They complied with her request, and the little boy was fitted with properly prescribed glasses. The teacher was well rewarded for her efforts when the overjoyed mother came to her the day after the child had started to wear glasses and told her of his pleasure in seeing the stars for the first time.

TYPHOID OSTEOMYELITIS AND CHONDRITIS

Presentation of Two Cases in the Same Family*

HENRY H. RITTER M.D., F.A.C.S. and S. JUDD BOCHNER, M.D., New York City

(From the Department of Traumatic Surgery and the Department of Surgery of the New York Post Graduate Medical School and Hospital, Columbia University)

THE apparent rarity of typhoid disease of bone and cartilage is due, at least in part, to the fact that many cases go unrecognized. The patients go along for months and years with a discharging wound, receiving intermittent treatment for chronic pyogenic osteomyelitis, and unbeknown to themselves or to the community, they harbor the typhoid bacillus.

The clinical manifestations of this disease are usually evident within the first year following typhoid fever, but as Winslow in a review of 101 cases points out, 20 per cent of these cases do not appear until "years later." Buschke reports a case in which the interval was forty five years. Garr reports a case in which the osteomyelitis appeared nine years after the typhoid fever, and in which there was a secondary recurrence of the osteomyelitis eighteen years later. Cultures should be taken with special reference to the typhoid paratyphoid group in all instances of chronic osteomyelitis, even though the patient may not remember ever having had typhoid fever. Only in this way can we hope to recognize and perhaps eradicate this relatively hidden endemic focus of typhoid fever.

We present 2 cases, one of osteomyelitis and chondritis of the ribs, and the other of osteomyelitis of the tibia, both due to the *Bacillus typhosus*. These cases are of particular interest because they occurred in a husband and wife who had typhoid fever at the same time, apparently from the same source, and both developed bone typhoid. Whether this be a coincidence or indication of a selec-

tive affinity of this particular species of *Bacillus typhosus* for bone is beyond the scope of this paper, but is of sufficient interest to be mentioned at this point.

Case 1—The husband, aged 43, a locomotive engineer, suffered a prolonged siege of proved typhoid fever lasting from January to May 1935. During the latter part of his illness he complained of some pain in the left chest. Some swelling and redness appeared over the left parasternal area, and in August 1935 an abscess was opened by his local doctor. Repeated recurrence of the abscess finally brought him to us at the Post-Graduate Hospital in December 1935. Cultures from the wound showed *Bacillus typhosus* and paratyphosus. Under special precautions the patient was operated upon on December 6, 1935. A chronic sinus was traced to the fifth costochondral juncture. The periosteum and perichondrium were thickened and both bone and cartilage were removed down to apparently healthy tissue on both rib and sternum. The wound was closed with a small drain. The postoperative course was uneventful and he was discharged on December 21, 1935. The wound healed by primary intention.

One week following discharge, the patient noted the recurrence of swelling and redness in the wound and in a few days a small abscess was opened. Cultures of the exudate showed *Bacillus typhosus*. Because of the extensive nature of the original operation a conservative routine of therapy was established rather similar to that used in tuberculosis. The local area was dressed under specific control to prevent secondary infection as well as to isolate this known focus of typhoid bacilli. It was not until the fall of 1936 that this sinus was finally obliterated.

Case 2—The wife, aged 44, developed typhoid fever in February 1935 while nursing her husband one month after the onset of his illness. She improved rapidly and was apparently well until March 1935 at which time she complained of persistent boring pain in the lower part of the left leg, most severe at night and when she rested. Palliative measures brought little relief. X-ray studies showed a well localized bone

*Cases presented at the Symposium on the Typhoid Carrier Problem at the New York Post-Graduate Medical School and Hospital, June 1936.

FIG 1 Roentgenographs of Case 2 showing the well-circumscribed chronic osteomyelitis with abscess due to *Bacillus typhosus*

abscess apparently of considerable duration. She was admitted to the Reconstruction Hospital Unit of the Post-Graduate Hospital, Service of Dr H. H. R., on November 25, 1935. There was a large tender swelling at about the junction of the middle and lower thirds of the tibial crest, measuring 4 inches in its long diameter. Operation, under special precautions, was performed on November 26, 1935. The gross pathology was that of chronic osteomyelitis with sequestrum. There was marked osteosclerosis and periosteal thickening. Osteotomy and saucerization were performed, and a vaseline gauze pack placed in the wound. The leg was immobilized in plaster. Cultures taken at the time of operation were positive for *Bacillus typhosus*. Blood Widal was negative. Cultures of the feces were negative. Examination of the tissue removed at operation showed a "nonspecific" chronic periosteitis and osteitis. Orr dressing and changes of plaster were repeated on January 2, March 1, and April 22, 1936. On the last date the wound was found to be closed and mobilization was allowed. The patient was able to go about her usual duties until June 1, 1936, at which time she again noted pain in the area of the wound, and on the following day a small bleb appeared. Seropurulent material drained from a sinus at this point for six months, until closure finally took place under a routine similar to that followed for the husband.

The decidedly chronic character of the disease, together with the history of having had typhoid fever, should in themselves lead to the possible diagnosis of typhoid osteomyelitis. A positive Widal and culture of *Bacillus typhosus* from the exudate will establish the di-

agnosis and, what is perhaps more important, the patient must then be recognized as a typhoid carrier.

The urine and stool cultures usually taken as criteria for the diagnosis of the carrier state of typhoid fever are negative in these people. A positive Wassermann reaction may further confuse the picture, particularly in view of the indurated character of the soft-tissue reaction. The omission of proper cultures for the typhoid-paratyphoid group of organisms in these cases must be considered as a grave error.

Radical block excision of the entire disease-bearing area is essential to the treatment of typhoid osteomyelitis and chondritis. Unfortunately, this is not always feasible because of the association of vital structures and because the limits of the tissues harboring the organisms are often indefinable. The sunshine, food, and rest treatment of tuberculosis is prolonged and costly, but where further surgery is inadvisable it is a logical and an excellent form of therapy. Vaccine therapy, as used by Garr and Gannon, and bacteriophage given into the wound as well as subcutaneously and intravenously, as described by MacNeal, are helpful adjuncts to the principal therapy which is surgery.

Summary

Two cases of osteomyelitis and chondritis due to *Bacillus typhosus* following typhoid fever have been presented. Both cases had been operated upon by radical procedures, and both had recurred, to close many months later under the rest, food, and sunshine therapy.

These patients are typhoid carriers and must be treated medically and socially as carriers.

The importance of searching for the *Bacillus typhosus*-paratyphosus groups in all chronic osteomyelitis cases is stressed as the only means of locating and limiting this occasional source of typhoid fever.

ALCOHOL AND THE LIVER

Alcohol and the habits induced from drinking large amounts of it are the most important factors in the production of fatty liver sometimes the forerunners to yellow atrophy of the liver (cirrhosis) Charles L. Connor M.D. San Francisco points out in the *J.A.M.A.* for February 4

He states that a careful review of 130 histories of cases in which cirrhosis or fatty liver or both were found revealed that the factor next in importance to alcohol is the abnormal diet which invariably accompanies severe chronic alcoholism. One can further reduce this to a specific lack of sufficient carbohydrate in the diet.

Fatty livers occur in many diseases and are incidental to poisoning by such substances as phosphorus, chloroform carbon tetrachloride and alcohol. The most common disease in man with which fatty livers are associated is diabetes due to the lack of proper sugar metabolism and the incomplete oxidation of fat.

Alcohol interferes with carbohydrate metabolism and fat oxidation and because of the poisonous action of alcohol on cells and tissues and because of starvation or lack of carbohydrate in the diet sugar is withheld from the metabolic cycle. It seems evident then that when two factors are operating—alcohol and starvation or alcohol plus a protein fat diet all of which lower the respiratory mechanism of the tissues of the body—the liver will accumulate unoxidizable fat and liver cells will be deprived of oxygen and nutrition. The liver becomes an unnatural storehouse of fat so far as oxygen carbon dioxide exchange is concerned. There is then a complete depletion of sugar (carbohydrate) from the liver the absence of which renders it more susceptible to all poisons.

By alcoholic poisoning and severe chronic alcoholism Dr. Connor explains he means the constant consumption of sufficient alcohol in any form to alter materially the normal carbohydrate fat metabolism or the consumption of large amounts so frequently that normal metabolism is not re-established in the intervals.

To comprehend this, he states the ordinary

drinker must discard his somewhat naive and amateurish conception of what constitutes a heavy drinker. One is astounded to learn that a two bottle man means a 2 quart bottle man and not two pints a day and that men and now very frequently women may consume a gallon or more of sherry wine (from 20 to 22 per cent alcohol) in twenty-four hours and one must keep in mind that most alcohol addicts like morphine addicts, become pathologic liars when questioned in routine history taking. They have acquired some degree of tolerance. This tolerance is broken through when the liver becomes filled with fat and the time comes when very small amounts of alcohol may cause a degree of lasting intoxication. This is so in experimental animals after a time smaller and smaller amounts of alcohol are needed to keep them in a constant state of semicoma.

Three phases of disease of the liver produced by alcohol are discussed by the author.

1. The acute fatty liver of alcoholism develops after prolonged drinking of large amounts of alcohol during which little or no food is taken or the food consists of protein and fat only. It is found in men picked up by the police who die shortly afterward. It is most common in the coroner's morgues in all large cities.

2. The fatty liver in which there is early but definite and progressing fiber like degeneration around the lobules of the liver is the product of alcoholism which is less in degree than that causing the first phase but which is nevertheless severe. In the liver which survives drastic alcohol poisoning and partial starvation diets a fiber like network of tissue will develop in the course of time.

3. The liver in the third phase is likely to be somewhat reduced in size and to have a nodular surface and a thickened covering. Fat may or may not be present. The condition follows the long-continued use of excessive amounts of alcohol by persons who have continued to eat a better diet but whose intake of alcohol and food has been abnormal.

THE LAUGHLEN TEST FOR SYPHILIS

SUMNER PRICE, M D, New York City

(Clinical Professor of Pathology, New York Polyclinic Medical School and Hospital)

THE aim of this article is not to present an argument for supplanting the Wassermann test by the Laughlen test, nor is this an attempt to discredit the Wassermann test. The aim is chiefly to show that the Laughlen test for syphilis compares favorably with other well-known standard tests. However, that in itself would be insufficient were it not for the fact that the Laughlen test is simple in technic, rapid, and suitable for certain purposes clinically where other tests requiring complicated technic might be impractical.

The Laughlen reagent is prepared by a modification of the standard Kahn antigen. It is in reality a suspension of meat particles in water and alcohol, to which has been added balsam, cholesterol, benzoin, and a fat stain. For those interested in the method of preparation of the Laughlen reagent, they are referred to Laughlen's original article.¹ Those interested in studying the various tests included in this article, in patients under treatment, are referred to my previous article.² (None of those 257 tests are included in this series.) Let it be sufficient, in defense of that article, to say here that in view of a positive history—in a generalization—I see no difference between a 2+ test and a 4+ test in so far as clinical interpretation is concerned, and no such distinction is made in this article. Neither do I consider the lack of positiveness of any single test, nor of multiple or repeated tests to be necessarily a true guide as to the sufficiency or efficiency of the treatment. Those points were not previously made clear. I am concerned only with the behavior of the tests.

In this series of 1,496 cases where Wassermann (Kolmer modification), Kahn, and Laughlen were done on each

serum, there were 60 cases that showed anticomplementary Wassermann and in which both Kahn and Laughlen were completed with satisfactory readings. In 1,319 there was complete agreement, however, in 904 of these there is no definite history known to me as to how many may never have had syphilis. Probably the majority of these were always syphilis free, and therefore the tests really contribute little to the series in the way of information regarding the respective value of the tests. The tests were positive in 109 cases, of which 30 are known to be untreated cases but are left in the group of unknown positives. In 97 there was a variable degree of disagreement, and it is to this series that the attention is drawn.

The tables (opposite page) throw a little light on the relative value of the Wassermann, Kahn, and Laughlen tests. The Kahn and Laughlen agree more closely because the Laughlen reagent is prepared through a modification of the Kahn antigen.

The Kahn and Laughlen, in my experience, definitely seem better than the Wassermann in "picking up" a treated case of syphilis, and for that reason is particularly recommended as a means of determining the presence or absence of syphilis in a prospective blood donor. It seems that most doctors agree, in spite of an occasional contrary article, that it is advisable to discard any treated, as well as any untreated, case of syphilis for blood donation. The Laughlen, although not infallible, is far superior to the Wassermann for such a purpose.

The Kahn and Laughlen are less subject to fluctuations under treatment since they usually remain positive in a low degree for a variable but quite long period after the Wassermann has become

TABLE 1

| | History of Treatment Unknown | Treated Cases | Totals |

| Wassermann and Laughlin disagree (total 87) | | | |
| Wassermann POSITIVE, Laughlin NEGATIVE | 4 | 8 | 12 |
| Wassermann NEGATIVE, Laughlin POSITIVE | 13 | 63 | 75 |

negative. The so-called Wassermann fast case is an exception. In case the fluctuations of the Wassermann have been forgotten one must remember the reason for the periodic check at six month intervals over a period of years after the test has once become negative.

The Laughlin is also recommended for use on babies, or wherever the amount of serum available is small—one large drop of serum is all that is required. In preoperative cases, where a differential diagnosis may be important, the Laughlin is very useful.

Other factors that favor the wider use of the Laughlin in the small laboratory and that make the Laughlin superior to other rapid methods not mentioned, are

- 1 The technic is simple.
- 2 Sterility is not essential
- 3 The test is not subject to interference by a slight degree of hemolysis except in rare instances
- 4 The reagent is preferably kept at room temperature.

5 Except for evaporation, the test is not subject to interference by normal variations in atmospheric temperatures (The Wassermann is notoriously troublesome in hot weather, particularly the complement.)

6 The reagent is stable and available at a moment's notice if prepared each week

7 The test is economical

8 No special equipment is required

Technic

The technic of the test consists of placing an equal quantity of serum and reagent on a slide and mixing thoroughly. It is immaterial whether a large platinum loop or a pipette is used to measure the drop so long as the amounts are about equal. The only requirements are slides must be clean and free of acids or other chemicals, there must be thorough mixing of the reagent and serum, the mixture must be in sufficient quantity to avoid drying before a ten minute period

has elapsed After ten minutes if there is no macroscopic clumping of the stained particles the test is read as negative

Always run a negative control When the reagent becomes old it becomes too sensitive, so that eventually all sera will react If fresh reagent is prepared each week from the stock (which keeps six to eight weeks) and negative controls are run, no difficulties in interpretation should be encountered The agglutination must always be macroscopic Readings made through the microscope will lead to errors in interpretation

Interpretation of the Test

After the serum and reagent have been mixed, gentle agitation is maintained for ten minutes, or until the samples are proved positive or negative Agitation need not be continuous, but should be repeated at intervals during the ten minutes (A large series may be carried out by using larger slides and more tests on one slide) The test is frequently read in degrees, such as 1, 2, 3, or 4+ The plan for such a reading is as follows: those reacting within two minutes, as 4+, those within four minutes, as 3+, those within six minutes, as 2+, those within eight minutes, as 1+, and those showing no reaction in ten minutes, as negative

The size of the clumps is not a guide as to the positiveness of the test

The time element, i.e., the time required for agglutination to become visible is the guide for the reading

A positive result is shown as a "brick dust" scattered through a clear fluid, with a tendency for the clumps to gather at the periphery of the drop of fluid as the clumps grow larger A negative result shows a slightly cloudy pink, or reddish, suspension of finely granular particles Readings are best made with the slide held above a dark background

The dye used that imparts the color to the suspension is Scharlach R, a fat stain, which is taken up by the finely suspended cholesterized meat particles When agglutination takes place the

color is therefore thrown out of suspension, yielding a brick dust in a clear fluid

I wish to acknowledge the assistance of my technician, Mrs Katherine Smith Howey, in helping me with this work

Appendix

Since this article was written, I have attended a conference at the office of Dr Charles R Rein, where Dr Mahoney of the United States Public Health Service, Dr A F Coca, and a representative of the Lederle Company were in attendance At that time it was recommended that the Laughlen reagent be withdrawn from general use Certain criticisms of the Laughlen test were advanced with which I am in sympathy

1 "The Laughlen should not be recommended for use with spinal fluids

2 "The fact that the test is economical should have no consideration in estimating the value of the test

3 "The test should only be recommended for use with inactivated serum for the best results" Inactivation may be carried out by heating the serum to be tested at 56 C for a half-hour, or 63 C for three minutes (Rein)

4 "The reagent should not be recommended for use by the general practitioner" The test is yet in a trial period, and should be confined to use in the larger hospitals and in the hands of a trained technician

5 "The technic should be better standardized with a more accurate measurement of the size of the drops of serum and reagent The material should be spread over a standardized area limited by paraffin rings" Such a procedure would undoubtedly lead to more uniform results at large Yet, in my hands, with the "crude" technic recommended by Laughlen, the test has worked with remarkable efficiency However, the platinum loop and the pipettes used have remained constant throughout and this

constancy might account for the satisfactory results

It is my belief that criticisms 1, 3, and 5 have been advocated for some time, and will be found in a supplementary note found in each package of reagent marketed

There were some other criticisms of the test with which I am not in entire agreement. These points of difference are

1 The test makes no allowance for doubtful readings

After all, it is not the reading but the interpretation, in view of the clinical history, that determines the doubtfulness of weakly positive reactions in any test. The point that the general practitioner would be unable to interpret the weakly positive reactions correctly seems more of a criticism of the general practitioner than of the test.

2 The fat stain added is useless and its addition is an attempt to make the product spectacular. In addition, it adds extraneous material that will increase the false positives. There is an element of biased personal opinion in such a criticism. The advantages of the dye seem to outweigh the disadvantages of its presence. The dye does not add anything to the specificity, but it does enhance the ease with which the test is read

3 The test will experience an undue number of false positives due to the presence of tuberculosis, malaria, or leprosy, in the patient.

That is a prediction, and not a proved point. In that respect, however, it does seem a valid criticism to withhold the general distribution of the reagent until further observation has been made. Even if this should be found true, such an objection would not contraindicate the use of the Laughlin for testing blood donors.

4 The test is tricky

The technic of the Laughlin is simple, but it is exacting. To say that the test is tricky is an exaggeration. A little experience can eliminate any claimed trickiness in the hands of a competent techni-

cian. The fact that too many poorly trained technicians exist should not condemn the test for the purposes for which it is recommended. The test is no more exacting, and no more tricky than the procedure of blood typing. Yet, I have heard no cry that blood typing should be "dispensed with" because it is tricky, nor is there any agitation that blood typing should not be generally used.

There seems to be an undue amount of alarm as the result of the granularity of the reagent as it becomes older, and because the reagent is crudely prepared. There is a fear that this granularity may be read as positiveness, and, therefore, in the wake of present agitation about syphilis many syphilis free patients will be treated unnecessarily.

The test is not recommended at the present time as a guide for treatment, and never should be so regarded, although in a study of the reagent it is necessary to observe how the reagent behaves in in the sera of treated cases. Cautions have already been given as to the granularity of the reagent, true agglutination must take place, there must be an actual throwing out of suspension of the colored particles. A negative control must always be done. Granularity does not constitute a positive reading. The test must not be read through the microscope. The time element is the factor for the reading.

I do not agree with the argument that there is no place, and no need for such a test as the Laughlin. The individual should determine the need. The need of the person supervising blood transfusion is far different from the one treating syphilis, and from the one supervising a routine diagnostic laboratory.

Finally, I should like to say that I have no personal interest in the commercialization of this product. During the first year the reagent was furnished to me without cost, but during the past year all reagent used has been purchased willingly through the regular channels. My experience with the test indicates that the Laughlin reagent warrants further investigation and use.

CONSTITUTION AND SITUATIONS

IRA S WILE, M D, New York City

IF HEREDITY is an essential factor in physical and psychic diseases, social effort can be effective in its control by selective matings, incarceration, sterilization, mandatory contraception, subsidized birth release, or even, for some cases, by a socially therapeutic abortion. Admitting the possible inheritable element, the gene responsible for the transmission of the defect, whether it be a dominant or recessive trait, must function in terms of the total organism. The definite control of genes depends upon factors of positive or negative eugenic control effective on mating to a degree far beyond our present skills. There is need for larger knowledge concerning the direct and indirect approach to environmental factors held to be dysgenic. It is evident that some persons reveal weak nervous systems as well as other physical inadequacies, but both are subject to external conditioning factors.

There are numerous assumptions that physical bases underlie psychic organization. These involve the principle that bodily structure is responsible not merely for cerebral functioning but also enters into personality organization to an extent sufficient to establish types. Thus Kretschmer¹ sets forth the linear, asthenic and athletic types with schizophrenic trends and the lateral pyknic group with cyclothymic tendencies. This bears considerable likeness to Jung's² differentiation of the inheriting extroverts and introverts advancing or retreating in terms of an inborn libido that determines their mode of adaptation to life. Bleuler's³ classification of syntonie and schizoid follows the same thought of basic structure, which is more fully urged by Adler⁴ in his entire concept of an organic constitutional inferiority as responsible for all human behavior, especially in its abnormal phases. In his language "Inferior organs and neurotic phenomena are

symbols of formative forces which strive to realize a self-constructed life plan by means of intense efforts and expedients."

From organs in general to endocrines in particular is but a small shrinkage, hence ductless gland structure and function have received considerable attention as possible causes of many vagaries of the human mind. In one form or another personality reactions have been attributed to physical conditions in health and disease, in direct inheritance, and in predisposition. That there are vague relationships is admitted, though their how and why are uncertain. Henderson,⁵ for example, states that if one parent has Huntington's chorea, 50 per cent of his children will be thus afflicted, while if the parent is a manic-depressive, 33 $\frac{1}{3}$ per cent of the children will be victims of the condition. In the presence of parental schizophrenia and epilepsy, mental abnormalities may be expected among 50 per cent of the children, while among hysterics 48 to 61 per cent of the children will have mental and nervous anomalies.

Are mental disorders directly transmitted? Meyerson, reporting on 22,300 admissions to the Taunton State Hospital, found that 10 per cent were related but that only 23 belonged to a family represented through three generations. It is very necessary to distinguish individual peculiarities from distinct familial failings. Subjection of similar persons to similar conditions may conduce to similar states without any semblance of direct biologic inheritance. The life histories of repeated generations of man will reveal greater vertical and horizontal distributions of measles and tuberculosis than of mental diseases. Not so many decades ago it was urged that tuberculosis was a hereditarily disseminated disease, but such a claim is no longer tenable.

The facts support Meyerson's statement* "There is therefore some ground to suspect that environmental conditions, social status and disease play a role in bringing about such variable conditions and that while the matter may be constitutional it is not heredity but individuality which must be considered."

"The marked variability in the age of onset of these mental diseases, the phenomena of anticipation and antedating thus point also to the conclusion that we are dealing with disease rather than the kind of heredity involved in the main biological factors." Emphasizing blastophoria, he indicates many physical and psychic effects of the reaction of the germ plasma to alcohol, thyroid feeding, heat, x rays, etc. There is a strong implication that heredity in mental disease is more a question of the transmission of a psychopathic constitution or a predisposition to responses termed psychotic. It is urged that the urban life is a tremendous force in causing a lessening of nervous stability.

Havelock Ellis† asserts that the level of physical and nervous stability is less in urban England than in the rural areas and that cities are racially dysgenic. No one would deny that the mode of life affects general physical welfare. The linkage of goiter and water supply, dietetic deficiency and pellagra, narcotics and crime, and prostitution and syphilis tells a tale of mystery if not tragedy. The mental hygiene aspects of economics are no more important than the economic phases of mental hygiene. The industrial revolution and the building of cities were as influential upon human activity and mental function as the occurrence of the plagues, white and black, or the French Revolution. Whether environmental pressures are blastophoric or structural, whether or not predispositions occur, the transmission of mental states is exceedingly difficult to control. Certainly the most favorable leverage for reasonable control lies primarily in the alteration of the dysgenic elements in the environment. There are ample indica-

tions that environmental factors are more significant than constitutional. The Great War and its resultant breakdowns, the neurotics, the "shell shocked," psychotic, and maladjusted testify to external pressures far beyond constitutional resistance.

Neuropsychiatric disorders during the World War had a higher incidence among American officers than among the enlisted soldiers and the rate was higher among officers serving abroad than among those remaining on this side of the Atlantic. The incidence among troops abroad was less because of the exclusions from service that had been established before the time of embarkation. The total incidence of neuropsychiatric disorders³ among the home forces was 69,394, classified as 11.4 per cent psychoses, 16.5 per cent psychoneuroses, 10 per cent nervous diseases and injuries, 2.9 per cent drug addiction, and 2.7 per cent alcoholism. The environmental pressures are reflected in the fact that 21.7 per cent of the urban and 16.9 per cent of the rural potential soldiers were rejected. There was a slightly higher rate of neuropsychiatric cases among the whites living in urban areas—5.6 per cent as against 4.6 per cent in rural groups, although 4.9 per cent of the whites lived in the rural areas. Of the 7,354 white psychotics, 4,228 were from an urban and 2,759 from a rural setting. Of the colored group, 73 per cent were from rural areas but the neuropsychiatric group contained 36 per cent urban and 64 per cent rural origins. There were, among the 556 colored psychotics 216 from urban and 323 from rural areas. Certainly such data do not imply the dominance of hereditary factors.

In support of the marked influences of environment are the figures for army discharges because of *nervous disease and injury*, of which one-third were due to syphilis of the central nervous system. Of the total 6,116 whites, 3,703 were definitely recorded as urban and 2,127 rural dwellers, of the 800 colored, 406 were urban and 385 rural. The differ-

cnce between urban and rural effects is sharply manifest

Assuming the weighted values of heredity and environment as fifty fifty, it is apparent that a social attack on the latter promises potential achievements, even affecting the biologic transmission of structural inadequacy to meet life. If the environment possesses even moderately blastophoric influences upon hereditary tissue, structure, and function, then the improvement of social conditions and the modification of an oppressive environment will tend to protect, if not advance, the heredity of stable stock—and thus is most important, as most pathologic trends and states appear to be recessive. Beyond doubt a social program could exert a strong protective influence against the deterioration of vigorous stable stock and even raise the potentials of relatively poor stocks if it took more cognizance of the value of lessening the hazards of doubtful intermarriages, whether consanguineous or alike in disease. Shuttleworth⁹ expresses the idea clearly: "The problem is no longer the relative potency and determining influence of heredity and environment, instead it is a problem of determining whether the differences in heredity existing in a given population are large or small relative to the range of the existing differences in the environment which are operating on that population."

The psychogenic point of view of Freud, emphasizing the significance of emotional conflicts, especially the psychosexual factors in the unconscious, makes too little allowance for physical responses to wholly conscious efforts and experiences. It does not suffice as a basis for practical constructive efforts to limit the development of diseases whose etiology is unknown but which cannot therefore be attributed to repressed desires and emotional conflicts. If the world were full of psychoanalysts of all schools, their prophylactic value would be limited because of their dogmatic disregard of the essentially environmental factors that inhere in every specific situation affecting personalities. Psychoanalysis, per se, is not

able to cure a large variety of mental disorders and thus has not been demonstrated to be an effective prophylactic for illnesses at present regarded as psychogenetic.

The personal psychic approach could make little advance against the twin evils of alcohol and syphilis, as manifested in nervous and mental disorders. The attack upon mental disorders calls for a broad foundation for understanding their origin and nature. In the language of Henderson and Gillespie,¹⁰ a mental disorder is "the sum of many conditions, and the end result of a large chain of processes. The earliest of these may have begun in the unfertilized germ plasma—another may have operated *in utero*, and the rest may be reactions of an organism thus handicapped to the aids and obstacles which it subsequently meets in the environment in which it finds itself—the influence of parents and teachers, the difficulties in the path of ambition, and the ease as well as the hardness of innumerable situations of life."

Obviously the approach to the prevention of mental diseases and the postponement of death cannot be merely psychiatric, psychologic, or purely biologic but must be medical, sociologic, and cultural in order to search for and utilize all eugenic and eutheic factors favorable to the development of the maximum number of balanced personalities. This is the essence of applied mental hygiene. Perhaps the heredity-environment status is best summarized in the statement of the British Committee on Mental Deficiency¹¹: "Heredity furnishes the material, environment shapes and uses it, heredity is the mechanism, environment, the stimulus which sets in action, heredity fixes the possibilities of development, environment determines which of these possibilities shall, and how far they shall, become realities."

Further development of this concept is found in the conclusion of Schwesinger¹²: "Personality is dynamic, not static, it is never the same twice, either for two individuals at the same time or for one individual at different times. For that

reason one hesitates to call it a structure." It is this dynamic conception that dominates a dispassionate consideration of living in and through situational stimuli. The prevention of mental diseases involves mass activity, while their cure calls for individual attention. The reason is implicit in Jennings¹² sound comment. The same kinds of differences between individuals can be produced by diversity of genes and by diversity of environment. There are few if any types of mental diversity that can be asserted on *a priori* grounds to be certainly genetic or certainly environmental. To determine to which category a given diversity belongs requires a knowledge of the pertinent concrete factors for the particular case examined."

The genetic differences are difficult to ascertain and the control of genes depends upon sterilization or completely certain contraceptive practices and upon legislative control of mating, but even such procedures depend upon social sanction and social control. There are larger groups of individuals whose genetic potentials are more or less unknown or doubtful but who are subjected to common environmental settings, practices, and pressures that are more susceptible to analysis, study, and eventual modification through rational constructive action. In the final interpretation, there is no fine line differentiating heredity and environment and both are subject to humanly directed forces for the amelioration or prevention of their regressive and dysgenic tendencies.

Social control has manifested real value through its somewhat effective attack upon ophthalmia neonatorum and rickets, as well as its efforts to detect and assist the poor sighted and hard-of-hearing children. Attempts to lessen these and other states, and all campaigns with a similar purpose, are of definite concern to mental hygienists as well as to those serving the blind or the deaf. Mental hygiene also can be valuable for the group nondeficient mentally and nonhandicapped physically. The psychologic

effects of bodily diseases, disorders, and disabilities may be profound, affecting outlook, temperament, attitudes, and behavior. Phantasy life, inferiority feelings, a sense of inadequacy, frustration, resentment, or hostility may gradually permeate an individual's conscious life and become the foundation for neurotic escapes, antisocial behaviors, egocentric negativism, hysteric fears, paranoid suspicions, hypomanic self assertiveness, or a self withdrawing schizophrenic trend. Hence, every movement to reduce the accidents and illnesses of children lessens their premature exposure to needless pains and frustrations and influences the incidence of mental distress and potential mental diseases. A consistent pursuit of this goal will postpone some deaths from actual diseases and others from lethal sequelae like meningitis and brain abscess, and in addition it will lessen the deteriorations following encephalitis, hemorrhages, and many secondary conditions, thus further postponing death. Whatever lowers the vitality standard, whether originating at the somatic or at the psychic level, is a threat to the race as well as to personal welfare, and concerns the mental hygienist.

All human behavior involves a constitutional and a situational factor and often the constitutional factor may be the intrinsic factor of the situation—as, for example, a facial blemish of an adolescent, the sense of inadequacy of a congenital cripple, or a palpitating fear developed by an unbalanced endocrine experience. Situational factors may involve personal factors of fundamental social importance. They often depend, however, upon social conditions with broad communal bases which can be attacked only by social efforts after deep understanding such as housing, low wages, exposure to toxic gases, prostitution and hazards of the street or of the factory.

William A. White¹⁴ holds the idea that the cultural standards of civilization create forces that make psychotic developments in individual cases but it is as true that they create opportunities for

personal development far ahead of anything which one finds in the culture of savages" The theorem of Le Chatelier is held to be fundamental, i e, "a system tends to change so as to minimize an external disturbance" Society unfortunately is man's greatest external disturbance and hence is faced with the need to change its own system in self-protection

No one would deny that "mental disease always has social significance and the social maladjustments to which it leads constitute types of reaction that are also manifest in accordance with the same laws at the other levels of functioning In other words the same laws hold for the manifestations of reactions at the social, the psychic, and the somatic levels" There is ample support for the thesis that "mental disease is a disorder of man as a social animal"

The urban-rural factor offers at least another piece of evidence regarding social pressures in terms of mortality rates Disregarding all possible discussions concerning differences in the hereditary make-up of urban and rural populations, it is not unfair to compare mortality rates as the revelation of comparative adaptations to life Assuredly hereditary elements are not responsible for the marked differences presented with the following table¹⁵

URBAN VS RURAL MORTALITY—WHITE U S, EXCLUDING TEXAS

| (Death Rates per 100,000 Population) | | |
|--|-------|-------|
| Diseases | Urban | Rural |
| Cancer and malignant tumors | 123 5 | 80 3 |
| Syphilis | 7 1 | 3 6 |
| Diabetes mellitus | 24 1 | 15 4 |
| Diseases of heart | 241 5 | 184 5 |
| Appendicitis | 21 0 | 8 8 |
| Hernia intestinal obstruction | 13 4 | 6 5 |
| Cirrhosis of liver | 9 4 | 5 2 |
| Nephritis | 92 4 | 78 0 |
| Congenital malformations and diseases of early infancy | 63 8 | 54 7 |
| Auto accidents, primary | 20 0 | 20 7 |

Why are the mortality rates of the italicized diseases higher in urban than in rural areas, if hospitals, dispensaries, registration regulations with follow-up, are helpful, if insulin is more available, and if prenatal care is more general?

The mortality of urban areas is 31 per cent in excess of the rural The reasons for this are numerous beyond enumeration but it is apparent that the total picture of urban death rates suggests the operation of struggle, strife, and suffering beyond the rural experience It is striking that urban life manifests the potential death values implied in the table, in contrast to the admitted low special figures for the rural population This is in harmony with the general low mortality rates for agricultural workers

These facts hint at varying effects of the conditions of living in the urban and rural areas as possibly being more significant than the differences in age and sex distribution of their populations, etc. One recognizes that the data may reflect differences in diagnostic skills and diagnoses and may mirror some differential distribution of a cause of death which now may be called cancer and now senility, etc Thus, however, does not account for the generally higher death rate in cities from diseases that receive there greater sanitary and public-health service, even in the poorly developed urban sections of the United States

The urban-rural mortality variations are in harmony with the types of mental disease in the urban and rural populations already noted The rates of cerebral arteriosclerosis, paresis, and alcoholic psychoses, as well as of manic-depressive and depressive attacks, are higher among the urban first admissions, while senile, involutional psychoses, and mental deficiency are higher in the rural areas, according to William A White Mere density of population affects the relationships of human beings and profoundly penetrates their lives, thinking, feelings, and actions Social density enters into personal problems and conduces to mental disorders, especially those less severe in expression than the psychoses The same urban-rural problems enter into physical and psychic interactions that affect human capability and equilibrium The lack of immunity of rural soldiers to measles and mumps is far greater than their susceptibility to mental diseases, and both

facts suggest the relatively low exposure to germs, viruses, and deteriorative toxic emanations from dense overcrowding and social frictions. The social problems of urban living demand new evaluations in the light of human maladaptations, the development of psychic difficulties, the postponement of mortality, and the maintenance of sound sane capacities for living.

Mental disease, as frank psychoses probably is not increasing even in terms of first admissions. Neither dementia praecox nor manic-depressive psychosis show a marked increase. Man's ancient complexities in a slowly developing civilization call for better mental adjustment but his young bipedal visceral organization is often less successful in adaptation and his organic responses may reveal the brunt of the impact, even though in the form of irregular dysfunction. We have inadequate figures on severe mental disorders and even less satisfactory data concerning the neurotic delinquent and the maladjusted personality. Maladaptation is not measurable in qualitative values of life and it cannot be judged from any quantitative data that has been developed, as the concept of abnormal behavior has been widened even while being mathematically evaluated.

From an analysis of recent trends in first admissions in New York, Massachusetts, South Dakota, New Hampshire, Rhode Island, and Illinois, there is no evident general tendency toward an increase of the mentally diseased. Rather, admissions for mental disease seem to suggest the possibility of a slightly decreasing rate in the near future. This is reasonable in the light of the increase of hospitalization due to education, the provision of more and better institutions, the lightening of economic pressures, etc., which caused rapid rises of admissions. This will lead to a natural relatively decreased number of availables unless there is an actual marked increase of the mentally diseased.

The data for Australia, Sweden, England, Wales, and Scotland substantiate the contention that mental disease is not increasing.

An analysis of the trends of specific psychoses in New York State—senile, general paralysis, manic-depressive psychosis, and dementia praecox—indicates that first admissions for these mental ills are decreasing. First admissions with cerebral arteriosclerosis and alcoholic psychosis are increasing, probably in some relation to the increase of old age in the population.

The trend for paresis is downward for each sex. The rate of male first admissions for dementia praecox is practically stationary, while the rate for females is declining slowly.

More care of a mental hygienic nature would be protective of mental health but obviously the prepsychotic group must receive the paramount attention. Any healthy nervous system may break down, depending upon the volume and intensity of the stimuli that are required to shatter its normal balance. Physical states may predispose or cause mental distress, and mental stresses may lessen vitality to resist certain types of organic involvement. Resistance values vary under conditions of time, place, and circumstances, i.e., at adolescence or the menopause, in the presence of the familiar or the unfamiliar, under the stress of a loss of status or pride, under the attrition of a sense of inferiority, guilt, or unbearable responsibility.

Social factors are receiving recognition in the attention given to alcohol, syphilis, and social pressure. The factor of natural selection is less operative than ever and many survive who are not fit to meet the strains of life. Their physical responses reveal their psychic struggles to adapt, and equally their psychic responses bespeak their physical maladaptations. Heredity and environment, constitution and situation focus in man and affect all men, but the social man and the society of men involve strains that may break man or even society. The social neuroses and the social psychoses are also dependent upon constitution and situation which in turn may bring about social deteriorations as significant to future generations as are neuroses and psychoses.

to the families of the present victims of mental disease. This threat appears more violent, if there be continuing truth in the prognostic allegation that one out of every five persons in our population is destined at some time to spend time, money, and effort to recover from a mental disorder. Social control has its task of mental hygiene.

INFECTION IN THE HOME

With its leaflet on "Health Examination of Adults" the American Academy of Pediatrics attacks a common source of childhood infection. Children frequently contract such serious diseases as tuberculosis and syphilis and a host of lesser ills from adults in the household who are themselves unaware of their condition. Periodic examination of adults in intimate contact with children would disclose many diseases in time to prevent their spread.

Tuberculosis, one of the most serious of the contact diseases, is one of the easiest to detect

X-ray reveals tuberculous lesions in the lung before the infectious stage of the disease is reached. Syphilis, sinusitis, and certain skin diseases are other infectious conditions which can be brought to light by periodic examination.

The adults from whom a child is most likely to acquire a contact disease are parents, grandparents, uncles, aunts, and servants. Early discovery and treatment of unsuspected diseases would benefit them and at the same time protect the child members of their households from injury.

HOW TO BLOW YOUR NOSE

It may seem a sad commentary on our boasted civilization that after the cons of man's upward climb we have to write to the *Journal of the A M A* to ask how to blow our nose. Yet the following appears in its highly respected and always helpful correspondence pages:

"To the Editor—What is the correct way to blow the nose? What difference does it make whether first one nostril and then the other is emptied, or the two together, so long as pressure is not exerted by forcible blowing?

ANSWER—The correct way to blow the nose, physiologically, is to draw the secretion back to the nasopharynx and expel it. This procedure is certain to prevent any extension of infectious

material to any of the uninfected cavities of the head and the ears. Nevertheless this practice is unesthetic, and various methods have been designed from time to time to clear the nose in a more esthetic manner.

The principle, regardless of what method is used, consists of a deep inhalation through the mouth and a gentle expiratory blast through the nose. The expiratory effort through the nose can be accomplished with one or both nostrils open. It is of the utmost importance that the blowing of the nose should be extremely gentle.

For practical purposes it makes little difference what method is used as long as forcible nose blowing is at all times studiously avoided."

COMPRESSION FRACTURE OF THE SPINE

Treatment by Spinal Fusion

M. BECKETT HOWORTH, M D, New York City

COMPRESSION fracture of a vertebral body is usually treated by rest in bed with a plaster of Paris jacket, brace, or hyperextension frame, with or without an attempt at correction of the deformity. Such treatment ordinarily requires two to four months of recumbency and several additional months of convalescence. The period of disability is long, the cost of treatment considerable, and the psychologic and physical effects on the patient frequently unhappy. Watson Jones and Böhler have reduced the period of hospitalization and bed rest by applying a snug plaster of Paris jacket with the spine in hyperextension and getting the patient up within a few days after injury. They have these patients begin exercises during the first week. A number of surgeons in this country have followed this example. This treatment is limited by the difficulty or impossibility of hyperextending, or even fully extending the dorsal spine, and in some cases the lumbar spine, and the unsuitability of application to certain types of patients. With either type of treatment there may be persistent stiffness, pain, and weakness at the fracture site. There is often disability for any strenuous occupation, and for athletics. In some cases the correction is lost in part or in full, particularly when the period of recumbency is relatively short, or hyperextension is not maintained. Many of these patients come to the orthopedist for further care.

The purpose of this paper is to evaluate the fusion operation in compression fracture of the spine. The basis of this evaluation is a study of 36 such patients who had the operation performed at the New York Orthopaedic Hospital. These

patients have arbitrarily been divided into two groups, 15 operated upon within two months after fracture, and 21 having operations two months or more after injury. A second series, comprising our 18 cases with dislocation or fracture dislocation of the cervical spine, was reported by Cole in September, 1937 (Archives of Surgery). The results in his group were good in 83 per cent.

No attempt was made to correct the deformity in the 21 late cases of compression fracture of the thoracic and lumbar spine, as the fractured fragments had already united. These patients complained of pain, weakness, stiffness, and disability. Examination revealed deformity, limitation of motion, and often tenderness and spasm. Roentgenograms confirmed the deformity, and in the later cases demonstrated the changes of traumatic osteoarthritis. Primary fusion was obtained by the operation in 80 per cent of the spines and by a secondary operation in the remainder. The symptomatic and functional results were good in 14 of the 21 cases, fair in 7, with a follow up period averaging three years.

A fusion operation was done upon 15 spines within two months after fracture. Correction of the compression was attempted in only 4 of these spines. Primary fusion was obtained in 86 per cent, secondary fusion in the remaining 14 per cent. The symptomatic and functional results were good or excellent in 13 cases, fair in 1, poor in 1. Thus the operation resulted in a very high percentage of good results when it was done within two months after injury regardless of whether correction was obtained or not.

The problem of the compression deformity, whether to correct it, how to do

it, and particularly how to maintain it, is a large one with many proposed solutions. One phase of the problem, however, demands serious attention, i.e., associated fracture of other portions of the vertebrae. In this group of 36 cases, there were 5, or 14 per cent with fractures of the laminae or lateral articular processes. It is significant that these fractures often cannot be seen even with clear roentgenograms carefully studied. The possibility of injury to the spinal cord when such fractures are manipulated is obvious. Therefore, the safest method of correction of a vertebral compression fracture is with the use of gentle and gradual force, with careful observation of the patient for neurologic complications. Correction can usually be accomplished in this manner by placing the patient on a Gatch bed with a hinged fracture board, the patient's head at the foot of the bed, and hyperextending the spine by raising the former knee portion of the bed. It is essential that the fracture board be used, as the sag in the ordinary springs is sufficient to prevent actual hyperextension of the spine. Pillows should not be used under the head and shoulders, and the kyphosis should be centered over the angle of the board. Correction may require several days and should be checked with lateral roentgenograms in the hyperextended position.

We have seen many cases in which hyperextension was secured only through the disks, with no change in the impacted vertebral body. This implies that not enough hyperextension was used. We have seen such cases pointed out with pride as excellent corrections, but with no follow-up. Naturally, as soon as hyperextension is released the spine tends to resume its original deformity. It must be demonstrated that the correction of the vertebral deformity has been actually maintained for a period of a year or more, in order to prove that the correction is of value. We have seen very few instances anywhere demonstrating the maintenance of correction in the vertebral body with nonoperative treatment. Without spine fusion, there is

often pain at the joint involved in the fracture after the fracture has healed. With spine fusion there is no pain in this joint, whether or not the deformity has been corrected. However, deformity in one area of the spine upsets the posture and mechanics of the remainder of the spine, and in some cases causes backache or fatigue, usually at the lumbosacral joint, particularly if this joint is structurally weak. For this reason more than any other it is desirable to correct the deformity before doing the fusion. In a few cases, where this has been done, the correction has been maintained by the fusion, and the posture has remained normal. In other words, we consider the ideal treatment for simple compression fracture of the spine (1) correction of deformity in the vertebral body, (2) maintenance of correction, promotion of early healing of fracture, and prevention of arthritis in the affected joint by spine fusion.

There is not sufficient time to discuss the treatment of these fractures when paralysis exists, and this is a combined neurosurgical and orthopedic problem. There is often a neurosurgical necessity for opening the spine, as for decompression, or for removal or rearrangement of comminuted fragments. In these cases the desirability of providing an adequate splint is often yet more urgent. Accordingly in these cases, fusion should, when practicable, be combined with laminectomy or other procedure.

The operation is performed as devised and subsequently modified by Hibbs. Exposure is made through a midline incision over the spinous processes. A careful subperiosteal dissection of the spinous processes, laminae, and articular processes is done with elevators, and the interspinous ligaments and the posterior three-fourths of the ligamentum flavum removed. Bleeding is controlled by careful packing. The capsules of the lateral articulations are removed and the articular cartilages and subjacent cortical bone cut away, leaving a gap averaging one-eighth of an inch wide. These gaps are filled tightly with bone chips from the

fossae inferiorly, or the spinous processes. Additional chips are turned across the interlaminal spaces from the laminae, and the spinous processes cut into small fragments that are placed across the laminae. After closure a spinal brace is applied, and the patient is kept in bed on a fracture board for six to eight weeks. If the deformity has been corrected, hyperextension should be maintained. Ordinarily the patient is allowed up with the brace at the end of six to eight weeks, but if the vertebral body is badly comminuted or the fusion should mature slowly, this period must be longer or a plaster jacket applied with the spine hyperextended. Thus the period of bed rest, or hospitalization, is almost always less than two months. In most cases all ordinary activities are resumed by the end of the fourth month, including work that is not physically vigorous. The great majority of these patients resume full physical activity, including vigorous work and athletics within six to twelve months after operation. The convalescent period can usually be shortened by the proper use of physical therapy.

The spine-fusion operation is technically difficult and should be attempted only by the surgeon especially trained in its use. In unskilled hands there may be bleeding or shock, and a high percentage of failure of fusion. It is not surprising that failure of fusion should occur occasionally, just as nonunion occurs in fractures. It must be remembered, however, that the chief cause of failure is to be found in the technic of the surgeon. Further, it must be recognized that some surgeons do not admit the possibility of technical failure in their hands, but consider all failures to be the fault of the patient, a position that is quite untenable. It is unfair to judge the value of the operation on the basis of these unskilled attempts at fusion and as a corollary it should be pointed out that the operation is not indicated in circumstances where there is no surgeon available to do it properly.

The fusion operation should not be undertaken when the patient is not a

suitable operative risk. The operation, when properly done, is not serious. The possibility of operative death from infection, hemorrhage, shock, embolism, etc., should be extremely small. For example, at the New York Orthopaedic Hospital, in the four years 1934 to 1937, 704 spine fusions were done without a single operative death from any cause. Many of these fusions were done on more difficult subjects than the ordinary one with fracture of the spine. There were no deaths among the 38 patients having fusion for fracture, and 1 trivial wound infection. Fusion does not stiffen the spine, it stiffens only the joints fused. These represent only a small proportion of the total motion in the spine, whereas the affected joints are generally moderately stiffened even without operation by the scarring resulting from the injury.

The question arises as to whether fusion should be done as a primary treatment or merely in those cases where other treatments have failed. The general attitude has favored the latter course, which means that fusion is called upon to cure the patients with pain and deformity of long duration, and a record of long hospitalization and incapacitation. This is a severe test, but in 21 such cases the record of results has been good. Dr. Clay Ray Murray has aptly said of fracture treatment that not the simplest but the best procedure for a given fracture should be used first. A procedure that has worked well in the late cases should be more successful if used early. This has in fact proved to be true in our 15 cases. The treatment that requires less time and is more certain, saves time, expense, and the patient's morale and happiness. It is not recommended for all cases under all circumstances, but as a procedure which should be considered when suitable. Given a patient who offers a suitable operative risk, a hospital providing adequate operating room and nursing care for this type of operation, a surgeon trained in the technic of the operation, spine fusion offers a reasonably safe and more certain and rapid method of re-

covery in fracture of the spine than any other type of treatment

33 East 61st Street

Discussion

Dr Clay Ray Murray, *New York City*—Dr Howorth has presented a matter of extreme importance to those engaged in the practice of industrial and traumatic surgery. He has advocated the advisability of fusion as a primary form of treatment in compression fractures of the spine with commendable saneness and logical thinking.

In discussing his presentation, I would like to stress particularly two of the points which he mentioned. One is the fact that a spinal fusion is a formidable procedure, with definite risk of mortality, infection, and back-muscle damage secondary to operative trauma when done by men unfamiliar with the technical procedure. The other is the fact that reliance on the fusion alone, without regard for either correction of deformity or meticulous postoperative development of back-muscle power, may result in incapacitating low-back strain.

It is unfortunate that the attitude of the Workmen's Compensation authorities here, as elsewhere, is in general opposed to the use of fusion, and yet there must be many cases that furnish the material for their point of view by reason of failure on the part of the attending surgeon to appreciate these two points.

In our own cases we have, in general, reserved fusion for those cases of compression fracture in which correction of the deformity to within reasonable approach to normal has been impossible—in which marked return of deformity occurs despite hyperextension in plaster, in which lesions of the posterior elements are demonstrable preoperatively, in the high thoracic cases in which marked deformity exists (and I agree that correction of these is extremely difficult, if at all possible), and in which pain persists despite maintenance of adequate correction and the adequate degree of back-muscle development in the latter course. These comprise about 15 per cent of our cases.

Were I to suffer from a compression fracture of the spine, I should prefer to have the deformity corrected, a fusion done and adequate postoperative care carried out—but whether or not I would follow that preference would hinge largely on who did it and where it was done.

I think a word of warning against fusion in those with any degree of spinal arthritis, in those who have reached that critical stage between 50 and 60 when little excuse is needed to

refrain from subsequent arduous labor, and in those who have marked malformations of the lower spine which frequently lead to low back disability, is in order.

Dr Howorth has presented a logical method of primary treatment for compression fractures if it is interpreted strictly as being logical only in proper hands, with proper preoperative correction, adequate postoperative care, and in proper patients. Anyone who interprets his story as indicating merely that fusion is the treatment for compression fracture of the spine will collect over a course of years additional poor results to bolster compensation insurance authorities in their objections to spinal fusion in compression fractures.

Dr W H Watters, *New York City*—In entering this discussion it occurred to me that it might be of interest to relate my experiences with spine fusion in fractures at the Beckman Street Hospital. I shall confine my report to 10 operated cases there in 1927 and 1928. These were all operated within a short time after injury depending upon the degree of shock, condition of back relative to contusions, hematomas, etc. In the allotted time I cannot go into the details of the method of handling these cases other than by operation. It seemed to me, however, that the findings at operation might be of interest.

In 7 of these cases fractures of the laminae were encountered—with extreme mobility of these structures in all cases. The postoperative courses in all these cases were essentially normal, except for a low-grade wound infection in 1 case. This was confined to the soft tissue, however, and did not influence the hospital stay or end result. Every case was discharged within eight weeks following operation. I might say that 1 of these cases was visited at a convalescent institution and found operating a heavy double-width lawn mower at the tenth week. Incidentally, this was a compensation case.

Strangely enough, this series may be equally divided into two groups, one group of 5 laborers covered by compensation, one group of 5 not in any sense compensable. This latter group includes a fireman, a policeman, a stationary engineer, construction foreman, and a stenographer. All of the latter group returned to work at approximately one year and have been continuously employed at their original or similar work for ten years. They have also been seen periodically for ten years. I have been in close touch with all these individuals and know that they deny any symptoms other than slight back fatigue upon prolonged extreme exertion.

The personnel of the compensation group was

as follows chauffeur truck driver window washer and two classed as heavy laborers. The follow up in this group was more difficult and shorter. By the end of the fourth year further attempt at study of this group was given up due to failure to locate.

One of this group continued to complain of pain, stiffness etc. and at one year a fracture or failure of fusion was quite apparent by x ray and clinically. Operation verified this and the case was classified as a failure of fusion. He was recuperated and returned to work one and one half years following the original operation or six months following the second operation. At the third year he was at his original work. The truck driver was at his original work for three years. The window washer was working as a porter at the end of the fourth year but was not washing windows in the upper floors. The two so-called heavy laborers one a Polish work man of 42 one an Italian of 17 had not returned to work at two years and no further follow up was obtainable.

Undoubtedly this series is too small to exert decisive influence upon a generally accepted method of treatment. It has, however materially influenced my own course of procedure in that I will still consider it the best preventive for persistent late symptoms and frequent increasing deformities. This is said with very definite reservations however in the laboring group and certain individuals under compensation.

With the marked changes that have occurred in the past few years in the field of economics politics medicine etc. it seems to me there are so many factors influencing man's desire or lack of desire to work that the adoption or condemnation of any standard procedure in these cases is fraught with danger.

In closing I would like to say that my own judgment in this problem has been influenced not only by the operative cases but also by the observation and study of a larger group of non operative cases.

DANGEROUS DRUGS AND DEVICES SEIZED

The Food and Drug Administration reports a steady increase in legal actions taken against drugs, cosmetics and devices under the new Food Drug and Cosmetic Law.

Although not fully effective until June 25 1939 the new act immediately outlawed drugs, cosmetics, and devices dangerous under the prescribed conditions of use.

Recent actions against cosmetics alleged to violate this provision of the new law include seizures of two brands of hair dyes containing coloring material alleged to be capable of injuring the user. Those seized were 37 packages of Lash Lure and 49 packages of Posmers Black Hair Coloring.

Actions against drugs alleged to be dangerous and to violate the new law included 3 bottles of Cal Co-Cin a pain killer containing emchophen 488 packages of B C Headache Powders, 11,325 bottles of Bromo-Seltzer and 3,526 packages of Stanback Headache Powders all of which contained among other ingredients bromides and acetanilid. Actions against devices held to be dangerous under the conditions of use resulted in the seizure of 2,922 nipple shields made of lead a poisonous metal, and two brands of nasal irrigation outfits as

follows 68 of Nazoscope and 7 of Hedklear.

The current report shows that continued activity under the Food and Drugs Act of 1906 resulted in the seizure of various quantities of contaminated food products containing insect fragments rodent hairs and other forms of filth.

The gullibility of the public and the rascality of the scoundwags who prey upon it seem endless. The list of misbranded patent medicines condemned by the Food and Drug Administration and printed in the *JAMA* of April 1 contains such names as Big Chief Herbs.

Grandma's Medicinal Herbs Minnehaha Indian Herbs Pain Go He-She Antiseptic Vaginal Suppositories Wah Poo Sah Kee-Kee Kee Will Du gout medicine and World's Wonder System Builder.

The Pain Go was essentially kerosene with small amounts of volatile oils such as turpentine and sassafras. A Remedy Tea made of ground wood twigs and needles with juniper berries was fraudulently represented as a remedy for diabetes kidney disorders, etc. It may be that a fool is born every minute, but Uncle Sam is at least trying to stop the patent medicine fakery from killing one every minute.

RELATIONSHIP OF INDUSTRIAL MEDICINE TO PRIVATE PRACTICE

CLARENCE D SELBY, M D , Detroit, Michigan

THE PUBLIC is accustomed to judge our profession by its ideals, ethics, altruistic objectives, and best practices. We of the profession do the same in judging the specialties of medicine. Surgery, for example, we judge by the collective accomplishments of good surgeons, not by the acts of general practitioners who occasionally venture into the abdomen. In this discussion, permission to judge industrial medicine by the same standards is assumed.

There are three classes of physicians practicing in relation to industry, full time, part time, and on call. As these designations imply, the full-time physicians alone give their whole attention to industry and that is always in one establishment. They are the only truly representative industrial medical group. The others are general practitioners or specialists who give limited attention to industry, usually in the treatment of occupational injuries and diseases. Being in general practice and only incidentally serving in industry, they can be regarded as private practitioners rather than industrial physicians but it must be admitted that they furnish service to about 85 per cent of the industrial establishments in the United States.

Confusion as to the purposes of industrial medicine has resulted from failure to distinguish the practices of these groups. In order that there be no misconceptions in this discussion, it is confessed that all conclusions as to the relationships of industrial medicine to private practice will be based upon the policies, ideals, and best practices of the full-time group.

Industrial medicine as exemplified by this group is the theory and practice of

medicine in relation to the health of the working people, as distinguished from the case work of the private practitioners serving in industry. Fundamentally, it is preventive medicine.

Its basic function is health maintenance, its object is to furnish employees the best possible health protection consistent with (a) the purpose of industry, which is manufacturing, (b) the employer's responsibility as fixed by law, which is the care of occupational injuries and diseases, and (c) the employee's rights as to free choice of medical counsel, which conversely are the rights of physicians in private practice in relation to nonoccupational sicknesses and injuries among the employed groups.

This conception of the scope of industrial medicine is more inclusive than private physicians are prepared to furnish, as attested by the fact that their services in industry are usually limited to treatment of patients. Yet it recognizes their rights as private physicians as well as those of other parties concerned in the general problem of protecting the health of the working people.

As a matter of fact, industry is not in the business of practicing medicine and the ordinary employer does not wish to assume more responsibility for treatment than is required by law. On the other hand, if the size of his plant warrants, he is willing to furnish a sufficiently complete health maintenance service to protect his employees against harmful working conditions.

Viewing industrial medicine from this standpoint, it is found to comprise several functions which will be discussed under three headings: industrial hygiene, physical supervision, and therapy, and in

their discussion the relationships to private practice will be considered

Industrial Hygiene

In reality, the physician is the health officer of the plant and as such is responsible for the plant hygiene, commonly known as industrial hygiene. He is familiar with the toxic materials that are used and the processes that have harmful though nontoxic features. His duty is to determine if the workmen are adequately protected against them, and if he finds that they are not, it is his duty to inform his management and to persist until control is effected. Furthermore, it is his duty to inspect controlled exposures often enough to satisfy himself that control is maintained. In short, his function as an industrial hygienist is to advise and assist his management in protecting the workmen against occupational diseases and other occupational impairments of health.

How he performs this function is not essential to this paper. It is purely preventive medicine and does not involve any competitive relationships with private practice. Nevertheless, there are two features that should be given consideration.

An Opportunity for Private Practitioners—As previously mentioned, private practitioners furnish about 85 per cent of the industries the only medical service they have. It is in the form of medical and surgical treatments of employees who become injured or sick while at work. They sometimes are permitted to consult their own family doctors but usually they are referred by their employers to designated physicians, often certain nearby practitioners. In New York, they may consult physicians of their choice provided those physicians have qualified for compensation work.

The point is that employers of all grades are becoming more generally conscious of the importance of industrial hygiene. Naturally, if they have hygiene problems they present them to the doctors who take care of their injuries. If

they fail to obtain the desired advices, many of them do not know where to turn. It is therefore suggested that physicians in private practice who accept patients from industry prepare themselves to offer such advice or inform themselves on where such advice may be obtained. This is an opportunity that medicine can not ignore.

Diagnosis of Occupational Diseases—A history of harmful exposures is essential to diagnosis of occupational diseases. A workman must be exposed to silica to acquire silicosis, he must be exposed to lead to have lead poisoning, and the conditions of exposure must be such as to cause the disease.

Embarrassing failures in diagnosis have come from failures to ascertain facts as to exposure. It is therefore suggested that all physicians, industrial and otherwise, proceed with caution in the diagnosis of occupational diseases, and refrain from reaching conclusions until the possible sources have been found to be adequately harmful.

Physical Supervision

Industrial hygiene methods are effective in preventing occupational diseases, in fact, a great deal has been accomplished, and theoretically it may appear unnecessary to go any further except to maintain control. However, the plant physician has to face the issue of alleged aggravation of disease from time to time and often he is asked to treat what are to him obviously nonoccupational conditions which belong to private practitioners.

In connection with these controversial cases, he always has important decisions to make and his decisions must be based upon facts, facts as to the exposures and facts as to the physical condition of the workman involved. These latter facts he can obtain only through physical examinations. So the physical examination of employees becomes a major function of industrial medicine, and further more it is essential to the maintenance of health, which is the basic purpose of industrial medicine.

Examinations are made at time of employment to assure safe placement, often enough during employment to assure protection against diseases originating in or influenced unfavorably by occupation, and for diagnosis to establish occupational or nonoccupational origin when counsel is sought

Patients Are Referred to Private Physicians—These examinations and consultations frequently uncover conditions that need medical care. As previously stated, industry has no wish to treat ailments for which it is not responsible, but realizing the importance of early appropriate treatment, it is the duty of the plant doctor to encourage workmen needing treatment to seek early consultation with their private physicians

This service in behalf of employees and their physicians is generally welcome. As a health maintenance measure, it is highly effective, and the interests of all parties concerned suggest that it be encouraged. A frank, friendly relationship between the private physician and the plant doctor is very desirable

Therapy

While industry has no wish to assume responsibility for treatment, compensation acts have obligated employers to furnish treatments for occupational injuries and diseases. Naturally, they expect their own doctors to render the service and this is usually done. However, the industrial physicians of the type under discussion are moving steadily from surgery to preventive medicine, and the evolution is leaving them dependent upon consultants, who are in reality private practitioners. Incidentally, there is frequently much to be done by the plant physicians in behalf of employees discharged by consultants as cured before they can be placed satisfactorily back in industry

So with the exception of minor injuries and the occupational diseases, which are infrequent, and considering the fact that private practitioners treat the injuries in about 85 per cent of all industries, it is

evident that the private practitioners are dominant in the care of sick and injured workmen. About all that the plant doctor actually does in this respect is to act as a clearinghouse and to correlate the services necessary to adequate care of employees for whom his management is responsible. In short, he acts as a case-finding agency

Industrial Medicine Is an Ally of Private Practice—This trend on the part of industrial medicine to ally itself with private practice in the care of industrial patients should be encouraged. Industrial medicine is an honorable specialty of medicine. It is suggested that the general profession be made more cognizant of its ideals and objectives. As a means toward a better understanding, it is suggested that more medical societies follow the example of the New York State Medical Society in organizing sections in industrial medicine

The Real Problem

Industrial medicine, as exemplified in the full-time service, is frankly admitted to be something new in the way of medicine. It is by no means a finished specialty, and no doubt there are still many features needing correction. Industrial physicians are well aware of this and their efforts are being directed with commendable sincerity toward betterment. They know that the care of industrial patients is not the ultimate potentiality of medicine in relation to industry, but that, on the contrary, it is the maintenance of employee health, and they are striving toward that as their objective

The full-time group, by use of industrial hygiene methods and by cooperation with public-health officials and physicians in private practice, are meeting medicine's responsibility in a way that reflects credit upon the whole profession. But they view with considerable concern the inadequacies of the service rendered by private practitioners acting on a part-time and call basis in the care of sick and injured workmen in 85 per cent of the industries of the United States. That

service is not only inadequate, but it is an important competitor of private practice. It is the real problem.

The Real Problem Is the Private Practitioner in Industry—As a means toward the solution of this problem, it is suggested that the private physicians in industry give heed to the reforms advocated by Dr R. G. Leland, Director of the Bureau of Medical Economics of the American Medical Association.* He advocates

1 Recognition of a three-fold function of medicine—public health administration, plant control or preventive medicine in industry, and care of the sick and injured workmen, or curative medicine,

2 Acceptance of the expert in industrial health control as a specialist in medical practice,

3 Formulation of criteria to determine to what extent and in what manner certain diseases are actually occupational diseases,

* *Industrial Medicine* 6: No. 5 p. 330

4 Study to accomplish a reconciliation of the divergent views on freedom of choice of physician,

5 Formulation of principles pertaining to the organization and administration of industrial health services,

6 Study to determine the manner in which some instruction on industrial health problems and methods may be included in medical education and

7 Elevation of industrial health services and industrial medical care to a position of greater importance and respectability in medical practice.

There are no better closing remarks for this paper than those used by Dr Leland himself. He said "The welfare of the millions of industrial employees and the future of medicine demand that this phase of medical practice be stripped of its commercial aspects and that it be assisted to develop as a thoroughly ethical, scientific, and respectable phase of medical practice."

3044 W. Grand Boulevard

POSTGRADUATE LECTURE COURSE

A course of lectures on heart diseases arranged by the New York Heart Association and sponsored by the Council Committee on Public Health and Education of the Medical Society of the State of New York, will be presented to the St. Lawrence County Medical Society at Ogdensburg, New York (12:30 P.M.) and to the Jefferson County Medical Society at Watertown, New York (6:30 P.M.). The program is as follows: May 4 "Degenerative Forms of Heart Disease (Hypertension and Arteriosclerosis)" by Dr. Lewis A. Conner; May 11 "Rheumatic and Syphilitic Heart Disease," by Dr. Cary Eggleston; May 18 "Acute Cardiovascular Emergencies" by Dr. John E. Deitrick.

The Use of X-ray and Fluoroscopy in the Management of Heart Disease by Dr. Harold E. B. Pardee and Therapy in Heart Disease by Dr. Harry Gold will be given in the Fall. All of the speakers are from New York City.

THE JOY OF BEING THE EDITOR

Getting out this magazine is no picnic
If we print jokes, people say we are silly
If we don't they say we are too serious
If we clip things from other magazines
We are too lazy to write them ourselves
If we don't we are stuck on our own stuff
If we stick close to the job all day
We ought to be out hunting up news
If we do get out and try to hustle
We ought to be on the job in the office
If we don't print contributions
We don't appreciate true genius
And if we do print them
The magazine is filled with junk
If we make a change in the other fellows write up
We are too critical
If we don't we are asleep
Now like as not some guy will say
We swiped this from some other magazine
We did—from the *Bulletin of the Medical Society of the County of Kings, N. Y.* (Quoted in the *Pennsylvania M. J.*)

ROENTGEN THERAPY IN TOXIC THYROID DISEASE

JACOB R. FREID, M D, and HENRY GOLDBERG, M D, New York City

(From the Radiotherapy Department of the Montefiore Hospital)

IT HAS long been recognized that thyrotoxic disease is a manifestation of a more profound disturbance of the organism than simply a disorder confined to the thyroid. Notwithstanding the fact that recent investigations have demonstrated, in more or less detail, those relations of the thyroid to other glands (pituitary, adrenal, gonads) and to the mid-brain, which earlier observers had assumed in a general way, the approach to treatment of thyrotoxic diseases today is still an indirect one^{1,2,3,4}. The problem, though considerably clarified, is still far from solution since we are as yet ignorant of the factors that may affect these complex glandular interrelationships in thyrotoxic disease. Most therapeutic procedures in use today are still directed toward the one obviously involved gland, the thyroid, whether by operation or by irradiation, or indirectly by medical treatment. Since the underlying disturbances are still unknown, the results of these measures are often limited, and even when arrests apparently have been obtained, recurrences may follow. Nevertheless, these results are often surprisingly good. At present, many assume that subtotal thyroidectomy is the best therapeutic measure. This is true for a large group of patients. Under certain conditions and in special cases other methods are desirable. The great majority of general practitioners have only a vague idea as to the merits of surgery and radiotherapy in the treatment of thyrotoxicosis. For this reason, we believed it worth while to re-evaluate roentgen therapy in thyroid disease. The results in a series of cases of thyrotoxicosis so treated and carefully followed for a number of years are given here.

Action of Irradiation

The method of action of irradiation on the thyroid gland is not as yet definitely established. Early workers in this field found no evidence of radiation effect on the normal thyroid gland of animals^{5,7}. Subsequent observers showed the normal thyroid glands of rabbits to be extremely resistant to x-rays. With large doses, however (approximately 3 to 10 E D), there could be produced in the gland a variation in the structure and a decrease in the colloid substance⁸. More recently, by means of special stains, changes have been demonstrated in the cells of the thyroid glands of rabbits following medium voltage irradiation with doses up to 10 E D. These effects were in the nature of degenerative changes in the chondrioma of all the cells, disintegration of some of the cells, and a reduction in the quantity of the colloid substance in the follicles. The structure of the gland regenerated at varying intervals following the irradiation⁹. These last experiments are of extreme interest and importance to radiologists because they furnish experimental evidence of a direct irradiation effect upon the thyroid gland. However, one must bear in mind that the observations were on animals, that the doses used were greatly in excess of those employed in the treatment of human thyrotoxicosis, and that the action of radiation on the normal thyroid gland may be different from that on an oversecreting gland.

The effect of irradiation on the human thyroid gland is also in dispute. Diffuse growth of the intra-alveolar connective tissue which could be a result of the atrophy of the parenchyma, has been described¹⁰. Radiation sclerosis of the

organ has also been observed.¹¹ On the other hand, in a series of 4,061 patients with exophthalmic goiter operated upon in the Mayo Clinic from 1926 to 1928 inclusive, 291, or 5 per cent, had been previously irradiated. At operation, only occasionally could gross changes be recognized in these glands. Microscopically, Broder could not distinguish irradiated from nonirradiated tissues.¹²

On the basis of the earlier work on animals and findings such as Broder's, it was assumed that the beneficial effects of irradiation were due to functional and not to organic changes. The theory most commonly held by radiologists is that advanced by Holzknecht some years ago.¹³ He believed that x rays acted by inhibition or depression of the growth and function of the cells and stated that x rays relieved hyperfunction in the same way as did surgical reduction, and could cause hypofunction when applied in excess just as did complete removal of the thyroid gland.

The normal thyroid gland is very resistant to irradiation. Patients treated for malignancies in the neck and larynx have received heavy irradiation over the thyroid, yet rarely if ever is myxedema produced. In the material at the Montefiore Hospital, not a single case of myxedema has been observed as a result of irradiation of a normal thyroid gland. We have, on one or two occasions, witnessed mixed pictures of myxedema and toxicity in patients who have been irradiated for thyrotoxicosis. The myxedema symptoms disappeared spontaneously after varying intervals. In this group, if the toxic symptoms predominated, further irradiation was given. It is a cliché too frequently repeated by surgeons that irradiation of the thyroid gland produces adhesions, often to the point of making subsequent operations, when indicated, more difficult. Such findings were occasionally present many years ago, in the days of crude machines and low voltage caustic irradiation. With the improved technic of the past decade this complication has been eliminated. Reports from the Mayo Clinic,¹²

as well as that of Joll,¹⁴ and Waltou,¹⁵ bear out this fact. If these observations were not sufficient, the previous citations on the effect of radiotherapy on the thyroid gland are proof of the rareness of irradiation fibrosis.

Irradiation of the Thymus

That enlargement of the thymus is often present in Graves disease has long been known to pathologists. The interrelationship of thyroid and thymus has been established by many investigators.^{16, 17, 18} More recently, Blackford and Freligh¹⁹ found hypertrophy of the thymus in 73 per cent of 74 cases of exophthalmic goiter. It was present in all patients under forty years of age and absent in half of those over forty. They considered thymic hypertrophy a result rather than a cause of thyrotoxicosis. The hastening of thymic involution in a rabbit following thyroidectomy, as established by Marine, *et al*,²⁰ is further corroboration of this assumption. On the basis of such findings, there apparently is no clear rationale either for surgical removal or for the irradiation of the thymus gland in thyrotoxicosis.

Technic

The technic of radiotherapy in thyroid diseases varies to a considerable degree in different clinics. This applies not only to the kilovoltage used, but also to filtration, focal skin distance, size of ports, number of ports, intensity of the irradiation, time interval between treatments, dosage per course, number of courses, and finally to the maximum period patients should be kept under treatment.

When this investigation was instituted in 1929, we planned to vary our technic, using both medium and high voltage x-ray therapy and also, in a limited number of cases, radium therapy. In some cases, treatment was to be intensive, and in others prolonged over considerable periods of time. By comparing these three groups, at a later date, we hoped to arrive at a technic which would give the best results and would be adaptable to

most patients. However, experience has taught us that in dealing with this complex disease it is unwise to adhere too rigidly to a standard method of treatment. As in surgery, so in radiotherapy, the physician handling the case must be as familiar with the disease as with the technic of treatment if the best results are to be obtained.

With few exceptions, the factors for the cases reported were 200 kv, 30 ma, 50 cm FSD, filtration 0.5 mm Ag (equivalent to 2 mm Cu) plus 1 mm Al. Two fields were used in most instances, a right and left lateral port, the size of each lobe of the thyroid, cross-firing the gland. Where the gland was substernal, a small superior mediastinal port was added. Dosage per treatment was 150 to 250 r per port. Usually one lobe was exposed at a sitting, the opposite lobe being treated two to three days later. These exposures were repeated at weekly intervals until each port had received 1,000 r. If patients recovered prior to this time, treatment was discontinued. If a second course of treatment proved necessary, it was done three months later, and occasionally a third course was given when exacerbations of the disease occurred.

At the present time we are treating another group of cases with medium voltage technic. The factors are 140 kv, 5 ma, 50 cm FSD, filtration of 4 mm Al, 125 r per treatment per field. Each lobe is radiated tangentially (the rays passing from the medial to the lateral aspect) so that the larynx receives minimal irradiation.

The cases receiving radium therapy are treated either with a special radium collar or else with a molded wax pack at 3 to 4 cm distance with filtration of 1 mm Pt. The patients were given 1,000 to 1,500 mg hrs at intervals of four to fifteen days, average once weekly. Treatment when necessary was continued for a period of about three months.

Complications

Complications met with in the treatment of this group of patients were of two

types, direct and indirect. The direct were due to the action of the x-rays on the skin and adjacent tissues. As noted in the statement on technic, our oldest group of patients were treated with 200 kv and 0.5 mm Ag, crossfiring the gland. In some instances, this resulted in an x-ray laryngitis, usually when a second course of treatment was given. As soon as radiotherapy was stopped, the laryngitis improved and later disappeared. We overcame this complication principally by treating the gland from tangential fields and more recently by changing to medium voltage.

We also noted in 2 of our patients, slight telangiectasis but no atrophy of the treated skin. In a period of eleven months, 1 of them was given three courses of 985 r to each side of the neck, a total to each field of approximately 2,955 r. The factors were 200 kv, 4 ma, filter 0.5 mm Cu plus 1 mm Al, 30 cm FSD. The gland was crossfired from a right and left lateral port with doses of 240 r, with only one thyroid field treated at a sitting. The superior mediastinum was also irradiated. Two weeks following the third course, there developed a severe x-ray laryngitis that persisted for months. One year following the last treatment, moderate telangiectasis but no atrophy was noted in the skin of the right neck and to a slight extent also on the left side. The other patient received 2,870 r over a period of one year with the following factors: 200 kv, 30 ma, 50 cm FSD, filtration 0.5 mm Ag plus 1 mm Al. The gland was crossfired from right and left lateral fields measuring 8×8 cm, each area being treated once weekly but never on the same day. Dosage varied from 100 to 125 r per treatment. No laryngeal symptoms were noted during the course of treatment. Thirty-nine months following the last irradiation, beginning telangiectasis was observed in the thyroid area. During the following eighteen months, the telangiectasis remained unchanged. The skin showed no evidence of atrophy.

Indirect complications which inter

ferred with treatment were intercurrent respiratory infections, toxic fibrillation and recurrent decompensation in severe cardiacs. Since our cases, with few exceptions, were ambulatory patients, treatment was discontinued when such complications arose. With cardiacs hospitalized, such complications need not hinder therapy.

Material

Fifty-eight cases are reported, all of whom were personally followed for a minimum of one year and a maximum of seven years. To simplify comparison with reports in the literature, the cases are listed under the usual divisions of exophthalmic goiter, when associated with exophthalmos, toxic hyperthyroidism, if no eye signs were present, and toxic adenoma, when nodules were palpated in the gland, recognizing that this is a clinical grouping in common use that is not based on any real differentiation in the disease itself. The cases have also been listed according to the degree of severity. The occurrence of severe complications is noted. These were severe myocardial disease of long standing, essential hypertension chronic nephritis, diabetes and gastric ulcer.

In Table 1, these groups are numerically listed and further divided according to sex.

TABLE 1

| | No. of Cases | | | |
|---------------------|--------------|--------|---------------|-------------|
| | Male | Female | Uncomplicated | Complicated |
| Exophthalmic goiter | | | | |
| Severe | 7 | 10 | 10 | 7 |
| Moderate | 2 | 3 | 5 | 0 |
| Mild | 0 | 3 | 2 | 1 |
| Hyperthyroidism | | | | |
| Severe | 6 | 3 | 5 | 4 |
| Moderate | 2 | 7 | 6 | 3 |
| Mild | 0 | 5 | 5 | 0 |
| Toxic adenoma | | | | |
| Severe | 0 | 1 | 1 | 0 |
| Moderate | 3 | 0 | 2 | 1 |
| Mild | 0 | 6 | 5 | 1 |
| Total | 20 | 35 | 41 | 17 |

Analysis of Material

(Tables 1 and 2) Table 2 (page 910) is a complete summary of the cases from the time of admission through the period of follow up. The basal rate and pulse

headings give those findings before treatment was instituted. Classification of severity is based on a combination of the above findings in conjunction with the clinical severity of the cases. In addition, a description of the patient's nutrition and eye features is stated in order to round out the general clinical picture.

In the seventh column, the radiotherapy administered is described. The use of x ray therapy of the deep (200 kv) or the medium type (140 kv) is indicated, respectively, by the headings "D" or "M". The number of roentgens in air, for the course of treatment, is also noted. For radium treatment, the number of milligram hours is stated, as well as the period of administration. In the two following columns, we note the basal rate and pulse rate findings upon completion of each course of treatment. These were usually taken within a month of the close of treatment.

The following column, labeled "result," is a summary of the results achieved. These are divided into three general groups. Cases called controlled are those in whom toxicity receded and the result was sustained. Those cases who showed response but in whom all the toxic features did not entirely recede, are called improved. Patients who showed no improvement are listed as failures. Whenever a recurrence is noted, it is stated in this column. The final basal reading available in each case and the time at which it was taken after treatment was instituted are also listed for each patient.

Finally, in the last column, headed remarks, individual features of each case, including complications and our comment, are given.

Table 3—Our total results show 79.5 per cent either controlled or greatly improved. This includes, (see following page) a rather large number of cases with severe complications, most of whom were at the same time severely toxic. The results as a whole, therefore, compare favorably with other methods of treatment. However, the following should be noted.

TABLE 3

| | | No Controlled | No Markedly Improved | No Moderately Improved | No of Failures |
|------------------------------------|----|---------------|----------------------|------------------------|----------------|
| No of cases of exophthalmic goiter | 25 | | | | |
| Severe | 17 | 7 | 5 | 2 | 3 |
| Moderate | 5 | 3 | 1 | 0 | 1 |
| Mild | 3 | 3 | 0 | 0 | 0 |
| No of cases of hyperthyroidism | 23 | | | | |
| Severe | 9 | 4 | 2 | 1 | 2 |
| Moderate | 9 | 7 | 1 | 1 | 0 |
| Mild | 5 | 2 | 2 | 0 | 1 |
| No of cases of toxic adenoma | 10 | | | | |
| Severe | 1 | 1 | 0 | 0 | 0 |
| Moderate | 3 | 1 | 2 | 0 | 0 |
| Mild | 6 | 3 | 2 | 0 | 1 |
| Total cases | 58 | 31 | 15 | 4 | 8 |
| Percentage | | 53 5% | 26% | 7% | 13 5% |

1 Our total series is small compared with other series, and included in the results is a group of mild cases. In any analysis, whether of surgical or radiotherapeutic results, the question always arises whether such cases should be included, since the group contains cases classified as autonomic imbalance, psychoneurosis, anxiety state, or goiter with mild or questionable toxicity. Good results are obtained with these patients by all methods of treatment. A truer picture of results with really toxic cases could be obtained from the literature were this mild group subtracted from surgical and medical reports.

2 Certain of the cases, earlier in the series, received too mild a course of treatment (1,000 r D. in ten to twelve weeks), to a point where it appears ineffectual from any theoretic view. Within the limits imposed by toxicity, treatment should be given steadily and in fair doses, using frequent basal rate estimations, as well as clinical evaluation as a guide.

3 There was a total of 5 recurrences, or 8.5 per cent, after a period of one and one-half to three years, occurring under the circumstances of severe working conditions, combined with personal difficulties. Two of these patients were easily controlled with further radiation. One was a severe cardiac who was sent to operation, and 2 were lost sight of. It was noted in several instances that the occurrence of acute upper respiratory infections caused a partial flare-up of toxicity that often receded with a clearing up

of the infection. Where toxicity persisted, further irradiation was given.

Graph 1—In Graph 1, which was constructed from all the cases that were reported, are plotted the total basal figures against the time (in months) when they were taken. The treatment periods are also indicated. With onset of therapy, no drop in B M R occurred for the first two weeks. Thereafter, there is a sharp fall which reaches a level about two and

GRAPH 1

one-half months after treatment was begun. There then occurs usually a slight rise in B M R, due to the cases not controlled by the initial course of treatment. With further therapy for this group, the curve continues steadily downward, and, in completely controlled cases, a level in the region of 0 or slightly above is reached. In this graph, the curve is seen to stop at the end of the year at about +18. Thus figure, how

GRAPH 2

ever, is the composite result of the failures and recurrences. Comparison of this curve with that reproduced from the paper of Holmes and Means, *et al.*,²¹ shows a decided similarity in the two curves. The sole difference is that they reached the final basal rate in about four months, whereas in our series it was reached more slowly.

Graph 2—Curve 2 is a composite of 30 cases which were well controlled, and serves to show what may be expected as to the course of any case (in terms of B.M.R. changes) if the case is responding well to treatment. This series consisted of patients with marked toxicity, all mild cases being excluded. The resulting curve shows a steady fall with onset of treatment that continues for four months. At this point, a number of cases showed a slight rise and were given further therapy. A secondary and more gradual drop is noted, reaching, in about ten months, the final level of these cases with the B.M.R. averaging +11. In this group of cases which responded well to therapy, the B.M.R., in comparison with that of the entire series (Graph 1), shows that the initial drop is more sustained, approaching a low level at the end of the fourth month. The final basal level is also lower for this group.

Graph 3—This group consists of all the severe cases of exophthalmic goiter. Changes in the basal rate, pulse rate, and weight while under treatment are plotted.

Pulse—The pulse curve shows the most characteristic downward progression. The variations in this curve correspond to the changes in the B.M.R. curve.

GRAPH 3

B.M.R.—The B.M.R., which averaged +65 at the onset, shows a decided drop with the first course of treatment, with a tendency to remain elevated at a lower rate, about +33. Additional treatment lowers it further but the final level remains at about +23. Part of the elevated rate, at completion of treatment, must be ascribed to the inclusion of many cardiacs with hypertension who normally run elevated basals.

Weight—The weight curve reflects, in inverted form, the changes noted in the curve of basal readings. At times in the individual case the rising weight foreshadowed a beginning improvement, when pulse rate and clinical examination were still unchanged. It was observed that, with the onset of a respiratory infection, this gain in weight was rapidly lost. The absence of a more pronounced gain in weight for the entire group must be attributed to the fact that these were mostly outpatients suffering from poor home conditions, i.e., insufficient food and rest, and also greatly worried over their economic status (1930-1936). Hospitalization of many of these would result in more rapid control of the disease. This group also included a large number of cardiacs. These patients gain weight even with improvement of their thyroid condition, much more slowly than the uncomplicated thyroid cases. One should always make sure that the gain in weight of a cardiac with severe thyrotoxicosis is not due to fluid retention.

Discussion

There is considerable variation in the percentage of cases of thyrotoxicosis

TABLE 4

| Author | Year Pub lished | Cases | Cured Per cent | Much Im- proved Per cent | Total Cured and Im- proved Per cent | Failed Per cent | Re curred Per cent | Remarks |

| Don (31) (England) | 1934 | 93 | | | 80 | | | |
| Freid and Goldberg (U S A.) | 1939 | 58 | 53 5 | 26 | 79 5 | 13 5 | 8 5 | |

controlled or greatly improved, reported from the various radiologic clinics (see Table 4) Our figure of 79.5 per cent corresponds closely to the carefully evaluated series reported by Don in 1934,³¹ of 80 per cent cured or greatly improved. Despite careful follow-up, individualization in treatment, and excellent technical facilities, we were unable to achieve the high percentage of cures reported from some other clinics.

Five recurrences, a percentage of 8.5, were present in this series. We list as a recurrence the return and persistence of the toxic picture after it was once controlled. Reports from the literature are often vague as to the frequency of recurrence. It is difficult to classify these at times, since flare-ups will occur in cases under treatment that later are completely controlled. They may also occur in controlled cases and subside without additional treatment.

Menville³⁰ cites a percentage of failures of 12.8, in 10,541 cases collected by questionnaire among the radiologists of the U S A. and Canada. Our percentage of 13.5 is close to the general average.

The comparison of roentgentherapy with surgery is more difficult. The results from the highly organized centers of thyroid surgery in America are brilliant,

varying from 87 per cent to 99 per cent controlled or greatly improved. A great deal of thyroid surgery, however, is done casually outside of the above centers. In this connection, therefore, the report of Clark and Black from Grace Hospital in Detroit is valuable.³² They noted 16 per cent cured, 40 per cent moderately improved, 34 per cent improved, and 10 per cent recurred, of 78 patients reviewed two and one-half years after operation. Reports from such groups, however, reach the literature only in isolated instances. This indicates that the results of thyroid surgery done by the general surgeon do not approach the results of the larger thyroid centers. On the basis of end results alone and disregarding mortality, the average case does at least as well and better with radiotherapy than with routine surgery.

In our series, there were no cases of death while under treatment. Likewise, no case went into thyroid crisis.

The variation in mortality rate of thyroid surgery is extreme. At the Lahey Clinic, a series of 3,422 cases operated on from 1926-1933 showed a mortality of 0.6 per cent.³³ Two-stage operations were done in one-third of these cases. At the same clinic, a series of 876 cases of toxic adenoma had an

operative mortality of 18 per cent. The average age of patients in this group was greater than in the first series. This factor probably accounts for the higher rate. Similarly, at the Crile Clinic, a series of 1,207 consecutive operations on patients under fifty had no mortality. In 1929 1,279 operations were done with a mortality of 0.86 per cent.³⁴ At the Mayo Clinic, the mortality was only 0.5 per cent for a series of 8,425 cases operated on from 1925 to 1933.³⁵

Turning from the remarkable results of less than 1 per cent mortality, at outstanding surgical clinics, we have Maes report of 7 per cent mortality rate in a series of 275 cases occurring in a non goiter region.³⁶ Only half these cases had exophthalmic goiter. The series from Grace Hospital previously referred to, had a mortality rate of 6 per cent.³⁷ Abroad, the reported mortality figures are still higher. At the Edinburgh Infirmary, the mortality was 12.3 per cent for 285 cases, many of only moderate severity, operated upon during 1923-1933.³⁸ Romans' series of 900 cases with an operative death rate of 2.5 per cent is representative of the lower figures reported from England,³⁹ yet is considerably higher than the figures of Crile, Lahey etc. It is clear that a negligible operative mortality in this disease can be expected only from highly organized centers for thyroid surgery where a large number of toxic cases come to operation each year.

To quote Lahey: "Thyroid surgery is not dangerous surgery when it is under taken in organized groups. When, however, it is done as casual surgery, such as the surgery of hernia, fibroid appendicitis, etc. and without organization for its management, the mortality will undoubtedly be high."⁴⁰ Casual radiotherapy is subject to a similar criticism not as to mortality but from the standpoint of poor therapeutic results.

These comparisons indicate a distinct place for radiotherapy in the treatment of toxic thyroid disease. Although radiotherapy cannot match the brilliant results of the organized centers where this

type of surgery is best performed, it easily compares with the therapeutic results of casual surgery and has not the great criticism of the latter's mortality rate (6-12 per cent). There is an additional group which is distinctly the province of radiotherapy. This group includes cases refused operation by the surgeon because of a complicating disease, extreme toxicity, advanced age, or poor response to iodine. Further, some patients refuse operation and some come to radiotherapy after an operative recurrence. In a few instances, where the surgical risk was great after roentgen therapy the improvement was such that the patient could safely go on to surgery.

Summarizing, it can be said that a trial period of about four months should determine definitely the value of roentgen therapy in any given case. Our patients are not iodinated prior to treatment, so that this procedure can be reversed, should there be resort to surgery later. One great difficulty was the outpatient status of our cases, which did not permit control of nutrition, rest, and emotional factors, as is possible under surgery. The economic status of these patients made this a difficult problem during the period of our study. A period of hospitalization for severely toxic cases at the beginning of treatment would offer the best corrective of this problem.

Summary

1 Fifty eight cases of toxic thyroid disease treated by radiation therapy are reported.

2 These cases were under observation for from one to seven years.

3 Thirty-one cases or 53.5 per cent were regarded as controlled.

Fifteen cases or 26 per cent were greatly improved.

Four cases or 7.0 per cent were moderately improved.

Eight cases or 13.5 per cent were considered failures.

Five cases or 8.5 per cent recurred.

4 A comparison of results from other radiologic clinics and from surgical clinics is included.

Discussion

Dr Bertram J. Sanger, *New York City*—It is always stimulating to us, who have felt radiotherapy offers such a simple and efficacious approach to the treatment of thyrotoxicosis, to see a renewed interest in the subject. This excellent

clinical paper of Doctors Freid and Goldberg only demonstrates again what results can be obtained with a carefully followed group of patients.

This method of therapy does not offer complete recovery in all cases treated, nor, for that matter, does surgery. About 20 per cent of postoperative cases in our experience have come to radiotherapy. Relatively about the same percentage of cases that had a sufficient trial on radiotherapy were ultimately operated.

Up to the present time there is no very definite criteria to aid us in the choice of cases. Special studies, such as glucose tolerance tests, creatine excretion studies, etc., gave us no leads. From a long experience in the treatment of this disease we have finally come to feel that those cases do best where the struma is not too large and when the thyrotoxicosis has not existed too long. It is our general impression that nodular goiter (adenoma) and cases with substernal extension of the struma, should not have radiotherapy. The latter often swell somewhat after exposure to the roentgen-ray, and with pressure symptoms pre-existing offer a real hazard.

Our plan of treatment has been rather more fixed than that outlined in this paper. We have used a standard dosage, given directly over a single area that includes the whole struma. Treatments are given at intervals of three weeks, the number of individual treatments being determined by close clinical and metabolic checkups during the course of therapy. It is most important for good results to continue treatments at these regular intervals without any gaps, until the desired clinical and basal metabolic results have been obtained. There is, however, a cumulative effect of the roentgen-ray on the overactive thyroid mechanism, and for that reason we discontinue treatment when the basal is approaching the normal range. Follow-up observations are then made at shorter intervals and if the basal metabolism tends to rise, treatment is resumed guardedly until the patient is well.

One should not expect miracles from radiotherapy. Many clinicians, who are inexperienced in this type of therapy, get discouraged after three or four treatments if striking results have not been observed, and resort to surgery. In our experience eight to nine treatments have been the average number required for cure, the range having been from two to twenty-seven. Auricular fibrillation and decompensation need not interfere with continuing treatment, though adequate medical measures for their relief must be instituted. I want to emphasize again that iodine in any form should not be given during the course of treatment with radiotherapy, as it ob-

viously masks results and makes it impossible to evaluate the basal metabolism as a guide to further therapy.

This paper also stresses the necessity of careful follow up studies by the radiologist and clinician if good results are to be expected. The basal metabolism gives us an excellent index of thyroid activity and affords the best control mechanism for outlining treatment. As Doctors Fred and Goldberg have said gain in weight is one of the first signs of improvement and this occurs often before there is any appreciable change in the metabolic rate. Nervousness, sleeplessness, and tachycardia go later. Exophthalmus and excessive struma may entirely disappear although in successfully treated cases they may persist in some degree.

To sum up radiotherapy offers a simple, hazardless approach to the treatment of toxic thyroid disease. For the most part the patient can be treated ambulatory and continue at his economic usefulness. However, just as results are not as good with casual surgery as with surgery in centers specializing in thyroid disease so with radiotherapy. Treatment with this agent undertaken by radiologists at large in a casual way without intense interest and experience in the procedure will only lead to unsatisfactory results and to a further relegation of this very useful and successful therapeutic approach to the limbo of discarded therapy.

Dr A. L. Loomis Bell, *Brooklyn*—I am sure that we have all enjoyed hearing this very excellent presentation of the roentgen therapy of toxic thyroid disease particularly since the cases have been so carefully followed and the laboratory work so thoroughly covered.

This careful study has demonstrated very definitely that the results to be expected in radiation therapy are not quite as good as some surgical results, but equally as good or perhaps better than results obtained by surgeons inexperienced in the handling of thyroid cases. It therefore seems to me that the important consideration in the treatment of toxic thyroid disease is not the superiority of surgery or radiation therapy in the individual case nor the merits of either form of therapy in the hands of a given individual or group of individuals. It is rather the question with which the general practitioner is faced whenever one of his patients is suffering from toxic thyroid disease. This question is how is this patient to be treated? Shall I refer her for surgical or radiation therapy?

Dr. Freid and Dr. Goldberg have, I think answered this question by the statement of their results and the results of others with radiation therapy and the comparison of these results with those obtained by special surgical clinics and by the general surgeon. They have stated, and properly so that there is no form of treatment that gives results as satisfactory as those obtained by surgical groups specializing in the care of thyroid patients. Furthermore, they have shown that the results obtained by the general surgeon are not to be compared with those of the special surgeon particularly with regard to the mortality rate.

They have also stated that the results from radiation therapy are by no means constant and with this type of treatment as with any other are subject to wide variations depending upon the experience of the individual radiologist with thyroid therapy.

The general practitioner has been provided by these authors with an answer to the questions previously stated. If his patient is suffering from toxic thyroid disease and if a surgeon specializing in treatment of this disease is available it is obvious that he should refer the patient to this surgeon for operation. If however no such expert surgeon is available, he must determine whether or not there is a competent radiologist near at hand and refer the patient for radiation therapy. By so doing he is not risking the high mortality rate of general surgery and he is offering the patient a chance of improvement that is equally as great as that to be expected from the general surgeon. Furthermore if x ray therapy results in improvement that is not satisfactory the patient can be referred for surgery, and even if only slight improvement has taken place, the possibility of post operative complication should be at least proportionately reduced. Assuming that radiation therapy is entirely ineffective as of course it will be in some cases, surgery is still available, and the risk should be no greater than before the radiation therapy was undertaken.

In closing I wish to state that Dr. Freid and Dr. Goldberg deserve great credit for so fairly stating the value of radiation therapy in toxic thyroid disease, and showing that the choice of therapy to be used in the individual case depends more upon the quality of radiation therapy versus the quality of surgical therapy than upon judgment of the basic value of either form of treatment.

Finel But bring me one that is well worn.'

—*Medical World*

The salesman had sold the tyro physician about everything he needed for his new office. "And oh yes" he said "you'll need a doormat."

TABLE 2 — CASES OF SEVERE EXOPHTHALMIC GOITER

| Name and Sex | Age | On Admission | | Degree of Exophthalmos | Type and Duration of Treatment | Basal Rate Following Therapy | | Result | Remarks |
|--------------|-----|--------------|------------|------------------------|--------------------------------|------------------------------|------------|---|--|
| | | Pulse Rate | Basal Rate | | | ing | Pulse Rate | | |
| ♂ I M | 39 | 123 | +56 | Moder | 1,000 r D † in 6 wks | +39 | 125 | Controlled BMR +9 14 mo after onset of treatment | Improvement set in following first course of treatment. Patient returned to work during his second course. The good result has been completely sustained over a follow-up period of 6½ yrs |
| | | | | | 3 wks interval | +29 | 122 | | |
| | | | | | 1,000 r D in 7 wks | | | | |
| | | | | | 11 mo interval | + 4 | 96 | | |
| ♂ A.Z | 30 | 115 | +58 | Severe | 1,000 r D in 7 wks | | | Controlled BMR +9 6 mo after onset of treatment | This case was referred for radiation following severe recurrence postoperatively. Goiter completely receded, exophthalmos markedly improved, no residual symptoms, basal normal follow-up 7 yrs |
| | | | | | 2,000 r D in 8½ wks. | +22 | 104 | | |
| | | | | | | | | | |
| | | | | | | | | | |
| ♀ K.H | 34 | 150 | +90 | Mild | 1,000 r D in 6½ wks | +50 | 142 | Controlled BMR +2, 7 mo after onset of treatment | Improved immediately with onset of treatment, and controlled with 2,500 r. The additional 500 r given later probably not necessary. Gland receded completely, and eyes became normal. Followed now for 6 yrs |
| | | | | | 2 wks interval | +14 | 100 | | |
| | | | | | 1,000 r D in 7 wks | +11 | | | |
| | | | | | 7 mo interval | | | | |
| ♀ B.W | 22 | 160 | +88 | Severe | 500 r D in 2 wks | | | Controlled BMR -2-3, 11 wks after onset of treatment | This was a very severe case, refused operation elsewhere. With 1st course, she was controlled for 1 yr, but then developed mixed picture of mild toxicity and myxedema. Later toxicity increased and she was treated again. She has stayed well with normal basal for 5 yrs. |
| | | | | | 1,000 r D in 15 wks | + 2 | 114 | | |
| | | | | | 1 yr interval | +27 | 126 | | |
| | | | | | 500 r D in 2 wks | | | | |
| ♀ L.C | 50 | 100 | +65 | Slight | 7 mo interval basal rose to 32 | +48 | | Controlled BMR +7, 9 mo after onset of treatment | Improved after 1st course, normal after 2nd course. The gland did not recede entirely. After 2 yrs, basal and pulse still normal |
| | | | | | 1,000 r D in 11 wks | +21 | | | |
| | | | | | 2 mo interval | +40 | | | |
| | | | | | 9,000 mchrs in 7 wks | | | | |
| ♀ S.A | 50 | 120 | +60 | Moder | 8 mo interval | | | Controlled BMR +25, 10 mo after onset of treatment | Patient is a case of moderate hypertension. Gland receded, nutrition improved. Residual elevated BMR believed due to hypertension. Good result 2 yrs. follow up |
| | | | | | 2,400 mchrs in 1 wk. | + 7 | 98 | | |
| | | | | | 1,000 r D in 7 wks | +42 | | | |
| | | | | | 6 wks interval | +28 | 92 | | |
| ♀ F.C | 31 | 140 | +54 | Moder | 1,000 r D in 5 wks | +20 | | Controlled BMR +2-4, 10 mo after onset of treatment | Good result 2½ yrs follow up |
| | | | | | 6 wks interval | | | | |
| | | | | | 1,000 r D in 3 wks | | | | |
| | | | | | 6 wks interval | | | | |

| | | | | | | | | | | |
|------|----|-----|-----|------|--------|---|------------------------------|----------------------------|--|---|
| M.C. | 34 | +80 | 100 | Poor | Moder | 10 000 mchrs. in 7 1/2 wks | +62 | 100 | Greatly improved. BMR +46, 8 mo. after onset of treatment | <p>Patient referred for radiation following post-operative recurrence. Improvement in hyperthyroidism, but weight gained greatly in last 3 mo. Initially gained 20 lbs. weight; also receded; controlled. Follow-up 20 mo.</p> |
| I.B. | 43 | +84 | 124 | Poor | Moder | 1 000 r D in 3 mo. | +60 | 98 | Greatly improved. BMR +50 3 mo. after onset of treatment | <p>On admission, patient was fibrillating and decompensated also hypertensive. Weight, tremor, exophthalmos, and cardio status improved. She refused further treatment in favor of operation. Our impression is that treatment should have been more intensive</p> |
| S.R. | 28 | +70 | 116 | Poor | Mild | 9,000 mchrs. in 6 wks. 3 1/2 yrs. interval basal rose to 47 from 0 200 r M. in 2 1/2 wks. 3 mo. interval 3 000 mchrs. in 3 wks 7 mo. interval basal rose to 36 400 r M. in 2 wks. 2 mo. interval 620 r M. in 4 wks. | +43 +50 +54 +53 | 103 74 110 80 | <p>Greatly improved, later recurred. BMR +12, 8 mo. after onset of treatment</p> | <p>Patient is sister to case B.W. She shows marked lability and a tendency to mild recurrence under severe economic strain. Always improved with treatment. Follow up 6 yrs.</p> |
| N.H. | 29 | +60 | 120 | Poor | Moder | 6,800 mchrs. in 5 wks. 1 1/2 yrs. interval 2 100 mchrs. in 1 wk. Basal dropped to 0 later to 10 later to 30 400 r D in 1 wk 3 mo. interval 1 000 r D in 3 wks | +28 +30 +41 +43 | 88 88 92 89 | <p>Improved, later recurred. BMR -3 1 yr. after onset of treatment</p> | <p>A severe cardiac well controlled with earlier treatment. When symptoms recurred 1 1/2 yrs. later and did not respond quickly to treatment operation was advised</p> |
| M.R. | 33 | +66 | 116 | Poor | Moder | 1 000 r D in 6 wks. 4 mo. interval 1 000 r D in 2 wks 8 1/2 mo. interval 20 000 mchrs. in 9 1/2 mo | +63 +73 +33 | | Improved greatly. BMR +22 2 yrs. after onset of treatment BMR 0 4 yrs. after onset of treatment | <p>A case of severe hypertension and arterio-sclerotic heart disease, with frequent decompensation, and fibrillation. He did best under the prolonged radium treatment. His residual symptoms are all cardiac. Mild moderate elevation of basal believed due to his hypertension. Follow up 8 1/2 yrs</p> |
| M.R. | 85 | +66 | 120 | Poor | Mild | 500 r D in 9 1/2 wks. | +60 | | Improved | <p>This patient improved clinically but insufficient treatment was given. Follow-up nussli-factory. Patient gained weight and strength rapidly. Would not return for BMR.</p> |
| L.R. | 59 | +65 | 104 | Poor | Marked | 1 000 r D in 5 wks. 3 mo. interval basal rose 1 000 r D in 5 wks. 6 mo. interval 1 000 r D in 6 wks. | +65 ? +40 | 124 124 | Improved. BMR +37 16 mo. after onset of treatment | <p>A very severe cardiac fibrillating, hypertensive, and frequently decompensated. The measure of toxicity hard to determine. BMR now +27. Greatly improved but not controlled. She has refused operation. Follow-up 3 1/2 yrs.</p> |
| J.H. | 51 | +85 | 116 | Bad | Marked | 1 000 r D in 8 wks. | +89 | 116 | Failure | <p>A case of severe myocardial disease and severe Grava. She was not hospitalized and did not return for follow-up or further treatment. Died in decompensation 4 mo. later</p> |

TABLE 2.—CASES OF SEVERE EXOPHTHALMIC GOITER (Continued)

| Name and Sex | Age | On Admission | | Degree of Exophthalmos | Type and Duration of Treatment | Basal Rate Following Therapy | Pulse Rate Following Therapy | Result | Remarks |
|------------------------------|-----|--------------|------------|------------------------|--------------------------------|---|--|--|---|
| | | Basal Rate | Pulse Rate | | | | | | |
| J C [♂] | 26 | +68 | 120 | Fair | Slight | 520 r M in 4 wks. 1 mo interval 520 r M in 8 wks | +64 116 | Failure | Patient uncooperative. Followed 4 mo He went to operation |
| B D [♂] | 32 | +60 | 104 | Poor | Marked | 520 r M in 4 wks 7 1/2 wks interval 300 r M in 3 wks 9 wks interval 520 r M in 3 wks. 9 wks interval 470 r M in 3 wks 6 wks interval 520 r M in 4 1/2 wks | +57 112 +41 112 +50 86 +40 92 +48 98 | Failure | A case originally uncontrolled by operation Patient also received 1,000 r D to right and left pituitary fields. Slight temporary recession. Surgery advised again |
| MODERATE EXOPHTHALMIC GOITER | | | | | | | | | |
| T S [♀] | 21 | +49 | 115 | Poor | Slight | 520 r M in 5 wks | +18 96 | Controlled. 3 mo after onset of treatment | A patient who was treated with iodides and improved. However on recurrence she was referred for radiotherapy and responded promptly and well. Has stayed well in spite of severe working conditions, attack of typhoid, respiratory infections, and emotional maladjustment. Followed 4 1/2 yrs, basal normal |
| S E [♂] | 47 | +25 | 90 | Poor | Moderate | 18,000 mchrs in 4 mo 2 mo interval 2,700 mchrs in 2 wks. | -4 78 | Controlled | Improvement maintained now for 3 1/2 yrs. |
| R.L [♀] | 35 | +41 | 110 | Good | Marked | 2,200 mchrs. in 1 wk. 2 yrs interval 1,000 r D in 5 wks. 1 yr interval 520 r M in 5 wks. | +20 80 | Greatly improved. BMR +20, 8 mo after onset of treatment | A case of moderately severe Grave's who did well on 1st course of treatment. Gland receded with therapy. Then emotional shock (husband's death) and respiratory infection brought on a recurrence. Treated again but follow up interrupted, response unknown Follow-up 3 yrs. |
| A.B [♀] | 47 | +48 | 132 | Fair | Slight | 2,000 r D in 6 mo 1 mo interval 500 r D | +14 Flb +33 | Greatly improved BMR +14 7 mo after onset of treatment | Treatment was overprotracted Patient often in fibrillation She gained a good deal of weight and was greatly improved. (BMR fluctuated, although general condition greatly improved) Extreme psychic factor here. Follow-up 1 1/2 yrs |
| W S [♂] | 22 | +40 | 126 | Fair | Marked | 1,000 r D in 4 wks 2 mo interval 1,000 r D in 2 wks | +64 112 | Failed | Worked 10 hrs daily while under treatment. Went to operation 6 mo after admission here |

SEVERE HYPERTHYROIDISM

| | | | | | | | | | | |
|--------------------------|----|-----|-------------|------|---|--|------------|------------|--|---|
| M.V.^{c} | 44 | +87 | 106 | Bad | 0 | 10,000 mchrs. in 9 wks. 0 wks. interval 10,500 mchrs. in 3 mo. | +39 +36 | 83 92 | Controlled. BMR -2 13 mo. after onset of treatment | A case with severe adrenal features, (diarrhea, weight atrophy, etc.) which was well controlled by radium. The toxicity was limited to remain underweight and nervous. Basal now normal. Follow up 8 yrs. 9 mo. |
| J.S.^{c} | 37 | +66 | 130 | Fair | 0 | 1 000 r D in 4 wks. | +48 | 110 | Controlled. BMR +17, 3 mo. after onset of treatment | Continued to improve after 1st course basal normal. Follow up 14 mo then lost sight of |
| J.S.^{c} | 49 | +60 | 128 | Good | 0 | 1 000 r D in 11 wks. | +10 | 80 | Controlled. BMR +10, 3 mo. after onset of treatment | He developed mild myxedema 2 mo. after treatment and this has persisted to date a period of 6 1/2 yrs. This is the only case with such small dosage developing and maintaining a myxedema picture. Recently he developed a pernicious anemia. This may explain residual features. |
| B.P.^{c} | 25 | +60 | 126 | Fair | 0 | 9 000 mchrs. in 4 wks. 2 mo. interval 9 000 mchrs in 2 1/2 wks. | +42 +15 | 120 100 | Controlled. BMR +7, 4 mo. after onset of treatment | Controlled for 4 yrs., then recurred and controlled again with 650 r M. to the gland |
| R.K.^{c} | 53 | +83 | 160 | Poor | 0 | 525 r M. in " wks. | +40 | 96 | Greatly improved. BMR +15 7 mo. after onset of treatment | A case with hypertension, nephritis, and diabetes, who never responded in the control of her diabetes. No clinical complaints referable to thyroid. Follow up 2 yrs. |
| A.S.^{c} | 33 | +59 | 110 | Poor | 0 | 1 000 r D in 4 wks. 2 1/2 mo. interval 500 r D in 1 wk. 8 mo. interval 1 000 r D in 2 mo | +23 +35 | 100 98 | Greatly improved. BMR +9 14 mo. after onset of treatment | A case improved by radiation therapy iodides, and rest, and fairly well controlled. Difficult to estimate the effect of the thyroid. Produced slight temporary elevation in BMR. Follow up 2 1/2 yrs. |
| M.P.^{c} | 56 | +75 | 140 | Poor | 0 | 4 500 mchrs. in 5 1/2 wks. 7 wks. interval 3 420 mchrs. in 3 wks. 1 yr interval 1 600 r D in 4 wks. 11 mo. interval 520 r M. in 1 mo. 2 1/2 mo. interval 260 r M. in 2 wks. | +50 | 90 | Partially controlled | Her last basal is now +20 pulse 78. It took a long time for her to reach this level. The slow result can be attributed to poor home condition of patient (husband out of work and difficult to get on with lack of food and rest) It is hard to estimate the role of therapy in this case. Follow-up 4 yrs. |
| R.L.^{c} | 55 | +73 | 120 Fib. | Poor | 0 | 1,000 r D in 3 wks. 9 mo. interval 520 r M. in 2 1/2 wks. | +70 +84 | | Failed | A cardiac in frequent decompensation. Some response to digitalis and diuretics. Follow up 1 yr Did not return |

TABLE 2 —CASES OF SEVERE EXOPHTHALMIC GOITER (Continued)

| Name and Sex | On Admission | | Degree of Exophthalmos | Type and Duration of Treatment | Basal Rate Following Therapy | Pulse Rate Following Therapy | Result | Remarks | |
|--------------------------|--------------|------------|------------------------|--------------------------------|------------------------------|--|-------------------------------|--|---|
| | Age | Basal Rate | | | | | | | |
| A P | 25 | +60 | 112 | Good | 0 | 1,000 r D in 4 wks. 1 mo interval 1,000 r D in 2 1/2 wks. 6 mo interval 1,000 r D in 4 wks | +50 128 +64 130 +60 132 | Failed | This patient did not respond to therapy. When operation was advised, she did not return. It was learned that she was later admitted to Central Islip as a case manic depressive psychosis. Her thyroid picture there fluctuated. After 2 yrs she was discharged with thyroid picture partly controlled. |
| MODERATE HYPERTHYROIDISM | | | | | | | | | |
| T H | 38 | +25 | 97 | Fair | 0 | 750 r D in 2 wks. | +13 86 | Controlled BMR +13 1 mo after onset of treatment | Clinically more severe than basal rate indicates. Responded promptly. Follow-up 8 mo. |
| E B | 37 | +45 | 88 | Good | 0 | 1,000 r D in 4 wks 8 mo interval 1,000 r D in 4 wks | +17 93 + 7 88 | Controlled BMR +6, 4 mo after onset of treatment | She made practically complete recovery with 1st course. Because of slight symptoms and bruit over gland 8 mo later a second course was thought advisable. Good result, entirely normal. Follow up 1 yr. |
| Y L | 50 | +38 | 122 Fib | Poor | 0 | 1,500 mchrs in 4 wks 2 mo interval 350 r D | + 7 90 | Controlled BMR +7, 5 mo after onset of treatment | Cardiac (enl heart hypertension, fibrillation basal pleurisy) controlled with small amt of therapy. Cardiac status unchanged. Follow up 1 yr. Last basal +10. |
| E P | 30 | +27 | 92 | Good | 0 | 1,000 r D in 2 mo | + 4 90 | Controlled BMR +3, 2 mo after onset of treatment | A case of toxicity following iodine. Toxicity easily controlled with one course of irradiation. |
| O D | 34 | +32 | 118 | Good | 0 | 520 r M in 4 wks | +30 108 | Controlled BMR +4, 4 mo after onset of treatment | His basal fell to +4, pulse to 86. All symptoms have cleared up and he has gained 20 lbs in wt 1 yr follow up. |
| T D | 52 | +55 | 104 | Good | 0 | 520 r M in 4 wks 3 mo interval 520 r M in 3 wks | +53 94 +25 82 | Controlled BMR +25 3 mo after onset of treatment | A patient with long standing goiter (10 yrs.) whose toxic features cleared up promptly with therapy 1 yr follow up. |
| A L | 57 | +45 | 94 | Poor | 0 | 1,000 r D in 5 wks 3 yr interval 650 r M in 8 wks 1 mo interval 520 r M in 4 wks. | +25 90 +40 110 +54 84 | Greatly improved BMR +25 8 mo after onset of treatment | With radiation and with treatment of the complicating duodenal ulcer he gained wt and toxicity subsided. Basal tended to remain partly elevated (+25). Although in good shape he has had a recent recurrence following gripe but toxicity is slight. 3 1/2 yrs follow up. |

TABLE 2—CASES OF SEVERE EXOPHTHALMIC GOITER (Concluded)

| Name and Sex | Age | On Admission | | Degree of Exophthalmos | Type and Duration of Treatment | Basal Rate Following Therapy | Pulse Rate Following Therapy | Result | Remarks |
|--------------|-----|--------------|------------|------------------------|--|------------------------------|------------------------------|--|---|
| | | Basal Rate | Pulse Rate | | | | | | |
| ♂ C A | 44 | +20 | 82 | 0 | 1,000 r D in 11 wks | +10 | 80 | Controlled BMR +10, 3 mo after onset of treatment | A mixed case, with mild toxicity and hypertension. Iodine caused partial involution of the enlarged gland. Follow up 3 yrs |
| ♂ A I | 53 | +6 | 80 | 0 | 1,500 r D in 5 wks | 0 | | Controlled BMR 0, 5 wks after onset of treatment | A case primarily of autonomic imbalance WtL and strength have steadily risen. Follow-up 4 1/3 yrs. |
| ♀ Y S | 44 | +17 | 88 | 0 | 1,000 r D in 4 wks 3 mo interval 500 r D 4 mo interval 500 r D | +10 | | Controlled BMR +7 6 mo after onset of treatment | Weight rose, symptoms receded Follow-up 1 yr |
| ♀ J S | 34 | +12 | 72-100 | 0 | 520 r M in 7 wks. | +1 | 64 | Markedly improved BMR -7, 8 mo after onset of treatment | Labile type. 1 yr follow-up |
| ♀ A G | 22 | +20 | 98 | Slight | 500 r D in 4 wks | +10 | 96 | Markedly improved BMR +8, 2 mo after onset of treatment | Nervousness receded, pulse rate lowered Questionable hyperthyroidism. Follow up 2 yrs |
| ♀ A P | 38 | +17 | 122 | Slight | 1,000 r D in 4 wks | +8 | 90 | Markedly improved. | Though a mild case, she was undoubtedly toxic. She was improved by treatment. Picture complicated by T B C of intestine. She developed T B C pneumonia and died. Follow up 8 mo |
| ♀ A C | 31 | +18 | 120 | 0 | 1,000 r D in 3 wks | +4 | 78 | Markedly improved BMR +4, 9 wks after onset of treatment | Basal rate and pulse restored to normal, but nervousness remained Follow-up 3 1/3 yrs |
| ♀ G C | 20 | +16 | 127 | 0 | 520 r M in 3 wks. | 0 | 104 | Greatly improved, BMR +8, 2 mo after onset of treatment | Many features of autonomic imbalance |
| ♀ D S | 43 | +10 | 100 | Slight | 6 000 mcIrs in 5 wks | +1 | 112 | Failed | Symptoms were primarily those of pressure which were not relieved. She went to operation |

PHYSICAL MEASURES IN THE TREATMENT OF NEUROLOGIC CONDITIONS

RICHARD KOVÁCS, M D, New York City

PHYSICAL treatment of neurologic disorders has made great strides since the time when simple forms of hydrotherapy were practiced for sedative or tonic purposes and the primitive electrical currents—the galvanic and faradic—were recommended without much rhyme or reason and often as a convenient means to disguise suggestive therapeutics. There is now available an almost bewildering multitude of newer physical agents, such as low frequency currents, diathermy and short-wave diathermy, static electricity artificial fever therapy, ultraviolet radiation, whirlpool baths, therapeutic pools, and exercise apparatus. The potency and controllability of these measures cannot be doubted once a proper conception of their primary physical and secondary physiologic effects is established and once they are linked up with a definite diagnosis and a general line of therapeutic endeavor.* They serve in the large majority of cases as adjuvants in giving comfort, decreasing the use of sedative medication, and maintaining or restoring function, and in a few instances they serve for treatment direct to the underlying cause. A comprehensive table of Veraguth¹ presents the changes in the nervous system and their relation to problems of treatment.

Neuritis and Neuralgia

In neuritis with its great variety of etiologic factors, as shown in the table of Cobb and Coggeshall,² a large variety of therapeutic approaches has been established. Physical measures applied in con-

nection with efforts directed to remove the exciting cause serve for constitutional effects in generalized neuritis and for relief of pain and paralysis in localized neuritis. The dividing line between *neuritis* and *neuralgia* is at times not quite definite and from the standpoint of physical therapy the same principles of procedure apply.

In *polyneuritis* of a rheumatic or toxic type general heat measures—electric cabinet baths, hot baths—are indicated for stimulation of metabolism and increased elimination." Artificial fever therapy—the rationale of which will be discussed later on—is justified in severe or resistant types and has been favorably reported on recently by clinicians (Bennett and Cash).³ Only mild fevers of 103 to 105 F for two to four hours each for two to six treatments are indicated. Due care is essential to prevent burns because of anesthetic parts of limbs.

In *localized neuritis* caused by trauma or pressure physical measures should be instituted from the outset while a search for the exciting cause is carried on. Rest and relaxation of the affected area by bed rest, light splinting, or a sling are simple and effective measures. It is indeed quite a question whether in acute neuritis with very severe pain, the relief obtained by any form of office treatment is worth the effort and risk of going about to procure it. Home treatment by simple physical measures or portable apparatus now helps to solve the problem. Mild local heating is the main standby for giving relief from pain. Its action is two-fold because it not only brings about direct sedation of sensory nerve endings but also relieves the exaggerated defense mechanism of muscle spasm. This action

* This presentation will confine itself to those conditions in the treatment of which physical agents play or should play an important role. It will present some of the newer methods and trends of physical treatment but because of limitation of space, will not include details of technique.

explains why more penetrating forms of heating—diathermy and short-wave diathermy—are more effective than hot compresses and bakers. The intermittent use of radiant heating from a simple heat lamp or infrared generator may serve for home use. In very acute cases sedative medication often cannot be avoided, but can be tapered off as relief by physical measures takes hold.

In subacute cases heat treatment may be followed or supplemented by mild counterirritation of the skin, for this purpose the Oudin or monoterminial high-frequency current, the plain galvanic current or ionization with vasodilating drugs, or local ultraviolet in mild sunburning doses may be employed. Mechanical measures such as gentle massage and muscle exercising currents are best reserved for selected chronic cases where the exercise of flabby muscles and the breaking up of fibrotic nodules or perineuritic adhesions may be indicated.

Bell's palsy due to neuritis of the facial nerve is of special interest because of the favorable possibilities of early treatment by physical means. It has been shown that edema in a nerve trunk may interrupt the passage of nerve impulses along the axons, especially if the edema happens to be at a point at which the nerve is passing through a bony canal (Cobb and Coggeshall).² The effect of exposure of the facial nerve brings on edema that blocks the facial canal near the point of exit and presses on the facial nerve. This etiology offers the possibility of a quick absorption of the edema by suitable physical measures, as has been amply proved by clinical experience of the author and that of other clinicians. It also explains the number of spontaneous recoveries within a few days or weeks, with absence of the reaction of degeneration in the so-called light cases. On the other hand, in untreated or originally severe cases, secondary involvement of the nerve fibers occurs due to continued pressure and, according to the extent of the nerve degeneration, a condition lasting from a few weeks to a year and lead-

ing possibly to permanent atrophy of some of the smaller muscles may ensue. On the basis of these facts, the immediate application of "decongestive" measures in cases of Bell's palsy seems rational and the usually quick and uncomplicated recovery of cases treated from the onset makes it evident that the former dictum, that no treatment and especially "no electricity" should be administered during the early period, is obsolete.

Treatment should begin in all cases with a superficial thermal measure such as the radiation from a small luminous heat or infrared generator. An exposure of from twenty minutes to one-half hour also serves to relieve pain if present. The comfort given by diathermy or short-wave diathermy is even more marked. The measure of choice for "decongestion" is the static-wave current, besides the electrokinetic effects under the electrode it also brings about painless contraction of all affected muscles. Its often repeated effect in clearing up the condition in a comparatively short time may be explained by the dispersion of the congestive infiltration around the nerve trunk. In a consecutive series of some 12 cases treated from the beginning, the author has not seen one develop the reaction of degeneration. Strapping or other means to prevent sagging of the affected side should be employed at once. In the absence of a static apparatus mild stimulation by a surging low-frequency current may be used.

If the patient reports late, i.e., after ten days, electrical testing is important for the prognosis of the probable duration, for it will allow differentiation between light cases lasting a few weeks and moderately severe cases in which recovery may take from three to nine months. In these severe cases physical treatment consisting of a thermal measure followed by electrical muscle stimulation by a low frequency current—preferably the slow sinusoidal—will comfort the patient and tend to maintain some of the contractility of the paralyzed muscles. It will not prevent atrophy of some of the intrinsic mus-

cles and neither will it prevent the occurrence of contracture in a small percentage of cases. If a tendency shows toward contracture, instead of electrical stimulation, only mild heating and gentle stroking massage should be employed.

Brachial neuritis, intercostal neuralgia, and the sciatic syndrome may receive physical treatment along the general lines already described. In alcoholic polyneuritis weakness of the lower extremities usually responds well to muscle stimulation by a surging faradic current.

In *trifacial neuralgia* physical treatment as a rule is not very satisfactory. A variety of measures are recommended but there are no controlled statistical studies available as to their effectiveness. Theoretically, deep heating by short-wave diathermy should be able to relieve arterial spasm—one of the suspected main factors in the condition. In *intercostal neuralgia*, radiant heat or diathermy combined with ultraviolet irradiation or the Oudin current for counterirritation and, in early cases, with the static brush discharge are usually helpful. In localized neuritis of the external cutaneous nerve of the thigh known as *meralgia paresthetica* there is presumably a fibrositis, pressure on the nerve as it passes through a fibrous tunnel of the fascia lata. Radiant heating followed by mild Oudin application usually relieves this condition in a few treatments.

Pressure upon *spinal nerve roots* with subsequent radicular symptoms is still debated by some clinicians in the recent literature. Wentworth⁴ in discussing the treatment of back injuries, states that one may accept that the posterior primary division of the spinal nerve winds closely over the ligamenture of the articulation, and that any inflammation of the joint may institute radiating pain, but that there is direct pressure upon the nerve roots appears improbable, there would seem to be ample space for the nerve in any spinal position. Oppenheimer⁵ on the other hand believes that the occurrence of neuritic pain suggesting spinal arthritis has often been found due to

segmental neuritis resulting from compression of the nerve roots by narrowing of the intervertebral foramina. The author has been able in a fairly large number of cases referred with such symptoms to give relief by deep thermal measures—diathermy and short-wave diathermy—followed by massage and static sparks. In a number of the cervical cases the application of head traction or at least suitable bracing is essential.

Fibrositis and Myositis

Fibrositis has been defined as the reaction of the fibrous supporting tissues of the body to extraneous poisons, which may be bacterial or toxic. It occurs in persons who may be constitutionally disposed to such a reaction. This reaction may be acute or chronic and may include inflammatory changes in muscles, tendons, bursas, and nerve sheaths. Fibrositis in the sheath of a nerve trunk must be differentiated from toxic neuritis. This now more and more generally accepted conception of fibrositis, accounts for many borderline cases between medicine and neurology. It also offers a potent field for the employment of physical measures for general treatment to counteract the constitutional factors and for local treatment to relieve pain and stiffness. The general measures are the same as those described for neuritis.

In the local treatment attention should be directed to an effort to remove the cause of local symptoms. The fibrositic nodule, which is considered a tissue reaction to the circulating toxins and appears histologically similar to the Aschoff bodies described in the myocardium. Recent contributions, including those from the Mayo Clinic (Krusen,⁶ Slocumb⁷), corroborate the fact, empirically established long ago, that it is possible in the chronic state to rub out the nodule by manipulative treatment, kneading massage. The author found contractile forms of electrical currents such as faradic or static effective. The diagnosis of a fibrositis may be made on the basis of typical pain and stiffness,

following exposure to cold or strain or coming on insidiously in a patient with a rheumatic tendency. In other cases, one may locate in the relaxed structures typical bands or nodules, often acutely tender. When the nodule is situated in muscle fibers, pressure upon it will often induce a reflex contraction of the muscles.

In the constitutional treatment of fibrositis and myositis, general thermal measures are of paramount importance. It is the instinctive desire of these rheumatic sufferers for a general regime of elimination, relaxation, and upbuilding, which fills many of the health resorts. Unfortunately, in this country, medically well-directed health resorts are not yet as numerous as they should be.

Nerve Injuries

The importance of physical treatment in nerve injuries is well established. Pollock⁸ states that "when a primary or secondary suture is indicated immediately, physiotherapeutic treatment must assist the operative procedure. When it is felt advisable to defer the operative procedure, physical therapy must be initiated promptly to the end that when the nerve regenerates, it will activate a mechanism capable of adequate movement." Contrary to an erroneous conception existing in some minds, there is no electrical test available that will ascertain whether or not there is a separation of nerve fibers to such an extent that spontaneous regrowth is impossible. In case of penetrating injuries the surgeon must decide on purely anatomic considerations whether to make an immediate nerve suture or not.

Among physical measures indicated in nerve injuries the intelligent use of splinting is one of the most important ones. It is regrettable to see, every so often, a person with a drop foot or drop wrist referred for electrotherapy in whom no splinting of any sort has been employed. Even the most painstaking form of electrical exercise applied for a short period daily, cannot possibly overcome the potential harm caused by the con-

tinuous drag of the antagonists when proper splinting is neglected. On the other hand, splinting should not be kept up indefinitely, as prolonged immobilization in itself will cause periarthral joint changes and muscle atrophy. Many patients have been incapacitated by the fibrosis that has resulted from the prolonged and uninterrupted use of splints.

Other physical measures indicated are as follows: "massage to improve the nutrition of the parts, to prevent adhesions of scars and fibrosis and to conserve the bulk of the muscles, passive movements to prevent deformity from shortening, interphalangeal fibrosis, ankylosis of joints, active exercise to conserve the unparalyzed muscles, to stimulate circulation, to educate synergistic muscles to assume the function of paralyzed muscles, electrotherapy to conserve the vitality, prevent complete atonia and increase the contractility of paralyzed muscles, and hydrotherapy and thermotherapy to assist in nutritional conservation and to facilitate other methods of treatment." (Pollock)

The judgment of an experienced physician usually combined with the skill of an expert technician is required to carry on the physical treatment of a severe nerve injury through its various stages. Attention must be drawn to the danger of burns following the application of heating measures by unskilled hands over an area with lessened or totally lacking sensibility. In the average case of nerve injury in extremities the warm whirlpool bath appears as the safest heating measure.

Degenerative Conditions

In this group one may include such conditions as general paresis, locomotor ataxia, and multiplex sclerosis in which there occurs degeneration of the highly differentiated elements of the central nervous system at times preceded by a primary inflammation. No restoration of these elements by any form of treatment can be expected. Hydro- and thermo-

therapy, massage, exercise, and various physical agents can be usefully employed for symptomatic relief or for general roborant effect.

In recent years hyperpyrexia by physical means has added a potent new weapon. Its rationale is well established in conditions caused by such thermolabile organisms as the different strains of gonococci. So far as syphilitic affections are concerned the high thermal death point of the *spirochaeta pallida* does not allow for such simple interpretation. Investigators like O'Leary⁹ and Neymann¹⁰ conclude that fever therapy affects the stimulation of the natural defensive mechanism of the body, but the nature of these hologic phenomena is at present still unknown. In contrast to the sustained very high temperatures indicated in gonorrheal infections, in many of the central nervous-system affections only moderately high fevers (from 104 to 105 F) sustained from three to five hours and repeated once or twice a week are indicated.

In *general paresis* a recent survey by Neymann¹⁰ shows that out of 908 cases treated by a number of clinicians by electropyrrexia, 28 per cent showed complete remission and 35 per cent were improved, 25 per cent died as a result of the treatment. Fever therapy by physical means is less hazardous and there appears to be no other proved effect of malarial inoculation except that of producing fever. Hinsie and Blalock¹¹ observed 326 patients for ten years and found most favorable clinical and serologic results in those paretics who received either form of fever therapy followed by chemotherapy.

In *locomotor ataxia* results similar to *paresis* have been reported with fever therapy, a tabulation by Neymann shows 54 to 60 per cent improvement in 90 cases. The author has also been able to achieve about the same percentage of improvement in a small series of cases. It seems advisable that fever treatment should be used mainly in progressive cases that appear clinically and biologi-

cally resistant to the usual specific treatment, it appears useful in relieving tabetic pains especially in those cases that are characterized by repeated shooting pains or gastric crises, it is also recommended in tabetic optic atrophy.

In *multiple sclerosis* a fair percentage of improvement by fever treatment has been observed by several clinicians, including the author. Hence, in spite of the well known spontaneous remissions in this condition, the routine use of a series of fever treatments seems indicated.

One may append here the striking results reported in recent years by fever therapy in *chorea minor*. Sutton and Dodge¹² found that it was possible to cut short an attack of chorea with one or two treatments, especially when cases were treated early regardless of their severity. Endocarditis appears not to be a contra-indication to fever treatment.

Hemiplegia

Physical treatment has a definite place in the treatment of hemiplegia following arterial obstruction or hemorrhage, it serves for the early rehabilitation and re-education of affected extremities, for hastening convalescence and restitution, and for contributing to mental ease. In the first week of hemiplegia while the patient may be still in bed, the application of radiant heat to the affected arm or leg will comfort the paralyzed limbs. Faulty positions of the joints with subsequent contractures are prevented by simple splinting measures and frequent changes in position. Passive movements should be performed early and be accompanied by gentle stroking massage. As soon as some muscular power has returned, the patient should be instructed to re-educate the antagonistic movement at the joints, thus counteracting the tendency to contracture.

In the subacute stage, one can endeavor to use physical measures for improving the vasomotor and sensory disturbances and the spastic paralysis. Graduated muscular contractions by a surging low-tension electric current combined with

gentle massage and suitable exercise serve for this purpose. For relieving paraesthesias and other disturbing sensations, the monoterminal high-frequency (Oudin) current applied through a condenser electrode to the limbs is quite useful. In institutions equipped with therapeutic pools efforts have been made to re-educate and relax the spastic muscles by carefully graduated exercises in the warm-water tank.

In late years an increasing amount of work has been done with physical agents directed to the brain in the subacute and chronic stage of hemiplegia. The author¹³ has for many years found clinical benefit from cerebral galvanism in hemiplegics complaining of headache and dizziness, not due to persistence of high blood pressure. The results may be due either to a direct influence upon the circulation of the brain or to reflex stimulation from the periphery. Martucci, *et al*,¹⁴ have found considerable benefit from cerebral diathermy while French authors have reported a favorable influence on contractures, gait, and speech by the new method of short-wave diathermy. Finally, Bourguignon¹⁵ and Cross¹⁶ have reported definite improvement in chronic hemiplegia by "transcerebral" ionization with calcium chloride. The ingenious method of Bourguignon consists of passing a galvanic current through the closed eyelid toward the occiput. This observer claims that calcium ions are introduced down the optic nerve to the base of the brain and diffuse through the brain tissue. Such reports from widely divergent sources would indicate the need of controlled clinical studies to evaluate this method of electrical treatment to the brain.

Conclusions

The review of the large variety of physical measures available in neurologic conditions indicates that they form a valuable adjunct in treatment. Many of these measures can be applied by the general practitioner and the neurologist, others are reserved for those espe-

cially skilled and equipped, or for institutional use. In all instances, however, it is important that physical measures be employed on the basis of a working diagnosis and with a definite conception of their physical and physiological effects. Likewise in all cases proper technic of application is essential for safety and efficiency. For the sake of the more extended and rational utilization of these important agents, it is highly desirable that there be a close cooperation between the diagnostic work and controlling observation of the neurologist and the clinical judgment and technical knowledge of the physical therapist.

Discussion

Dr. Joseph E. J. King, *New York City*—In discussing this paper I shall limit my remarks for the most part to organic lesions for which neurosurgical procedures have been done or are anticipated. The use of electric cabinet baths, hot baths, artificial fever therapy, diathermy, low-frequency currents, etc., in the treatment of neuritis, neuralgia, Bell's palsy, myositis, degenerative conditions, etc., have been described by Dr. Kovács, and are fairly well known, but I have had no experience in these conditions worth mentioning.

I wish to emphasize what the speaker has said regarding the use of physical measures in the

broad sense to peripheral nerve lesions, mono- or hemiplegias, or pareses associated with brain lesions—tumors abscesses and those of traumatic origin—and paraplegia and quadriplegia associated with spinal-cord tumors cysts and trauma.

The first most outstanding emphasis or impetus toward physiotherapy in my experience was in the neurosurgical services in the World War. The number of peripheral nerve injuries and paralyses by gunshot and other trauma was large. This afforded a splendid opportunity for organization of large and at that time rather well-equipped departments of physiotherapy both as regards equipment and personnel. Occupational therapy, which is but a form of the subject under consideration, also was developed to a high degree.

I heartily agree with the speaker's quotations from Pollock, especially that "physical therapy must be initiated promptly (and I might add continued for a long time) to the end that when the nerve regenerates it will activate a mechanism capable of adequate movement." This is most important. It is no surgical triumph to effect a good nerve suture and neglect the muscle, ligaments, and joints of the extremity supplied by the nerve, resulting in a useless face hand, arm foot, or leg.

One of the most outstanding examples of implicit faith on the part of both patient and therapist was the almost interminable visits of the patient to the department of physical therapy for treatment following neurolysis of a nerve for partial paralysis or nerve suture after complete division. This treatment was continued for months with no apparent improvement from day to day. Still it was continued. Observation of the large number of patients with these injuries at Cape May and Fox Hills proved the efficacy of physical measures which are now so much improved.

Splinting has been referred to. This is most important to prevent stretching or overstretching of the paralyzed muscles by the opposing unaffected group or groups. Attention has been called to the fact that these splints should be readily removed for the purpose of using the various forms of physical therapy and that they should not be left in position for an uninterrupted long time. The damages produced by prolonged and continued splinting may decidedly outweigh the advantages. The most suitable splints used by us were devised at Cape May by Dr. Robert Buerki, now Medical Director of the University Hospital, Madison Wisconsin. I refer to those used for paralyses of nerves of the upper and lower extremities. All, with the ex-

ception of the airplane splint were made of bronzed steel wire, about No. 9 size and were light and yet strong enough to maintain proper position. They were fitted with cuffs, straps and buckles and could be removed as easily and quickly as a glove. Some other splints are so heavy and cumbersome that it is almost like a tug-of-war to get them on and off.

Massage electrical stimulation, manipulation baths of all kinds mechanical apparatus etc. have proved effective in maintaining the nutrition of the parts preventing fibrous ankylosis, and atonia. However active motion or attempts at active motion in an incompletely paralyzed muscle or groups of muscle are of the greatest value in restoration of function. The controlled use of various kinds of tools in a workshop is to be commended as well as other exercises especially in swimming pools where the drag against gravity is lessened.

What has been said about peripheral nerve injuries likewise applies to the plegias and pareses associated with brain and cord lesions. I do not know of any form of physical therapy that benefits the patient suffering from the douloureux or major trigeminal neuralgia.

The intelligent use of physical measures in the cases with which we have to deal is heartily endorsed.

Dr. John H. Nolan, *New York City*—We are indebted to Dr. Kovács for his sane and conservative presentation of his subject. All that we can expect of physiotherapy is the relief of pain and conservation of muscle tone.

Generally speaking doctors have very little faith in the management of nervous diseases—partly because they have been taught to believe that nerve tissue once diseased cannot regain function and partly because of inadequate instructions in physiotherapy.

It is true that nerve tissue cannot regenerate—but how is anyone to know that there is complete destruction. We all know that many disorders characterized by inflammation, hemorrhage thrombosis etc. have an accompanying edema that disturbs function quite as much as actual destruction. While this pressure edema is subsiding many things can be done to keep the paralyzed muscles in optimal condition for regaining function such as splinting light massage, passive motion.

Dr. Kovács says that the dividing line between neuralgia and neuritis is at times not quite definite. This should not be. Neuritis is unfortunately a name given to almost any kind of a pain on the surface of the body whether of nerve, muscle or bone. To be brief neuritis

is a disorder characterized by pain, sensory disturbances, muscular weakness, and paralysis. Neuralgia is an irritative phenomenon with paroxysmal pain along the distribution of anatomic nerve supply. Neuritis requires bed rest and soothing baths. Neuralgia requires diathermy and counterirritation.

At this point I would like to emphasize the value of early diagnosis in the treatment of neuritis. On July 2, 1935, a 40-year-old man presented himself complaining of numbness in the hands and feet of two weeks' duration, which was gradually becoming more troublesome. He was accustomed to consume a considerable amount of alcohol.

On examination briefly, he presented a slight ataxia of the left hand, the right being normal. The deep reflexes showed only the absence of the Achilles. There was weakness in extension in both hands as well as grasp. There was no disturbance in the muscle status, except extreme tenderness in the calf of the muscles. Sensory examination showed a glove and stocking type to touch, pain, and temperature in the hands and feet, as well as absence of vibration sense. The cranial nerves presented no abnormality, Wassermann test was negative.

When I told him that he had a beginning alcohol neuritis and advised that he would have to discontinue his drinking, he assured me that this he could not do, that he would rather be paralyzed than stop. I informed him that I would do my best and advised that he take a well-known preparation of vitamin B in adequate amounts and take his chances. He also was instructed to take a vitamin B tablet with each drink.

He returned July 11. The vibration sense had returned, sensation to pin was normal. On July 17 there was no further change. On August 6 he was well, sensory examination was normal and the Achilles reflexes were present. Since that time I have seen him on frequent occasions and he has never complained of his trouble, and in my opinion he is practically well, in spite of the fact that he is drinking more than ever. He still takes his vitamin B.

Dr Kovács' experiences with the early treatment of Bell's palsy is of paramount importance, because he has shown us that the earlier the treatment is given the better are the results.

As far as fibrositis and fibromyositis are concerned, the best results that I have seen have been brought about by the clearing up of local infections and hyperthermia, to illustrate a patient, who for ten years had been totally disabled because of fibromyositis and had been considered for a long time having peripheral

neuritis, became perfectly well after the removal of infected tonsils and fever treatment. He was able to return to his occupation.

I think that fever treatment of paresis is well established, but naturally the results depend on treating the case in early phases. This applies to tabes also.

Our results at the City Hospital have been disappointing, probably because our cases are all of such long duration. I think that if it were possible to see tabes in its incipency much could be done. I have never seen any benefit in our wards obtained in optic atrophy. Hemiplegia tends to improve of itself but needs splinting, light massage, braces, and especially re-education as soon as the patient is able to cooperate. Occupational therapy is very useful and not only encourages the patient to use the crippled parts, but gives him a new outlook on life.

I have not seen any improvement in multiple sclerosis or any of the degenerative diseases, but feel that it is worth while to try fever therapy under hospital supervision. Finally, I believe that x-ray therapy is especially useful in pituitary adenoma, to retard malignant growth after operations, and to relieve intractable neuralgic pains.

Dr Ralph T Collins, *New York City*—I have been very much interested in the presentation by Dr Kovács. I think he has covered the subject quite well, but I would like to make a few remarks relative to this subject. At the Neurological Institute we have a large physical therapy department consisting of fifteen technicians. This department has been, and is, a very popular and busy department. Our experience with neurologic conditions is wide and varied. I agree with Dr Kovács' remarks as far as he goes. We have not had the same brilliant results with hyperthermia in multiple sclerosis as he has had. In those cases of peripheral neuritis that have dysesthesia we have found that warm whirlpool baths have been very comforting. Where there is motor disability in these cases, we also use the galvanic motor-point stimulation. We have found that most cases of Parkinsonism are relieved of their rigidity, tremor, and general tension by a combination of a Nauheim bath and general massage. All types of myelitis usually require physical therapy in the form of superficial heat, electro stimulation of the muscles, and exercise. A typical facial neuralgia has yielded to the Oudin current and a fast sinusoidal current. In many cases of root pains from a vertebral arthritis, the symptoms are relieved by some type of penetrating heat.

and massage. We do a great deal of peripheral nerve work following nerve suture in the form of diathermy through and through the scar galvanic motor point stimulation of the muscles involved and superficial heat and exercise. A great deal of our work consists in re-education of patients who have had cerebral vascular accidents and those who have had cerebral and spinal-cord tumors removed. Of course those patients from whom a meningioma has been removed deserve more concentration upon re

education. Our fever therapy Department is very active and we are treating many conditions of the nervous system. At the present time, we are experimenting in the use of cerebral galvanism for the relief of lumbar puncture, headache, and encephalographic headache with good results. In closing I wish to stress that in about 95 per cent of our patients we are treating symptoms and not the neurologic lesion. This percentage should be reduced in the future.

SECRETARY ASSISTANT TO THE PHYSICIAN

She sits still in her chair
And listens to voices from everywhere
She knows all the gossip she knows all the news
She knows who is happy and who has the blues
She knows of our sorrows she knows of our joys
She knows all the girls who are chasing the boys
She knows of our troubles she knows of our strife,
She knows every man who talks mean to his wife.
She knows every time we are out with the boys
She knows the excuses that each man employs
If the Assistant told just half what she knows
It would turn all our friends into bitter foes

She would sow a small wind that would soon be a gale
Engulf us in trouble and land us in jail
She would start forth a story that gaining in force
Would cause half our wives to sue for divorce
She would get all our churches mixed up in a fight
She would turn all our days into sorrowing nights.
In fact she could keep the whole town in a stew
If she told but one-tenth of the things that she knew

WORKMEN'S COMPENSATION

Rules and Regulations Promulgated by the Industrial Commissioner Covering Chapters 258 and 930 of the Laws of 1935 Amending Section 13 of the Workmen's Compensation Law

Rule 1 Medical Compensation Boards shall pass upon the applications of physicians within a reasonable time and notify the Industrial Commissioner of their action. If any such board fails to recommend that a physician be authorized to render medical care under Chapter 258 the physician may appeal to the Industrial Council as provided in clause (G) of Subdivision 4 of Section 10-A of the Labor Law, and the Council thereafter will have sole jurisdiction.

Rule 2 Removal of physicians from panels and revocation of licenses of medical bureaus. Section 13-d

The recommending compensation board or the Board of the County Medical Society in a county where any authorized physician has removed his office, shall investigate, hear, and determine all charges of professional or other misconduct by any authorized physician or by any licensed compensation medical bureau or laboratory under the rules and procedure prescribed by the Industrial Commissioner as follows:

(a) The physician or medical bureau accused of misconduct shall be given twenty days' notice of the charges in writing, including a bill of particulars setting forth the specific section and subdivision of the law violated, and the time, date, and place of the hearing.

(b) Careful records and minutes shall be kept of the hearing.

(c) These records, together with the report of the Board of the Medical Society or other Board, with its findings shall be submitted to the Commissioner.

Appeals filed by physicians and medical bureaus with the Industrial Council shall be referred to the subcommittee designated by the Industrial Council to

ascertain the facts and report its findings to the Council for final action.

(a) A physician or medical bureau may file an appeal with the Industrial Council from the decision of the Medical Society or other Board.

(b) A physician or medical bureau appealing and the Medical Society or other Board whose decision was appealed from, shall be notified in writing, indicating the time, date, and place of hearing.

(c) The physician or medical bureau may be represented by counsel.

(d) Accurate stenographic or stenotype minutes of the hearing shall be kept for the file of the Commissioner and Industrial Council.

Rule 3 When a physician, in association or in copartnership with another physician or physicians, or through another physician or physicians as employees or agents, maintains and operates one or more offices principally for the treatment of injured claimants under the Workmen's Compensation Act, he shall apply for a compensation medical bureau license.

Rule 4 All reports, except Form C-104 filed by attending physicians and specialists, must be verified before a Notary Public or a Commissioner of Deeds to insure their value as prima facie evidence in a compensation case.

Rule 5 All specialists and consultants shall submit a report of their findings in triplicate, one copy to the Industrial Commissioner, one to the attending physician, and one copy to the employer or insurance carrier. If a specialist acts as attending physician, he shall file 48-hour and C-4 reports with the employer or carrier and with the Industrial Commissioner.

Rule 6 All medical reports filed by attending physicians and specialists must contain the authorization certificate number and code letters

Rule 7 When it is necessary for the attending physician to engage the services of a specialist, consultant, or a surgeon, or to provide for physiotherapeutic procedures costing more than \$25 00 or to provide for x ray examinations or special diagnostic laboratory tests costing more than \$10 00, he must secure authorization from the employer or insurance carrier or the Industrial Commissioner

E G—When the total fees for physiotherapeutic treatment approach the sum of \$25 00 the physician shall file an additional C-4 report and request authorization as prescribed in Section 13-A-5

This rule also applies to hospitals, specialists, consultants, and surgeons who are actually engaged to perform such services.

If telephone request for such authorization is made, it should be confirmed by letter. If such authorization is not forthcoming or is not denied within five working days or if such denial is not justified medically or otherwise, the special services required for the patient's welfare should be proceeded with on the ground that authorization has been unreasonably withheld.

Such authorization is not required in an emergency under the provisions of Section 13 A 5

Rule 8 The authority of an employer for the services of a specialist in excess of a \$25 00 fee applies only to the necessity for such services, but the choice of such specialist is entirely within the jurisdiction of the injured worker

Rule 9 When it is in the interest of the injured employee, and where an x ray is required and it is impossible to secure the services of a qualified x-ray specialist, the Board of the local County Medical Society may designate a specially qualified individual to take x ray pictures under the supervision of the at-

tending physician. The attending physician, however, shall render a bill for such service to the employer. This in no way, however, deprives the employer or insurance carrier from having other x-ray pictures taken if they so desire.

Rule 10 A physician authorized to treat workmen's compensation cases, when requested to supersede another physician, must, before beginning treatment of such patient, make reasonable effort to communicate with the attending physician to ascertain the patient's condition. The superseding physician must also advise the attending physician of the name of the person who has requested him to assume care of the case and state the reason therefor. If the second physician cannot contact the attending physician, and the claimant's condition requires immediate treatment, the said physician should advise the doctor previously in attendance within forty-eight hours that he now has the patient in his care. The preceding physician shall supply the succeeding physician with a complete history of the case.

Rule 11 In the event of a serious accident requiring immediate emergency medical aid, an ambulance or any physician may be called to give first aid treatment.

Rule 12 A registered physiotherapist may treat workmen's compensation cases at his own office or bureau when the case is referred to him by an authorized physician. The authorized physician should, however, give written directions to the physiotherapist as to the kind of treatment to be rendered and the number of treatments to be given. These directions must be given in writing by the physician and shall constitute a part of the record of the case.

Rule 13 Bills for x-rays and consultations shall be submitted for payment directly to the employer or carrier by the specialist rendering the service. These services must be authorized in writing by the physician in attendance.

Rule 14 Physicians treating claimants

in hospitals may secure the signature of claimant for authorization to obtain copies of any necessary hospital records

Rule 15 The physician in attendance in public hospitals must be the judge as to when the "emergency status" of the case has terminated. In case of a dispute the matter shall be referred to the Compensation Board of the Medical Society of the county in which the hospital is located for immediate decision.

Rule 16 Medical inspectors of insurance companies shall be admitted to hospitals or other institutions where injured employees are confined, upon proper identification, for the purpose of complying with Section 13-j.

Rule 17 Hospitals and dispensaries shall not operate a medical bureau or clinic for the purpose of rendering medical care and treatment to compensation cases. Hospitals and dispensaries shall not render medical care and treatment to ambulatory compensation cases except for the emergency treatment.

Rule 18 No license is required for an employer to operate a first-aid station for emergency treatment, but no subsequent treatments are to be rendered by any one, other than a qualified physician on the minimum fee schedule basis.

Rule 19 No advertising matter of any nature on compensation work, by or on behalf of authorized physicians, medical bureaus, or laboratories shall be permitted.

Rule 20 No insurance company or self-insurer may reduce the size of NOTICE TO EMPLOYEES (FORM C-105) which is to be posted in all places of employment covered by the Act, unless such permission is granted on application to the Industrial Commissioner.

Rule 21 Section 13-F-2 applies only to the physician selected by the claimant to treat him as provided by Section 13-A.

Such physicians are entitled to a fee for attendance at a hearing when subpoenaed by any party in interest or when directed to do so by a referee or when produced by an insurance carrier or employer.

When such physician is a general practitioner his fee shall be \$10.00 plus mileage (outside New York City) and a fee of \$5.00 for each additional case on which he testifies at the same appearance.

When such physician is a specialist and is so designated and qualified and has examined, consulted, or treated under his specialty, his fee shall be \$25.00 plus mileage (outside New York City) and a fee of \$12.50 for each additional case on which he testifies at the same appearance.

In exceptional cases involving specialists' testimony, the matter may be referred to the Industrial Commissioner who may consider the allowance of a higher fee.

On and after February 1, 1938, in the event of failure of such doctor to complete and submit a verified C-4 report as required by Subdivision 4 of Section 13-A or when the content of such report is vague, misleading, or otherwise incomplete, such doctor shall not be entitled to an attendance fee, unless otherwise directed by the Industrial Commissioner.

Rule 21-A A physician who testifies at hearings or examines claimants or participates in examinations for evidential material for compensation case hearing purposes only may accept fees for such services from claimants, employers, or carriers.

Rule 21-B Any physician, specialist, or consultant involved in the medical care and treatment of a compensation case must appear at a hearing when subpoenaed and shall give his testimony for the prescribed fee set forth in the rules and regulations adopted by the Industrial Commissioner.

This ruling does not deprive the specialists and consultants from applying to the Industrial Commissioner for a higher fee as provided by Rule 21.

In the event of failure to comply with this regulation, such physician, specialist, or consultant will be held responsible to the Industrial Council.

Rule 22 Hospitals shall render bills

for board and room accommodations, medical and surgical supplies, and nursing facilities.

Hospitals may render bills for x-ray, physiotherapeutic, anesthesia, and pathologic services when rendered by or under the supervision of salaried physicians on the staff

The names and qualifications of all physicians and persons rendering services for which charges are made by hospitals must be included in all bills and all medical and x ray reports shall be promptly filed with the employer or its insurance carrier and the Department of Labor

Rules Governing Recommending of Authorized Physicians by Insurance Carriers and Employers and the Procedure to Be Followed by Medical Inspectors and Consultants

Rule 23 The supplying of names of authorized physicians by insurance carriers to their policyholders is in contravention to Section 13, as amended by Chapter 258 of the Laws of 1935. Such policyholders and all employers may secure a list of all authorized physicians in the vicinity of their places of business by applying to the Industrial Commissioner of the Department of Labor

Rule 24 Any physician who acts in the capacity of medical inspector for an insurance carrier or employer in the case of an injured employee under the care of another physician shall not participate in the treatment of said injured employee except in the operation of a rehabilitation clinic or bureau under Section 13-j of the Law. Nothing herein contained affects the right of transfer as provided in Section 13-a(3)

Rule 25 When a medical examination is had under Section 13 a(4) it shall be by a qualified physician at a place reasonably convenient to the claimant and in the presence of the claimant's physician, if in the latter's opinion his presence is necessary. A duplicate copy of all notices of requests for examinations must be sent to the attending physician

Rule 26 No physician designated by an insurance carrier or an employer as a consultant in the case of an injured employee, shall subsequently participate in the medical or surgical care of said injured employee, except with the written consent of the injured employee and his attending physician. Nothing herein contained affects the right of transfer as provided in Section 13 a (3)

Rules Governing the Licensing and Operation of Compensation Medical Bureaus

Rule 27 The character and frequency of accidents, the number of employees in a given plant, and the availability of qualified medical care in the immediate vicinity of the place of employment should be considered in relation to the authorization of an employer's compensation medical bureau.

Rule 28 The bureau should be located in the industrial plant or in the immediate vicinity

Rule 29 The question of the necessity of the presence of a physician during working hours, or the availability of a

physician at stated hours should be determined by an inspection of the plant to ascertain the nature of the hazards and the frequency of accidents

Rule 30 The bureau shall be well housed with sufficient space, light, and air and shall conform to reasonable sanitary requirements. Proper facilities in the form of personnel for assistance in emergencies, instruments, sterilizers, dressings, and drugs shall be available at all times and in amounts proportionate to the size of the plant and the number of employees. Such facilities shall be

adequate for more than mere emergency care and for the more severe type of industrial injury

Rule 31 A bureau license may be given for a stated project which, because of the hazards of the project and the frequency of accidents, requires continued medical care and such license shall be for the life of the given project only. In such cases all employees of all sub-contractors shall be covered by the license

Rule 32 No license shall be issued to an employer to cover any but his own employees except as indicated in Rule 31

Rule 33 No license is required to operate a first-aid station by an employer of labor. Such first-aid or emergency

station should be properly equipped for first aid in accordance with the type of hazard encountered at the particular place of employment

Rule 34 Form C-105, a notice of the rights of an injured employee and the responsibilities of the employer, shall be posted in each compensation medical bureau and first-aid station

Rule 35 All compensation medical bureaus when operated by summer camps and other institutions, wherein such camps and institutions are operating for profit, shall be charged a license fee of \$25.00 per annum for the operation of such medical bureaus which are in operation for six months of the year or less

March 1, 1939

DIAGNOSIS OF MANY DISEASES POSSIBLE THROUGH THE EYE

Such conditions as diabetes, high blood pressure, inflammation of the kidney, syphilis, tuberculosis, intracranial or brain pressure, and optic nerve inflammations often may be diagnosed through the eye long before their presence might otherwise be suspected, Arthur J. Bedell, M.D., Albany, N.Y., says in *The Journal of the American Medical Association* for March 18.

"The background of the eye is the stage on which many of the tragedies of life are enacted," Dr. Bedell states. "By careful repeated examination, early changes can be detected and steps taken to eradicate or diminish the ravages of destructive forces."

This examination is made with a simple ophthalmoscope, an instrument containing a mirror arrangement making possible the examination of the inside of the eye.

The author points out that the recognition of the signs of the above conditions is possible

through the major blood-vessel changes and alterations which may be found in the fundus or back part of the eye.

Although the correct interpretation of all of the gross pathologic signs of the above diseases is a lifetime study, Dr. Bedell believes that, when sufficiently trained, every physician should at least be able to recognize them and by constant daily application should steadily improve his diagnostic capacity.

"The ocular fundus is one of the most available regions in the entire human body for the recognition of incipient, advancing, and destructive processes," Dr. Bedell declares.

"To the initiated, examination of the fundus discloses important clinical signs, which, when gathered together, form part of the life record of the patient. From the knowledge gained by the study of thousands of such reports, accurate prognostic as well as diagnostic conclusions can be drawn."

COMMITTEE IN SPECIALTIES

A Joint Committee in Specialties, comprising pathologists, anesthetists, radiologists, and physical therapists, has been formed in the State

of New York with Dr. M. J. Fein as chairman and Dr. Madge C. L. McGuinness as secretary. About 1,500 Society members are represented.

PRESIDENTIAL ADDRESS

Educating the Public

WILLIAM A. GROAT M D , Syracuse New York

SOME thirty five years ago Grover Cleveland, then ex President of the United States and Professor of Law at Princeton, addressed the Annual Meeting of the Medical Society of the State of New York. He made a plea to the medical profession, asking them to tell the people the truth about medicine that they might see what doctors had done and could do. He said as the keynote of his address 'Tear off this veil of mystery.

We can speculate as to what might have been in his mind. We can think of him as an old man perhaps already marked by the finger of death. Surely he wanted the mystery of life, the mystery of death, the mystery of illness and of mental conflicts solved. Perhaps he saw as the great mission of medicine the sweeping aside of all mysteries surrounding the fundamental things of life and living of death and dying. More and more in the last decade or so medicine has been attempting to do this very thing. It has been attempting to educate the public as to what we know about the mysteries of the human body and its ailments, the functional activities and vital processes. Yet the mysteries remain as the veils are removed. Should we not consider in this hurly burly of things how much confusion is due to faulty methods and misdirected efforts? Surely there is something wrong. Either we are educating the public too much or we are not educating it enough.

Public health education, what should it be and how might it be carried on? Let us consider as examples what the public asks and what it receives in the way of education in a few other professions. Do engineers, with whom we are frequently rated, try to inform the public and educate the public in engineering or do they keep pretty much within the

profession? It is evident that they choose to discuss such things with other engineers and the associated professions figuring that only those who have the proper background can comprehend and make useful applications.

How about the law and the lawyers? Do they give lectures, hold meetings, gather groups together for luncheons in order to have them understand about the law and the administration of it? Much of the medical information we give so freely and informally is falling on unaccustomed ears, and the energy may be wasted. At least some of it appeals only through the curiosity engendered. There seems to be an undiscovered hormone within us urging us to seem to solve and then immediately tell. The smaller part is simple easily understood healthy, and constructive.

Little by little over a period of years so-called welfare and public-health welfare lay groups have taken up what they call health education. First these groups were introduced as assistants. Now they come as dispensers of knowledge quite independent of the medical profession. These people have absorbed a certain amount of information and make their living dispensing it. It is called a new profession whereas it is a piece of an old one. Organizations backed by funds collected from the public in various direct and indirect ways, seek to popularize the principles, demonstrate the values, organize the administration, and in some instances control public health work.

They accept the researches of medical science, sometimes on their own quick appraisal. In their enthusiasm they now and then accept something as the last word in a way that startles the trained mind. They readily oversell and make bothersome what should be simple,

practical ideas By themselves and of themselves they do no research, support no charity, but they declare themselves to be convinced that medical science is sound, and accept as their mission the demonstration of that fact to other lay people They teach that large nonprofessional staffs, augmented technical personnel, larger buildings, and greatly increased expenditures for public-health purposes would give greater efficiency and pay in happiness and in dollars and cents In their philosophy the law of diminished returns would be automatically repealed Yet they offer no proof They would act as representatives and publicists, organizers, and selling agents for health and welfare ideas They are entrepreneurs, middlemen loading the cost of medical care

If this goes through according to prospectus, medicine through government restrictions and lay influences will be as elaborately mismanaged and thoroughly misunderstood as the Childrens' Crusade!

Dr Ray Lyman Wilbur, former President of the American Medical Association, as Chairman of the Committee on the Cost of Medical Care, a committee composed of practitioners, public-health officials, directors of institutions, economists, and eminent citizens, in 1927 said

"Medicine stumbles ahead as a great social factor led by a few far-seeing individuals, prodded by a lot of uplifters, legislators, and enthusiasts, and with a well-developed defense complex against those changes which come to all growing things The practice of medicine can only be fully understood by those who have lived it, and yet, unless the profession bestirs itself, great changes in medicine will take place through the instigation and pressure of outsiders The golden thread of human understanding and of close personal relations between doctor and patient may be left out of the new social fabric which is being woven right under our eyes" Twelve years ago—and they are still weaving with golden thread

Continuing, he declares "We must face the facts, we must study them to see

what they mean, we must guide ourselves by what they tell us, not by traditions and thinking that belong on the retired list."

In 1939 we can say for ourselves that it is the duty of the medical profession to meet changing conditions, recognize social developmental ideas, and demonstrate its ability to assimilate them and lead the procession We are the source of medical knowledge, the ultimate distributors of the bounties conferred It is the law The growth of ideas has enlarged the scope without necessarily curtailing the possibilities of the profession Medicine should continue to assist in the proper development of the thing which it itself has so laboriously created, and ideas for further development need not deny privilege or endanger the health of the people We desire that the fabric be woven right under our eyes

Some lay promoters have a loose way of telling about medicine and giving out medical information We should not imitate them The physician in going to the laity is still bound by professional experience and custom Neither is static. Modifications that are sound endure and come as a slow development, not by sudden ructions In his professional presentations the doctor should obey the rules of research, be cautious of confounding theory and speculation with fact, and in presenting facts present all of them He should be extremely cautious in reaching dogmatic conclusions Of course he cannot understand the free style of the propagandist, education by publicity and high-pressure salesmanship methods as applied to public-health questions by lay writers The lay mind sees the story, the trained mind the fact. Medical publicity by medical organizations is now an accepted fact When under direction of organized medical bodies, broadcasts and releases can be made without sacrifice of principle or danger to the truth There is much we might do to curb the enthusiasm of those well-intentioned lay organizations that would, if left to themselves, promise more than medical science could fulfill

Health education must not use methods that arouse fear or attempt to subjugate by fear. We can waste a great deal of time, as Christian has told us in his address "Some Limitations in Preventive Medicine"* at the New York Meeting of the American College of Physicians April 4, 1938, talking to the public about things for which no preventive measures are known. These are abstractions with no germ from which anything worth while can grow. The fear of the unknown can destroy the art of living.

Public health education has had a rapid growth, but to have a healthy growth and bear fruit worthy of the husbandman the trees must be severely pruned. The danger of prompt medical publicity about medical discoveries is a serious one. The lay public can garble the simplest item of news into a catastrophe. They can take a tentative statement and transform it into a great discovery.

The changing attitude of official health agencies toward health education largely by lay groups, and the conclusion they have reached that approaching the public through the practicing physician may be of greater value, is shown by the report of the New York Cancer Commission to the legislature in February of this year. The commission has this to say regarding public education and cancer control:

"Public education in cancer has been carried on in this state by the Division of Cancer Control of the New York State Department of Health, by the American Society for the Control of Cancer, the New York City Cancer Committee, and by various county medical societies. From 1933 to 1937, inclusive, all agencies in upstate New York reached, through public lectures approximately 68,000 persons, whereas the Massachusetts cancer educational program is estimated to reach 100,000 persons in a single year. The method pursued in Massachusetts is that of concentrating effort on having public education done in each locality by local physicians. This achieves the

double effect of reaching many more people than can be done through the individual efforts of a few full-time workers and at the same time stimulates the interest and encourages postgraduate education of the physicians themselves. The commission accordingly has recommended that the Division of Cancer Control endeavor to stimulate and encourage the medical profession to carry on public education in cancer and that the services and experience of the Division of Cancer Control be placed at the disposal of the medical profession to this end."

The cooperative educational campaigns that have been carried on by the New York State Department of Health and our State Society through its committee on public health and education in pneumonia and syphilis demonstrate the value of this educational method, and as early as 1933 attracted wide attention. They have combined the educational and professional possibilities of the two to their mutual advantage. They have facilitated the education of the medical profession to the highest point by making available the known methods of diagnosis and treatment, and serve the official agencies by the promotion of the health of the people in a most effective manner. The principles laid down in 1933 by Dr. Farmer's committee and encouraged by the state at first in a small way, now more extensively should develop into a general health education principle. Naturally there are things that may be done by the one, or by the other, or by both, but most things can be done best through cooperation of those who have wisdom.

The responsibility of doctors in the education of the public against the promiscuous use of drugs is twofold. Improper use of such substances as the barbiturates and sulfanilamide, to mention but two, has grown to enormous extent. We are remiss in that we have spread the lay use through the publicity we have given them. Now we must educate the public in the dangers of such illegitimate use and must ask restricted

* *Ann. of Int. Med.* 12-0 (March) 1939

sale An Associated Press dispatch, widely published on April 12, 1939, states that Dr J S Cunningham, District State Health Officer, at a joint meeting of committees representing the Monroe County Medical Society and the Rochester Pharmaceutical Association, reported that there had been 84 severe cases and 94 mild cases of drug intoxication resulting from self-medication in Monroe, Wayne, and Livingston counties during the past year Dr Cunningham attributed 12 deaths in those three counties last year to self-administration of drugs, and committees of doctors and pharmacists considered asking legislation to restrict drug sales

It was stated that the easy purchase of "dangerous" drugs was a "menace" to the welfare of the public and a special warning was issued advising against the purchase, unless prescribed by a physician, speaking particularly of sulfanilamide and its derivatives

I hope, in rapidly sketching and abstracting to save our time, that I have laid the background for the following conclusions

Public-health education is an important duty of the medical profession and should be reserved to them and the official health agencies The spread of information to the public may be easily corrupted by political propaganda It should be simple, direct, and suggest the need for professional advice It should not discuss matters of treatment even in a broad way, for diagnosis should precede treatment, and self-diagnosis is dangerous under all circumstances The value of such education depends on how clearly it tells when and how to seek advice from those who

by training and experience are legally qualified to give it

Well-planned education of any nature is progressive One should not read the last chapter first just to get the thrill It is to be given only by professional or professionally supervised teachers, not by lay volunteers The general education laws of the state and the control of our public schools recognize this principle

The attitude now being taken by the New York State Department of Health that certain health education is best done by physicians and that in many ways the department should help improve the doctor and then use his improved facilities and abilities for the spread of knowledge to the public is to be commended Surely eventually we will be called upon in the none-too-distant emergency and we must be prepared to lead, and to accept our responsibilities in any new order of things Only by the preservation of truth can civilization survive

The attitude of the national government in taking lay or amateur advice on health matters and general educational matters showing preference for spontaneous ideas, even of ideas of grandeur, in contradistinction to scientific cooperative studies by experts with legal authority, is to be deplored and opposed

Governmental propaganda of destruction and confusion, of half-truths and half political buncombe is a sad picture of an otherwise noble animal attempting to devour its young Public-health propaganda feeding on the medical and social sciences, wearing a cloak of philanthropy to cover selfish political designs is not to be confused with health education

CONFERENCE ON INDUSTRIAL MEDICINE

The Twenty-fourth annual meeting of the American Association of Industrial Physicians and Surgeons with the American Conference on Occupational Diseases and Industrial Hygiene

will be held at the Hotel Statler, Cleveland, June 5-6-7-8 The meeting will include scientific sessions of both medical and nonmedical value to industrial health.

Public Health Notes

J ROSSLYN EARP, L R C P, D R P H

New York State Department of Health

The Cost of Safety

IN THE expensively successful environment of the twelfth annual convention of the Greater New York Safety Council (Hotel Pennsylvania, March 27, 1939) a physician reporter finds himself temporarily bemused. Here are several thousand representatives of big business gathered to conspire for the greater safety of human life and limb. Of course, through the erudite calculations of Dublin and Lotka one knows that theoretically human life has a money value. And then among the representatives of big business one notices that the insurance companies are also represented. Light dawns ways have been found to convert the theoretical value of human life into something that shows on the ledger.

There is workmen's compensation, and automobile accident insurance and fire insurance and even the accident risks that the banker takes when he unwillingly takes title to a property. These also are insured.

Those who have to pay in cash for accidents find it worth their while to inquire how and why accidents occur. Mr John O Dornbusch, Manager of Insurance for the Central Savings Bank in the City of New York, finds that the majority of accidents result from falls on stairs or in public halls. His investigators must answer the following questions:

- 1 Are the treads or tread coverings particularly worn or otherwise defective?
- 2 Are the stairs well lighted at all times?
- 3 Are the stairs equipped with at least one handrail running the entire length of the stairs?

4 Are the stairs uniform in tread width, and riser height?

The second highest cause of accidents is from falling plaster. Porcelain handles are found to be extremely dangerous. Rubber mats, whether used in lobbies or on stairways, must be inspected frequently as they have a tendency to curl.

Newly built modern homes have their own though different hazards. The additional fire risks of modern air-conditioning equipment were graphically described by Mr R E Maginnis of the American District Telegraph Company. Mechanical filters, through which air is forced to remove dust, lint, and other foreign matter, offer possibilities of severe hazards: the oil film and the dust can generate great heat and smoke even if the material of the filter itself is non-combustible. The forced draught into the building may suck in sparks, the forced draught through the building may distribute fire and smoke leading to panic, which may be more dangerous than the fire itself. Fire may arise within the system from an overheated bearing or from friction sparks from a fan that is not properly serviced, kept clean, or in true alignment.

These accident hazards must occur in many homes that carry no insurance. They will be observed by many a family physician in the course of his rounds. The doctor who consults his own financial interest will leave them severely alone; they may bring him business. But many physicians will nevertheless warn the household of accident hazards in their midst, and no doubt the minatory physician will often incur the householder's displeasure for meddling in matters that do not concern him.

The Production of Antipneumococcus Serum

The time has by no means arrived when antipneumococcus serum can be forgotten. Perhaps that time never will arrive. At any rate the Division of Laboratories and Research continues to carry out the provisions of the Hawkins-Schwartzwald Act. Horse serums for seventeen types of pneumonia have been prepared for clinical trial. During the last year this achievement has been supplemented by the experimental development of antipneumococcus rabbit serum for practically all known types. The supply of these serums is limited. Demand for them is rapidly increasing.

In order that limited supplies should be most profitably expended, and in view of the urgent need for more accurate knowledge of the effects of serotherapy in

pneumonia caused by the higher types, distribution has been restricted to a number of collaborating medical centers in different parts of the state. As a result of knowledge so gained and the progress made at the laboratories it was decided at the beginning of April to make available for general use rabbit serums of Types II and XIV and horse serum of Type IV, in addition to the serums for Types I and V hitherto available. The supply stations that have been stocked with the three new antipneumococcus serums are located as follows: Albany, Buffalo, Binghamton, Cooperstown, Corning, Glens Falls, Kingston, Mineola, Ogdensburg, Olean, Poughkeepsie, Riverhead, Rochester, Syracuse, Warsaw, White Plains.

MEDICINE FOR THE MEDICINE MAKERS

The suggestion advanced by Dr. Thomas Parran, surgeon general of the United States Public Health Service, that the drug and chemical industry "revive in modern counterpart the 'wardens of the apothecaries' who enforced drug standards in the seventeenth century upon those who 'unfaithfully prepared' their compounds" met with such wide approval in the industry that the executive committee of the Drug, Chemical and Allied Trades Section of the New York Board of Trade will consider immediate action to that end, Ray Schlotterer, secretary, says.

Dr. Parran advanced the proposal at the annual dinner sponsored by the trade group at the Hotel Waldorf Astoria. The idea was dis-

cussed informally among drug wholesalers, producers of proprietary medicines, and chemical men. Whether the action would take the form of establishing a standing committee to set up and enforce standards or whether it would follow the patterns used in some other industries for voluntary self-regulation was not clear. The general notion of an enforcement body within the industry was widely favored, however.

Mr. Schlotterer said there was no question but that self-regulation is the alternative to increasing governmental controls. It offers the only possibility for progress in the industry, he said, for, without self-regulation, the industry faces the likelihood that its "hands will be tied" by a growing body of new laws.

ANOTHER PEST IN THE OFFING

The ravages of the mosquito, *Anopheles gambiae*, which in 1938 killed 10 per cent of the population of certain districts in Brazil and which may eventually reach North America, are described in a report of the Rockefeller Foundation.

According to the report, the *Anopheles gambiae* is the most dangerous member of the mos-

quito family. In 1938 it infected with malaria 90 per cent of the inhabitants in the Jaguaribe Valley of the State of Ceará in Brazil, with a mortality rate of 10 per cent in certain districts, and caused disruption of the normal life of the communities to the extent that virtually every person in the affected areas will be on government relief this year.

The Woman's Auxiliary

To the Medical Society of the State of New York

Onondaga County

Dr Brewster Doust was guest speaker at a meeting of the Woman's Auxiliary to the Medical Society of the County of Onondaga held on April 4 in the Syracuse General Hospital. Mrs John Buettner reported on the state convention held on April 24-26. A social hour followed the meeting.

Queens County

Many members and guests of the Woman's Auxiliary to the Medical Society of the County of Queens enjoyed a luncheon and bridge at the Amber Lantern Restaurant, Flushing, Long Island, on April 12, 1939. There were table prizes, door prizes, and four special prizes. Mrs. Robert Yanover, chairman of entertainment, and her committee were in charge of arrangements.

Rockland County

Mrs J C Dingman presided at a meeting of the Woman's Auxiliary to the Medical Society of the County of Rockland held in the Rockland State Hospital on March 21. Dr Russell Blaisdell, director of the hospital, welcomed the guests. Mrs Trevalyn Omstead, chairman of legislation, discussed the bills now pending that are of interest to the medical profession. After the executive session the members enjoyed listening to three members of the hospital staff. Dr Joseph Miller, head of the male reception and parole board, spoke on the Rockland State Hospital in general—its buildings and their function. He spoke of the care given patients from the time of their admission. Miss Witte, director of nursing at the hospital, discussed the nursing of the mentally sick, and Dr Kilpatrick, in charge of the children's division, spoke on the importance of the careful guidance of the problem child and told of the interesting work that is

being done with this group. Mrs Alfred Stanley was hostess for the afternoon and Mrs A Selman and Mrs S W Toms presided at the tea table.

Saratoga County

A meeting of the Woman's Auxiliary to the Medical Society of Saratoga County was held in the home of Dr and Mrs Frank Mastrianni on April 4, 1939. Mrs. Mark Nettles presided. Dr Mastrianni, local health officer, addressed the auxiliary under the auspices of the speakers bureau of the Saratoga County Medical Society. His subject was "Cancer." He reviewed the history of the disease and emphasized that both Egyptians and Indians were acquainted with it. He emphasized the need of a physical check up yearly, or twice yearly, especially for persons over forty. Dr Mastrianni announced that tumor clinics are being established in the Memorial Hospital at Albany and in the Samaritan Hospital at Troy. In closing, Dr Mastrianni said that there is good prognosis in early recognized cancer cases and urged that fears be confirmed or allayed by competent physical examination and x ray. Mrs Mastrianni was hostess after the business meeting and program.

Schenectady County

A meeting of the Executive Board of the Woman's Auxiliary to the Medical Society of Schenectady County was held on March 22, 1939 at the residence of Mrs William Mallia. The program for the May meeting will be a round table discussion on current medical legislation.

Suffolk County

The members of the Woman's Auxiliary to the Medical Society of Suffolk County honored their past president, Mrs Stan-

ley Jones, at a luncheon at Gerard's Restaurant, Huntington, on March 28 Mrs George Oxholm had arranged a delightful musical program for the entertainment of those present Among the guests were Mrs John L Bauer, of Kings, first president of the State Auxiliary, and Mrs Daniel Swan, of Queens, president of the State Auxiliary, as well as other

members of the state executive board

. . .

The Seventeenth Annual Convention of the Woman's Auxiliary to the American Medical Association will be held in St. Louis, Missouri, May 15-19, 1939 The New York State Auxiliary will send delegates, but it is hoped that a great many members will attend

A RAP AT THE STATE HEALTH PROGRAM

Creation of a bureau of health education in the state's department of education was advocated by Dr C E A Winslow, Professor of Public Health at the Yale School of Medicine, in an address before the Public Education Association at the Hotel Pennsylvania on April 5

If the health procedures of this state are to be improved, many "radical changes" in the existing health organization are required, Dr Winslow declared On the whole, New York State is woefully lacking in adequate health facilities, he charged

An experienced school administrator should be placed in charge of the health education bureau, which should include health and physical education instructors, doctors, nurses, and dentists, Dr Winslow said He urged committees of similar make-up for each area

"The entire school health program should be formulated and conducted under the advice of

a regularly constituted and continuing council on health education," Dr Winslow continued "To insure correlation and secure desirable technical assistance, the state department of health and the state department of mental hygiene should also be invited to designate representatives to sit with the council "

As practiced at present, Dr Winslow continued, the state health program is "extremely narrow" in objective, limited to a rigid routine, and almost wholly lacking in correlation with the educational program as a whole He based his conclusions on the findings of the recent regents' inquiry, in which he took part

"On the whole, it seems to me that health service is perhaps the least effective of all phases of the health program which we have studied in New York State," he asserted "Radical changes are essential if it is to be made reasonably efficient "

LUCKILY THERE WAS A "DOCTOR IN THE HOUSE"

It is estimated that three hundred lives will have been saved due to the forethought of Dr Daniel L Bower, member of the House of Representatives in the recent Indiana legislature, who sponsored a bill providing for emergency ap-

propriations for purchasing pneumonia serums for indigent cases

The original bill had set July 1 as the date on which the first appropriation for this purpose should be available

OUCH!

"I think—," began the doctor on the witness stand

"You are not on the stand as an expert witness," interrupted the attorney "We want your testimony as to what you know, not as to what you think "

"I'm sorry," the doctor answered quietly "I'm not a lawyer I can't talk without thinking"—*Medical World*

MORE MOUTHS FOR SILVER SPOONS

The erstwhile low birth rate among the well-to-do classes is rising, Dr Clyde V Kiser of the technical staff of the Milbank Memorial Fund, said at the seventeenth annual conference of the fund at the New York Academy of Medicine, 2 East 103rd Street He based his report on records of more than 375,000 married American women of child-bearing age, collected by the National Health Survey of 1935-1936 in eighty-four cities of nineteen states

Medical News

Serum to Protect Children from Measles

THE New York City Department of Health has issued an important notice on the use of convalescents' serum in the control of measles. It advises that convalescents' measles serum injected intramuscularly into children not later than the fifth day after exposure to measles will either prevent or attenuate the disease in 95 per cent of the children so treated. The attenuated disease that may develop is so modified that complications practically never occur. Nevertheless, this modified measles usually confers a lasting immunity.

In children up to the age of five, measles causes a higher mortality than is generally realized. It is therefore advisable to attempt complete protection in this age group, postponing the possibility of contracting measles to a later age period when the disease is less dangerous. For the same reason this practice should be adopted in children in any age group who are run down or suffering from any other illness.

To prevent measles completely, children up to the age of three should receive 5 cc. of convalescents' measles serum, those from three to ten years, 10 cc., and those older than ten years, 15 to 20 cc., depending on their size.

The dose for modifying measles in children over five years of age is one half of the above amounts when given not later than the fifth day after exposure, or the full amount from the sixth to eighth day of exposure.

In hospitals and children's institutions, regardless of the age of the children, the

attempt should be made to prevent completely the development of the disease so as to prevent an outbreak of measles in the institution.

Since the serum is derived from humans, the risk of allergic or anaphylactic reactions is practically nil, and only rarely does a mild local reaction occur at the site of injection.

Convalescents' serum, as supplied by the Manhattan Convalescent Serum Laboratory, is prepared from blood obtained from individuals recently recovered from measles; it is proved to be sterile and Wassermann negative before it is released, and its distribution has been licensed and is under the supervision of the U. S. Public Health Service.

The Manhattan Convalescent Serum Laboratory is a nonprofit organization. For this reason the serum is supplied at the cost of production to hospitals and physicians. Measles convalescents' serum is furnished at the rate of fifty cents a cc., or \$2.50 for 5 cc.

Serum can be obtained at the Manhattan Convalescent Serum Laboratory, Room 610, in the William Hallock Park Laboratory of the New York City Department of Health, 15th Street and East River, between the hours of 9 A.M. and 5 P.M., and from 9 A.M. to 12 noon on Saturdays. At all other times serum can be obtained from Dr. William L. Wheeler, Jr., 348 West 22d Street, Chelsea 3-4149.

Further information regarding convalescents' serum supplied by the laboratory can be obtained from Dr. William Thalhimer, director.

County News

Broome County

Dr. William H. Hobbs addressed the Broome County Medical Society on "What Place Should Transurethral Resection Occupy in the Treatment of

Vesical Neck Interference?" on April 11 at the Monday Afternoon Club House, Binghamton. Discussion was by Dr. C. D. Squires and Dr. D. O. Chamberlain.

Erie County

On April 5, Dr Elmer Milch discussed "The Management of Diffuse Peritonitis, Subsequent to Perforated Appendicitis," before the Section of Surgery of the Buffalo Academy of Medicine, on April 12, the Buffalo Radiological Society conducted "A Symposium on Roentgen Therapy of Infectious and Benign Conditions," and on April 19, the Section of Obstetrics and Gynecology listened to a paper on "Hemorrhage in Obstetrical Cases," by Dr Henricus J Stander, of New York City

Cortland County

Syracuse papers a few weeks ago gave prominence to the half-century of medical practice of Dr John E Leonard, of Harford Mills, with a column story of his life and a fine picture of him reading the *New York State Journal of Medicine*. He "has been a familiar figure at the firesides of many homes in a dozen townships of four counties for half a century," we are told. Among his interesting memories—"in a single twenty-four-hour day in his early years of practice Doc remembers driving a horse sixty-three miles and visiting twenty-eight patients when on many of the calls he had to break drifts open for the tired horse."

When the influenza epidemic raged shortly after the United States' entry into the World War "Doc for many days did not even see his bed, let alone sleep in one, and his work in that disastrous epidemic is still remembered among householders and doctors of the parish. He lost just two of all the many patients he treated over a wide area." When relatives and friends urge him to retire, he relies "Maybe I will I'll think it over, anyway."

Franklin County

Dr George E Wilson, Vice-President of the Saranac Lake Medical Society for the past year, was elected president of the society to succeed Dr Spencer Schwartz at the final meeting at the John Black Memorial room on March 29

More than fifty members of the society, the Osler Club, and guests, attended the meeting and heard a lecture on "Silicosis and Allied Conditions Due to the Inhalation of Dust" by Dr Leroy U Gardner, director of the Saranac Laboratory

At the final meeting of the Osler Club, Dr Edwin M Jameson was elected president to succeed Dr Walter Taylor, D D S, and Dr Arthur Vorwald was named vice-president

The medical society and the Osler Club have sponsored seventeen meetings from last November through March this year. Distinguished physicians from all parts of the east and Canada lectured at the meetings and four clinical pathologic conferences were conducted by local physicians

Greene County

Dr Lyle B Honeyford, of Catskill, who died on April 2, was a former President of the Greene County Medical Society. He was largely responsible for the establishment of the Greene County Memorial Hospital and became the first president of its medical board, serving until 1937, and through his own gifts and those of his friends aided the institution financially

Jefferson County

Dr Cary Eggleston, of the Cornell University Medical College, will address the Jefferson County Medical Society at Watertown, May 11, at 8 P M on "Rheumatic and Syphilitic Heart Disease"

Kings County

The Doctors Orchestra of Brooklyn gave its first public concert March 29 in Brooklyn State Hospital for the Insane.

Monroe County

Dr Elmer Milch, of Buffalo, read a paper on peritonitis before the Monroe County Medical Society on March 21

New York County

The New York City Department of Health, with the aid of Works Progress Administration employees, has begun x-

ray examinations of 20,000 fur workers to determine the percentage of tuberculosis infection, believed to be an occupational disease in the fur industry

The tests are given at the rate of about five hundred a day. A new type of x ray machine, capable of four exposures a minute, is being used. The total cost of the x rays will be about \$1 a person.

The tests are being given under the direction of Dr Herbert R. Edwards, Director of the Bureau of Tuberculosis of the Department of Health. Dr Edwards said that wherever there is a suspicion of tuberculosis the record of the case will be turned over to the individual's private physician with the recommendations of the health department.

In instances where an individual has no private physician the records will be turned over to the Furriers' Joint Council, which has a medical board. According to Mr Potash, information already available reveals a great many cases of tuberculosis, heart disease, and asthma among the union membership.

Dr Livingston Farrand, President Emeritus of Cornell University, will speak at the New York Academy of Medicine on May 11 at 8:15, on "Primitive Man and Medicine."

Dr William Hallock Park, former Director of the Bureau of Laboratories of the Health Department of New York City and an outstanding specialist in the field of antitoxins, died on April 6 of a heart attack in his home, 1225 Park Avenue. He was seventy-six years old.

Dr Park was cited by Yale University as "the perfect type of the scientist in the service of the state." He accomplished great things as "the family doctor to New York City's millions," but he made no personal financial gain, and the honors that he gained were not sought, but showered upon him.

He was mainly responsible for the conquest of diphtheria by his toxin anti-toxin. Dr Park's extensive research work made possible the supply of pure milk in New York.

Since 1894, when he took over the position of director of the city's Bureau of Laboratories, Dr Park sought to prevent such scourges as pneumonia, scarlet fever, tuberculosis, cancer, typhoid, measles, diphtheria, influenza, and other contagious maladies—and he was largely successful, so much so that he was hailed as "the American Pasteur" when the American Public Health Association conferred upon him the Sedgwick Medal in December, 1932.

That same year Dr Park received the Public Welfare Medal of the National Academy of Sciences "for work as head of the research laboratories of the New York City Health Department and the application of scientific discoveries for the prevention of disease."

Fifty years after he was graduated from the College of the City of New York with the class of '83, Dr Park received the Townsend Harris Medal from his alma mater for attainment in medicine.

In 1923, Dr Park was President of the American Public Health Association.

Despite his untiring work in his laboratories, Dr Park found time to write several scientific books and many articles and monographs. He wrote *Pathogenic Micro-Organisms*, *Public Health and Hygiene*, and *Who's Who Among the Microbes*. He contributed to technical journals on bacteriology and immunology, public health, and hygiene.

Dr Charles Rupert Stockard, Professor and Head of the Department of Anatomy of the Cornell University Medical College, 1300 York Avenue, New York City, and an outstanding biologist, died on April 7 in the Rockefeller Institute Hospital, York Avenue and 66th Street, of heart disease after an illness of six months. He was sixty years old and lived at 1035 Fifth Avenue.

Dr Stockard was noted chiefly for his scientific investigations on morphologic subjects, on the experimental production of monstrosities and the influence of alcohol and anesthetics on the development of animals. He was President of

the Board of the Rockefeller Institute of Medical Research and an investigator for the Huntington Fund for Cancer Research

A contributor to medical journals in this country and abroad, he was managing editor of the *American Journal of Anatomy* and editor of the *Journal of Experimental Zoology* and of the *American Anatomical Memoirs*. He was the author of *Origin of Blood*, published in 1915, *Hormones and Structural Development*, 1927, and *The Physical Basis of Personality*, 1931

Ontario County

The second quarterly meeting of the Ontario County Medical Society was held at the sanitarium in Clifton Springs on Tuesday, April 11. The program 1 "Diabetic Coma," by Dr Paul Newland, of Clifton Springs, 2 "Common Diseases and Injuries of the Hip, by Dr Adrian S Taylor, of Clifton Springs

The papers were in the nature of clinics. Patients were presented for examination and various points in the talks illustrated by lantern slides

Orleans County

Two Orleans County physicians, Dr Edward Whittier and Dr William O Burbank, of Albion, are celebrating a half century of medical practice. They were graduated together from the University of Buffalo Medical School on March 26, 1889. Five others of the class are still living

Oswego County

Dr Oliver W H Mitchell, of Syracuse University, addressed the Oswego County Medical Society Auxiliary on March 29 on socialized medicine

The fact that national health programs have met with favorable results in other countries is no indication that a similar system could be successfully operated in the United States, Dr Mitchell contended. Taking into consideration such factors as population and the difference in standards of living, the success of

socialized medicine in this country is improbable, he indicated

Queens County

Queens physicians are complaining that the police have marked them out as special targets in handing out summonses for minor infractions of motor regulations. According to the *Brooklyn Eagle*, the Queens County Medical Society has taken official cognizance of the situation by addressing a resolution of protest to Police Commissioner Valentine, who has promised to look into the alleged persecution. A committee has also been appointed to confer with Inspector John M O'Leary, in charge of traffic in Queens

A legend has arisen that the prodigality of police with tickets for doctors resulted from a recent incident at Queens General Hospital

According to the story, a traffic police man who had suffered a fractured leg was taken to the hospital for treatment. A member of the hospital staff spotted him in the ward as a policeman who had once served him with a summons

"Gee," joshed the doctor, "I wish I had charge of your case. Would I get even!"

The policeman is supposed to have resented the remark and spread the story among his colleagues

However, Dr Joseph Wrana, president of the medical society, does not lean too heavily on this story as the possible spark for the police war on physicians

"I believe that we can look for the reason in the stricter investigation which is being made today into the status of applicants for treatment in municipal hospitals, particularly in Queens," he said

"Heretofore, it had been customary for policemen and firemen to receive free treatment and occupy beds at municipal hospitals, which are primarily intended for the care of the sick poor. The stricter regulations now in force may be responsible for retaliatory measures by the police

"They overlook the fact that we doctors have nothing to do with the regula

tions. They are entirely up to the executives of the hospital. We do not even receive any compensation for the work we do at municipal institutions.

"The danger in the present situation lies in the fact that a delay to a physician caused by an overzealous or malicious police officer may mean the difference between life and death to a patient."

Dr. A. W. Martin Marino addressed the Medical Society of the County of Queens on April 7 on "Office Proctology."

Dr. Albert L. Voltz, who died on March 27, was President of the Queens County Medical Society in 1930-31.

Rensselaer County

Dr. Merlin J. Zeh, of Watervliet, is celebrating the fiftieth anniversary of his start in medical practice.

St. Lawrence County

Dr. Cary Eggleston, of the Cornell University Medical College, will address the St. Lawrence County Medical Society in Ogdensburg on May 11 at 1:30 P.M. on "Rheumatic and Syphilitic Heart Disease."

Saratoga County

Recently in Saratoga County the question arose as to the legality of the board of supervisors appointing physicians to treat syphilis patients in their own offices and to pay for their services on a fee basis from a county appropriation. The attorney general has expressed the opinion that the board of supervisors has ample authority under Section 12, subdivision 44-a of the county law, to provide for syphilis treatment on a fee basis.

Warren County

The Glens Falls Academy of Medicine met on March 31 in the Crandall Library auditorium. Dr. Robert E. Buckley, of New York City, spoke on "The Importance of Sinusitis to the General Practitioner."

A Spring drive of syphilis education will be launched May 3 by the Warren County Tuberculosis Committee at a dinner in Glens Falls to be addressed by State Health Commissioner Godfrey. Mr. Osborn will represent the state committee on the program. Miss Marjorie Bucknam, executive secretary, scheduled a preliminary organization meeting April 10, inviting the principal organizations of the county to send delegates to hear three prominent local speakers describe the objectives of the campaign and to review educational material.

Here are two cogent paragraphs from Miss Bucknam's prospectus of "Why Syphilis Education Is Needed in Warren County":

1. Until a majority of our citizens will readily accept a talk about syphilis control with the same detachment that they would about tuberculosis, we need meetings on syphilis.
2. Only a small percentage of the people of Warren County realize that the facilities for the diagnosis and treatment of syphilis, as maintained by our official health agencies, are unexcelled by any other county in the state. If more people are informed of these facts they will take advantage of them and rally to their support at all times.

Westchester County

The right of persons on relief in Westchester to select their own physicians, the elimination of "politics" in medical welfare work, and participation in such work by some 500 county physicians who do not now accept cases are all proposed in a new plan now under consideration.

Growing and widespread dissatisfaction among physicians, welfare officials, and taxpayers, with the present loosely organized methods of administering medical care to relief recipients has resulted in the formulation of the plan, which, if adopted on a county wide basis, may point the way toward a reorganization of

the medical-relief structure of the entire state

The plan, drawn by a committee composed of members of the county medical society and welfare officials, centers about the appointment of a county "arbitration committee" composed of five physicians chosen by the president of the medical society and five welfare officials selected by the conference of county welfare officials to administer the medical care of persons on relief

In the opinion of the members of the society and of officials in public-welfare work, the plan would provide the mechanism to generally improve the present medical-relief situation, obtain a more general participation of the medical profession in serving welfare patients, and would assure the highest type of medical service at the lowest cost to the taxpayer

Comprising the committee of eight which drew up the plan are Dr Edward C Wood of White Plains, chairman, Dr Mark G Khatshco of Mount Vernon, Dr Herbert W Schmitz of Yonkers, and Dr Charles Neil Jeffries of Mamaroneck, for the county medical society, and Nicholas J Ebbitt, Yonkers, Commissioner of Public Welfare, Charles D Devinne, Public Welfare Officer of the Town of Mamaroneck, Mrs J Hobart Cox, Public Welfare Officer of the Town of North Castle, and Miss Edith Parker, Assistant Director of the County Department of Family and Child Welfare

The medical society estimates that at the present time not more than 200 of the 700-odd practicing physicians in the county are treating relief patients

Although in some parts of Westchester physicians and public-welfare agencies are cooperating on a successful medical care program, many medical men in other areas will not touch relief work because a satisfactory working agreement with the

public agency cannot be achieved The medical society has received complaints that in still other districts, physicians refuse to participate on the grounds that the medical-relief setup is a political football and that doctors are being literally "kicked around"

By arming an arbitration committee with authority to take affirmative action where it is needed, it is believed that many difficulties between the physicians and the administering welfare officer can be settled

A Michigan medical editor, who has been studying county medical publications for a year or more, has handed down the verdict that "for interest from the reader standpoint" the Westchester Medical Bulletin leads them all, and Editor Bryan has written him a graceful note of thanks The Bulletin of the New York Academy of Medicine is listed by the Michigan editor as "purely scientific and one of the best we have seen"

A regular meeting of the White Plains Medical Society was held Tuesday evening, April 11, at the Gedney Country Club, Ridgeway, White Plains Several important business matters were discussed, after which Mr John J White presented a preview of the New York World's Fair

At a regular meeting of the Yonkers Academy of Medicine, held Wednesday evening, March 15, at the Amackassin Club, Dr Clyde H Brown, attending physician of French Hospital, New York City, presented an interesting paper on "Arthritis"

The Mount Vernon Medical Society held a regular meeting, Thursday evening, April 13, at The Knolls in Mount Vernon The speaker was Harrison F Martland, noted toxicologist

The Fourteenth Scientific Session of the American Heart Association will be held at the Hotel Jefferson, St Louis, Missouri The

general cardiac program will be given on Friday, May 12, and the program of the Section for the Study of the Peripheral Circulation on May 13

Correspondence

To the Editor

Recently one of the European refugee doctors, who bears a name similar to mine and whose controversial affair with the Board of Regents reached even the daily press, happens to be confused with my person. This has become known to me by many sources, doctors as well as patients. You would oblige me greatly if you would publish a correction in your esteemed paper.

Sincerely yours,

Gustav Erlanger, M.D.

New York City
April 6, 1939

Doctor Gustav Erlanger, who is a practicing physician in the Borough of Manhattan, should not be confused with a foreign physician of a similar surname, who recently appealed to the Courts from a ruling of the Board of Regents of the State of New York refusing to endorse his foreign license to practice medicine.—*Editor*

Hospital News

A Plan to Care for Chronic Patients at Home

THIS is "something people ought to get excited about," says Ralph G. Hurlin, of the Russell Sage Foundation, in speaking of the "housekeeping service for chronic patients" in New York City.

For a long time many physicians have been of the opinion that a large proportion of the chronic patients in hospitals and nursing homes could be as well or better cared for in their own homes, at an economic saving to the community and with positive benefit to themselves, if adequate home service were provided. The WPA Housekeeping Service project here described is believed to be the first in the country that affords data as to the practical service that visiting housekeepers may render in homes that could not otherwise give adequate care to a member of the family suffering from a chronic ailment. The present report summarizes what has been learned from the experience so far gained.

The social service rendered by these housekeeping aids in keeping families together and in creating peaceful home conditions for the children is a collateral value of perhaps equal importance with the service rendered to the patient.

The report has just been issued by Mary C. Jarrett, Secretary of the Standing Committee on Chronic Illness of the Welfare Council of New York City and Technical Adviser to WPA Project for Home Care of Chronic Patients in New York. The report is based on nearly three years of operation of this project, and a further six months of operation in amalgamation with a similar WPA housekeeping project for home care of recipients of old age assistance.

The project for chronic patients is sponsored by the New York City Department of Hospitals and is under the joint technical direction of the Committee on Chronic Illness of the Welfare Council of New York City and the Henry Street

Visiting Nurse Service, with the assistance of an advisory committee under the chairmanship of Dr. Ernst P. Boas, representing medicine, hospitals, and various phases of nursing and social work.

It Relieves Overcrowded Hospitals

It appears definitely true that a large proportion of beds in most hospitals is occupied by chronic patients who can be as well or even better cared for in custodial institutions or in their own homes, and that the average stay of these patients in the hospital is several times longer than for acute patients. It has been estimated that 1 chronic patient in a hospital displaces 4 or more acute patients.

The care of chronic patients by housekeeping aids in their own homes, where this is indicated, is believed to be cheaper than care in hospitals or custodial homes, and usually the patient is happier in a home environment. The report offers data on this question which is not, however, definitive.

The great value of such housekeeping service to other members of the family in a large proportion of instances has been abundantly demonstrated. Numerous instances are on record of homes saved from disruption, of nervous breakdowns averted, of children enjoying a peaceful and orderly home life because of the service of housekeeping aids. It is broadly true, the report shows, that where such service is of value to the patient it is also of value to every member of the family. Thus, as the report points out, the total value of the service is not medical or economic only, but also social.

No definite conclusions can yet be drawn as to the value of housekeeping service in specific types of chronic illness, nor as to its value in certain types of psychiatric disorder. Neither have adequate data yet been assembled to make the case for housekeeping service as a per-

manent measure for public welfare. Further evidence on all these questions will be gathered as the project continues

How The Plan Works

The housekeeping aids are drawn from WPA relief rolls, and are for the most part middle-aged women. Before being engaged they are given health tests, including Wassermanns. No woman with syphilis or communicable diseases are engaged for this work.

The housekeeping aids are given a brief course of instruction in home economics and in the general nature of their duties before beginning work. They are periodically visited by their supervisors, who make about two visits a week to each home receiving service. An in training course is now being organized, this will consist of two weeks of instruction and demonstration, followed by a month in the field, and another period of demonstration and instruction of half time for four weeks.

The present staff of approximately 2,000 housekeeping aids is under the direct supervision of 120 examiners, who in turn work under 20 senior examiners supervised by 4 medical social workers. Two chief medical social workers direct the supervisory staff, and they are responsible directly to the technical adviser.

The housekeeping aid in this project is definitely not a practical nurse. Neither (and thus the family is made to understand) is she a maid. She is not expected to do work that could be done by other members of the family. The examiner is definitely not a social worker, though she may have to observe and report conditions requiring the attention of a social worker. The report shows that the personality of the examiners—their tact, understanding, and judgment—is usually excellent.

The project as a rule serves only families of \$100 or less income per month. All cases are recommended by a recognized public or private welfare agency with the approval of a hospital, clinic, or private physician, and are under general medical supervision by the nine project physicians. These physicians do not give medical treatment or advice, their function is to evaluate the results of the service.

The report indicates that the project has already demonstrated the economy and social usefulness of housekeeping service for appropriate cases. More definitive answers to the questions raised are expected to emerge from further study of the enlarged project. Any further information can be obtained from The Welfare Council of New York City, 44 East 23rd Street, New York City.

The Camouflage of the Face Mask

"For a long time," writes Mr. T. R. Ponton, editor of *Hospital Management*, "I have been very doubtful of the value of the face mask as a preventive of infection from droplet expulsion. When I see a surgeon with his mouth covered with a few layers of gauze, thinking that he is thereby protecting the wound, I wonder that there is not more wound infection. When I see a nursery nurse wearing a mask for hours I am concerned not only for the safety of the patient but also for the lack of efficiency which results from discomfort.

"For a long time I have intended to make some tests to find out whether or not the mask as ordinarily used was a menace or a protection but have neglected it. Last month I was making a survey in an eastern hospital and noted the usual technic in the nursery. I asked the superintendent to have the nurses talk into some Petri dishes and have the laboratory report the results. Instead of talking the nurses coughed. One nurse gave a pure culture of pneumococcus, the other gave pneumococcus with other bacteria. If the two tests had been negative

they would have proved nothing, but even one positive test proves that the mask is not the absolute safeguard that we have come to believe it to be

"I would not decry the use of the face mask to protect both the patient and the wearer. On the contrary I believe it has a decided value if properly used. I would, however, warn against the false sense of security which is so often seen when the mask is worn. It is only bacteriologic common sense to realize that when a mask has been worn for hours it has become so moistened with the breath as to allow easy

penetration of bacteria. The impervious mask has the value that it at least deflects the bacteria which are projected from the mouth of the wearer and it prevents the wearer from direct contamination. The gauze mask may be of value if it is worn for a short time as an emergency measure to protect both wearer and patient from an unavoidable exposure to the direct line of expulsion. One of the manufacturers has recently put on the market a mask which is claimed to be comfortable and impervious to bacteria. I have had no experience with it."

Operations Seen by Television

The evolution of television as an aid to the teaching of surgery is seen following an experiment at Israel Zion Hospital in which 75 doctors, nurses and students, seated in a room 500 feet away, witnessed the performance of an operation.

The experiment conducted with the co-operation of a patient suffering from a hernia was the first of its kind in medical history and met with the unqualified approval of the operating surgeon, technical engineers, and the onlookers.

"It proved," said Boris Fingerhood, superintendent of the hospital, "that students need no longer crowd into operating room galleries. They will not have to resort to blackboard notes and textbook illustrations because they now can see every move in clearest detail."

See and Hear Proceedings

The movements of the surgeon's hands and his explanatory comments were picked up by a television camera and microphone and transmitted through cables to the receiving room, where the

witnesses, in groups of 20 to 30, saw the operating room scene on small screens.

The images, in black and white, were visible also to the operating surgeon on an additional screen on the television monitor, the instrument that changes the pictures into electrical impulses for transmission.

A robed and masked engineer of the American Television Company, which installed the equipment, was on duty in the operating room and on several occasions was called on by the surgeon to adjust the mechanisms in order to avert slight blurs.

Despite the occasional imperfect visions, the experiment met with praise from the surgeon, who requested that his name be withheld but expressed certainty that "a new leaf in the book of medical science" had been opened.

The hospital plans to install receiving sets throughout the institution so that staff doctors can "look in" on operations and consult with the operating surgeons.

Improvements

WITH building and expansion projects costing nearly \$15,000,000 already under construction, and at least sixteen others costing nearly \$9,000,000 scheduled to be started during 1939, the New York

City Department of Hospitals has borrowed twenty draftsmen from the Department of Public Works to hasten preliminary work in the busiest year in history, Commissioner S. S. Goldwater states.

The program, aided in part by Public Works Administration funds, will add to the city's hospital service a psychopathic hospital, two tubercular hospitals, five outpatient buildings, three laboratories, a convalescent day camp, a nurses' home, an isolation building, three expanded outpatient departments, a new administration and staff building, and scores of renovated and improved outpatient departments.

Even these additions will not begin to meet the full demands on the city's medical services, Dr Goldwater said. At the top of his list of badly needed projects for which no money is now available, he placed new general hospitals in Brooklyn, Queens, and Harlem, new tubercular hospitals for Brooklyn and the Bronx, and a new hospital devoted entirely to treatment of venereal patients. This last facility was needed, he said, because of the increased volume of venereal patients resulting from the Department of Health's campaign to educate the public on the subject of venereal disease.

The largest project which will be started this year is a \$1,690,000 psychopathic department at the Kings County Hospital. Second largest is a new outpatient building, also at Kings County Hospital, which will cost \$1,087,000. A new tuberculosis ward and administration building at Riverside Hospital will cost \$970,000, and new wards and extension of the outpatient service at Harlem Hospital \$937,000.

In a few days the department will be ready to occupy the new \$3,500,000 tuberculosis hospital for children at Seaview, S I.

New equipment for three state institutions in Buffalo is provided for in the \$1,843,712 item included in the 1939-1940 budget presented to the Legislature by Governor Lehman.

The largest single item for new equipment is \$153,500 for the Institute for the Study of Malignant Diseases in High Street,

in addition to its regular appropriation of \$388,830 for salaries, including increments, maintenance, and operation.

The item for equipment includes \$150,000 for purchase and installation of equipment for the new 78-bed addition to the hospital and \$3,500 for an incinerator for the group.

The hospital addition, when equipped, will have the most modern facilities for treatment of malignant diseases.

The Buffalo State Hospital is down in the budget for appropriations of \$967,892 for salaries and maintenance and an additional \$2,500 to install a sprinkler system in the hospital's carpenter shop and power plant. Provision is made for scores of salary increases under the Feld Hamilton annual increment act.

A new maternity department is being added at St. Francis Hospital, in the Bronx.

Plans for construction of a new wing to the South Shore Communities Hospital at Oceanside, L. I. have been accepted by the board of directors, it has been announced by George D. A. Combes, chairman of the board.

The hospital was opened on Armistice Day ten years ago, and has never had an empty bed, but it has not been possible to erect a new wing until now.

Work on the wing will start before fall, Mr. Combes declared.

Improvements to cost over \$600,000 will be made at Veterans Hospital 81, Kingsbridge Road and Sedgwick Avenue, the Bronx.

Completely modern x-ray equipment has been installed in the eight room addition recently constructed at the rear of the Mercy Hospital at Watertown. The major piece of new apparatus is a \$4,000 x-ray outfit having a capacity of 100

milliamperes, entirely shock-proof, and an electrically operated tilting table

. . .

George Bennett, entering upon his 21st year as President of Rockaway Beach Hospital, announced at the 28th annual meeting of the hospital, that he would appoint a special committee of directors to investigate possible methods of enlarging the institution. His announcement was made following the reading of annual reports which indicated great increase in the demands made on the hospital during the past year, when the 100-bed institution accommodated as many as 135 patients at one time

. . .

Unless the city appropriates nearly \$2,000,000 additional each year to finance the care of charity patients in privately operated hospitals, service for the poor of Queens, as in other parts of the city, faces "radical curtailment," hospital trustees declare in a report under consideration by Mayor LaGuardia

The North Shore hospitals falling in the category of "voluntary" institutions are Flushing and St. John's hospitals. With Mary Immaculate and Jamaica hospitals, Jamaica, and the two Rockaway institutions, St. Joseph's and Rockaway Beach hospitals, they meet the requirements of the borough's charity cases not cared for at Queens General Hospital or other city institutions outside Queens.

The report on behalf of the needs of the "voluntary" hospital trustees was formulated by a committee which requested that the city budget increase its allowance for such institutions by \$1,967,145.

According to the committee, the hospitals have depleted their capital funds by \$20,000,000 in the last ten years in taking care of public charges. Unless they receive financial aid greater than that given by the city in the past years, they "are in imminent danger of being forced to curtail radically their services to the city and community," the committee declared

. . .

The Bronx is seriously lacking in hospital facilities, William Seltzer, superintendent of Bronx Hospital, told the members of the Lions Club recently at the weekly luncheon meeting in the Schnorer Club, 163rd Street and Eagle Avenue.

"If our Fire Department or Police Department was undermanned to the same extent that we are short of hospital facilities, the deficiency would be keenly obvious," he said. "The only borough which is worse off than the Bronx is Queens."

Seltzer, representing the United Hospital Campaign Committee, expressed his thanks for a new oxygen tent which the club recently presented to the hospital. He said it will be particularly useful in the treatment of patients with heart ailments, who are being benefited more and more through oxygen treatments

. . .

Foundation work for the \$3,500,000 Tri-Boro Hospital for tuberculosis patients, adjoining Queens General Hospital in Flushing Hillcrest, has struck a snag due to underground springs, and only 30 per cent of the foundation work has been completed, it is learned.

Just when the foundations for the twelve-story hospital, the nucleus for a huge Queens Medical Center, would be completed, could not be learned since progress has not been as rapid as expected on account of the unforeseen hidden springs and inclement weather

. . .

Bids for the construction of the Mercy Hospital of Hempstead will be sought after final approval of the building plans has been given by the board of consultants of the Brooklyn diocese, according to an announcement by the board of directors.

The new building will be four stories high and will be set back four hundred feet from Mill Road.

The building has been designed with many setbacks so that the patients will get plenty of light and air, and be able to go outdoors on convenient roof decks,

when the weather permits Sun parlors and enclosed porches will also be provided.

A new and larger chapel has been constructed at St. Mary's Hospital at Amsterdam.

A two-story clinic, 84 by 48, is to be constructed at 501-509 West 131st Street, northwest corner of Amsterdam Avenue, New York City, by Knickerbocker Hospital from plans by Francis Seaman, architect. The cost is placed at \$40,000 the former home of the hospital stood on this site. The new quarters are on Convent Avenue, between 130th and 131st streets

The Catholic War Veterans, New York State Department, are agitating for a new veterans' hospital on Long Island. They also are asking that 500 beds be added to Base Hospital 81, Kingsbridge Road and Sedgwick Avenue. At present Base Hospital 81 has a capacity of 973 beds and a waiting list of 400

Various bodies in South Queens have started a drive for a municipal general

hospital to serve Woodhaven and environs

Extensive alterations at the Leonard Hospital in Troy will give more room for some of the services

The improvements will include a large rest room for the special nurses with showers, lavatory, and other conveniences. There will also be a new autopsy room and morgue

The laboratory will have a new museum for its pathologic specimens and there will be two storerooms

The Samaritan Hospital in Troy has opened a new tumor clinic.

The Onondaga County Hospital will fireproof the older part of its structure at a cost of \$10,000

The Junior Auxiliary of the Peekskill Hospital will convert the board room into a comfortable waiting room

The Trudeau Sanatorium at Saranac Lake has opened a new two-story recreation pavilion

At the Helm

THESSE hospital officials have been chosen

Dr James A. Dickson, to be president of the medical staff of Amsterdam City Hospital.

Dr James M. Bernhard, to be president of the medical staff of St. Mary's Hospital at Amsterdam.

John D. Clarke, of Delhi, to be president of the board of managers of the Delaware County Sanatorium

G. Louis Cook, to be president of the Memorial Hospital Association of Ithaca, re-elected

Dr George R. Dempsey, to be president of the Cornwall Hospital board

Dr James M. Dobbins, to be president of the medical board of St. John's Hospital, Long Island City

Dr John L. Hemstead to be chairman of the medical staff of the Albany Hospital

Clarence A. Ludlum, to be president of the trustees of the Jamaica Hospital re-elected.

Dr William J. Ryan, to be chairman of the Tuberculosis Sanatorium Conference of Metropolitan New York

Alvin S. Rosenson, to be president of the Jewish Hospital of Brooklyn, re-elected

Mrs. Oscar Swift, to be president of the Brooklyn Thoracic Hospital, re-elected for the ninth term

Dr John A Enzien, to be president of the Leonard Hospital medical staff at Troy

Dr John A Farella, to be president of the Yonkers Professional Hospital, re-elected

Dr Oscar E Gomoll, to be chief of staff of the Mercy Hospital at Auburn

Dr A F Leone, to be chief of the

medical staff of the Orleans County Hospital

Dr J H Mitchell, Jr, to be president of the Cohoes Hospital, medical and surgical staff

Dr John J Quinlan, to be president of the staff of Troy Hospital, re-elected.

William A Seely, to be president of the Chenango Memorial Hospital

SULFANILAMIDE AND THE DOCTOR

The doctor now sits in his big office chair,
With his feet on the top of the table,
His brow is all furrowed with deep lines of care,
(Just picture him there, if you're able)—
His office is filled, but with big empty chairs,
And his office force all now are idle,
While the sound of a snore from the office next door,

Makes a pain in his head and his middle
Just a few years ago, he was quite on the go
And his phone was eternally ringing,
His patients, when sick, always wanted him quick,

And to others his praises were singing,
But today there's a lull in his work, and the dull
Weary hours are becoming depressing
With no work now to do, he is terribly blue,
And his predicament is distressing,
No more mastoids to do when his office is through,

No tonsils to pluck from their housing,
No sinus to drain for relief of the pain,
No ears coming in for a dousing
No boils now to lance, while the victim will dance,

No appendices to remove,
No more reason to hope that the old cystoscope
Will a friend muchly needed now prove
No gallbladders to drain, no disease of the brain
From absorption of toxins malicious,
No more chills in the night, many parents to 'fright,

And no more infection so vicious
We revolve in our mind the reason to find
For the loss of all means for a living,
And the reason we see can nothing else be
But sulfanilamide we are giving—
So with nothing to do, and the prospect so blue
We can only sit down and discuss
Not what have we done with this product,
But—what has it done with us?

G M MAXWELL—in J A M A

TRUST THE DOCTOR

In spite of the fact that its material rewards are not great, medicine today attracts and holds superior young men and women, it would not do so if they felt that their future depended on governmental favor rather than upon professional attainments. Experience teaches that there is far more reason to place confidence in the high purposes and altruism of the physicians than in the tall talk of politicians or the wishful thinking of professional reformers.—Editorial, *Chicago Daily Tribune*

DISTRICT OF COLUMBIA'S MEDICAL PLAN

The members of the Medical Society of the District of Columbia have voted heavily in favor of a prepayment medical service plan. Out of 529 voting, 483 ballots were affirmative, 44 negative, and 2 indefinite. The plan is to include members of the Society who volunteer to participate, and the clients will be employed persons under sixty years of age, in present good health, earning \$2,000 a year or less if single, or \$2,500 or less if married, who will pay \$1 50 a month if single, \$2 50 for husband and wife, and \$3 50 for a family. In adopting a fee schedule for medical services, the income level of the group to be served, and the monthly payments of subscribers have been taken into account. Physicians participating will be required to subscribe to the fee schedule, a copy of which will be provided them when the agreement is entered into. The plan was worked out with the aid and advice of Dr R G Leland, Director of the Bureau of Economics of the A.M.A.

LORENZ J. BROSNAN, Esq.

Counsel Medical Society of the State of New York

Malpractice—Expert Testimony Required

FREQUENTLY a patient dissatisfied with results of medical treatment seeks to hold a physician liable for claimed malpractice although unable to produce in court any medical testimony of any actual neglect or departure from proper and approved procedures. Such attempts rarely succeed without competent testimony as part of the plaintiff's proof, as is illustrated by a case recently passed upon by an appellate court in one of the New England states.*

The plaintiff in the case was a boy of about eleven years of age at the time he sustained an injury while coasting. The runner of another boy's sled had struck him, pierced his clothing, and made a wound in his chest. The boy was promptly taken to a hospital where he was examined by Dr. A., a visiting surgeon of the staff who was on service for that particular month and also by another physician, Dr. B., who was designated as house officer."

Dr. A. directed the taking of x-rays and they were found to be negative. The wound was thoroughly cleansed and was closed by the use of two interrupted horsehair sutures. Tetanus antitoxin was administered. The boy remained in bed at the hospital for nine days and on the eleventh day went home. During that period he was treated daily by the "house officer" and seen daily on rounds by Dr. A.

Following discharge from the hospital the patient returned to the outpatient department, and was seen further by Dr. B. from time to time for two months. During this time pus appeared in the wound, and on two occasions Dr. B. picked some threads from it. A month later on the boy was taken to a different hospital and confined there for a few days.

According to the records he was found suffering from a chronic sinus of the chest wall, and after x-rays were taken and found to be negative, he was taken to the operating room where the sinus was excised and a small piece of wool fabric was removed. He was sent home in the care of a physician, and in two weeks thereafter the wound had healed.

An action to recover damages for alleged malpractice was brought on behalf of the boy against Dr. A., the surgeon. Upon the trial, the facts were in general shown to be as above related. The proof showed that the defendant did not have any connection with the care of plaintiff when he returned to the outpatient department, and never saw plaintiff after his discharge eleven days after the accident.

The proof showed that Dr. A. when he first saw the child found a lacerated wound over the left breast, exposing the chest wall. The chest wall being thin, Dr. A. told the "house officer" to be careful in any scraping of the wound, lest the pleura might become injured, causing the lung to collapse. The purpose of treatment was described as being to get out all foreign material possible, to give anything left in room to get out, and to drain and help evacuate the wound of any pus or foreign material. The defendant testified that when the patient left the hospital, serum was discharging but there was no pus, and that a wound of the nature plaintiff had received might very well take three or four months to heal. He also testified that it was a natural course for a sinus to develop about foreign material, and that good surgical treatment had been administered throughout.

The trial Court directed a verdict in favor of the defendant, and the case was

* *Tallon v. Spellman* 19 N. E. (2nd) 33

taken to the Appellate Court upon plaintiff's contention that the case should have been submitted to a jury.

The Appellate Court affirmed the judgment in favor of the defendant physician, and said in the course of the opinion:

"The precise relationship between the defendant and the 'house officer' does not appear. An inference, however, is warranted that included in the duties of the house officer was the administering by him to patients of such treatment as the defendant should direct. The extent of the liability of the defendant would be for negligence in his acts or omissions in the examination of the plaintiff, in the diagnosis of his injury, in the directions for treatment which he gave the house officer, and in the supervision of the treatment given by the house officer up to January 14 when the plaintiff left the hospital. There is nothing in the record to indicate that the defendant had anything to do with the outpatient department or had any supervision over treatment there given to patients.

"One contention made by the plaintiff is that the defendant was negligent in not discovering and removing from the wound, at the time of the examination of the plaintiff, a bit of wool fabric, which, several months later, was removed at the second hospital to which the plaintiff went. If the testimony of the defendant were accepted, there was adequate reason for not determining at

that time whether any foreign matter was in the wound, the course followed by defendant of awaiting the partial healing of the wound and the formation of a sinus was prudent and proper, and the defendant in all that he did or did not do followed good surgical practice and was not negligent. If his testimony were rejected, as it might be, there was no expert testimony on which to base a finding that the conduct of the defendant was improper or in violation of the obligation as to using care which he owed to the plaintiff. The standard of care set by the law in the ordinary negligence case is the care that would be used by an ordinarily prudent person in similar circumstances. The standard of care by which the negligence of the defendant in an action for malpractice is determined, is somewhat differently expressed. In such cases the measure is the skill and care that persons in the same profession as the defendant ordinarily have and use in similar circumstances. We do not think that the common knowledge and experience of men are such that a jury in this case could, unassisted by expert testimony, say that proper medical practice required going into the wound at the time of defendant's examination, or while the plaintiff was under the defendant's supervision, to probe for any foreign material that might be there, or could say that the defendant was negligent in following the course he did rather than the course now suggested by the plaintiff's counsel."

Claim of Malpractice in an Obstetric Case

A young married woman, the mother of one child, made arrangements with a physician specializing in gynecology and obstetrics to attend her during her pregnancy and to deliver her when the time came. In due course, the patient was admitted to a hospital where she was delivered of a normal healthy child.

Labor was short and it was not necessary to use instruments. Following the delivery, the physician expressed the placenta and after examining it found it apparently to be intact. The patient remained at the hospital for ten days under his care and she seemed to be in all respects normal. When she left the

hospital, the patient was told to remain in bed for a week and thereafter to restrict her activity and communicate with him in the event of complications, re turning for a checkup in a month.

About ten days after she left the hospital, she made complaints to the doctor that after a long walk she had developed some bleeding. He examined her and found that she had passed some blood clots. He advised her to rest in bed and prescribed for her. A few days later she seemed to be in all respects normal. Three days thereafter, at a time when the doctor in charge of the case was not available, it appears that she again

started to bleed and called in another physician who performed a curettage upon her and removed portions of retained placenta.

A malpractice action was brought against the first physician claiming that he had failed to properly care for her in the course of the delivery and the after care. The case came on for trial before a court and jury, and at the conclusion of the testimony introduced on behalf of the plaintiff, upon defendant's motion, the action was dismissed on the grounds that plaintiff had failed to establish that defendant was in any way guilty of malpractice.

Anesthesia Death

A boy about seventeen years of age had had a tooth extracted following which his jaw became swollen and he developed cellulitis with a lingual abscess, and an oral surgeon was consulted and advised an operation for the purpose of treating the condition. The oral surgeon, after a consultation with another specialist in his field, decided that the anesthesia to be administered should be evipal, and a physician who had for many years specialized in anesthesia was called in to administer the same. The said physician, preliminary to the operation, examined the patient and found his heart, pulse, respiration, blood pressure, and lungs normal from an anesthesia standpoint. There was no respiratory involvement whatsoever and the air passages were clear. The anesthetist computed the dosage of evipal to be administered as 8.64 cc. The patient was placed in a dorsal position and the solution of evipal was carefully injected into a vein in the bend of the elbow. When the patient appeared

to be completely anesthetized, the oral surgeon proceeded with the operation, which took from five to ten minutes. However, upon the completion of that procedure, the patient's breathing stopped and although emergency measures were introduced the patient was declared dead within a half hour.

A malpractice action was instituted both against the oral surgeon and the anesthetist in which the plaintiff's contention was that evipal should never have been used that it was contraindicated that it was in an experimental stage, and that other and safer anesthetics could have been used in the case.

The case came on for trial before the court and a jury and there was a direct conflict of testimony as to the propriety of using evipal. The issues were submitted to the jury and a verdict was returned in favor of the defendants thereby exonerating them of the charge of malpractice that had been made against them.

I sneezed a sneeze into the air
It fell to ground I knew not where
But hard and cold were the looks of those
In whose vicinity I snooze

—*Epitome*

The Sixty third annual convention of the American Association on Mental Defect will be held at the Palmer House in Chicago, from May 3 to 6 inclusive.

Across The Desk

Is Homo Sapiens Cracking Up?

THE great dragon-lizards of prehistoric time were lords of all creation for fifty million years, but what became of them?

They cracked up

Preceding them, the giant insects dominated all they surveyed for unknown eons—enormous scorpions prodigious spiders, incredible grasshoppers

Where are they now? Gone Cracked up

If able to think at all, they may have supposed themselves the last word, the final crown, of created beings

That is what man thinks he is—ruler of the world and lord of all he surveys But his reign has been brief indeed compared with the eons of time when the giant insects ruled the blue and the prehistoric monsters bellowed through the jungles Is he, like them, but transitory, a mere episode in the history of our strange globe?

Perhaps

Breaking Down Internally

Signs that man is beginning to crumble under the strain of his own so-called civilization are remarked by many onlookers That the world has gone mad and civilization is about to commit suicide is so usual an observation that it has become commonplace. We are like dwellers on the slopes of a volcano who pay no attention to its rumblings—until too late

But that is not the worst Our rather tough and boisterous old human race has come through some pretty dark ages of war, war, and then more war, and has somehow emerged on higher levels than before, but now cracks are starting to appear in man's own mental and nervous framework that may show that he is breaking down internally

That is the belief of a scientist who has spent years studying our poor human wreckage He sees "incontrovertible evi-

dence" that "the human nervous system as a whole is breaking down" In fact, "mankind would appear to be cracking" All over the world reports indicate such "an appallingly rapid increase in insanity, crime, exhaustion, and degeneracy" as to "suggest ubiquitous bedlam"

Not only are the figures for insanity "startling," but they are "probably only a reflection of the vaster numbers" on the borderline, not actually committed, but "biologically and medically insane, split and criss-crossed by conflicts of impulse and errors of psychation which plunge them into the deepest unhappiness and suffering"

A Word to the Wise

It is Dr Louis Berman, of New York City, who paints this dark picture, and the figures he puts on his canvas he takes from cases that have come under his own hand and from official findings that cannot be doubted Crime is rising along with insanity, and the degenerative diseases of the vital organs "have multiplied out of all proportion to the average prolongation of life" Altogether, "physically, as well as psychically, men are showing that they cannot stand the complexities and perplexities of living together under the conditions of our so-called modern civilization" They are cracking up

But right here we come to the vital difference between *homo sapiens*, who knows he is cracking up, and the dragon-lizards, saber-toothed tigers, mammoths, scorpions, spiders, and grasshoppers, which were cracking up, but never suspected it If Mr *Homo* is so *sapiens*, then *verbum sapienti satis*, and Dr Berman gives him the word to save him from going the way of the others Man, it may be, can do something about it, the others could not

To find the roots of crime and of anti social twists and quirks of personality,

Dr Berman examined a group of 250 convicts in Sing Sing prison in comparison with a group of normals in New York City and also examined a group of juvenile delinquents in comparison with a group of normal children. He discovered that both the criminals and the juvenile delinquents showed glandular defects and disturbances two to three times as great as in the control groups, a fact that convinced him that endocrine abnormalities "play a fundamental role" in antisocial behavior.

Wizardry Steps In

What wizardry it seems, to reach into the human system and, by tinkering with the delicate endocrine glands, to turn a liar and thief into a normal, fine, honest boy. Exactly that was done with Alexander, a lad well on the road to crime. After injections of extracts of the pituitary and parathyroid glands and a helpful change of diet, his teacher said he was "so changed that it seemed almost impossible to reconcile his present behavior with his past." He is now doing well in college. This is only one of several case reports of Dr Berman.

So *homo sapiens* has a hint here, any way, of what he can do to help mend one crack in his make up.

Insanity and crime go hand in hand in this doctor's view, both are antisocial manifestations, both due to imbalance, maladjustment and social disharmony. If we could clear up the crime and craziness in this mad world, or half of it, or a quarter, what a different place it would be. Well Dr Berman figures that over 40 per cent of the inmates of our mental hospitals are sufferers from dementia praecox, which often yields so happily to the new treatment by insulin shock. It is, of course, superfluous to describe the treatment to this audience, or to recount the almost miraculous transformations of personality worked by it. Many pages are devoted to it in Dr Berman's book, which is well titled *New Creations in Human Beings* (published by Doubleday Doran).

If, then, we can halt the criminal tendencies of the juvenile delinquents by bringing harmony to their endocrine glands, as we tune the delicate strings of a violin, and if we can brush the cobwebs of hallucination from the crazed mind of the schizophrenic, then we may not only keep *homo sapiens* from cracking and crumbling, but we may make him more *sapiens* than he ever has been.

Disquieting Questions

Two disquieting questions arise right here. Genius, some say, is a form of insanity. The riotous imaginings of a Dante or a Shakespeare may be but sublimer forms of the hallucinations of the schizophrenic. Michelangelo's glorious dreams in marble and on canvas may only reveal that he was a hyperthyroid. As a matter of fact, Dr Berman takes several pages to prove that Charles Dickens, with his prolific imagination, had thyroid over activity and parathyroid deficiency. Are you going to end that sort of thing, gentlemen? Are you going to reduce us all to a dead level, turn human kind into human kine, as it were? Think twice about it.

Again, if all the little coming criminals are to be cleverly doctored into little coming saints, is there not danger that the world's history, from then on, will after all be but a dull affair? Glance back a moment. Suppose that Nero had had his glands fixed and become but a fiddler in the Rome Y M C A. orchestra. Suppose that Cleopatra had been well about the opposite of everything she was. Suppose the Borgias had founded a life saving league, that Torquemada had started the be-kind-to-animals week, and Bloody Mary had been so tender hearted that she swooned at the sight of gore. Who would read a history book? The salt would be gone from the story of our race.

Is the world to be reduced to a hum drum level of innocuous desuetude?

No danger. Not if the morning paper is any indication.

American Congress on Obstetrics and Gynecology

The American Congress on Obstetrics and Gynecology will be held in Cleveland, Ohio, from September 11 to 15. It is sponsored by the American Committee on Maternal Welfare, formed of representatives of many member organizations, which include the various national and sectional obstetric and gynecologic associations, hospital associations, public-health organizations, and nursing associations.

The purpose of the congress is, as stated "To present a program of our present-day medical, nursing, and health problems, from a scientific, practical, educational, and economic viewpoint as far as they relate to human reproduction and maternal and neonatal care."

There will be sessions for each professional group in the morning with round-table discussions. The afternoon meetings will have papers of general interest to all members attending the congress. The public will be invited to the evening sessions where there will be speakers of national prominence.

The program for the physicians will include among many others such subjects as pregnancy associated with thyroid disease, heart disease, diabetes, tuberculosis, nutritional factors, carcinoma of the female genitive tract, and abortions.

The congress is not planned as a meeting for specialists in any sense of the word but for all physicians who are interested.

ORGANIZATION

The professional groups included are those interested in and concerned with the problems of human reproduction, maternal welfare, and neonatal care.

1 Medical (a) General practitioners, (b) Specialists, (c) Educators

2 Nursing (a) Institutional supervisors, (b) General and private-duty nurses, (c) Educators, (d) Public health

3 Public Health (a) Administrators, (b) Field workers

4 Institutional administrative (a) Hospital, (b) Outpatient, (c) Educational

MEMBERSHIP

Membership fee is \$5.00 which includes a year's membership in The American Committee on Maternal Welfare and registration in The American Congress on Obstetrics and Gynecology Cleveland Ohio September 11-15 1939. Applications should be made to the Headquarters Office The Annex, 650 Rush Street Chicago. Make checks payable to R. W. Holmes Treas.

ONE OUT OF NINE

It is estimated that only one out of every nine syphilitic women who get treatment gets enough to protect the child. The reasons are obvious remarks the *Maternity Center Briefs*. Women do not seek care early and the treatment of which they must avail themselves is all too often so unattractive and so unacceptable to any sensitive women, that it takes more courage than the average pregnant mother has to continue with it. It is discouraging that any one should have to spend time in this day and age urging that needles be sharp that doctors and nurse be

courteous and sympathetic, that privacy be afforded patients and yet the lack of these is the reason why many of the pregnant women known to be syphilitic do not get enough care to protect their babies against syphilis.

This is true all over the country. Clinics are over-crowded, needles are dull, there is no privacy and day after day patient after patient stalks through without hearing the words of sympathy and understanding that encourage her to come for the next treatment.

AMERICAN BOARD OF INTERNAL MEDICINE INC

Written examinations for certification by the American Board of Internal Medicine will be held in various sections of the United States on the third Monday in October and the third Monday in February.

Formal application must be received by the

secretary before August 20 1939 for the October 16 1939 examination and on or before January 1 for the February 19 1940 examination.

Application forms may be obtained from Dr. William S. Middleton, secretary-treasurer, 1301 University Avenue, Madison, Wisconsin, U. S. A.

POWERFUL

One Negro woman to another: Has you all bought your tuberculosis seals yet?

No, I ain't never bought none. What they for?"

"They sell em' to prevent tuberculosis and I buy me fifty cents worth every Christmas and stick em on my chest and I ain't never had tuberculosis." —*Southern Hospital*

BE CAREFUL ABOUT THIS

The octogenarian Mr. Jones during an operation for the rejuvenation of youth became very impatient.

"Don't be so restless," growled the nurse.

The poor man went on moaning and sobbing.

"Don't cry, the pain will soon vanish."

"I'm not crying because of pain," explained the old man. "I'm afraid I'll be late for school." —*Ill. Med. J.*

Books

Books for review should be sent to the Book Review Department at 1313 Bedford Avenue, Brooklyn, N. Y. Acknowledgment of receipt will be made in these columns and deemed sufficient notification. Selection for review will be based on merit and the interest to our readers.

REVIEWED

Pediatric Surgery By Edward C Brenner, M.D. Octavo of 843 pages, illustrated. Philadelphia, Lea & Febiger, 1938. Cloth, \$10.00.

Conceding essential differences in anatomy, physiology, and pathology, the separate consideration of the surgery of childhood would seem to be justified in the publication of this and similar volumes. There have been other publications on this subject and Dr Brenner's *Pediatric Surgery* naturally falls in the group of those of real value and interest.

In spite of its considerable length, 843 pages, the treatment of fractures and orthopedic diseases has been left to the more specialized books dealing with these subjects. With a full volume, even after the omission of these topics, it is obvious that the field of pediatric surgery is a broad and important one. Various divisions of the subject, such as Thoracic Surgery, Urological Conditions, Neurological Surgery, and others have been assigned to those specially qualified to describe and discuss them. It is, of course, difficult to exclude from the pages of such a book descriptions of certain diseases of childhood which are more properly considered in the usual textbooks of pediatrics. Their inclusion in this book is obviously for the purpose of featuring their surgical significance, if any. "The child's body is no place for heroic surgery" is the foreword of the author. The surgical treatment of children would seem to be safe in the hands of one who believes in such a practice.

JOSEPH RAPHAEL

Diseases of the Skin for Practitioners and Students. By George C. Andrews, M.D. Second edition. Octavo of 899 pages, illustrated. Philadelphia, W. B. Saunders Company, 1938. Cloth, \$10.00.

The second edition of this book is a great improvement over the first which

appeared in 1930. It has been entirely revised, reset, and remodeled. In fact, it can be said that it has even been "streamlined." The original edition contained 1,091 pages while this edition contains 899 pages, but has 75 new diseases added. Also, the pathology of the majority of the conditions described has been added, greatly enhancing its instructive value. The classification is according to etiology with all the dermatoses grouped together that have a common causative agent, such as the fungi in one chapter, the filterable viruses in another, animal parasites in another, etc. Those conditions lacking a definite classification, such as psoriasis, lichen planus, and acne receive a full chapter for themselves.

The treatment throughout the entire book has been greatly revised and brought up to date. Sulfanilamide is discussed from the standpoint of its use in several different conditions and the eruptions caused by it. Roentgen and radium therapy each receive an entire chapter. Where necessary, prescriptions are given in detail, and should prove a big aid to the student and practitioner.

The chapters on ultraviolet and Grenz ray therapy are left out entirely in this new edition.

The book is abundantly supplied with photographs, many of the original pictures being retained and new ones added. They are typical of the conditions described and the reader gets an excellent idea of the disease under discussion.

The subject of syphilis is thoroughly gone into from beginning to end.

All in all, the book is well written, terminology is simplified, and the subject matter is kept as plain as possible, so that it is easily read. There is only one thing missing—a bibliography.

GEORGE F. PRICE

Eat and Keep Fit. By Jacob Buckstein M.D. Octavo of 128 pages New York, Emerson Books, 1938. Cloth, \$1.00

In *Eat and Keep Fit* the author has literally packed an enormous amount of valuable information. It is simply and well written. One might quarrel with the ideas on acid and alkaline diets, one misses some of the newer thoughts of the various fractions of the vitamin B complex. On the whole, however, the job of supplying concise, reliable data on the role of diet in the body economy for the layman has been well done.

BENJAMIN M. BERNSTEIN

Histological Technique For Normal Tissues, Morbid Changes and the Identification of Parasites. By H. M. Carleton M.A. and E. H. Leach, M.A. Second edition. Octavo of 383 pages, illustrated. New York, Oxford University Press, 1938. Cloth \$7.25

This book gives in compact form the chief methods employed in microscopical examination of human and other mammalian organs. There is a chapter outlining the conception of cells and tissues as complex, colloidal entities which are easily altered by the treatment to which they are subjected. The fundamental processes of fixation, embedding, sectioning, and staining of tissues is described in detail. Several chapters are devoted to methods which are most suitable for the various organs and tissues. Examination of body fluids and dejecta for parasites is described in detail. Many of the pitfalls and means of avoiding them are freely indicated.

EDWARD H. NIDISH

Thoracic Surgery. A revised and abridged edition of *Sauerbruch's Die Chirurgie der Brustorgane.* By Ferdinand Sauerbruch and Laurence O'Shaughnessy F.R.C.S. Quarto of 394 pages illustrated. Baltimore, William Wood & Company 1938. Cloth \$13.50

This is a splendid monograph and we were greatly impressed by its scope and wealth of detail. If anything of value to the thoracic surgeon or the general surgeon interested in thoracic surgery has been omitted, we have failed to note it.

Despite the detailed discussion the reading is not tiresome, and the plates are excellent. The indications for and the technic of the various special procedures are clearly stated. This is a worthwhile addition to American literature on thoracic surgery.

JOHN J. GAINES

The Compleat Pediatrician. By Wilburt C. Davison M.D. Second completely rewritten edition. Octavo of 250 pages. Durham, Duke University Press 1938. Cloth \$3.75

The second edition, like the first, is a remarkable and unusual book. To an exceptional degree it does contain the material a practitioner needs in caring for a child.

The form is very much changed. The last numbered section is 243, in the first edition 1937—an emphatic illustration that it is practically, if not literally, completely rewritten. This does not mean less material but regrouping and an entirely different method of numbering.

We would cordially recommend the book to every pediatrician and general practitioner seeing children. For the systematic instruction of undergraduates another type of textbook would seem necessary but even this junior gentleman could have it beside him.

WALTER D. LUDLUM

Classic Descriptions of Disease. With Biographical Sketches of the Authors. By Ralph H. Major M.D. Second edition. Quarto of 727 pages, illustrated. Springfield, Charles C. Thomas 1938. Cloth \$5.50

This book, with Garrison's *History*, Camac's early collection of classics, Fulton and Long's *Readings*, Victor Robinson's *Pathfinders* and the ambitious annual volume of *Medical Classics* of Emerson Crosby Kelly together constitute a kind of medical bible. They are our sacred books. Medicine, law, and the church have all had their saints, scholars, lawgivers, prophets, statesmen, and soldiers. Major chronicles a goodly number of representatives of medicine falling into one or another of these categories.

gories, more or less metaphorically speaking, with their written gospels, poems, sagas, prophecies, and decrees as imperishable as any left by the hand of man

Being the second edition, Major has added malaria and yellow fever, and revised many of the biographic sketches. There are additional readings and illustrations and the index has been accordingly enlarged

There is a great thrill to be had in reading these 403 selections from the writings of 190 authors, the mature medical mind can recapture here the rapture with which in its juvenile period it encountered the great classics of general literature

We repeat with added emphasis our judgment of the first edition in 1932. For every physician's '6-foot shelf' The outstanding medical contribution of the year

ARTHUR C JACOBSON

Pathological Technique A Practical Manual for Workers in Pathological Histology including Directions for the Performance of Autopsies and for Microphotography By Frank B Mallory, M D Octavo of 434 pages, illustrated Philadelphia, W B Saunders Company, 1938 Cloth, \$4 50

This book provides a critical and well-balanced summary of the author's experience of forty-five years in pathology. It is written concisely, clearly, and to the point, including those technical procedures which have proved good and reliable by use over a period of many years

The book is divided into three parts. Part I includes general materials and histologic methods, part II treats of special histologic methods, and part III discusses autopsy methods. The latter is a concise, brief exposition of different methods used in autopsy work, together with a critical discussion of the advantages and the disadvantages of each method and suggestions where each might be of special use.

The book will prove useful to those who have occasion to employ histologic techniques and to perform autopsies

DAVID M GRAYZEL

Outline of Roentgen Diagnosis An Orientation in the Basic Principles of Diagnosis by the Roentgen Method By Leo G Rigler Student's Edition Octavo of 212 pages \$3 00 Atlas edition, octavo of 212 pages, illustrated. Philadelphia, J B Lippincott Company, 1938

Omitting any discussion of biophysics and technic, as well as lengthy discourses on the physiology of various mechanisms of bowel behavior, Rigler presents the fundamentals of x-ray interpretation in brief, concise outline form for both students and practitioners. The sections on the heart and mediastinum are especially good, these being for many years the object of special study by the author. Almost one third of the book is devoted to the gastrointestinal tract including recent work on cholangiography

The book has a great deal to recommend it, despite the objection that some may raise to the format. For the use of students there is a paper covered edition without x-ray reproductions

ANDREW M BABEY

Practical Otology By Morris Levine, M D Second edition Octavo of 416 pages, illustrated Philadelphia, Lea & Febiger, 1938 Cloth, \$5 50

It was our privilege to work with Dr Levine many years ago, and as we read his second edition of *Practical Otology* we could feel throughout the volume the dynamic personality of the individual, filled with the desire to learn and to transmit his learning to those associated with him as physicians or as students. The author transmits to the reader the essence of otology gathered from a rich experience both in clinical work and in teaching. This book has been prepared with the idea of simplicity, yet it carries with it a completeness that makes both a text and a ready-reference not only for the student and practitioner but also for the otologist. There are many very fine illustrations, both clinical and anatomic, which are an asset to the book and of great value to the reader. We unhesitatingly recommend this work

SAMUEL ZWERLING

NEW YORK STATE JOURNAL *of* MEDICINE

VOLUME 39

MAY 15 1939

NUMBER 10

Editorial

No Political Ties

Many physicians and laymen are asking whether there is any tie between organized medicine and the Gannett Committee which is fighting the Roosevelt Administration and the New Deal. The answer to this question is an unequivocal 'No'.

Organized medicine has no part in partisan political controversies. There is as much variation in the political ideas of physicians as of any other cross section of the public. Medical organizations have neither the desire nor the right to impose a political credo upon their members.

The Gannett Committee is fighting compulsory health insurance as part of its general attack upon the New Deal and increased governmental domination of the individual. Physicians are opposed to compulsory health insurance because they consider it a costly, cumbersome way to deliver inferior medical care. Agreement on this one point does not mean a general political alliance.

Physicians of various shades of political thought have allied themselves with the Gannett Committee's fight on compulsory health insurance because they believe this group can muster strong articulate opposition to a system in which they sincerely disbelieve. Their union with the Gannett Committee on this issue does not necessarily indicate political agreement all along the line, any more than the projected alliance between England and Soviet Russia means that Mr. Chamberlain has turned Bolshevik.

There are physicians working with the Gannett Committee who are in complete agreement with its entire program. Others are supporting the fight against compulsory health insurance but are in strong sympathy with other New Deal objectives. In either case

it must be understood that their acts are in the public interest. Organized medicine welcomes support in its effort for a democratic control of practice but it has no alliance with any groups and is not committed to any party.

The Legislative Picture

The legislature has been in session four and considered a number of bills in which the profession has an interest. In the brief remaining period before adjournment physicians should redouble their efforts to secure the passage of desirable measures and to defeat undesirable bills.

First on the list of measures deserving immediate consideration is the Hanley-Mailler physicians' lien bill. This is in any real sense a landmark measure. It merely guarantees payment of services rendered in accident cases when the injured person is awarded money with which to defray medical and hospital expenses. Hospitals and lawyers already enjoy this protection. It is a valid reason for discriminating against physicians. For this legislation should be made to Hon. Oswald D. Brown of the Assembly, Hon. Irving M. Ives, Majority Leader, and Hon. Irwin Steingut, Minority Leader.

The Piper bill for nonprofit medical expense indemnity is another measure calling for early adoption. This practice of voluntary insurance would ease the financial burden on the low-income class without sacrificing the quality of medical service or opening the door to the practice of medicine by corporations.

The Williamson bills limiting the practice of roentgenology by non-licensed physicians and the Giordano bill providing medical care for home-relief patients are also deserving of immediate medical support. There is still time to put these worthwhile measures through if a concerted drive is made for them.

On the negative side are several bills that must be defeated. Bills that threaten the independence and integrity of medical practice are to be particularly watched. Chief among these are the Wagner and Boccia compulsory insurance bills, the Milmoie osteopathy bill, and the Esquimaux bill legitimizing the practice of medicine by medical service corporations. Opposition should concentrate on these dangerous measures.

The legislative committees of the state and county societies should be vigilant and energetic in defense of sound medicolegislative principles. Their influence is greatly enhanced, however, by individual expressions of opinion confirming their stand. A personal letter or call is often more effective than a printed petition bearing many signatures.

signatures The individual practitioner has the power to influence medical legislation if he only chooses to use the simple but effective weapons at his hand

New Drugs for Glaucoma

Glaucoma, whether it be of the acute congestive, aphakic, traumatic, buphthalmic, or chronic simple type, is an illness of such serious import that any advance in its conquest is especially deserving of comment Hitherto, the use of miotics, particularly pilocarpine and eserine, and the institution of surgery have been the mainstays of the ophthalmologist Unfortunately, the latter procedure has in the past been attended by the danger of hemorrhage into the eye which resulted from the sudden lowering of pressure

Clarke,¹ basing his work on a sound pharmacologic basis, has found that acetyl beta-methylcholine (mecholyl), when injected retrobulbarly, lowers the blood pressure, produces miosis, results in stimulation of the parasympathetic, and causes a rapid fall in the intraocular tension When combined with prostigmin, it is even more effective in acute glaucoma since it acts synergistically with this drug Untoward effects may be noted following the use of mecholyl which may assume serious proportions but if the dose is kept below 0.03 Gm, these reactions can be obviated In allergic individuals the use of this drug is contraindicated because of the danger of sudden death from respiratory failure

The fact that in 75 of the 100 cases treated Clarke was able to establish normal tension and maintain it by this and other methods of treatment, and in 17 others to bring his patients to the stage where surgical intervention was relatively safe, is in itself sufficient to warrant further trial of these two drugs in the treatment of glaucoma

Sugar Metabolism with Vitamin B₁

It is a difficult task to keep up with the rapid developments in the field of vitamin therapy Since the availability of vitamin B₁ in synthetically pure form as thiamin chloride, it is being widely used clinically for various conditions Because of this fact, observations are being recorded following its use, which at times seem paradoxical The appearance of herpes zoster, as noted editorially in a former issue of the JOURNAL,² is but one of them Others are more important

¹ Clarke, S. L.: *Am J Ophthal* 22: 249 (March) 1939
² *New York State J Med* 39: 403 (Mar 1) 1939

because they present problems for the practitioner in the diagnosis and therapy of diabetes

It is established that vitamin B₁ materially influences the metabolism of carbohydrates in the body, but the complexity of the effect on sugar metabolism is evident from the reports of Watson¹ and of Hart and Wise² The former records a case of a known diabetic who was maintained in good health and whose urine was kept sugar free by the administration of 32 units of insulin per diem Following six injections of thiamin chloride for neuritic pains (2 mg per diem) marked pallor, sweating, and other symptoms of an acute hypoglycemia occurred, and this attack was relieved by taking barley sugar What is even more significant is the statement of the patient that during the period he was being given vitamin B₁, he required considerably less insulin to keep his urine sugar free

On the other hand, Hart and Wise report an opposite effect from thiamin chloride In a patient who had been receiving 4 mg of thiamin chloride daily, an examination of the urine showed a marked reduction of the Benedict's solution The fasting blood-sugar content was found to be only 90 mg, and following a high carbohydrate diet, the urine was again examined and found to be negative for sugar In 3 other patients who were taking 6 mg of thiamin chloride daily, the Benedict test was negative

We are apparently faced with two new problems in the diagnosis and treatment of diabetes which are the result of the use of vitamin B₁ Is it not possible that the treatment of diabetes with insulin may be amended in the future when exact knowledge of the role of vitamin B₁ in carbohydrate metabolism is available? In the meantime, physicians should be on guard against hastily diagnosing diabetes mellitus on the finding of a positive Benedict test in a person who has been taking concentrated doses of this vitamin

DR CHARLES H. GOODRICH

The sad news has just been received that after a short illness, Dr Charles H Goodrich died on May 6

He was so recently actively engaged among us that it becomes difficult to reconcile ourselves to the reality that this useful life is finished For many years, in various positions in the Kings County Medical Society and in our State Society, he served organized medicine with great distinction As president of our Society, his executive ability, his unvarying courtesy, his toleration of opposing viewpoints, and his steadfast trend toward the goal in view made his administration distinctive Personally, a lovable character, seeking to do justice to all, he endeared himself to all who worked with him

The Medical Society of the State of New York has lost a wise counselor and guide Many of us feel that we have lost a friend

We shall remember him His good works are his epitaph

Current Comment

Whether the plan for amplifying the care of the sick on a nation wide basis has any merit or not, it certainly involves an expense of colossal proportions, and the question can easily be raised as to whether the same end might not be attained by other means. "The Burning Question" discussed in a current issue of the *Weekly Roster and Medical Digest*

"It does seem to me that there has been an unwarranted amount of mud slinging in the direction of the doctors in the past year or two. No doubt the mud has been slung for a purpose, namely, to discredit the profession by painting it black in order to put across someone's ideas on socialized medicine. This is an old trick used by politicians and others for many years. And innocent victims frequently have paid a terrible price for the loose talk of those who oppose them.

'Medicine has been its own watchdog, and in that capacity it has certainly protected the public against the quack and the charlatan to whom the sale of drugs and cures is a purely business proposition, measured only on a basis of dollars and cents and not by results.

'Certainly the doctors will be the first to agree that the poorest family in the United States should have proper medical care, for they have been setting a voluntary example of social responsibility ever since the first physician started practicing on these shores. So they are not unreasonable in demanding that they have a good bit to say about any plan that is put into effect." From a commentary to be found in a recent issue of the *Allen town (Pa.) Chronicle and News*

'American people are the easiest people in the world to deal with, because they have an open mind." A statement made by Oswaldo Aranha, Brazilian foreign minister, when visiting here. When we think of the medicosocial problems confronting our people now, we hope he

means that the American people will listen to both sides of a question, not that they will listen to anything—propaganda or truth—and indiscriminately believe what they hear.

Liberals originally, as the name implies, like the earlier Whigs, believed in the policy of voluntary cooperation. Their political philosophy rested on the basis of the right of individual liberty, limited only by the equal rights of others. Consequently their test of each and every State interference with individual freedom was whether that specific interference was strictly and absolutely necessary in order to maintain the equal freedom of others. They had no respect whatever for the principle of immediate expediency in questions of State interference. While it might be ever so expedient for the State to step in on this or that situation and take charge of it while there might be a good deal of inconvenience and trouble accruing if the State did not step in, nevertheless unless it were proved *necessary* for the State to step in for the maintenance of equal freedom, they were against its doing so. Their root principle was that when it is not *necessary* for the State to act, it is necessary for it *not* to act. Albert Jay Nock in the *May American Mercury*

The brain is guided by logic. The heart leaps in response to impulses that are more powerful than logic has ever been. They whose hearts are in the right place are foremost when duty has to be done, when the impossible has to be achieved. Their education is glorified by courage." *The Commentator* May issue.

'There are certain children about whom democracy is especially concerned in these times and must be the children of the unemployed, other children with

out adequate shelter or food or clothing, children of migrating families, children confronted with discrimination and prejudice, children beyond the reach of medical service, children denied help in attaining faith in an ordered universe

Not till these and such as these are included in democracy's concern can we feel secure about its future

They have become an 'integral part of democracy' and not merely a 'segregated group' for whom provision is to be made as of some body apart

"The *New York Times* of April 28 comments on President Roosevelt's remarks made in his opening address at the Fourth Child's Conference, held recently at the White House

. . .

"Lump together all the nobodies who have misgoverned France since 1870, and put them against the two names of Curie and Pasteur—how about that? Is it not at least conceivable that two hundred years from now the name of Hitler will be remembered only as belonging to somebody or other who ran Albert Einstein out of Germany?" I speak of

this because there is taking place in this country a movement which is making real history, and which I think is perhaps not fully recognized as so doing. We all know it is going on, but I doubt that we

have taken its measure as the most important movement of our time—ininitely more important than the whole sum of intrigues, connivings, threats, lies, and general swineries which are the 'news' of the period, and which we regard as making up the history of the period. I refer to the great westward migration of European culture, and the effort to transplant it in this hemisphere

Culture's refugees, therefore, come from all Europe to our universities, our press, our urban centers of creative activity. They come out of all peoples, nations, and languages, bringing their big and little hoards of cultural experience and creative intuitions and artistic energies

"What will come of it is, of course, quite beyond prediction. The long and short of the situation seems to be that we are fast falling heir to a couple of thousand years of civilization, whether we will or no. The legacy is being dumped in our lap without so much as a by-your-leave. We have, then, the responsibility of choosing whether we shall welcome it as a windfall. If we do, here is the greatest chance that has ever come to any people"—The opinions of Albert Jay Nock, in an article "Culture Migrates to the U S A," from which we have quoted. It may be read in its provocative entirety in the April *American Mercury*

Correspondence

To the Editor

In your April 15th issue of the *New York State Journal of Medicine*, page 771, appears an editorial on "Absorbic Acid." We would appreciate any information you can give us as to just what this is, and where it may be obtained. Thanking you for this courtesy, we are,

Rochester, N Y Very truly yours,
April 28, 1939 Paine Drug Company

. . .

It is the little slips like this that turn an editor's hair gray, make his nerves

jumpy, and bring him to the palatial parlors of the mortician before his time. How they happen is beyond human ken. Our editorial, of course, was plainly concerned with "Ascorbic" Acid, obtainable from most drug firms, and not with "Absorbic Acid." *Ascorbic Acid* is the name for *Cervitaminic Acid*, a synthetic vitamin C.

We are happy to note the interest our correspondent evinces, and thank him for being among those who brought this to our attention.—Editor

ANATOMICORADIOGRAPHIC STUDIES OF THE SPINE

Changes Responsible for Certain Painful Back Conditions

LEE A. HADLEY, M D, Syracuse, New York

IN A CONSIDERATION of the causes of backache it is necessary to bear in mind the posterior joints and also that "crossroads of neuralgia," the intervertebral foramen. Exclusive of costal articulations there are normally fifty-one small diarthrodial joints in the spine. Each one of these has the same fundamental structure and is subject to the same types of injury and disease as the larger joints of the body. Sprains, partial dislocations, and arthritis are frequently encountered. The fibrous tissue of the spine is known to be well supplied with sensory nerve endings. The intervertebral foramen transmitting the spinal nerve is a bony ring partially bounded in back by the posterior joint and in front by the intervertebral disk. Referred pain is likely to result from pathology within the foramen secondary to disturbances of these adjacent structures.

Two types of degeneration of the intervertebral disk have been described. The type observed in early life is characterized by herniation of the nucleus pulposus, either through a break in the cartilaginous plate into the vertebral body or through the annulus fibrosus into the spinal canal. The latter condition may or may not produce symptoms by pressure upon the cord or nerve roots. The disk degeneration noted in later life is characterized by fragmentation of the cartilaginous plate with granulation tissue growing from the adjacent vertebral body into the disk and later replacing it by fibrotic tissue or bone. These interesting pathologic conditions of the disk are not of themselves painful. Nerve endings are present in the ligamentous tissue of the spine, but not in

the disk. The symptoms result from secondary disturbances of the foramina and posterior joints.

Degeneration of the disk produces a thinning of this structure, thus bringing the vertebral bodies closer together. If the posterior articulations do not slip past each other, kyphosis results at this level, a condition usually encountered in the dorsal or upper lumbar region. Thinning of the disk in the cervical or lower lumbar region usually produces a subluxation of the posterior articulations, resulting in the following possible causes of localized or referred pain:

1. Strain upon the ligamentous structures of the articulations.

2. A disturbance in the relationship between the articular surfaces. Due to the inclined plane of the posterior articulations, subluxation from thinning of the disk may thrust the lower vertebral body forward beneath the one above, so that the intervertebral foramen is decreased not only in its axial but also in its anteroposterior diameter.

3. With encroachment of the intervertebral foramen there may be fibrosis about the nerve root bundles giving rise to symptoms of radiculitis.

4. In extreme cases, bony impingement between the tip of the articular process and the pedicle above or the lamina below may cause pain. At first, the tip of the articular process presses against the periosteum-covered bony surface, later, notches may be eroded in the bone by this pressure. The condition is best seen in the stereoscopic 45-degree oblique lumbar view (Fig 1). It may also be recognized by a break in the S-curve as seen in the anteroposterior view.

FIG 1 Oblique roentgenogram (retouched) made with the sagittal plane of the patient at an angle of 45 degrees to the horizontal plane. The third disk is normal, the fourth disk is thinned by an old herniation of the nucleus pulposus, sclerosis about this herniation is shown as a semicircle at X. Line A represents the normal interpedicular diameter of the third intervertebral foramen. B is the contracted interpedicular diameter of the fourth foramen. The normal third apophyseal (posterior) articulation is shown at C, but D, the fourth articulation, is subluxated, so that the superior articular process of the fourth body impinges against the lamina of the fifth at F. This patient had lumbar pain with unilateral muscle spasm of six months' duration, relieved after fifteen months of immobilization by plaster and a brace.

Description of the S-Curve

In the anteroposterior view, centering through an intervertebral disk of normal thickness in the lower lumbar region, an S-curve can be traced. The line follows the undersurface of the transverse proc-

ess and the lateral surface of the inferior articular process, then crossing the apophyseal joint it extends along the lateral surface of the superior articular process from the body below. This curve is seen best if the plane of the articulation is nearly sagittal, but it can be made out even when the articulation is more nearly transverse. In case there is an apophyseal subluxation, such a view shows a jog in the S-curve at the point where the posterior articulations have slid past each other.

In certain cases of marked lordosis, some of the patient's weight is thrust backward onto the posterior articulations of the spine, so that subluxation of these joints may take place. In cases of scoliosis, there may be subluxation if sufficient rotation of the spinal bodies has not occurred, usually, however, even in extreme scoliosis, apophyseal subluxation does not seem to be present if the bodies are rotated. As a result of injury or thinning of the anterior portion of the disk, reverse subluxation of the apophyseal joints may be visualized as a pulling apart of the articular processes.

Exostoses from the disk and posterior joint margins especially in the cervical region tend to encroach more or less upon the intervertebral foramina. These spurs are much more extensive than they appear on the film. In this connection it should be noted that detached fragments of bony tissue frequently form in the substance of the disk margins. Care must be exercised not to misinterpret these as fractured exostoses. Normally the nerve occupies about one-sixth to one-fourth the diameter of the foramen. The remainder of the space is taken up by lymph spaces, blood vessels, areolar and fatty tissue. Bony- or fibrous-tissue encroachment may constrict the foramen to the size of the nerve which may even become flattened in a ribbonlike manner. In examining cadaver material the nerve can usually be separated within the foramen by blunt dissection but in other cases it appears to be adherent and surrounded by fibrosis.

Anterior flexion of the cervical region, as in the lumbar region, increases the diameter of the intervertebral foramen while dorsal extension constricts it. Also the foramen is constricted by rotation or flexion toward it and enlarged by the opposite movement.

This probably helps to explain the production of pain upon certain movements in cases of foramen pathology. These patients not only complain of local pain, tenderness to deep pressure, muscle spasm, and limitation of motion from posterior joint derangement, but also frequently suffer from radiculitis as well.

Radiculitis

In the cervical region this condition is characterized by pain referred to the shoulder, arm, or hand and corresponds in distribution to that of the involved nerve root. With dorsal radiculitis the patient complains of intercostal or abdominal pain which may be confused with angina, gallbladder, abdominal, or even pelvic disease. Lumbar radiculitis produces sciatic pain. The pain of radiculitis is not infrequently aggravated by coughing, sneezing, or bearing down—the so-called Dejerne's sign. The spinal fluid protein may be increased. Not all patients, however, suffering from radiculitis exhibit foramen encroachment upon x-ray examination. Many of them are relieved by small doses of radiation therapy applied to the nerve roots.

The Anterior Curve

A lateral roentgenogram of the normal cervical spine at rest reveals the bodies arranged in a symmetrical anterior curve. Upon anterior flexion of the neck the curve is reversed but it always remains symmetrical at all points. In the cadaver specimen it is impossible to produce angulation at one point without cutting the posterior joint capsules at this level. Following severe trauma, x-ray of the cervical spine may show the normal anterior curve replaced by angulation at one point. This probably indicates a partial bilateral subluxation of the posterior joints with muscle spasm. Uni-

FIG. 2. Congenital fusion of the second and third cervical segments—both the bodies and arches fused. Normal anterior curve replaced by traumatic angulation with partial subluxation of the posterior joints between fifth and sixth vertebrae (arrow).

lateral subluxation is not unusual but is difficult to visualize.

Fusion

Bony fusion of the spinal segments is frequently met with in the cervical region.

FIG 3 Forty-five-degree oblique view of the cervical spine showing the normal relationship of the foramina, posterior arches, and pedicles

Certain cases are probably congenital and others are undoubtedly secondary to degenerative change of the intervertebral disks. Either the bodies, lamina, or the posterior joints may be fused (Fig 2). Some of the foramina are constricted in diameter while others are normal in size. One clinical significance of fusion is that it decreases the flexibility at certain points and places greater strain on the remainder of the cervical region.

Gliding Movement

X-ray studies of the cervical and lumbar spine taken in extremes of flexion and extension reveal that anteroposterior movement is achieved not only by com-

pression of the disk between the bodies but also by a gliding movement of each vertebral body backward and forward on the one beneath it. This movement must be a factor in producing wear upon the disk with a resulting degeneration of this structure. In the neck the point of greatest amplitude of this gliding is about the midcervical region which corresponds to the level of most frequent disk degeneration. In the lower lumbar region this gliding movement is somewhat less marked. Thus we find that the intervertebral disk is not only a buffer and a hydrostatic ballbearing but that it also acts somewhat as a bursa to facilitate a gliding movement between the vertebral bodies.

Radiographic Technic for Cervical Foramina

The film is made with the patient sitting upright, spine erect, chin up, and the shoulder of the side to be visualized against the vertical plate holder. The latter should be at such a height that the upper end of an 8 by 10 cassette is on a level with the patient's ear. Arrange the transverse plane of the shoulders and the sagittal plane of the skull each 45 degrees to the plane of the film. The head may be steadied by a support between the cheek and the plate holder. Direct the central ray downward 10 degrees and toward the midcervical region.

The Oblique Cervical Film

A film of the cervical spine made according to the above technic normally reveals all of the cervical foramina (Fig 3). There is no foramen beneath the first segment. The topmost or second cervical is oval and those below this point are shaped, as Schmorl¹ has described, somewhat like the "sole of a shoe."

Posterior to the foramina the laminae of the same side of the arch are seen in section. In the normal spine these appear in a smooth, sweeping curve and are about equidistant. Any malalignment in this curve or irregularity in the spac-

ing of the sections indicates a disturbance in the structure or the articulation of the cervical units

The pedicles on the side opposite to the visualized foramina appear as a curved line of small equidistant oval shadows. If correct technic has been used in making the film this line of pedicle shadows will intersect the shadows of the vertebral bodies near their anterior surfaces. In certain cases of cervical spine disturbance these pedicles may be distorted in shape, size, spacing, or alignment.

Backache from reflex causes, metastases, cord tumor, anemia, diabetes, and other local or systemic conditions can hardly be discussed in a paper of this length nor can therapy be properly considered. It should be mentioned, however, that conservative treatment has proved valuable. In the acute cases rest on a very firm bed either with or without extension and heat with gentle massage for the muscle spasm are indicated. Ambulatory cases require support, strapping, a brace or molded jacket followed by graduated exercises as the condition improves. As I previously reported before this medical society,² radiation therapy in small doses applied to the nerve roots is of distinct benefit in certain cases of radiculitis. Patients unrelieved by conservative measures may require spinal fusion or facetectomy, as described by Williams.³

Synopsis

There are two distinct types of pathological change in the intervertebral disk which produce thinning of this structure. Thinning allows the vertebral bodies to approach each other, resulting in apophyseal subluxation or slipping of the posterior joints. This is shown by a break in the S-curve. Pain may be caused by bony impingement of the tips of the subluxated articulations or by constriction of the foramina (Fig 4). Decrease in the foramen diameter results from apophyseal subluxation, hyperplasia of connective tissue, or exostoses, particu-

FIG 4 Patient complained of severe pain with muscle spasm of the neck and shoulder. Bony encroachment of third, fourth and fifth foramina. Second sixth and seventh appear normal. Compare with Figs 3 and 5.

larly in the cervical region (Fig 5). Angulation of the cervical spine may follow trauma and results from a bilateral subluxation of the posterior joints at the involved level. Congenital or acquired fusion of adjacent segments is not infrequent in the cervical region. In this region also pathology of the intervertebral foramina and posterior arches is revealed by the oblique studies. Sections of the foramina may reveal crowding of the nerve root in certain cases. Study of the anteroposterior flexion of the spine reveals an extensive gliding motion between the bodies, particularly in the midcervical region. Wearing of the disk by this natural function

is offered as an explanation of the frequency of disk degeneration in this area

Discussion

Dr James P Cole, *Buffalo*—Dr Hadley has brought to our attention and clarified to a great extent some of the more obscure lesions of the spine that produce disability. The small degenerative processes mentioned are difficult to diagnose without a thorough and careful examination of roentgenograms. I feel that if we follow the technic that is advocated by the author very often lesions will be discovered that might have been overlooked in the ordinary plates.

I heartily agree with what has been said concerning the production of radiculitis from degenerative processes of the apophyseal joints of the spine, or slipping of these joints. It is also true that anomalous conditions of these joints will produce the same syndrome. Motion of the apophyseal joints is usually essential for the production of symptoms from the radicles of the spinal nerves or from fascial changes in this type of case. Malformed apophyseal joints and hypermobility of these joints will also jeopardize the intervertebral nerves.

It has been mentioned that thinning of the intervertebral disks decreases the size of the intervertebral foramina with the causation of radicular pain. As an example of this I would like to point to the observation that the fifth lumbar root canal is decreased in size following thinning of the intervertebral disks, causing posterior displacement of the fifth lumbar vertebra.

My personal experience with the use of the S-curve, as described by Dr Hadley, is very limited. My sentiment is that the tracing of this curve would be of value in the lumbar region of the spine when one is dealing with these inconspicuous lesions of the spine.

The obliteration of the normal anterior curve of the cervical spine has been mentioned following certain traumatisms to this region. It has been my experience to find that, if this situation exists, the lateral articulations are either partially or completely subluxated with tearing of the capsules of these joints.

Perhaps I have misconstrued what has been

FIG 5 Oblique X-ray of cadaver specimen with sections cut from the foramina as indicated. Numbers 2 and 7 normal in size with the nerve root surrounded by blood vessels, fatty and areolar tissue. Bony and fibrous encroachment of the fifth and six foramina with crowding of the nerve root downward. Compare with Fig 4.

said concerning the gliding of vertebrae on each other. I have always been of the impression that there was never any actual gliding between normal vertebrae but a tendency to glide. I would like to ask Dr Hadley if I am right in this assumption.

I know that the author has had a great deal of experience with this subject and has made many observations of the spine in cadavers. I would like to inquire if he has observed that the intervertebral canal carrying the fifth lumbar nerve root is decreased in size in comparison to the other lumbar nerve canals?

There are some observers who do not believe that changes in structure of the spinal apophyseal joints can produce a radicular type of disability and therefore I know this paper is of timely interest. Due to this fact I compliment Dr Hadley on this excellent article as well as for the publication of many related articles that have appeared in the literature in the past few years.

MEDICAL ACADEMIES PAST AND FUTURE

JOHN F. FULTON, M.D., New Haven, Connecticut

(From the Laboratory of Physiology Yale University School of Medicine)

MEDICAL academies have flourished for many centuries among democratic peoples. It was about three hundred years ago that the first medical academy, which has continued since its foundation, came into being. Three important scientific societies also sprang into existence at the same time, and I think it no accident that such groups of thinking men began to explore the secrets of nature at a time when certain nations had begun to demand more liberal representative government. In any country the story of the early medical academies is one rich in human interest, but I shall limit my discussion to two countries and to two themes, and then conclude with brief comments upon the present and future of academies of medicine in the United States. The two countries I have in mind are England and Germany—let me hasten to add, England and Germany of the seventeenth century—and the two themes one, that medical academies and scientific societies grew up and thrived quite independently of the universities, and secondly, that they generally flourished best in those countries where men were at liberty to foregather with one another and freely to speak their minds. Fielding Garrison points out¹ (p. 287) that the early medical academies were derived from the medieval guilds. He then adds 'In the face of much futile speculation as to the origin of guilds, they were in the last analysis, but a natural expression of the herding instinct of mankind, the tendency of people of similar type to flock together, on occasion, for cooperative or self protective purposes. This associative spirit, common to all warm blooded

animals, probably goes back to prehistoric times and was doubtless a going concern in ancient Egypt or Babylon."

England

In January, 1639—just three hundred years ago—John Milton was traveling in Italy, still a man in his early thirties. The *Ode on the Nativity*, "L'Allegro," *Il Penseroso*, and "Comus" were all behind him, and 'Lycidas' had just been published, and there had already developed in his mind, perhaps fully by 1639, his great plan for 'Paradise Lost,' but this was interrupted by news of troubles at home.² He abandoned his trip and his plan for writing, and soon returned to throw himself into the historic struggle for supremacy of democracy and parliamentary government. Milton's prose became at once as great as his poetry, he first attacked the autocracy of the church, then the divorce laws, and in June, 1644, the *Treatise of Education* appeared in which he inveighed against the authority of the universities, on November 24, 1644, came "Areopagitica," the greatest plea for free speech ever written by an Englishman—or by anyone else, for that matter.³ Finally, *Eikonoklastes* in 1649, and in 1651 and 1654 he published his first and second 'Defense' of the English people—that people which in 1648 had beheaded its monarch. These were the years, ladies and gentlemen, during which the first scientific academies came into existence. These groups were an expression of a great liberal movement in thought—a movement that manifested itself, not only in science, but in art and literature, and to a large extent also in the lives and

Read January 11, 1939, at the convocation called to dedicate the new home of the
Rochester Academy of Medicine, Rochester, New York

labors of humble men. The medical academies of our own day are a direct outgrowth of this movement, and as such represent a precious part of our liberal heritage—a thing that we must defend and nurture at a time, be it said, when there are too few who raise their voices after the manner of John Milton. To re-echo the thought of Wordsworth⁴

“Milton! Thou should’st be living at
this hour
England hath need of thee ”

There were, to be sure, scientific and medical organizations before 1639. The Royal College of Physicians of London, for example, was founded by Henry VIII in 1518—more than a hundred years earlier—but this organization did not originally, and has not since, fulfilled the functions of a medical academy.⁵ There were, no doubt, other and short-lived medical societies before the seventeenth century, but my point is that, if they existed, they did not flourish, and the literature of the sixteenth century gives us only fleeting records of such organizations.

The academy of which I wish to speak first is the Royal Society of London. In his *Treatise of Education*, Milton had protested that the universities were backward, not only in science, but in the teaching of other disciplines as well. Actually no one of the sciences, except astronomy and mathematics, was formally taught in any of the universities prior to the seventeenth century, and when the experimental method was revived by Galileo and William Harvey the universities remained resolutely set against the introduction within their walls of this new philosophy and procedure.⁶ The best intellects, however, were drawn toward these new ideas. In the early forties, there began to meet together in a London tavern such men as Robert Boyle, Glisson, Wilkins, Wallis, and later Christopher Wren, with the expressed purpose of “advancing natural knowledge by means of experiment.”⁷ They were influenced no doubt by Harvey’s dis-

covery—they all knew William Harvey, for he did not die until 1657—and they were also moved by the writings of Francis Bacon, whose *New Atlantis* had appeared posthumously in 1627. This young group of young enthusiasts, who referred to themselves as the “Invisible College,” met intermittently during the troubled period of the Civil War, the Commonwealth, and the Protectorate, and finally on November 30 in 1662 they received a royal charter and thus became officially recognized as the “Royal Society of London.” Since then, on the 30th of November each year—for two hundred and seventy-six years—they have met without fail for their annual convocation. The early members were industrious minute-takers, and they have left a full record of their deliberations, in 1665 also they began to publish their proceedings under the now familiar title of the *Philosophical Transactions of the Royal Society*. I need scarcely mention that many of the most important early contributions to medicine and physiology appeared in these *Transactions*, since at that time there were no other medical journals. The early members, such as Richard Lower and Robert Boyle, were deeply interested in problems of medicine: blood transfusions, respiration, the structure and functions of the heart, etc., and I would like to read a few characteristic passages—not from the *Philosophical Transactions*—but from their early minute book.⁸

October 1, 1662

“Dr Wren proposed the experiment of forcing up water in two pipes of different diameters and equal altitudes, but having both in the lower end equal bores, the water in the larger pipe would be forced out by less strength than that in the smaller pipe. He was desired to bring in a description of this experiment, and something by way of account concerning it, at the next meeting.

“Dr Wren presented some cuts done by himself in a new way of etching, whereby, he said, he could almost as soon do a piece on a plate of brass, as

another should draw it with a crayon upon paper

Dr Wren observed, that the grafting of a root upon a tree, and so setting it within the ground, makes it thrive very well

'The experiment of lifting up bellows under water was made, and Dr Goddard, Dr Whistler, and Dr Wren were desired to prosecute the same "

Mention of Christopher Wren prompts me to digress for a moment to consider his early career, since it illustrates in a vivid way the versatility and omnivorous curiosity of that virile age. Born in 1632, Wren attended Westminster School where he distinguished himself at mathematics and Latin, he left the school when he was fourteen, and became Sir Charles Scarborough's demonstrator in the anatomical theater at Surgeon's Hall (London), here he had unusual opportunities for dissection and, on his own initiative, developed exceptional skill in injecting anatomical specimens. In 1649 at the age of seventeen he matriculated as a Commoner at Wadham College, Oxford, taking his degree in 1651. Wren remained in Oxford until 1657 when he accepted the Chair of Astronomy at Gresham College in London, but in 1660 he returned to Oxford to the Savilian Professorship of the same subject. Some time before 1663 he assisted Thomas Willis, physician at Oxford, in preparing drawings of anatomical dissections, Willis mentions, incidentally, that Wren drew the celebrated figure of the base of the brain illustrating the arterial circle. I have always suspected, therefore, that it was Wren and not Willis who made the discovery of the circle,* because the vessels that he drew had evidently been injected and the plate itself is very much clearer than Willis' description in the text.

Wren was also responsible for directing interest to the possibility of blood transfusion. His experience with injections had led him quite naturally to consider the possibility of introducing substances into the blood vessels of living animals

Thus he did sometime before 1657 and Sprat¹⁰ records that 'By this *Operation* divers Creatures were immediately purged, vomited, intoxicated, killed or revived, according to the quality of the liquor injected. Hence arose many new *Experiments*, and chiefly that of *Transfusing Blood*, which the *Society* has prosecuted in sundry instances, that will probably end in extraordinary Success.' Actual transfusions were eventually carried out by Lower in 1665. Several human beings were transfused in 1667 without ill-effect, but fears were aroused when dogs who had been transfused were found subsequently to "piss blood." However, it was gravely suggested by some that the senile might be rejuvenated and conscientious objectors made more warlike by giving them a little fighting blood.

But to return to Wren, Sprat describes¹⁰ many other of his activities during this early period. One finds sentences such as (pp 316-317)

He has invented a very curious and exceeding speedy way of Etching. He has started several things towards the emendation of Water works. He has made Instruments of Respiration, and for straining the breath from fuliginous vapours, to try whether the same breath so purified will serve again.

He was the first *Inventor* of drawing Pictures by Microscopical Glasses. *He has found perpetual, at least long lived Lamps, and Registers of Furnaces, and the like, for keeping a perpetual temper, in order to various uses, as hatching of Eggs, Insects, production of Plants, Chymical Praeparations, imitating Nature in producing Fossils and Minerals, keeping the motion of Watches equal in order to Longitudes and Astronomical uses and infinite other advantages."*

Boyle, who also refers frequently to Wren, describes at length in the *Usefulness of Experimental Philosophy* 1663, an operation devised by Wren for the removal of the spleen. It is a most creditable surgical procedure and it is interesting that to diminish suppuration

Academica naturæ curiosorum sive ephemeridum medico-physicarum Germanicarum curiosarum contains in the preface an appeal "to physicians to devote themselves to science." The *Philosophical Transactions*, which had just started in England, are referred to as their model, they were to differ from the *Philosophical Transactions* in publishing only in the field of medicine, botany, anatomy, chemistry, pathology, and physics. The editors explained the need of the undertaking they proposed on the ground that the spread of beneficial knowledge is slow and that unless some such method as a medical paper were devised it was impossible to reach the busy man. As a symbol of the society the ship "Argo" was adopted, the golden fleece signifying scientific truth¹² (p. 171). There were papers in the first volume by the early presidents, twelve of the twenty-seven papers being on zoology, and much space was devoted to pathological monstrosities. Several years ago in one of these early volumes I found the first reported case of a cerebellar tumor with autopsy.¹⁷ Hydrocephalus is depicted and seizures of opisthotonos are described in detail which allow one to identify them with classical jacksonian cerebellar seizures. It will interest Dr. van Wagenen that there are many other cases of brain tumor reported in these early volumes, in one of which a bold surgeon made an attempt to remove a bony exostosis. The roots of the public-health movement and of modern epidemiology may be traced in these early contributions. Here then is the first medical journal in the history of our art* brought out by the first medical academies.

* It is sometimes stated that Thomas Bartholin's *Acta medica et philosophica hafniensia* was the first periodical devoted to medicine. The first volume did not actually appear until 1673 (for the years 1671 and 1672). This also represented an activity of an early medical society, "Societas Regia medica Hafniensis," and is therefore interesting in showing that another democratic country felt the need of a channel of publication at this same time. Thereafter, medical journals, as every medical librarian knows to his or her sorrow, began to spring up in every country and almost every town—like mushrooms (Garrison¹).

Academies of Medicine in the United States

An existing institution cannot readily be understood without the study of its origins, and I therefore hope that the foregoing historical details may aid us in formulating a definition of the functions of an academy of medicine in this country, now and in the future. It may perhaps seem a long jump from the Leopold Academy to the present moment, but I am not sure that this is the case. Although the European press is at present unreliable in its information, I believe the Leopold Academy still exists, and it would be difficult to imagine any institution that is more likely to weather the present hysteria in the German Reich than this ancient academy. To be sure, it has lost—only temporarily I hope—many of its foremost members, but no government, however hysterical, can wholly ignore the value of public service.

If this academy has served the people of Rochester, as well as its members, no cataclysm in Washington or Albany, or in Chicago, can seriously affect its future. I know enough of the local history of this place to realize that the contribution of the Rochester Academy of Medicine to the public good is one that makes it—and other American medical academies that have had similar public-spirited guidance—well-nigh impregnable. As an example, one need only mention the work of one of your most distinguished members, Dr. George Goler, a great pioneer in the public-health field, who gave you clean water and much else, through his work in the municipal health department. With the late Professor Charles Dodge, he was among the first to use diphtheria antitoxin in this country (1894). No community can afford to forget these things—and I look upon it as one of the primary duties of an academy such as this to see to it that the community does not forget.

In a changing social order, strongly swayed by new and perhaps more liberal philosophies of government than we have

known in the past, a democratic institution such as this has two primary responsibilities, one to its own members and the other to the lay public which it also serves. To its members, it must give protection and service—protection, especially from a few irresponsible members of an honored sister profession, who concern themselves more often with breaking than making the law of the land, protection also from politically influential reformers who have not practiced the art, protection, finally from certain reactionary demagogues within our own ranks, who mistake fascistic practice for democratic principle. To its members, a medical academy must also give service, especially intelligence service, and the backbone of an academy is its library. The standards of any medical community or a university can be judged, and are judged, by the strength of its library and the quality of service it renders both to its members and to the lay public. I know too little about the happy circumstances that made possible the magnificent structure that we are now dedicating, but it surely stands as a symbol of the high esteem in which this academy is held by the citizens of Rochester, I venture to think, however, that the intellectual edifice that lies within will be even more important to the community in future years than the attractive house that gives it shelter. I have often wished that Oliver Wendell Holmes had written his 'Chambered Nautilus' in reference to a library rather than to the stately mansions within man's soul. No matter what happens in the social order, if you have built a lofty intellectual mansion within this place, it will become a citadel to which you can repay with almost every problem. So it would seem that, having been so fortunate as to acquire this spacious home, it becomes incumbent upon you to strengthen your library to a corresponding degree. With Mrs. Cooksley's wise assistance, this should not prove difficult, and she no doubt looks forward to the time when the new stack room will be filled and blockaded with unshelved books and to

another ceremony such as this which will be held to dedicate the new wing—a stately mansion—of the library!

It was mentioned earlier that in a democratic state an academy of medicine must serve, not only its members, but also the lay public, this phase of its responsibility, however, is seldom discussed. The respect in which any profession is held varies with the extent to which it has won the confidence of its public. It is unfortunate, as some of you must already well know, that the American medical profession has within the past year seriously lowered its prestige in the eyes of the American public at large. This is not the place to analyze the reasons, but I have no hesitation in mentioning one infallible remedy that this academy has already discovered, i.e., the importance of educating the lay public of the community in the affairs of medicine, its aims and objectives, and the standards of conduct and service that it wishes to maintain. The public is also entitled to have sane counsel concerning other things, such as health examinations, the communicable diseases, especially those of venereal origin, and malignancy, finally, with the modern high pressure radio advertising, the public needs added protection from the ever-growing multiplicity of drugs and nostrums. These things can and should be provided by a modern medical academy, and your facilities for doing them are now vastly increased.

I said in the beginning that scientific societies, and especially medical academies, have developed independently of the universities. As a sociological institution, you are, therefore, older than any school of medicine, you feel the public pulse—especially the dicrotic notches—with more sensitive fingers than do they, and historically you have played a larger part, certainly abroad, than they in bringing about many reforms in medical education and in the public health field. But now your academic baby, after a stormy adolescence, is reaching its maturity and is striving to live at peace with

its parents and its benefactors. A wise father takes pride in a precocious offspring, and a child of such lineage will ever respect and assist the parents who gave it birth.

The Eliot inaugural address was delivered seventy years ago at a time when no university had assimilated its medical faculties. Another significant inaugural address, delivered in this town,¹⁸ a little over three years ago, indicates how points of view have advanced since Eliot's time, science and medicine were accepted by Mr Valentine with a gracious welcome. Would it be ungracious of me to suggest that it is no accident that the universities of the world have flourished in a manner unknown in previous centuries *since* they accepted medicine and science within their walls? However this may be, we are still very new and sometimes a little uncomfortable in these studious surroundings, and no university—except possibly Rochester—seems to know quite what to do with us. Even Charles Eliot complained of his obstreperous colleagues in the Harvard Medical School. The reason is not far to seek—for the status of a medical faculty in a university has never been determined in our new social order, and each new university president, if he is wise, tries a new experiment. Parts of some faculties have been put on so-called "full time", the physicians seem to take this better than the surgeons. But I think the real difficulty lies in the fact that no university has ever ventured to define the precise relation of a university medical school to the community it serves. My conviction is that, while they travel along somewhat different ways, the responsibilities of a university medical school are precisely the same as those of a medical academy. Their aims and aspirations are the same to advance the art and science of medicine, to educate the public as well as the profession, and finally between them to provide adequate medical care for the community. In the highly uncertain state of institutions of higher learning in this country, the future of our profession lies in the

democratic academies of medical service whose building we dedicate tonight. They will be supported in accordance with the service they render, and, as such, they are a primary, permanent bulwark of modern medicine.

I would like before leaving to make a small contribution to your library in the form of an early volume from the first medical journal—the *Miscellanea curiosa* of which I have already spoken. I hand it to you, sir, as a sincere token of my appreciation and esteem.

TUBERCULOSIS OF TENDONS, TENDON SHEATHS, AND BURSA ABOUT THE HAND

FRANK N. POTTS, M D, Buffalo, New York

TUBERCULOSIS involving the tendons tendon sheaths and bursas proximal to the wrist is not commonly seen, as it is not a common complication of bone and joint tuberculosis. There is little in medical literature referable to this condition and statistics are not available as to the frequency of this lesion as compared with other types of tuberculosis. Like other tuberculous lesions, it is probable that early recognition and properly directed treatment will lessen the pathologic process and increase the degree of functional recovery.

Definite knowledge of this lesion is dated from that time when histologic and bacteriologic studies were possible. Prior to that, observers were restricted to such observations as they could make and such clinical studies as were available. There was a constant question in the early writers' minds as to whether they were dealing with a sarcoma, a simple cyst, or a hygroma. Tuberculosis of the muscles and tendon was described in 1863 by Latour and Depres but demonstration showing the giant cells were probably first made by Hoeftman in about 1875. There was considerable controversy relative to this being a primary secondary lesion.

Kanavel in 1923 reported 14 cases. A recent survey in a large sanatorium for tuberculosis makes no mention of tuberculosis of the tendon or tendon sheaths and it is not possible to determine from the statistics presented whether or not some of the cases of tuberculosis of the carpal bones might not have been preceded by infection of the tendons and sheaths. I have recognized only 3 cases.

The diagnosis was proved by section. The lesion can occur at any age and the reported cases are mostly in young adults,

although those under my observation were over 50 years of age. The consensus of opinion is that the lesion is a secondary one. One of my patients had recently been discharged from a sanatorium as an arrested pulmonary case. Another showed no evidence of any other involvement. There are several cases reported that show no evidence of any other lesion. The disease is usually unilateral with a strong preponderance in the right hand the palmar surface being most frequently involved. Gillies has recently reported a case involving both hands. It is of extreme importance to determine the relation of injury as an etiologic factor. Opinions differ, some holding that trauma is a dominant factor others that such is improbable. It is not unlikely that trauma plays a part. One can believe that tissues of the hand can become traumatized and, because the vitality is impaired, readily have tuberculosis superimposed. Likewise, it is possible that the infection can enter through the skin, and a previous infection nontuberculous in nature, may be a predisposing factor. My first patient worked in a fertilizer works. It was his duty to shovel the dead carcasses and parts, sort same, and weigh them. Much of this material was tuberculous. The little finger of the left hand had a bone scratch became infected, drained for some time, then healed over. The finger remained thick and somewhat restricted in both flexion and extension although there was no joint lesion. Six months later there was a swelling on the ulnar side of the wrist, on the palmar surface. Biopsy showed this to be tuberculosis. My second patient had had a crushing injury to the second finger at the proximal phalanx, left hand and this became swol-

len and sensitive three days later. Both conditions persisted. Twelve weeks later there was a swelling on the palmar surface of the forearm just above the annular ligament. Biopsy proved this to be tuberculosis. My last case does not give a satisfactory history of injury, but has a definite active lung lesion. It is of great importance to industry to determine the relation of injury to this disease.

Pathology

The pathologic findings vary greatly, due most likely to the duration of the disease. The earliest lesions are chiefly those of an irritation to the synovial tissue, but specific in nature—a simple synovitis. The tubercle bacillus may be found in this stage with the fluid slightly turbid, or it may contain small flakes of necrotic tissue. The synovia of the sheath or bursa may be thick or thin. It may be smooth and glistening, or may be thick, congested, and studded with small reddened elevations, granular in texture. The sheath may be spotted with tubercles. Apparently the disease does not necessarily spread by proliferation alone. The sheath may be adherent to the tendon in places, varying in extent from a few cm. to 8 or 10 cm. The tendon becomes altered, no longer retaining its glistening white appearance, but now having a yellowish tinge and a dull surface. The disease may have progressed to a villous stage where the sheath has become quite thick, gray, or even a dark red color. At this time the sheath is quite adherent to the tendon, and may with difficulty be separated from it.

From this stage on, the necrosis takes place. The tendon may become frayed and even necrosed to the extent of losing its continuity, and the bursa presents very much the same appearance. There is considerable distention with fluid or with funguslike material. In the earlier stages the wall is thickened, the fluid is thin and slightly turbid, and the tendons are clearly defined and freely movable. On the escape of the fluid, the wrist appears normal. Later, the ten-

dons may be so matted together as to make their identity difficult. The entire bursal space may be filled with a red, thick, granular mass that extends down into the hand and along the tendon sheaths into the fingers. The presence of rice bodies is variable. They are described as appearing in the later stages of the disease. Mumford believes that they are built around giant cells that are extruded from the deeper layers of synovial sac. Rogers describes finding the tubercle bacillus in the homogeneous masses constituting the rice bodies, which, when found, are usually in large numbers. Their appearance would suggest that they are all of practically the same age. Blodgett believes they always mean tuberculosis. Tubby believes them pathognomonic of tuberculosis. They are not always present, however, no matter how far the disease has progressed. They may not be observed on opening the bursa above the wrist, but may be expressed into this space from the palmar bursa. It is not believed that they are present in the tendon sheaths, but rather only in the bursal sacs.

The disease may progress to the stage of caseation. At this time the contents of the bursa and sheath have changed to the stage where the familiar caseation of tuberculosis is present. The tendons may be undergoing this advanced change of necrosis and fragmentation and yet be able to perform, to a degree, their normal function. The thick, red, funguslike mass surrounding the tendons has undergone caseous degeneration and there is some cloudy fluid and shreds of tendon. This tuberculous abscess may then rupture and numerous sinuses appear, which may become secondarily infected. Observers have noted the presence of marked scar tissue evidencing attempt at repair. This scar would involve several of the tendons, making a firm mass. Lisfranc and Chassagnac thought this represented sarcoma, but it was later shown that it was tuberculosis.

When one considers the relation of the tendons to the bursas and their close rela-

tion to the many small joints, it would seem improbable that tuberculosis could involve one type of tissue and not eventually involve the others. Zahnert states that there is no authenticated case of tuberculosis of a tendon wherein the muscle is not involved. No other writer has expressed a similar opinion. The disease does extend to the joints, and may involve the skin. Zahnert states that it is rare for the tendon to become involved in a case of joint tuberculosis.

The symptoms are those of a slowly progressive swelling, which may arise in the involved finger, but is more commonly noted in the palm or in the wrist. There is some impairment of use and a sense of stiffness, there is some degree of pain, which is more probably dependent upon the degree of swelling and stiffness than the fact that the tendon sheaths are undergoing change. Pressure over the swelling produces tenderness. The proximity of the median nerve in the involved area gives rise to symptoms, which vary from tingling in the index, middle, and ring fingers, to numbness. At times the discomfort is that of a burning sensation to a marked degree. There is not as a rule a great deal of pain, but rather a continuous ache. This can be differentiated from the discomfort that arises from the motion of the roughened tendons in the thickened sheaths. Crepitation, very coarse, may be detected in the bursas above the wrist. The swelling at first is not tense, and pressure on it may force the contents either into the palm or from the palm to the space above the wrist. This is likewise noted when rice bodies are present. Constitutional signs and symptoms are lacking unless the primary focus is active. The patient may appear unusually robust and be in what he considers excellent health, he is inconvenienced rather than incapacitated. He may have been working a good many months with very little discomfort.

A case is reported where the patient discredited the diagnosis and continued at his work, apparently with no ill effects.

Diagnosis

A differential diagnosis considers chronic tenosynovitis, not tuberculous, inflammatory masses, syphilis, and tumor. Chronic tenosynovitis would have a history of a period of onset and acute symptoms with crepitation very early, pain, and inability to use the part, then the gradual subsiding of these symptoms with the enlargement residual. Inflammatory masses should give a history of infection and swelling with temperature and redness and constitutional symptoms. Syphilis and tumor must be considered, and a negative Wassermann reaction would be helpful in the former. A patient with swelling in a finger or in the wrist, with or without history of injury or infection, with probable tuberculosis of the lungs or having had tuberculosis of the lungs with evidence of its being arrested, with negative x ray and negative Wassermann, and without constitutional symptoms, should arouse one's suspicions. A definite diagnosis can only be made through biopsy and animal inoculation. A histologic study of the removed tissue shows the presence of marked endothelial proliferation with many tubercles in the connective tissue surrounded by caseous degeneration. Around these areas of necrosis is marked lymphocytic and endothelial infiltration. Properly stained specimens may show the tubercle bacillus.

Prognosis

If we accept the principle that this is a secondary lesion, the prognosis is fairly good. However, the extension to the surrounding tissues, especially to the bone, constitutes a very serious complication—serious from the viewpoint of function rather than mortality. The very nature of the tissues involved renders complete eradication extremely difficult. Unless all the diseased tissue can be removed, the possibility of cure is remote. Cases are recorded in which presumably all infected tissue was removed, a long period of arrest enjoyed, but where later the infection again became evident. The ability of the patient to handle the primary focus would be a

larger factor in the progress of the secondary lesion. Complete extirpation of the infected tissues offers the best prognosis. If the process is limited to one tendon sheath, or to the bursa, it is possible to accomplish this, although it becomes less probable as the involved areas increase in number and extent. When the problem is limited to the elongated sac, comprised of the palmar bursa, it is most hopeful. The prognosis is distinctly better in younger patients, and is probably better in this type of tuberculosis than in most others, because the possibility of complete eradication does exist as the parts are accessible.

Treatment

Much can be done for tuberculosis of the tendon sheaths and bursa. It responds both to conservative methods and to radical surgical therapy. A case uncomplicated by an open lesion can be properly splinted, the hand and fingers kept at rest for a long period, and good results obtained. This procedure has been carried out for many years with satisfaction. The swelling subsides, the symptoms disappear, and the function to a large extent is recovered. It is a long, trying procedure. The tendons become involved in scar tissue and there is lost motion at the wrist and in the fingers, which necessitates many months' treatment to overcome. Careful attention to a primary lesion is necessary. Even under the most careful hygiene the lesion may progress. We are still dealing with tuberculosis and there never has been a substitute for physiologic rest. Efforts at surgical intervention have their place. Aspiration of the fluid and the injection of iodoform emulsion is mentioned in an article written in 1928. In those cases that are limited in their extent and are approachable, complete extirpation combined with splinting and x-ray therapy offer the best possible results.

If a primary focus is determined and it is active, the case is a sanatorium type. Prolonged rest, fresh air and heliotherapy, and x-ray therapy for the infected

hand is the indicated program. A cockup splint should be applied and the fingers immobilized until the swelling disappears, and then the function will be gradually restored. X-ray treatments are continued by exposure every two weeks. Under favorable conditions, marked improvement will be seen in from four to six months. The pain is lessened, the swelling subsides, and the use of the hand does not aggravate the infection. This patient may be cured or may be an arrested case for several years. With the use of x-ray treatment, which I believe should be continued for at least a year, he is able to return to work.

In the light of our present knowledge preference must be given to the surgical extirpation of the tuberculous tissue. The disease is more quickly eradicated, function more quickly restored, and the possibilities of extension lessened. In the absence of sinuses and secondary infection it is a safe surgical procedure. Consideration in electing the case must be given to other tuberculous lesions. I should consider the following points in elective operative treatment: that it be a proved case of tuberculosis, that there be no demonstrable active lesions other than the one to be operated, that there be no secondary infection in the hand, and that there be no more than one and preferably no involvement in the tendons of the fingers. Under these circumstances a general anesthetic is given and a dry field obtained by use of either an Esmarch, or better, the cuff of a blood-pressure apparatus with pressure about 25 mg. above the individual's normal pressure. This can be released from time to time to lessen the pressure on the musculospiral nerve. The operation may be rather long, depending upon the amount of dissection necessary. As a rule, both radial and ulnar bursas are involved. The incision is on the palmar surface in the middle of the wrist and forearm and extends above and below the annular ligament. Great care is taken to avoid the nerves. The tendons are freed from the tuberculous tissue. Dissection is carried down to the surface of

the pronator muscle, and as far as possible the tuberculous tissue is removed in a mass. The wound is then closed and the hand splinted for several days. If there is no lesion complicating the parts operated, such as in the carpal bones it is well to start function as soon as the wound has healed. X-ray treatment should be given twenty four hours before and within a week after the operation. The x ray has been given every two weeks, an exposure of five minutes using 5 ma., 3 mm of aluminum, $9\frac{1}{2}$ inch sphere, gap spark, twelve-inch distance.

Case Reports

Case 1—W G male 55 years old General Hospital No 200,335 examined October 29 1929. He had been at present place of employment fifteen years. P.M.H. was unessential and negative for any sustained illness or acute infectious diseases. Numerous injuries in the nature of scratches about the hands and fore arms were observed. He had many slight infections which always healed. He was employed in a fertilizer plant handling bones, hides and animal scrap and shoveling and weighing same. His complaint was a painful swollen right wrist of one week standing because of which he was unable to work.

In May 1929 he sustained a laceration and subsequent infection in the right little finger. The active infection subsided and the swelling became less noticeable but did not entirely disappear. This later became more noticeable and the swelling involved the forearm. Local treatment resulted in improvement. He lost several weeks work in the summer in an effort to hasten recovery. In October the swelling was again noted there was pain in the wrist and some restriction to motion. On examination there was no other lesion determined than at the right hand and wrist. The fifth finger was swollen at the proximal phalanx, there was no swelling in the palm but there was a definite swelling on the flexor surface of the right forearm. Coarse crepitation was felt and heard in the mass, and the mass and swollen finger were sensitive. No enlarged lymphatics were felt and there was no evidence of acute inflammatory reaction. X-ray examination of hand and forearm was negative for bone or joint pathology and Wassermann reaction was negative. Impression chronic tenosynovitis ganglion or possibly tuberculosis. Biopsy fascia over anterior surface of wrist greatly distended on

incision a deep red fungallike mass seen surrounding the tendons and extending under the annular ligament. The tendons could not be easily separated from the mass. No unusual bleeding from the mass, and no free fluid or pus could be seen.

Diagnosis tuberculosis. A section was reported as showing many giant cells many tubercles lymphocytic reaction, and tuberculous granulation tissue. A guinea pig inoculation was positive and the histologic diagnosis was tuberculosis.

The wound healed quickly and has remained so. The swelling never entirely subsided the swelling in the finger subsiding to a large extent but not entirely. The pain was distinctly lessened. The patient returned to work June 1 and has continued to date. The treatment consisted in keeping the hand up on a cockup splint for five months during which time he received x ray therapy at two-week intervals. The crepitation in the tendons has disappeared and swelling has not increased in either the wrist or finger. Examination of the chest shows apices, hazy especially the left. Upper left lobe shows increased density probably the result of pleurisy.

This case had a definite infection in the little finger. He worked in animal scrap, some of which was undoubtedly tuberculous. He appears to be a healthy man. X-ray of the chest shows evidence of old pleurisy. He has a proved tuberculosis of the bursa in the wrist. With a short period of rest and continuous x ray treatment he has shown no advance of the disease and is clinically greatly improved.

Case 2—S M white Polish male aged 58 General Hospital No 210 552, examined December 1930. P.M.H. negative for prolonged illness or other injuries except for a crushing injury to the left second finger several years previously. The patient complained of pain in the left second finger and a swelling in the wrist on the flexor surface. He stated that in August 1930 he had pinched his left second finger between a core and a core carrier. It hurt him at the time but not severely. He continued at work but about a week later noticed a swelling at the proximal phalanx. There was some stiffness in the finger. He noticed a painless swelling in the wrist and the flexor surface on December 14. On examination of the left hand a definite cylindrical swelling was seen in the second finger

at the proximal phalanx. The greatest amount of swelling was on the flexor surface. It was not acutely inflammatory, it was sensitive only at the flexor surface. Motion in the finger was not painful unless the motion was made against resistance. The motion in the finger was somewhat restricted at the interphalangeal joint and at the metacarpal phalangeal joint. The swelling could not be expressed into the palm. There was a swelling above the wrist on the flexor surface that was greater toward the radial side of the hand. This could be pressed into the palm, causing a definite swelling here. There was no discomfort arising from pressure on the wrist bursa. There was some slight loss of both flexion and extension at the wrist. The other fingers were not involved. The epitrochlear node on the left arm was enlarged but not painful. The axillary nodes were not enlarged or sensitive. Examination of the chest did not reveal any pathology. An x-ray examination of the hand showed normal bone and joint tissue and no evidence of disease of the chest. A primary focus of tuberculosis was not discovered. The Wassermann test was negative. Impression tuberculosis of the flexor tendon of the left second finger and of the wrist bursa. Biopsy: a section of the flexor tendon sheath showed same to be thick, not edematous, a pale, dull white, and not adherent. On excising the wrist bursa, the mass was thick, the bursa was distended with thin, cloudy fluid, and numerous small flakes of necrotic tissue or pus were seen. The wall of the sac was lusterless and gray in color. The bursal wall was not adherent to the tendons, although the tendons were adherent to each other, forming a gray matted mass. The incisions were then closed.

Diagnosis: tuberculosis granulation tissue. In this section there were no giant cells. The entire specimen was infiltrated by many round and few plasma cells. This specimen was from the bursa. The section from tendon sheath showed typical tuberculosis with very distinct epithelioid and giant cell tubercles. A guinea-pig inoculation was positive for tuberculosis. The incisions remained healed, and the swelling in the wrist has not increased in size. It was of course much smaller after the operation because of the removal of the fluid. It is not painful. There has appeared along the tendon in the palm a cylindrical, nonsensitive mass that I believe is an extension along the tendon sheath. The hand is on a cockup splint and the patient is receiving x-ray therapy every two weeks. This impresses me as a favorable case for operation, but permission has not yet been granted.

Case 3—J S, white, German male, aged 50, General Hospital No 211,410, examined January 23, 1931. P M H disclosed that the patient had been confined in a tuberculosis sanatorium for two years because of "pleurisy," and had been discharged as an arrested case in 1928. He complained of pain in right palm and wrist, and stated that while carrying a quarter of beef, he had turned same over on a block and felt pain in the right wrist. Two days later, while hanging up a quarter of beef, he again felt the same type of pain in the wrist. He was treated for three weeks for rheumatism. The hand was then x-rayed and a diagnosis of fracture of the semilunar was made. The hand was then splinted for three weeks and the swelling subsided to a marked degree. After being out of the splints for about three weeks, the pain and swelling recurred. He had returned to work, but had great difficulty in continuing. At the time of my examination there was swelling in the palm of the right hand and in the wrist bursa. On pressure over either swelling the contents could be forced into the other space. There was restriction to flexion and extension at the wrist. There was no involvement in the fingers. There was a stinging pain in the palm of the hand. The epitrochlear nodes were enlarged but not sensitive, and the axillary nodes were palpable. The man is thin, poorly nourished, and unhealthy looking. Examination of the chest shows râles in the upper right chest, but no sputum. X-ray of the chest shows considerable increased density and mottling of the upper lobes of both lungs, perhaps more on the right side, and evidence of a small cavity on a level with the third right rib in front.

Diagnosis: tuberculosis. X-ray of wrist shows area of rarefaction between the cuneiform and os magnum. What was mistaken for a fracture of a semilunar is an arthritis spur. The original x-rays showed the same process, except that later films show extension of same, and a more definite rarefaction. Biopsy: an incision was made over the distended bursa in the right wrist. Considerable turbid fluid was removed but no pus or evidence of necrosis was seen. The wall of the sac was thick and numerous fibrous strands were seen extending down into the cavity and attached to the tendons. The tendons were surrounded by a dark gray, thick fibrous tissue. This was easily separated from the tendons and did not bleed. Pressure on the bursa in the palm forced fluid into the opening in the wrist. Some of this fluid was sent to the laboratory, and a portion of the bursal wall was removed for section. Diagnosis: tuberculosis. Laboratory report: many cells were seen. Diagnosis:

typical tuberculosis. A guinea pig inoculation was positive for tuberculosis. This patient has tuberculosis with cavity in the lungs, tuberculosis of the carpal bones, and of the wrist and palmar bursas. I classify him as a very poor surgical risk. He should be in a sanatorium. While receiving treatment for tuberculosis, he should have his hand splinted and have x ray treatment given it.

Conclusions

Tuberculosis of the tendons, tendon sheaths, and bursas is not frequently seen. It is probably a secondary lesion. Diagnosis can and should be proved by biopsy. It responds to treatment, a very important part of which is the extirpation of the lesion whenever this is possible. X

ray treatment is a beneficial therapeutic adjunct and should be continued for a very long time. Undoubted cases of cure are recorded. It is interesting to note in reviewing the available literature that no mention is made of tuberculosis involving the tendons of the lower extremity, although mention is made of involvement of the bursa around the great trochanter.

WHY THEY DON'T HEAR

Only about half of the adult population of the nation claims to have normal hearing according to random samplings made in connection with United States Public Health Service surveys.

Findings also revealed that only 56 per cent of these people who think they hear perfectly passed audiometer tests for normal hearing. Many failed to hear the very high and the very low tones.

It was demonstrated through tests with bone conduction vibrators placed on the mastoid bones that these losses for high tones are due to primary degeneration of the acoustic nerve. This degeneration results from infectious processes associated with certain systemic diseases—such as scarlet fever, meningitis, diphtheria, in

fluenza and the like—as well as from local infections of the middle ear (otitis media). The common head cold is a frequent cause of these middle-ear infections.

The study of hearing loss among persons having noticeable impairments of hearing for speech reveals many new facts. Loss of hearing due to congestion and lesions of tissue in the middle ear without accompanying injury to the acoustic nerve, is found to be characteristic of deafness among children of public-school age. Practically all deafness among persons over 25 years of age involves some degree of nerve degeneration. This degeneration is more localized among males and rather widely distributed throughout the ear among females.

SAVING LITTLE EYES

As a result of increased educational activities in recent years, rapid strides have been made toward the conservation of eyesight, particularly among children according to the annual report of the National Society for the Prevention of Blindness, Inc.

Blindness due to one ailment alone has been reduced by 75 per cent during the last thirty

years during which the society has functioned. The report points out. This is ophthalmia neonatorum which frequently causes blindness at birth. The society's report emphasizes that the 75 per cent reduction in the victims of this malady was accomplished "because an organized program was carried on to save sight for tomorrow."

THE NATIONAL HEALTH PROGRAM

HAVEN EMERSON, M D , New York City

IT IS A proper and obligatory function of government to undertake the collection of facts that may disclose the state of the public health, to interpret these facts in a way to develop an understanding by the public of the need of improvement in conditions that may be affected by governmental services, and to propose plans for public consideration and present projects of law and appropriation to put such plans into effect

Such functions are defined in the basic public-health laws of most states and of large cities that operate under charters that authorize their independent enactment of local sanitary codes

That the federal government should have assumed such a function is not unreasonable, but inasmuch as the constitution reserves to the sovereign states the exercise of the police power within which is included the function of public health, our reasonable curiosity is aroused when the national government assumes responsibility for activities for which state and local governments are charged with the primary responsibility

Why this national survey of chronic and other disabling sickness, generally called a National Health Survey? In what aspects of preventive medicine have we fallen so into arrears that we must be pilored before our neighbors and by presidential declaration as having "grossly inadequate public-health services?" Where has there been more, or more recent, progress in life saving? Where is the care of the sick more generously, more skillfully, more humanely provided, for such a continental population? Where is the evidence that a third of our people are in sickness without medical care which they need, know they need, and want but cannot get?

Before we accept the evidence that has

been offered that a serious national dereliction exists and demands sudden, extreme, and very costly remedies, and before we acknowledge the reasonableness of the deductions presented to the conference of last July or accede to the plans urged upon Congress by the federal promoters of greater projects of expenditure, let us review the record

By executive order #7481, four assistant secretaries and one member of the Social Security Board were on October 27, 1936, directed by President Roosevelt "to continue to sponsor cooperation among the health and welfare agencies of the federal government, to continue the work under agreements then in effect, and to study and make recommendations concerning specific aspects of the health and welfare activities of the government, looking toward a more nearly complete coordination of the government in these fields "

This interdepartmental committee was in the same order directed to continue to function through the special technical committees it had already set up and others it might find necessary in order to deal with new problems

The public has before it three documents that have resulted from the interests of the Interdepartmental Committee to Coordinate Health and Welfare Activities, under the following titles

The National Health Survey
The Report of the Technical Committee on Medical Care
The National Health Conference

It is to be expected that the next document will be a draft of a project of law introduced February 27 by Senator Wagner to make effective the proposals presented last July 18 to 20 (The Wagner National Health bill, Senate 1620)

Read before the Medical Society of the County of New York, February 27, 1939

Now before we accept as final, or even desirable, the very considerable revolution in social and professional endeavor for health which the provisional proposals of the technical and interdepartmental committees offer us as the price of superior health, we may think it wise and fair to look about us and learn from contemporary civil records what is the health status of the nation

Never before in man's history has any people of such mingled races under one government, in such large numbers, so varied in economic and social qualities and opportunities, shared so generously in the application of the sciences of preventive medicine as have the 130,000,000 people of the United States in the year 1938

The gap between what is known and what is done remains wide enough to tempt an increasing army of aggression to war upon ignorance, superstition, indifference, and selfishness, man's four chief and constant enemies to his health. As there seems to be no slowing of the pace of new discoveries, the need of interpreters of these in terms of everyone's life (i.e., family physicians), and of administrators to make our resources effective (i.e., health officers), will continue to the end of the road, which some believe will be the point at which life will be so safe as to be uninteresting, and so long as to be unendurable.

It is no mean or accidental item of history, this dropping of the general death rate, of the maternal mortality, of diphtheria, typhoid fever, tuberculosis, pneumonia and the enteric affections of children to levels heretofore hardly hoped for or calculated in the managed plans of an increasingly regimented society. We are in a sense at the top of an accomplishment that is but the result of a century of rational and determined effort to put knowledge of human biology to work for the people by the joint interests of organized society and its representative government.

No form of government or society or relation of the medical profession to both or either has been developed else

where with a richer result to a nation's health

Such a national good fortune in health as is now ours is not an accidental happening, not merely the lucky marriage of science and society or of medicine and government, but the solid, competent, and calculated result of several generations of painstaking evolution in the use of new knowledge, new institutional and organizational resources, new spirit and ambition for well being in the souls of men

It has been a sound axiom of public health service that it is best when closest and most responsive to the needs of family and neighborhood. There are as many varieties and levels of health as there are of disease and the problems of health like those of sickness are chiefly personal almost wholly family, to a slight degree local and state, and to a minimal degree federal or national in character

The National Health Program, based on inadequate evidence and fallacious deductions from this evidence, is to all intents and purposes a project of federal spending to hurry the distribution of wealth by making federal grants to aid backward and impoverished states to get more nearly the amount and quality of care, for many years available to wealthier advanced and populated states. Instead of responding to the terms of the President's executive order the technical committee and the interdepartmental board have devoted themselves to alarming the country, exaggerating inadequacies ignoring excellences, and proposing remedies beyond the means of money and personnel to accomplish unless with long delay and gradual development.

They propose increase in public health work expansion of hospital facilities, care of the indigent, indemnity for wages lost in sickness compulsory sickness insurance. Faced with this the American Medical Association, the American Hospital Association, the American Public Health Association, and the American Dental Association have passed resolutions expressing reservations in various respects, all disapproving of compulsory

sickness insurance and all approving expansion of public-health work

What are the states doing and what should they do and specifically what should the New York State Medical Society do?

If federal money is spent it will be distributed through state health officers, whether for health or medical care. The state is expected to formulate expression of its own needs and methods of meeting them. The elements essential for such a formulation appear to be the state health department, the state medical society, and state services for the sick. These should agree upon the facts of the situation and then make a report to the public on the needs of preventive and curative medicine, and of individual and administrative medicine in New York, and give conclusions as to specific remedies (a) in public health, (b) care of the indigent and medically indigent, (c) care of the sick among the low-income group by voluntary prepayment, (d) extension of hospital services to an inclusive service, hospital, outpatient, nursing, and home care, (e) hospital construction and equipment needs.

Personally, I believe more is to be expected from building on the voluntary hospital service association base of prepayment plans, if medically controlled, than by separate new governmental schemes. It is essential to retain individual personal practice of medicine, the general public to pay for much of the physician's services to the poor out of tax money. There should be maximum community responsibility and organization, and a minimum use of state and federal grants-in-aid.

The Detroit and Michigan plans seem good to me, and there are others in process of development which will prove sound and useful.

Analysis and results and economics in medical services depend upon retention of personal and collective professional responsibility and initiative, and complete community understanding and participation. The federal government should put its own clumsy incoordinated

services in order, and limit its activities to grants-in-aid of impoverished backward states. There should be an end of exploitation of the residual unserved needs of the poor for political purposes, and a generous recognition by government—federal, state, and local—that official services for sickness and for its prevention have in the past always followed the initiative and humanitarian contributions of the medical profession. There seems to be no reason to believe that there is any particular wisdom or experience at the command of the federal government which does not have its origin in local and state medical and public-health practice and personnel.

If we can hold the gains of the past generation while the federal government experiments with its own structure and functions at the expense of the taxpayers and the stability of local government, we shall be able to continue for the future that development of official and voluntary preventive medicine that has been the particular glory of social progress of the past half-century, based upon the application of the increasing knowledge of human biology for social ends.

The federal government has the doubtful privilege of taking vast sums from the pockets of people in every state, using what it finds expedient for its own payroll purposes, and then returning such parts of the balance as it sees fit to the respective states, which sums of money they could and would use better and at less cost if left to raise and spend their own tax resources for health and sickness care according to their own respective needs, judgment, and methods.

Evidence of neglect in using medical services for the sick and to protect the people's health, as published by the federal government, appears to me to be unconvincing and unsupported by adequate facts.

The assumed conclusion that any substantial portion of those claimed to be at present unable to command medical services for sickness and health, would by the proposed large expenditures be less

often sick, or sick for shorter periods, or would have any significant improvement in their life expectancy or freedom from preventable disease, is illusory and unwarranted.

The ever sheeplike and gullible lay public that still believes in medical and social panaceas has by numerous devices of plausible publicity been persuaded that there can be put at their disposal greatly increased medical benefits if only they demand them. There is neither

spontaneous nor well informed demand, nor likelihood that any great increase in useful application of medical services as proposed in the federal spending project will result from carrying out the so-called "National Health Program," which could not be better assured by using facilities and methods that we are experienced in, and at costs within our means, without involvement in indefinite and accumulative debts to our successors, both patients and physicians

MECHANICAL HEART BEATS FOR SAN FRANCISCO FAIR VISITORS

The ceaseless motion of the heart—from the cradle to the grave, at the rate of seventy beats to the minute—is dramatically demonstrated to visitors to the 1939 Golden Gate International Exposition on San Francisco Bay. The display is part of the exhibit of the Ciba Pharmaceutical exhibit in the Hall of Science.

Over two billion heart beats—the equivalent of seventy beats per minute over a 66-year period—are indicated on a three-dimensional model heart which stands five feet high in the center of the exhibit. Lights flashing over other models trace the course of the blood flow, the movements of the valves. Supplementary drawings and animated models explain

How the heart pushes forward one gallon of blood per minute when a person is in a resting position, three gallons when standing and thirty gallons when running

How the arteries and veins contract and expand how the pulse is created and how valves function in stopping back flow

How the blood stream provides food to the cells removes waste matter

How the red blood cells supply oxygen to the body and how the white cells provide protection against invading bacteria how blood platelets act in the formation of clots shown on a model enlarged 10 000 times

How the heart itself is supplied by blood to enable it to carry on its pumping functions

The danger of inflammation is emphasized showing how efficiency of the heart is reduced. Popular misconceptions of high blood pressure too are outlined and explained along with heart disease its prevention and treatments for relief

THE DIFFERENCE

You cannot diagnose thousands of persons as thousands but only as the sum of individual diagnoses you cannot treat the diseases of thousands of persons except as the sum of individual treatments, therefore the public-health function ceases where diagnosis and treatment begin. I would go a little further and say it ceases when education or instruction is in fact construed by the recipient as diagnosis or treatment

—Floyd S Winslow M D

HOW HE DID IT

The patient who chooses a competent physician and then sticks to him lays the foundation for a type of medical service that shoppers' never receive. In spite of the absence of laboratory aids to diagnostic and therapeutic precision the old time family doctor achieved clinical miracles because he knew his people. He knew their family history, their physical and mental tendencies their idiosyncrasies, their deficiencies and their strong points

—The New York Medical Week

OTOGENOUS NONSUPPURATIVE ENCEPHALITIS

A Clinical Entity

MILES ATKINSON, M D , F R C S , New York City

(From Neurosurgical Service, Bellevue Hospital, Service of Dr. Marvin Jones, Manhattan Eye, Ear and Throat Hospital)*

WHEN localizing cerebral signs appear in the course of an adjacent suppurating focus in the skull, the most likely diagnosis is brain abscess, and that diagnosis usually turns out to be correct. But not always. There are times when the diagnosis has been confidently made and yet exploration finds no abscess. When, nevertheless, the patient recovers, the fact is disconcerting. The reason is to be found in the presence of an area of infection that has not broken down—a localized nonsuppurative encephalitis—and the importance of recognizing this condition as a clinical entity is that unnecessary exploration may be avoided. It is as easy to provoke suppuration in a previously nonsuppurating area, or to convert a localized into a spreading infection, in the brain as anywhere else in the body.

Incidence—This is a comparatively unusual condition. In the literature there are only some 25 well-established cases since Oppenheim¹ published the first in 1899, including those published by Voss² of Riga, Borries,³ Adson,⁴ and Symonds.⁵ Yet it is more common than is generally appreciated, and in any event the importance of a disease process is not to be judged solely by its frequency. I have now seen 15 cases, a number for one observer out of all proportion to the total reported. This can be explained only by cases being misdiagnosed, usually as abscess, for it is impossible to overlook them. The situation, as with abscess,

is most common in the temporal lobe secondary to ear disease (11 cases), and I have recently seen 1 in the cerebellum, only 1 other such having been reported and that by Behlau⁶ in 1928. Of the remaining 3, 2 were in the frontal lobe, 1 following a sinusitis and 1 a fracture, and the third was in the parietal lobe following a fracture.

Pathology—The pathology of localized nonsuppurative encephalitis is the pathology of localized brain infection in general, and is in essentials the same process as occurs with inflammation in any situation in the body. An infection in the skull spreads beyond the bone to the dura (diagram), which becomes involved either with or without the formation of an extradural abscess. Resulting from this pachymeningitis arises a localized leptomeningitis which may be either serous or adhesive.

Serous Encephalitis—If serous (the *méningite de voisinage* of the French writers) there is also some degree of adjacent serous encephalitis, what might be called an "*encéphalite de voisinage*." This serous encephalitis is usually so mild as to show itself only by headache, but occasionally it is more severe and extensive and then gives rise to a characteristic clinical picture not always recognized for what it is. The process is very comparable to the effusion that occurs into a joint in consequence of adjacent infection in the end of a long bone. If the causative condition is not promptly dealt with, the previously uninfected serous encephalitis may become infected (Richardson)⁷ and turn into a localized infective encephalitis.

*My thanks are also due for the opportunity of investigating cases to Drs. John R. Page, James G. Dwyer and A. S. Wilson of the Manhattan Eye, Ear and Throat Hospital.

- 1 Extradural space
- 2 Subdural space

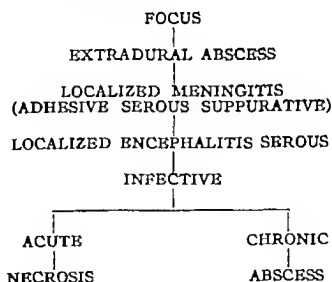

Infective Encephalitis—(A) Infection can enter the brain substance by other means than that just described. The more common is by the production of a localized adhesive meningitis whereby meninges and cortex become welded together, providing a path for direct invasion of the brain. By this means an area of encephalitis is produced which in most cases the precursor of an abscess but which occasionally subsides without suppuration. This is the chronic variety, or better the "nonhemorrhagic" to distinguish it from the next.

(B) Less commonly, infection enters the brain by a vascular path and produces an area of hemorrhagic encephalitis that does not suppurate, but not infrequently undergoes necrosis in the center and rapidly extends to and perforates into the ventricle. These cases are often, though wrongly, called acute abscesses. This is the acute or hemorrhagic variety and is caused by an organism of greater virulence and probably of a different type than the former variety. Such cases arise usually in association with an influenza otitis. Microscopically, the brain in these cases shows perivascular hemorrhages, and a lymphocytic infiltration that is duplicated in the spinal fluid picture, a very characteristic finding. Barnes¹ has labeled these cases 'otogenous hemorrhagic encephalitis' which is descriptive but I think a mistake, for it suggests a specific disease whereas these cases are only one part of the large group of adjacent brain inflammation and further are not invariably otogenous. Rich-

ardson in 1934⁷ reported 2 cases of localized encephalitis in the frontal lobe, the result of frontal sinusitis, and the second case probably falls into this group.

Unfortunately the process described above is not always subject to ocular proof. The existence of Group A can only be surmised from the evidence of physical signs and results of treatment. Serous encephalitis also can only be deduced from clinical signs and course. Nevertheless it seems fair to assume that the process of inflammation observed in other situations is not materially different in the brain. The analogy between the serous variety and a joint effusion has been pointed out. The varieties of infected encephalitis have their counterpart in infections of the peritonsillar tissues—those that subside without suppurating, those that produce a quinsy and those that spread rapidly and widely through the neck.

The various steps in localized infection of the brain may be made clearer by the following table:

Diagnosis—As would be expected the three stages under discussion have many clinical features in common with an abscess a fact that makes differential diagnosis a matter of some difficulty. Thus, all present the signs of a focal cerebral lesion associated with an active or recent suppurative focus in an ear or nasal sinus. Such a picture immediately evokes a diagnosis of brain abscess, the presumption of pus. But an acute in

flammatory peritonsillar swelling does not evoke the presumption of pus—it evokes only the question of it. The affair of diagnosis is to decide if it is there. So it should be in the brain. The reflex must be reconditioned to think in terms of the process, not in terms of the result, particularly since each stage of the process presents a fairly distinct clinical picture.

Serous Encephalitis—The outstanding feature of this stage is the onset with a convulsion, after recovery from which the patient is found to have focal cerebral signs. The attack may be single or it may be repeated several times—one of my cases had 6—and after each one the focal signs are more marked. In every case a dural lesion, commonly an extradural abscess, is found, and treatment of this and of the original focus results in permanent disappearance of focal signs within forty-eight hours.

This matter of convulsions and adjacent infection is important. It is customary to divide the course of an abscess of the brain into three stages. It is taught that the stage of onset is often ushered in by a convulsion and, especially in children, that there follows a latent stage, and that some days or weeks later the signs of an abscess begin to appear—the manifest stage. Such a clinical picture, translated into pathologic terms, means that the infection first attains the cortex, which signals the event by one or more convulsions (stage of onset), that gradually infection invades the brain substance (latent stage), and that finally a localized abscess is formed that causes signs (manifest stage). If operation is performed at the first sign of cerebral attack—the convulsion—the later stages may be prevented. Since I have appreciated this train of events, I have operated on 5 cases, 4 in children, in which a convulsion was the first sign of cerebral involvement to appear in association with suppuration in the ear, but was succeeded by no focal signs, cases therefore in which presumably the cerebral edema was too slight to produce them. In each

case I found a dural lesion, and in none was there any further cerebral complication. And I have seen 1, a little girl of 2½ years, in which operation was urged but not performed until very much later when gross signs of a brain abscess were present. A large extradural abscess was present and she died eventually of an extensive loculated temporal abscess.

It is my conviction that all cases with a suppurating lesion in the skull in whom a convulsion supervenes should be explored without delay in the expectation of finding some dural lesion.

Case—A girl of 9 had an acute exacerbation of a chronic ear infection on the right with a subperiosteal abscess, for which a simple drainage was performed. Six days later, when the acute stage had subsided, the simple cavity was converted to a radical, a small area of dura being uncovered during the operation. The wound was packed. Three days later the child suddenly started to have left-sided convulsions that continued for an hour and left her with a hemiparesis. The wound was immediately reopened, the dural exposure enlarged, and an area of necrotic dura found beneath the bone. This was excised, releasing a localized collection of turbid fluid from beneath. The wound was very lightly packed. The hemiparesis had gone the next day, and apart from some headache and irritability the child made a straightforward recovery. Six months later she was completely well and without any sign of brain involvement.

Chronic Infective Encephalitis—This group offers the greatest difficulties in diagnosis. It is of these cases that Symonds⁵ said that “they present no characteristic clinical picture,” while Borries designates them as cases of “abscess without abscess” and says that only by negative exploration can they be differentiated. While admitting that both these statements are true of individual cases and that differential diagnosis may be impossible short of exploration, yet there are certain clinical points that help to decide whether or not suppuration has taken place—which decision is after all the crux of every case of infection with a pyogenic organism. With a nonsuppurating area of encephalitis, head

ache is apt to be severe and continuous, eyegrounds commonly show slight changes, and fever is present. But the sign of greatest value in differential diagnosis is the findings in the spinal fluid, where an increase in cells numbered in hundreds is seen, while with an abscess they are numbered in tens, and where, moreover, mainly polymorphonuclears are found, as against the common large mononuclear finding with abscess. Finally, there is in encephalitis an association syndrome—clinical signs and spinal fluid signs rise and fall together—while when suppuration and localization is occurring there is an increase of physical signs with a decrease in spinal fluid signs, the dissociation syndrome emphasized by Borries.

Case—A boy of 13 was operated on for an acute mastoid on the right side. Six days later he complained of severe headache but had no neurologic signs. Temperature 97 F. Pulse 92. Spinal tap showed 6 cells, 2 polymorphonuclears. Five days later the boy had gradually been getting worse, was drowsy and had vague left-sided signs. Spinal fluid showed 22 cells, 18 polymorphonuclears. Temperature 99.2 F. pulse 54. He was thought to have an abscess, was explored and no abscess was found. A wide decompression was done. Next day his headache had improved, but the neurologic signs persisted. Temperature 102 F. pulse 100. Spinal fluid gave cells 182 polymorphonuclears, 85 per cent. Clinical signs and spinal fluid increased during the next two days, and a second exploration was negative. From then on signs and spinal fluid picture steadily improved and he ultimately made a complete recovery. This was in 1927 before the significance of various signs had been appreciated. The spinal fluid picture would now supply the diagnosis.

Acute Infective Encephalitis—This variety gives as characteristic a clinical picture as does the serous variety, so characteristic and so different from the picture of an abscess that it is surprising that the two should ever be confused. Thus, the condition arises usually in the course of acute infection rather than chronic, there is mental excitement, even noisy delirium very different from the drowsiness or stupor of an abscess

patient, the clinical signs are widespread from an early stage, fever may be high with a corresponding pulse, and the patient becomes very rapidly and gravely ill, there is often papilledema, and the spinal fluid shows an increased cell count in the hundreds, the greater proportion lymphocytes, which suggests a nonpyogenic organism. The mortality is high—4 of my 7 cases died.

Case—A woman of 57 was operated on for an acute mastoid on the left side following influenza. Five days later she complained of headache, was restless and occasionally somewhat disoriented, but she was extremely ill. There were no neurologic signs. Two days later the lateral sinus had to be occluded. Five days after this restlessness became extreme, she had to be restrained, was completely disoriented, developed a naming aphasia, a right hemiparesis and bilateral papilledema, with 100 cells in spinal fluid, 86 per cent lymphocytes. She was treated on the lines described below and after a stormy passage made ultimately a complete recovery.

Treatment—This can be summed up very briefly. The most important consideration is a negative one, that exploration should be avoided unless a diagnosis can be made by no other means. To incise an area of inflammation before suppuration has occurred is the surest way to provoke it and to produce spread of infection. But if brain exploration is taboo, exploration of the focus of infection and of the neighboring dura is incumbent, with appropriate surgical treatment of any lesion found. At the same time a local decompression by free removal of bone should be made.

Other positive measures are such as may also be used for a tumor with increased pressure: hypertonic solutions, limitation of fluid intake, catharsis, and lumbar punctures. While all possible measures for relieving pressure must be taken in the acute cases, the matter is less urgent in the chronic, and in them the exhibition of hypertonic solutions is not to be recommended. Their use may induce a false sense of security, and the

improvement in symptoms, occurring as an abscess localizes, may be ascribed wrongly to the good effects of the sucrose

Summary—(1) The results of the spread of infection from an adjacent focus to the brain tissue have been discussed

(2) Three varieties of localized non-suppurative encephalitis have been described, with their characteristic clinical features

(3) The importance of avoiding exploration if at all possible has been stressed

Discussion

Dr Albert B Siewers, *Syracuse*—I feel that Dr Atkinson is to be commended for his clear presentation of such a difficult subject I too should like to emphasize a point that he himself stressed—that is, that exploration should be avoided unless absolutely indicated, to which I might add that suspicion of brain infection or

abscess formation calls for the most drastic treatment in all medicine, namely, masterly inactivity I have never seen anything but disastrous results from the too early exploration of an abscess and I can safely say too that I have seen excellent results in brain abscess when the surgeon was a procrastinator and put off interfering until everyone else was nearly in despair Certainly there are many cases that look like abscess formation but do not go on to an abscess formation.

On January 22 of this year, I saw a 17 year old girl in semicoma The pupils were small, disk margins blurred, arteris of fundi were shiny, and the veins engorged There was a facial weakness and a positive Babinski, with the depression of all deep reflexes These symptoms came on after a week of middle-ear disease, during which the mastoid had been invaded, and she complained increasingly of headache The spinal fluid was cloudy and had 1,400 cells Radical mastoid was done and the dura exposed to the size of half a dollar, apparently under pressure. The wound was drained with iodoform gauze and left open Lumbar puneture was repeated daily for five days with a gradual decrease in cells concomitant with disappearance of neurologic signs Culture of the spinal fluid yielded no growth and the cells were 80 per cent lymphocytes I do not believe that this case could be classed with the usual class of mastoid with meningitis, there were definite signs of encephalitis and we have the association syndrome which Dr Atkinson pointed out, that is, clinical signs and spinal fluid signs rose and fell together in nonsuppurative encephalitis

EASY WAYS TO MAKE ILLNESS MORE ENDURABLE

Raising a patient's bed to the height of a standard hospital bed—27 inches—greatly lessens the strain on whatever member of his family may be acting as nurse, Elizabeth W Hard, R N, Greenville, N C, advises in *Hygeia*

This is one of her suggestions for making convalescence from a long illness as comfortable as possible for both patient and family

"The bed can be elevated with bricks or wooden blocks placed under the legs," Miss Hard says This not only helps the nurse but generally it is a better height for looking out of windows and in summer it is cooler

If the bedrooms are not pleasant, the author advises that the patient be placed in the dining room, living room, or even the kitchen

"A new outlook is highly exciting after months of seeing the world from one side," Miss Hard observes "An adjoining room, adjacent porch, or even a convenient hallway affords great relief and change if the bed can be occasionally shifted or the patient moved"

A table reaching across the bed, with a center panel to be used as a book rest, is a great convenience "A wooden one can easily be made, with the advantage that a narrow ledge can be added which prevents toys from falling off or books from being pushed over the edge," says Miss Hard "It can be pushed to the foot of the bed and be out of the way, yet easily available when not in use If the patient is allowed to sit up to eat, it can be used at mealtime"

TUMORS OF THE MEDIASTINUM

N CHANDLER FOOT, M D, New York City

(From the Department of Surgical Pathology New York Hospital and Cornell University Medical College)

It is proposed to present in this paper the salient features of the tumors of the mediastinum, it is not its purpose to set these forth too meticulously or too technically, but rather to attempt to sketch an outline that will be of use to the diagnostician when confronted by new growths of this region. When considering these tumors, one should take them up from the standpoint of the various anatomic elements composing the area from which they take origin. We have but one organ normally resident in the mediastinum if we except such adnexa as the trachea, esophagus, great vessels and the like, this is the thymus. The thyroid may stray there, as well as the parathyroids and, in addition, we have important groups of lymph nodes. The nervous apparatus in the mediastinum, like the tubular structures just mentioned, is either in the form of nerves or of ganglia extensions of another system.

Thymus—This organ presents an interesting group of tumors¹ that arise at its site and usually involve the neighboring structures, particularly the pericardium and great vessels. Any stony-hard tumor of the anterior mediastinum that surrounds the great vessels and spreads over the pericardium should at once arouse suspicion of thymic origin. There are nonmalignant tumors that may be composed largely of fat, in which more or less disarranged and distorted thymic tissue is distributed in the form of irregular islands. There are rare forms composed of small round cells with occasional Hassal's bodies, often very rudimentary scattered among them. These nonmalignant tumors may grow to very large dimensions and about 50 per cent of the former type may be associated with symptoms of myasthenia gravis.

We had such a tumor at the New York Hospital that weighed over 2,200 Gm occupied all of the left chest, and extended well into the right, involving the great vessels as well. It was successfully removed and the patient, a boy of 13, has made a signal recovery. This case was unassociated with myasthenia gravis. Occasionally these tumors may show cystic changes.

The malignant tumors may be divided into seven general groups: lymphocytic, lymphoblastic, thymic reticular, perithelial, granulomatous (so closely allied to Hodgkin's granuloma that it probably represents this condition in the thymus), epithelial or carcinomatous, and the teratoid type that combines the epithelial and lymphoid elements in one neoplasm.

As a general rule the sarcomas are seen in relatively young subjects, the epithelial in those of cancer age, while the teratoid occur chiefly in children. All of them are very malignant so far as local destruction and invasion is concerned. Although they rarely metastasize to organs at a distance, such metastases have been described. They present almost insuperable obstacles to surgical removal on account of invasion of vital organs and they are therefore almost invariably fatal. Many seem to be radiosensitive, but it is difficult to cover their extensions. While the primary tumor may be reduced to a mass of inert fibrous tissue the metastatic foci in the lungs may flourish and ultimately kill the patient. The lymphosarcomatous type has been known to cause lymphoid leukemia.

Thyroid and Parathyroid—Excluding intrathoracic goiters, which are often of the adenomatous variety, tumors of the thyroid and parathyroid may be situated

in the upper mediastinum, having become incarcerated there. One might expect to find fetal adenomas, embryonal adenomas, or malignant transformations of these. There are a few cases recorded of fairly large adenomas of the parathyroid that have become incarcerated in the mediastinum, one such was extensively studied and explored with negative results until a Boston surgeon located the growth and removed it. The microscopic features of these two groups of tumors may be omitted here, suffice it to say that any tumor usually found in the thyroid or parathyroids will have the same characteristics when it occurs in the mediastinum. Symptoms of thyroid or parathyroid dyscrasia usually accompany them and give the diagnostician a clue.

Lymph Nodes—The mediastinal nodes may be the site of any of the lymphoid tumors, such as nodular lymphosarcoma, large or small celled lymphosarcoma, and Hodgkin's granuloma. We need not expand this theme any further.

Bone—Tumors may grow from the bony thorax into any part of the mediastinum. They may be anything from mere exostoses to very malignant osteogenic sarcomas and, as they do not differ from these as seen elsewhere in the skeleton, they may be dismissed with mention only.

Cartilage—Far more common are the cartilaginous tumors that arise in the vicinity of the mediastinum. They may be nonmalignant or malignant and here, again, do not differ materially from those found elsewhere in the body, except that one notices that comparatively innocent-looking chondromas, in this situation, may prove to be malignant on further acquaintance and actually metastasize and produce daughter growths in the lung that may retain the nonmalignant microscopic appearance of the primary growth. For this reason we have learned to suspect any cartilaginous tumor of the thorax. From the histologic standpoint, they may vary from extremely cellular structures composed of irregular

and atypical cells with little cartilaginous matrix, to very well-differentiated chondromas with much hyaline chondromucin and rather well-formed cartilage cells. Should the latter show marked irregularity in size and shape and a tendency to share wide lacunas with similar cells (instead of lying singly therein) it is well to give a guarded prognosis. Mitotic figures do not help much in the diagnosis, for they are seldom found.

Fibroma—This tumor may, of course, be found in the thorax and may attain considerable size. A solid tumor, it causes symptoms of compression and casts a rather uniform, dense shadow on x-ray examination. It differs not at all from fibromas in other situations.

Desmoid—Very large fibrous tumors with a matrix-like tendon (which gives these growths their name) and of an extremely wooden consistency, may occur here. They are slowly and progressively expansile and may attain enormous size, one of them in the Thoracic Tumor Registry weighed over 4 Kg. They differ from ordinary fibromas insofar as they tend to infiltrate muscle and bone, destroying these by pressure, much as an aneurysm does, but they do not metastasize. They should not be confused with the "desmoid" of the rectus abdominous sheath, which is a low-grade myxosarcoma and histologically different from the very acellular growth we are discussing. They can be successfully removed, but the surgical risks inherent in such an operation are great, if not completely extirpated, recurrence is likely.

Myxomas—Growths originating in mucoid tissue, resembling Wharton's jelly in the umbilical cord, are quite common in the mediastinum. They are gelatinous and exude a viscid, glary fluid on section, as they are relatively soft they are much less likely to give early symptoms than are their firmer and more compressing relatives, the fibromas and desmoids. They are often associated with lipomas, in the form of myxolipomas, probably owing to the fact that the two tissues are closely related in the embryo.

Fibrosarcoma and Myxosarcoma—

These are sometimes found in the mediastinum and are not unlike such tumors in any other part of the body, carrying the same invariably bad prognosis. They are not particularly radiosensitive either, as fibrous tissue is theoretically radio resistant.

Lipoma—Simple lipomas are frequently seen in the mediastinum,³ growing out into one or other chest cavity and ultimately compressing the lung. They are apt to show late symptoms as they are soft and themselves compressible, not exerting much pressure on the lung until they have attained considerable size. They have been reported as weighing as much as 4 Kg. As noted, they may show an admixture of myxomatous tissue, we had one such tumor that filled an entire chest cavity and nevertheless caused remarkably little discomfort to the patient, considering its great bulk. Roentgenograms of such tumors show a peripheral fading-out of the shadow that forms a halo about it and is quite characteristic. Microscopically they can scarcely be told from ordinary adipose tissue, aside from the occasional irregularity of the size of the fat vesicles and in those cases where there is mucoid tissue as well.

Liposarcoma—Ewing recognizes two types of these tumors, the embryonal, or lipomyxomatous type, and the adult type. The former is characterized by being very firm and brownish yellow, under the microscope it is composed of a rather uninteresting adipose matrix in which are sparsely distributed very bizarre giant cells resembling spiders and having large, multiple hyperchromatic nuclei. Smaller mononuclear and fusiform cells, like those of a fibrosarcoma, are dotted among these. This is a fascial tumor primarily and it is not found in the mediastinum, although as myxolipomas may occur there it would not be strange if one should be encountered. The second group, however, has been relatively often seen in our laboratory. Grossly, these growths are yellow to orange in color, much like "xanthomas" and the section

surface is dull and opaque. They may attain considerable size—one of ours filled the upper half of the right chest. Microscopically they usually have very little resemblance to adipose tissue and one would not suspect their origin from their appearance. They are composed of masses of polygonal cells growing in plugs, like epithelial islands. Occasionally there are groups of typical "mulberry cells," like embryonal fat cells, but they may be totally lacking. One finds tumors that represent all the transitions from this fetal fatty tissue, through the mulberry phase, to relatively mature adipose cells, or very atypical sarcomatous cells. There are two points that indicate fatty origin in the more solid and obscure of these tumors: their histology resembles that of the "fat organs" of Flemming (found in the axilla and groin of the relatively mature fetus) and, most importantly, the cells are all peppered with fine lipoid granules that stain positively with fat stains. It is almost futile to make a positive diagnosis of liposarcoma without having done a confirmatory fat stain.

Xanthoma—A few cases of this tumor have been reported as occurring in the mediastinum. Heuer cited 2 in his article in *Nelson's Looseleaf Surgery*⁴, 4 or 5 more have since been reported. This growth raises problems in pathology: is it, or is it not a true tumor? Like many disputed subjects, there are times when it seems to be neoplastic and others when it appears to be a granuloma, an inflammatory collection of fat phagocytes filled with cholesterol. Gruenfeld and Seelig⁵ have discussed this at length. In the latter instance the patient may be found to show hypercholesterolemia. Macroscopically these tumors are well encapsulated, rather waxy and bright orange-yellow in color, microscopically they may be wholly or in part composed of foamy cells in a matrix of variably typical fibroblasts. They may take on a sarcomatous appearance and exhibit many foreign body giant cells as well, with a yellowish brown pigment scattered

through the tumor, but these are not true sarcomas and may merely represent a different degree of development from that of the ordinary xanthoma. The whole question parallels that of the giant-cell tumor of bone rather closely. In the mediastinum they have all of them been of the simpler, foam-cell type of xanthoma and the prognosis after surgical removal has been good.

Myomas and Myosarcomas—In the thorax one might theoretically expect tumors to arise from misplaced rests of either smooth or striated muscle, or from cardiac muscle. They might also originate in muscles resident in the neighborhood of the mediastinum. Generally speaking, nonmalignant muscular tumors of the mediastinum are unheard of. Rhabdomyosarcoma of either striated or cardiac muscle has been described, the latter by Wolbach.⁶ Such tumor might also arise in teratomas of the mediastinum. At all events, they are extremely rare.

Vascular Tumors—Hemangiomas and hemangiosarcomas, common enough in the abdominal cavity, are very rarely met with in the mediastinum. This is also true of the lymphangiomas.

Tumors of Nervous Origin—One might think that these would also be rare visitors to the region under discussion, but this is not the case. They arise from nerve trunks, ganglia, and from scattered fetal rests in the mediastinum, particularly the posterior mediastinum. Nerve cells may migrate from the ganglionic crest in embryonal life and give rise to tumors that range through the gamut of possibilities in nerve-tissue development. Neuroepitheliomas,⁷ malignant tumors of primitive neuroepithelium, have been described, ganglioneuromas⁸ and malignant forms of these are not infrequently encountered, although the latter are rare, the former are not uncommon. They comprise a certain percentage of the "hour-glass tumors"⁹ that consist of two enlargements, one within the spinal canal and the other in the mediastinum, the two connected by a narrow isthmus that lies in the root foramen. Another

type of hour-glass tumor is the nerve-sheath tumor known as neurilemmoma or Schwannoma,⁹ grossly much like the ganglioneuroma, but microscopically composed of Schwann cells that form peculiar and typical "Verocay bodies" with palisaded nuclei that are pathognomonic and readily recognized.

From the fibrous tissue of the nerve sheaths one may have neurogenic fibromas or fibrosarcomas developing. We have had one of these that grew rather slowly and ultimately metastasized widely and fatally. Tumors of the sympathetic nervous system may show the characteristics of sympathicoblastomas, a group that is becoming more and more subdivided into component groups, but most of these are metastatic from the suprarenals. The pigmented chromaffin cells of the sympathetic system, which form so-called "paragangliomas," rarely do so in the mediastinum, but there is accumulating evidence that a rather recently recognized, almost invariably nonmalignant tumor of the larger bronchi may belong in this category. Hamperl,¹⁰ of Berlin, has gone so far as to say that it does. These tumors are really parabronchial and break into the lumen from recesses in the wall. In their fresh state, a membrane of bronchial mucosa can usually be demonstrated separating the tumor from the lumen.

Teratomas—For some reason, the chest is a frequent site of teratomatous growths¹¹ that may range from simple epidermoid cysts, containing sebaceous material and hair with some admixture of fluid, to very diversely developed teratomas that contain bone, cartilage, and a variety of other tissues. They may form solid tumors that are readily recognized on x-ray examination on account of the bone they contain. Unfortunately, many of these tumors fall into the class best known as "embryomas," or undifferentiated, primitive, and therefore malignant tumors that probably represent the malignant form of the teratoma. Under the microscope they may show little tissue that can be identified with

any adult structure, exhibiting many mitotic figures and constituting undeniably malignant and destructive growths. Occasionally one sees such a tumor, part of which has developed into recognizable bone, nervous tissue, epithelium, etc., but another part of which is composed of undifferentiated fusiform cells that resemble embryonal mesoderm, or sarcoma, and constitute the bulk of the tumor. These cells are just as malignant as though unassociated with well-differentiated tissue. Several of these have been operated upon, or explored in our department of surgery during the past five years.

Metastatic Growths—Naturally, any malignant tumor may invade the mediastinum from a point without its strict confines, such as a carcinoma of the bronchus, esophagus, etc. Metastases from points farther away also occur, but these are all mentioned in passing, as they are not primary in the region we are discussing.

Remarks

In closing, it would be well to point out the importance of employing varied technic in investigating tumors of this region. Mere hematoxylin and eosin will not solve all the problems that confront one here, although they serve the experienced pathologist surprisingly well. The neurogenic tumors, for instance, will not show up in their true light unless other technics be used. Silver impregnations are invaluable in the investigation of the tumors of nervous origin. One should have abundant material and then fix thin blocks in a number of ways, and stain or impregnate by a variety of methods, if one would bring these troublesome tumors into their proper categories.

Discussion

Dr Arthur Purdy Stout, *New York City*—The review of the various mediastinal tumors that has just been presented by Dr Foot covers such a variety of lesions that it will be impossible to discuss all of them although each tumor group tempts one to elaborate upon his necessarily brief summary. Therefore only certain features will be touched upon.

It might be well to enlarge upon the statement that hemangiomas and hemangiosarcomas are very rarely found in the mediastinum. This must certainly be true, for I was unable to find records of a single case. There are at least 10 cases in which either the lung, the pleura, or both are involved. Hall's lung tumor was malignant and metastasized while several of the other cases had multiple tumors both in the lung and elsewhere.

In this connection lymphatic cysts and lymphangiomas should be mentioned. These usually appear in the upper anterior part of the mediastinum. The common form is the downward extension of a cystic hygroma from the neck behind the clavicle into the upper mediastinum. But they may also appear as entirely mediastinal tumors without any neck or axillary involvement. Cases of tumors in children appearing in the anterior mediastinum have recently been reported by Michaelis. Skinner and Hobbs have reported them almost filling the lower half of the right chest. Elger has suggested that they are perhaps of branchomesodermal origin and have been drawn down into the thorax by the descent of the heart.

Dr Foot dismisses the mediastinal bony tumors of the thoracic cage with the statement that they do not differ from those seen elsewhere in the skeleton. This is perhaps true but it

seems worth while to emphasize the fact that sometimes they grow to a very large size without seriously discommoding the patient. The largest pure osteoma that I have ever encountered grew from the inner surface of the eighth and ninth ribs, forming a smooth, ovate tumor measuring 20 by 14 cm and weighing 3,100 Gm. It compressed the lung and displaced the heart to the right. The patient was a male, twenty-three years old, and the growth was first noticed at the age of sixteen. When examined, it was uniformly solid and was composed of well differentiated bone trabeculas without any associated cartilage. The patient died after excision of the tumor and four ribs. Rather unfortunately the case was reported by Dr Auchincloss in 1934 as an osteochondroma on the basis of the x-ray diagnosis, without waiting for the completion of the pathologic examination. There was also present in the left lower lobe a small, rounded osteoma of the lung. We thought it unlikely that this was a metastasis, although of course it may have been one as Dr Foot points out in connection with chondromas of the chest wall associated with intrapulmonary chondromas.

I am not sure from his statements about smooth muscle tumors in the mediastinum whether or not Dr Foot is acquainted with any cases. Kaplan has reported a polypoid leiomyoma attached to the origin of the left pulmonary vein in a four-year-old child, and Kudlich and Schuh have reported a myoplastic sarcoma attached to the wall of the pulmonary artery at the root of the left lung in a twenty-seven-year-old man with metastases in the left adrenal and the right ventricle of the heart. In addition to these, a smooth muscle tumor was found in the pleura of an eighty-three-year-old woman by Catron. I have seen one in the wall of the esophagus, where they are much less infrequent.

Dr Foot steps aside from the mediastinum for a moment to pay his respects to that tumor of mystery, the so-called bronchial adenoma. I am interested to learn that apparently he looks with favor upon Hamperl's suggestion that it may be a chromaffin-cell tumor. There was a time, I think, when he believed that they were in the nature of carcinoids because he succeeded in staining argentaffin granules in the cells of one tumor. My experience with these tumors is limited to 14 cases, and so far their genesis has baffled me. They seem to me quite different from any tumors with which I am acquainted which arise from the mucosal epithelium, its glands, or its ducts. They are quite different from any of the special forms of mucous and salivary gland tumors, of which I have seen 1

example arising in a bronchus. I have never succeeded in blackening any granules within the cells with silver. They do not appear to me to be lipoid-containing, although I have not had a chance to confirm this point. However, the general arrangement and appearance of the cell strands more nearly resemble tumors of some of the glands of internal secretion than anything else, and I shall not be surprised if it can be demonstrated some day that they belong in this category. Their biologic behavior is well known, chiefly through the observations of the Mt Sinai group, who have studied more of them than anyone else. Kramer and Som have pointed out that they may reach the size of a grapefruit without actual invasion. I cannot agree with this statement. In our group of cases there are several that have penetrated the wall of the bronchus and impinged upon the lung. This occurs by a process of microscopic invasion that is so slow and restricted and is accompanied by such a degree of fibrosis that the growth always appears to be encapsulated, even when it reaches the dimensions of 6 by 10 cm, as occurred in 1 of our cases. Examination of the confines of our tumors always showed infiltrative rather than expansile growth. I quite agree, however, that the tumors are otherwise benign and no case has been known to metastasize.

I want to endorse what Dr Foot has said about the importance of proper fixation, some versatility in histologic technic, and the examination of many parts of any given specimen. These are essential if we are to progress in tumor investigation.

In conclusion I should like to thank Dr Foot for his well-considered presentation and especially for asking me to discuss it, for this has stimulated me to review my acquaintance with a most interesting field of tumor pathology.

INFLUENCE OF INDUSTRIAL MEDICAL WORK ON GENERAL HEALTH AND MEDICAL SCIENCE

R. R. SAYERS, M D , and ROY R. JONES, M D , Washington, D C

(From the United States Public Health Service)

THE VALUE of the industrial hygiene program in the prevention of specific occupational diseases is readily appreciated, but frequently we fail to realize the possible benefits to the general health of the worker and his family that may follow our efforts in this field.

Hygiene is defined as "that branch of medical science which relates to the preservation and improvement of health, both in individuals and in the community." A comprehensive program in industrial hygiene includes more than plans for the elimination and control of specific occupational disease hazards. It makes use of all measures that have to do with the preservation and improvement of the worker's health. Industrial hygiene occupies a definite place in well balanced public-health departments—local, state, and federal. Like all other divisions of the public-health program, to be effective it needs to be a cooperative and not a competitive service. As in other public health activities, the work of the medical personnel must be supplemented by that of the nurse, dentist, statistician, and engineer. The benefits upon the general health in the community resulting from a well-directed program in industrial hygiene are not only dependent upon the assistance rendered by these immediate groups, but also upon the correlation of such a program with the work of other health and welfare agencies in the community—particularly that of the family physician.

The practice of public health may be said to be the application of preventive and curative methods of treatment upon groups as differentiated from the personal or private practice of prevention and cure

upon the individual case. For convenience, public-health methods may be classified as educational, administrative, and professional. From the definition and classification given, it is obvious that in a sense all legal practitioners of medicine may be considered as public health officials, and the services they render as such in the field of industrial hygiene are largely determined by the opportunities they have of contacting industrial groups, and by the extent to which they cooperate with the duly designated public health agencies.

According to the U S Census Report for 1930, approximately 49,000,000, or more than one third of our population, were gainfully employed. About 15,000,000 of this group were employed in the manufacturing, mechanical, and mineral industries. In the past more attention has been given by those in industrial hygiene to the study and elimination of obvious occupational-disease hazards associated with employment in this latter group of industries.

The past few decades have seen marked changes in medical practice as applied to industrial groups. Formerly, industrial medicine was chiefly concerned with the treatment of traumatic injuries, and the selection of applicants for employment. The adoption of compensation laws providing benefits for accidental injuries was a deciding factor in the establishment of such services. The relationship of health to accidents gradually became apparent, and the more progressive employers have provided more complete health supervision. Thus, enactment of laws compensating for occupational disease have made medical supervision more impor-

FIG 1 Relative mortality in different occupational classes, by cause, 10 states, 1930

tant There is probably an even greater relationship between general health and occupational disease than between health and accidents

As a result, today many establishments employing large numbers of workers commonly provide medical supervision. However, approximately 50 per cent of all workers in manufacturing establishments are found in plants employing less than 250 workers. There is serious need for the development of an industrial-hygiene program that will serve this group. The success of health activities in the larger establishments will be directly benefited by such efforts.

In the main, occupational diseases are chronic, resulting from months or years of exposure. Many workers in the larger establishments gain their training and experience in smaller plants, and unless they have adequate health supervision during periods of such employment they will come to work in the larger establishments more susceptible to, if not already suffering from the effects of, harmful occupational exposure.

It has been shown that the incidence of pneumonia, tuberculosis, and some of the so-called degenerative diseases are greater among some labor groups than among the general population. This, it is acknowledged, is due to social and economic conditions as well as conditions of industrial environment. Corrective measures to be effective must include specific attack upon these three fronts. The following table indicates the difference in mortality rates by various occupational classes.¹

Fig 1 shows graphically the relative mortality in different occupational groups, by cause. It is apparent that we have here in some occupational groups, an ex-

TABLE 1—ADJUSTED* MORTALITY RATES MALES 15-64 YEARS OF AGE, IN 10 STATES † 1930, ACCORDING TO OCCUPATIONAL CLASS

| Occupational Group | Rate per 1 000 | Population | Deaths |
|--------------------------------------|----------------|------------|---------|
| Professional men | 7.0 | 636,608 | 4,428 |
| Proprietors, managers, and officials | 7.4 | 1,426,425 | 12,440 |
| Clerks and kindred workers | 7.4 | 2,216,477 | 13,793 |
| Skilled workers and foremen | 8.1 | 2,725,992 | 23,282 |
| Semiskilled workers | 9.9 | 2,543,762 | 22,281 |
| Unskilled workers | 13.1 | 2,455,778 | 32,248 |
| All gainfully occupied males | 8.7 | 14,013,367 | 121,951 |
| Agricultural workers | 6.2 | 2,008,830 | 13,479 |

* Adjusted to distribution of all gainfully occupied males in three age groups, 15-24, 25-44, 45-64.

† Alabama, Connecticut, Illinois, Kansas, Massachusetts, Minnesota, New Jersey, New York, Ohio and Wisconsin.

cessive mortality from certain diseases which we should be able to greatly reduce through the application of public-health measures. This approach is logical and in keeping with established public-health procedure. In the control of communicable diseases we plan our educational and administrative program for the age group most seriously affected, through the public-school system and for the mothers of these children through their women's clubs and parent-teacher associations. In our efforts to reduce mortality of the mother and newborn, we carry our services to that group. Those employed in industry constitute a well-defined unit in our population and one through which much should be accomplished by cooperative public-health efforts.

Numerous investigations may be cited to show the excessive rates of tuberculosis and pneumonia, in certain occupational groups, and the effects of such rates

TABLE 2.—DEATHS AND DEATH RATES FROM TUBERCULOSIS IN THE TOWNS A B C AND H

| Year | Town A Esti- mated popula- tion | Deaths from tuber- culosis | Death rate per 1,000 | Town B Esti- mated popula- tion | Deaths from tuber- culosis | Death rate per 1,000 | Town C Esti- mated popula- tion | Deaths from tuber- culosis | Death rate per 1,000 | Towns A B C Deaths from tuber- culosis | Death rate per 1,000 | Esti- mated popula- tion | Town H Deaths from tuber- culosis | Death rate per 1,000 |

* Average

upon the mortality rates for the community or state are clearly evident. The above table, provided in the report of Drury² upon the incidence of tuberculosis among polishers and grinders in an ax factory, shows that the death rate from pulmonary tuberculosis among the workers was found to be more than ten times that for the general population of the state, and that the rate in mill towns (A) (B) (C) was approximately twice that for town (H) where the industries did not afford exposure to siliceous dust.

In the report upon the Health of Workers in the Granite Industry³ by the Public Health Service, it was found that the annual rate per 1,000 for tuberculosis among pneumatic tool cutters for ages 20 and over was 19.58 while for rural Vermont the rate for a similar age group was but 1.42.

It has been estimated⁴ that in the whole U S there are more than 500,000 workers employed under conditions affording a harmful exposure to silica dust. It is apparent that efforts to reduce tuberculosis among this group through control of the silica hazard and through a well planned education program as to how tuberculosis may be prevented will materially benefit the general population.

The antituberculosis campaign frequently carried out in our public school systems to detect and treat early cases of

pulmonary tuberculosis and prevent the spread of the disease, is just as applicable to adult population groups—provided contact with such groups may be established. It is known that the employees in certain industries are working under conditions that favor the increase and spread of pulmonary tuberculosis, and some of these groups have asserted their interest in a tuberculosis-control program, provided it may be carried out without creating undue and unnecessary economic and social handicaps. It is the duty of persons interested in the successful control of pulmonary tuberculosis in the community to develop this program.

It is well known that the incidence of pneumonia among iron and steel workers is greatly in excess of that for some other occupational groups and for the general population. Table 3 (page 1008), taken from Public Health Bulletin No 202,⁵ reporting upon the incidence of pneumonia among iron and steel workers shows their pneumonia rate is approximately twice that for employees in public utilities and other industries as a group.

The report further states

"The death rate from pneumonia in the female population of the city at these ages was 56 per year per 100,000 during the four years ending December 31, 1927. In the registration states the rate for the same period was about 28. When

TABLE 3—FREQUENCY OF CASES OF PNEUMONIA (ALL FORMS) CAUSING DISABILITY FOR EIGHT CALENDAR DAYS OR LONGER AMONG THE MALE MEMBERS OF SICK-BENEFIT ASSOCIATIONS REPORTING TO THE UNITED STATES PUBLIC HEALTH SERVICE 1922 TO 1928, CLASSIFIED ACCORDING TO INDUSTRY

| Industry | Annual Number of Cases per 1,000 Men (in Terms of Years of Life Observed) | Number of Cases of Pneumonia | Number of Years of Life Observed* |
|-------------------|---|------------------------------|-----------------------------------|
| Iron and steel | 4.4 | 1,457 | 330,606 |
| Public utilities | 2.6 | 521 | 202,822 |
| Other industries† | 2.9 | 854 | 292,477 |

* Sum of the average number of members for each of the years included

† A miscellaneous group, products include chemicals abrasives, plumbing fixtures, electrical equipment, paper, paper novelties, timepieces, hats, underwear, flour, soap and other articles of manufacture. During the five years, 1924-1928 the pneumonia rate for this group was 3.0

the last-named figure was adjusted for the higher pneumonia mortality generally found in cities, an estimate of about 34 deaths per year per 100,000 females was obtained for the age group 15 to 45. Therefore, the mortality from pneumonia among the women of the city in which the steel plant was located was above the average for American cities.

"Among the city's male population at these ages the pneumonia death rate was almost twice the female rate. Among employees of the steel works studied, the rate was higher than among males in the general population, but this is of little significance since more than one-half of the male population of the city at the ages mentioned was estimated to be engaged in the steel industry. More illuminating is the comparison with the mortality rate of the women. In certain departments of the steel plant studied, e. g., the blast furnace, coke ovens, open hearth, coal mines, and general labor departments (considered as one group), the pneumonia death rate was 4.3 times that of women at the same ages in the city as a whole. There is little evidence, therefore, that community conditions were responsible for the high rate among the steel workers. On the contrary, the comparisons clearly indicate that the male pneumonia death rate of the community was increased appreciably by the prevalence of the disease among those engaged in certain processes of iron and steel manufacturing."

Pneumonia in all forms continues to be one of the leading causes of death. We

should not fail to grasp the opportunity we have here to follow established public-health procedure and plan for and carry to those most seriously affected a definite program. Those actively engaged in industrial-hygiene activities have here an opportunity not only to aid the workers as a group, but at the same time do work that will lessen the incidence of pneumonia among the general population.

Recent reports based upon analysis of data collected during the National Health Survey⁶ indicate the severity and incidence of disabling illness and show a marked difference in time lost in various occupational groups.

A review of the experiences reported by those states providing compensation for occupational diseases indicates that although such diseases are definite and important, they are minor causes for lost time from work due to illness. Newquist has stated that there is approximately fifteen times as much time lost from work due to general illness as from specific occupational diseases and accidents.⁷ When compared with compensation for accidents it is found that occupational-disease costs represent approximately 2 to 10 per cent of the total accident cost. Occupational diseases are preventable, and as our experience increases we should be able to reduce them to a marked degree more readily than we can expect to control accidents.

When industry first began seriously to control accidental injuries, industrial accidents were a major cause for lost time from work. With the development of a comprehensive accident-prevention program, industrial accidents are rapidly being controlled, so that at present it is estimated that off-duty accidents cause by far the greater amount of lost time from work. As a result we see the safety personnel devoting perhaps most of their time to educational measures designed to lessen accidents in the home, public meeting places, and on the highway.

As one important objective, there is a definite need in the teaching of medicine for greater stress to be placed upon the

relationship of environment to health. It is believed that this may be accomplished by the medical schools, without detracting from necessary clinical instruction relating to diagnosis and treatment. Obviously, medical students need to know curative measures. It is, however, just as obvious that they should likewise be familiar with preventive measures. Not that the proportion of time allowed in school, which is assigned solely to the subject of preventive medicine, need be lengthened, but that throughout all clinical years emphasis should be placed upon the relationship of environment to disease. One important factor or means of accomplishing this would be to train the student in taking a complete occupational history. With the information such a history would make available, there is less chance for neglecting to consider the effects of industrial environment when arriving at the diagnosis and treatment of diseases.

In our engineering schools, where industrial processes and planning are taught, the accident and health hazards associated with the operation should be given the attention they merit. Thus, to our future captains of industry we should make available during their undergraduate or training career, such information as will make them familiar with industrial health and accident hazards. When the small plating tank, used for teaching purposes, is equipped with control exhaust, and its needs stressed, the larger ones used in industry will more likely be found effectively controlled. When new processes are discussed in the classroom and the operators' health considered, the same practice will more likely be found in modern industrial environment.

The necessary safety devices guarding against accidents and occupational diseases should be an integral part of machines and equipment manufactured for industrial use. Examples of the application of such preventive measures should be shown to engineering students. When employers demand safe equipment, manufacturers will produce it.

As another objective, there is immediate need for the development of a program of cooperation between state departments of health and organized medicine, which is designed to make available, to workers in the so-called hazardous trades and employed in small groups, effective health supervision. This supervision should be such as to afford the proper placement of applicants for work at tasks they are physically able to carry on with safety to themselves and to their fellow workers. It should provide regular periodic examinations of industrial workers to detect early evidence of any injurious effects of environment upon health, at a time that will permit elimination of the industrial hazard without necessitating change of occupation for the worker. Such supervision should likewise provide regular and authentic advice as to ways in which general health may be improved, and time lost from work due to preventive illness be effectively reduced. The benefits of such a program will be realized when and if state departments of health are staffed with adequate personnel, familiar with, and trained in, industrial hygiene as a public-health activity, and when collective cooperation is assured from managements and labor. Our social security program has made it possible for state health departments to initiate the assumption of responsibilities in this field as rapidly as trained workers are available.

It is encouraging to note that rapid progress is being made in the development of industrial hygiene as a regular public health activity.

At present there are 23 state health departments and 4 city health departments that have established bureaus or divisions of industrial hygiene. The majority of these units have been established during the past three years. Industry, labor, and organized medicine can do much to aid in the further development and usefulness of these agencies. All groups should become familiar with the plans made by these bureaus and how

they may be of public service. Not only the workers and their employers will benefit by such cooperative action, but what is just as important, community and national health will be improved and protected.

The situation as regards the prospects of an educational health program among employees of our larger industrial establishments is, fortunately, much more promising. Industrial medicine to these groups has come to mean preventive medicine, including the prevention of every-day illnesses as well as specific occupational diseases. It is indeed fortunate that we have this experienced group of medical and engineering personnel anxious and willing to assist health officials and the modern employer in rendering a similar service to establishments without full-time medical supervision. Within these larger units we have the organization already established to begin a more comprehensive program of health education. Leaders in safety promotion are usually well equipped to assist in arranging health educational activities. The addition of health topics to accident prevention programs will increase the interest of the worker in both phases of environmental protection. Workers have taken a greater interest in accident prevention since, as an organized group, they have been shown the need of their cooperation. We may expect equally whole-hearted assistance from them if they are given a part in an industrial community-health program.

It is obvious from these approaches that we have discussed that the situation requires the application of public-health methods relating to educational and administrative control. Public-health measures cannot be applied effectively in the control of illnesses until agencies are advised as to when, where, and why such illnesses are developing. The local and state health officers are unable to accomplish much without the cooperation of the

practicing physician in regularly reporting the incidence of disabling illness. In the case of establishments maintaining medical supervision this could be a relatively easy matter, but where such services are not available we must continue to look to the support of the family physician. It is believed that when a health agency is prepared to do something about those cases that are reported and take definite steps to prevent recurrence, we shall have the whole-hearted support of all regular practicing physicians.

Workers and their families are becoming increasingly health conscious. There is urgent need for health authorities both public and private to assume leadership in present health-education movements. Experience indicates that it is possible through well-organized public-health activities to make a group or community health conscious without the mass hysteria and fear that have sometimes followed unguided efforts to inform the public regarding health matters.

It is the feeling of those most closely associated with the development of industrial health activities in state and city health departments that, generally speaking, employers, workers, and communities favor this program, and with their support it is certain that the effects of well-directed industrial-hygiene activities as a public-health function will soon be reflected in an improvement in the general health of the community.

Few things are more important to a community than the health of its women. If strong is the frame of the mother, says a proverb, the son

will give laws to the people. And in nations where all men give laws, all men need mothers of strong frames.—T. W. Higginson

SYPHILIS CONTROL

Administrative and Epidemiologic Aspects

CLEALAND A. SARGENT, M D , Buffalo, New York

(New York State Department of Health)

A SYPHILIS-control program should include case finding, location of sources of infection by epidemiologic investigation, treatment of patients with early and potentially infectious syphilis, prevention of congenital syphilis statistical studies, and public health education

Case Finding

We are primarily interested in patients with early and potentially infectious syphilis. To classify cases and to avoid duplicate reporting, it is essential that a syphilis register, which consists of reports of all cases diagnosed as syphilis, be maintained. In addition to the identification of the patient, the case card should also contain the date and character of first signs or symptoms, date of diagnosis, serologic history, amount and kind of antisyphilitic treatment administered, and the name and address of the physician from whom the report was received

A register of serologic reports may be used as an additional aid in the classification of syphilis cases. If the serologic register contains both positive and negative reports, information pertaining to the results of the examinations of contacts and the serologic histories of reported cases may also be obtained. To reduce the clerical work to a minimum the original cards submitted to the laboratory with the blood may be used to make up the register of serologic reports.

The value of the registers of syphilis cases and serologic reports increases with the length of time they are kept and the volume of reports received. To be used to advantage the reports must be filed so that individual records may be located quickly with a minimum of effort.

The patient's name and case-card numbers may be entered on alphabetical cards that are placed in visible files, and the corresponding case cards filed in chronological order in vertical files. When the registers are made up of a large number of records, the individual reports may be coded and filed by the 'Russell-Soundex' method

Advantages of the Syphilis and Serologic Registers

In addition to being aids to case finding, the syphilis and serologic registers are used to determine the areas in the city where syphilis is most prevalent, so that a more efficient control program may be planned. They are used to obtain information for statistical studies such as the difference in the median age at death of patients infected with syphilis, as compared with the median age of all patients at death. The serologic histories of patients who lapse treatment, as compared with those who submit to treatment regularly, the prevalence of syphilis among pregnant women, the rate of infection among various groups of the population etc. By recording all the serologic reactions, treatment history and diagnosis upon each case card, with the various changes in addresses and sources of treatment, we have been able to render a service to physicians. If a physician submits blood to the laboratory of a patient previously reported as a case of syphilis by another physician a letter is written to the physician in which he is informed that with the written permission of the patient, a search will be made of our files for information pertaining to the history of the patient. In

New York City May 11 1938*

TABLE 1—DISTRIBUTION OF EARLY SYPHILIS CASES ACCORDING TO DIAGNOSIS WHEN REPORTED AND SOURCE OF REPORT

| | Physician | Clinic | Total | Percent |
|--------------|-----------|--------|-------|---------|
| Primary | 155 | 133 | 288 | 35.5 |
| Secondary | 94 | 85 | 179 | 22.1 |
| Asymptomatic | 182 | 161 | 343 | 42.3 |
| Total | 431 | 370 | 810 | 100.0 |

many instances we have been able to give the serologic and treatment histories over a period of years. This procedure tends to encourage the reporting by correct name and address. It also brings to the attention of the physician that the reports of cases may be used to good advantage and they are not placed in files merely for the purpose of accumulating records. Physicians will report cases if they can be assured that the information is to be kept confidential and that in return a definite service may be rendered.

The positive serologic report should be checked against the syphilis register. In Buffalo the laboratory report is used as the basis for the case report. If the case is located in the syphilis register, the data contained in the current laboratory report should be entered on the original case card. Changes of address, attending physician, etc., contained in subsequent reports should be noted on the case card.

If the name of the patient having a positive serologic report is not located in the syphilis register, the attending physician is requested to report the case using the report form provided for that purpose, or he may be requested by telephone to state the date and character of first symptoms and the diagnosis. If the attending physician is communicated with promptly following receipt of the positive serologic report, the desired information may be obtained by telephone without revealing the identity of the patient.

We are primarily interested in patients whose infection is in the early and potentially infectious stages. An early case is defined as one infected within one year. Women infected with syphilis are considered to be potentially infectious throughout the childbearing age. Male syphilis patients are classed as potentially

infectious until the end of the second year of their infection. Twenty doses of an arsenic and twenty doses of bismuth or a heavy metal are accepted as sufficient treatment to render a patient with syphilis noninfectious.

Records of early and potentially infectious cases should be placed in visible files, while records of the late and noninfectious cases should be kept in the inactive register.

Every precaution should be taken to keep all information confidential. All

TABLE 2—NUMBER AND PERCENTAGE OF CASES LOCATED THROUGH FOLLOW-UP ACCORDING TO STAGE OF DISEASE AND SOURCE OF REPORT

| | Physician | | Clinic | |
|--------------|-------------|---------------------------------|-------------|---------------------------------|
| | Total Cases | Cases Located through Follow up | Total Cases | Cases Located through Follow up |
| | | Percentage of Total | | Percentage of Total |
| Primary | 155 | 16 | 133 | 35 |
| Secondary | 94 | 8 | 85 | 28 |
| Asymptomatic | 182 | 64 | 161 | 99 |
| Total | 431 | 88 | 370 | 162 |

records must be kept in locked files. If there are large numbers of records it may be advisable to have them placed in a room in which no other form of clerical work is to be done, to which only those engaged in the syphilis-control program be permitted to enter, and a lock having no master key be placed on the door. No information should be given by telephone even to the attending physician.

Inasmuch as many patients with gonorrhea also have syphilis, all physicians to whom positive gonorrhea reports are sent should be requested to examine the patients for syphilis and to submit blood for serologic tests.

Table 1 indicates the diagnosis at the time of investigation of 810 early infectious cases in 1936-1937 in the city of Buffalo. It is interesting to note that 35.5 per cent of the cases had primary lesions and 22.1 per cent had secondary lesions.

Follow-up by epidemiologic investigation and examination of individuals in penal institutions, industrial plants, etc., have been a productive means of case

finding The number and percentage of cases located through follow up according to the stage of disease and the source of report is indicated in Table 2. This table indicates that 30.8 per cent of the early cases investigated were found as a result of various types of follow up.

Epidemiologic Investigation

In addition to the identity of the patient, the epidemiologic investigation form should contain the classification of the case, data pertaining to the use of

prophylactics, the name, age, address, and marital status of all contacts prior and subsequent to infection, the dates and number of contacts and date and results of examination of contacts.

Compulsion should not be used to obtain the examination of contacts. Our investigators are not permitted to interview a contact in the presence of another individual. In general it has been our policy to have a contact interviewed by a staff member who does not know with whom the individual was in contact. This is done so that the name of the patient who gave this confidential information may not be disclosed. The contacts are submitted to repeated examinations for a period of three months.

As a result of the investigation of 810 early syphilis cases, 611 contacts were named, an additional 33 contacts were reported by first name only, and the inmates of 39 houses of prostitution were designated as the sources of infection. One hundred and forty six contacts were nonresident. Of the remaining 106 contacts, 12, or 2.5 per cent, refused to be examined. Three died before the exami-

| Total | 94 100.0 | 85 100.0 | 179 100.0 | |

nations were made. One hundred and fourteen of the remaining resident contacts were negative upon examination. Fifty five were negative upon one examination, 43 upon two examinations, and 16 upon three examinations. Five contacts were negative upon the first examination but were positive upon the second. Two contacts were positive on the third examination after being negative on two examinations. The 336 resident contacts with positive results upon examination, were classified as follows: early, 210, other potentially infectious, 50, late, 76.

TABLE 5.—INTERVAL BETWEEN DIAGNOSIS AND FIRST
TREATMENT—PRIMARY SYPHILIS

| Interval | Diagnosis to First Treatment | | | |
|------------------|-----------------------------------|--------------------------------|-------------------------------|--|
| | Physician No Per centage | Clinic No Per centage | Total No Per centage | |
| Under 1 month | 90 58.0 | 76 56.5 | 166 57.3 | |
| 1-2 months | 2 1.3 | 1 0.75 | 3 1.1 | |
| 2-3 months | 1 0.7 | 0 0 | 1 0.3 | |
| 3 or more months | 0 0 | 1 0.75 | 1 0.3 | |
| Not stated | 62 40.0 | 56 42.0 | 118 41.0 | |
| Total | 155 100.0 | 133 100.0 | 288 100.0 | |

By epidemiologic investigation the intervals between onset and diagnoses of early primary syphilis cases were determined. In Table 3 it will be seen that 58 per cent of the 288 primary cases were diagnosed within a month of the first symptoms. Table 4 indicates that the diagnoses of 51.3 per cent of the secondary cases were made within a month of the appearance of symptoms.

The intervals from diagnosis to first treatment of the primary cases were 57.3 per cent within one month, as seen in Table 5, and in the secondary cases 50.1 per cent as indicated in Table 6.

In our experience it has been found that to investigate approximately 100 early

infectious syphilis cases to find 1 early case not previously reported among the contacts. For two months accurate records were kept of the time devoted to the various types of field work by the staff members. It was found that the average cost of investigation of early syphilis cases was approximately \$7 per case. The average cost of locating and persuading contacts to submit to examination was approximately \$17 per contact.

TABLE 7—EARLY SYPHILIS DATE AND CHARACTER OF FIRST SYMPTOMS UNKNOWN OR NOT STATED

| Interval | Diagnosis to First Treatment | | | | | |

| Total | 182 | 100.0 | 161 | 100.0 | 343 | 100.0 |

Not infrequently cases are located that cannot be classified as early, potentially infectious, or late, due to absence of symptoms and lack of history of lesions. All individuals under thirty years of age having two recent positive Wassermanns, not previously reported, negative upon physical examination, and giving no history of lesions of syphilis, are investigated as early syphilis cases. These cases are not classified as early cases unless among their recent contacts a patient is found with lesions of early syphilis.

Patients attended by private physicians are not interviewed without the consent of the physician. If an investigator is not permitted to interview a private patient, the physician is requested to obtain the information and complete the epidemiologic

investigation form. For the most part, patients with early syphilis are interviewed only once by staff members. Practically all information obtained upon investigation as recorded in the preceding paragraphs was obtained upon one visit to the patients. It has been our experience that the investigation of early syphilis cases can be more thoroughly carried out by clinic physicians at the time of the patient's visit to the clinic than by field workers.

Treatment

The public cannot be protected from syphilis by such measures as quarantine or immunization. Treatment of infectious cases controls the spread of the disease. Although antisyphilitic drugs, laboratory services, and treatment in clinics are provided without charge for patients without funds, one of the major problems in syphilis control is keeping infectious cases under treatment until they are rendered noninfectious. A recent study of the treatment histories of 666 early and potentially infectious syphilis cases brought out the fact that 50.3 per cent of private cases and 75.5 per cent of clinic cases lapsed treatment before the forty doses of antisyphilitic drugs were administered. Two hundred and sixty-eight patients, or 40.2 per cent, did not lapse treatment. The 398 patients who were delinquent actually lapsed treatment six hundred and fifty-three times, or an average of 1.6 times per patient. At the end of one year, 65.8 per cent of the patients had received the forty doses of antisyphilitic drugs, 6.7 per cent were under treatment, and 27.3 per cent had been lost from observation. The nurses made 2,396 visits to patients who lapsed treatment during the year, or an average of 3.6 visits per lapsed case.

A definite program of obtaining the treatment histories of all early and potentially infectious cases at least once a month, should be carried out. In Buffalo, nurses visit all clinics each week at which time they obtain the names of

patients who have lapsed treatment. The names of private, early, and potentially infectious syphilis cases are entered on file cards, which are placed in a "tackler" file so that each week each nurse is given the names of patients to be checked with private physicians. Patients who have lapsed treatment are visited by the nurses, whose duty it is to determine whether there are sufficient reasons why the patient should not resume treatment. If there is no apparent reason why the patient cannot continue treatment, he is advised and urged to do so by the nurse. If the patient does not return for treatment within one week, a warning letter is delivered and read to the patient by the nurse. If all other means fail, we resort to legal compulsion but in such a way as to embarrass the individual as little as possible.

Patients who lapse treatment should be followed promptly to prevent the spread of syphilis and to locate them before the address has been changed so many times that there is danger of losing them.

By checking the treatment histories of private patients, we have been able to render a service to physicians, since every effort is made to induce the patient to return to the physician who was treating him when he lapsed treatment. During 1937 we were able to return 68 per cent of delinquent private patients to their physicians.

Prevention of Congenital Syphilis

In Buffalo the names of all applicants for marriage licenses and the married and maiden names of all clinic prenatal cases are checked against the syphilis and serologic registers. All pregnant women who have been infected with syphilis are visited by the nurses and permission obtained to discuss the patient's history with the director of the prenatal clinic and to request him to administer antisyphilitic drugs during pregnancy. If a patient with syphilis in the early or potentially infectious stage has recently married, he is requested to have the

marital partner examined and kept under observation. This program will soon be unnecessary due to laws recently enacted.

The married and maiden names of all mothers of babies born in the city during the month of January 1938, were checked against the syphilis and serologic registers. It was found that only 8 per cent had serologic tests made during pregnancy. Four per cent of these names were in the syphilis register, indicating they had been diagnosed before pregnancy.

Syphilis Control in Penal Institutions

The control program may be conducted to good advantage in penal institutions because an excellent opportunity is offered for case finding and the administration of treatment. We have a program whereby new patients are treated, and those under treatment before being committed to the county penitentiary are treated while in the institution and are returned to the clinic or private physician upon being released, so that there may be no interruption in the treatment.

Syphilis in Industry

It is now the policy of many large industrial plants to examine all applicants for employment and to reject those who are infected with syphilis regardless of the stage of the disease. This procedure works unnecessary hardship on many individuals and tends to handicap the control program. We have attempted with a fair degree of success to induce the medical staffs of industrial plants to consider each case individually and to employ those who will cooperate by submitting to regular treatment.

Publicity

We have recently completed posting approximately 175,000 letters to residents of Buffalo. Each envelope contained two pamphlets and a circular letter. To obtain an active mailing list and to avoid the criticism of using the names in our syphilis register a large commercial firm in the city was induced to address all envelopes using their mailing list and

addressing the material in their plant

Articles are published locally from time to time and an average of forty talks per year for the past two years have been given before local groups

Bimonthly meetings of the clinic physicians, the medical consultant, and the director of the syphilis-control service are held. Both the clinical and control programs are discussed

The syphilis-control program should be well balanced. The first consideration should be given to the development of adequate diagnostic and treatment facilities. The case-finding program should not be stressed to the point where so many early and potentially infectious cases are found that they cannot be followed closely enough to keep them under treatment. The epidemiologic investigation of early cases is interesting, but does not lend much to the control program unless contacts are located and examined and all infected individuals

are properly treated. Attention to details is of extreme importance. The case cards should be kept up to date and active. The individual cards in the syphilis and serologic registers should be kept in their proper places, because to misplace a case card causes delay and possibly loss of the record if there are several thousand reports in the files. Very close attention should be given to keeping all information confidential. All forms should be completed so that no data may be missing when needed for future reports and studies.

It may not be practicable for a department with a small staff to embark upon a case-finding or an epidemiologic investigation campaign, yet a program of keeping reported early and potentially infectious cases under treatment until they are no longer infectious, should be a part of the public-health program of every department to which syphilis cases are reported.

MEDICAL PLAN FOR TRANSPORT WORKERS

Medical care for the 55,000 members of the Transport Workers Union in New York City under the most comprehensive health program yet inaugurated by a union will start soon, according to the *New York Post*.

The result of more than a year of planning and study, the union's medical-care plan will cover all doctor's office and home care, the service of a staff of specialists, and minor and major surgery.

A hospitalization plan will be eventually included, but details of this part of the program are yet to be worked out.

The cost of the plan for the first year has been set at \$170,000. This amount will be met from a medical fund in the union's treasury, and the profits of two dances for which ticket purchases will be obligatory to all members.

The main body of general practitioners under the plan will be strategically located throughout the city, with about 1,000 members allocated to each doctor on the medical panel.

These doctors will be paid a per capita amount for each member for all necessary home and office care, and at least one routine examination a year. The amount to be paid is understood to be substantial.

In addition, the union will have a staff of eight specialists in surgery, x-ray, diagnosis, ear, nose, and throat, pathology, skin, and psychiatry.

The only other medical plan comparable in membership is the health clinic operated by the International Ladies' Garment Workers Union.

The Transport Workers' plan differs in that it provides medical care on a family doctor basis, whereas the I L G W U provides a clinic service.

The union is understood to be working out a plan with a number of private hospitals whereby members of the union will get reduced rates. Dental care may also be brought into the plan.

The program during its first year is expected to develop sufficient data for the building of a complete medical, hospital, and dental service not only for members, but also their families.

GENERAL REFLECTIONS ON PSYCHOSOMATIC MONISM

SMITH ELY JELLIFFE, M D, New York City

MY PURPOSE of being here this evening I think will be best fulfilled if I begin what I have to say by inviting you for a moment to a recent meeting of the New York Psychiatric Society over which Dr Brill presided and where Dr Frederick Tilney was the speaker of the evening. His was a most stimulating extemporaneous talk on 'Some Observations on the Meaning and Utilization of the Cerebral Cortex'.

In a simple and yet profound way he outlined the gradual organization of the form and function of the nervous system showing how from earliest forms it grew in response to future opportunities and how each and every part of the body became represented in neural structure for coordination and adaptive action.

I shall pick out for you but a very few of the aspects of his discussion. He traced the gradual synthesis of the general body functions of metabolism, etc., from the earliest nuclear responses, such as seen in simple spinal cord animals, up to their midbrain and final archipallial cortex. Then as the receptors of smell and sight and hearing and touch became more significant their representations in higher paleopallial and neopallial cortex, the higher always exerting some dominating or controlling action on the lower.

Among the bits of illustrative material he called attention to the behavior of the newborn rat, how helpless it was. It could not even find the mother's nipple without her help, even as you and I, and most interestingly it was pointed out that if the tail of the newborn rat was pinched it went into a convulsion, a thoroughly inappropriate effort to escape. But as the rat grew in days first the fore limbs and then the hind limbs lost their convulsive uncoordinated activities and finally the rat had control over efficient

means of escape and was able to run away from the tail pincher.

The discussion proceeded around the table, as has been our custom at these meetings, and finally it was up to me. Casting around for something to say, at least different from the other sharers in the discussion, I said that every time I came in contact with Dr Tilney and with his profound grasp of neural anatomy, I was much impressed and much like one of his described newly born rats. My tail was pinched and I went into a convulsion—not expressed in a motor way but purely in the mental realm. His canvas was so full of suggestive pictures I ran around in my head like a wild man trying to tie them together, especially as they could be applied to the everyday activity of the psychiatrist. I said that in my harum-scarum psychical whirl induced by his intellectual pinch of my backward understanding, I grasped frantically for some life preserver, some conception of what was going on in this some island of safety to which I might struggle and from there emerge to the ground and finally coordinate my intellectual limbs for adaptive action.

I went on to say that in my time of stress I had clung as a foundation to a conception that had come to me from my interests in psychobiology, from the eminent English psychiatrist of the Darwinian school—Maudsley. It was an old idea but I liked the name, namely, that an organism is a bit of structuralized matter in the language of a mathematician whose work had intrinsically engraved itself into the structure behind it organic and which Semov and which called

which he built an imposing psychobiologic structure of the "mneme" or memory and its functions which belong in the frame of reference of what I wish to discuss this evening. Professor Bleuler, formerly of Zurich, has wrought this conception into a synthesis of great interest in a number of works, but more particularly in his *Naturgeschichte der Seele*.

When, as Semon put it, protoplasm touches the external world of reality, a definite impression is made upon its structure with a definite response and which when repeated gives rise to increased writing-in (engraphy) of stimulus and increased outward response (ecphoria). Here one may see a very precise formulation of oft repeated ideas—from Democritus, Heraclitus, Protagoras, to Locke, Hume, Kant, Leibnitz, Freud, etc.

We shall not linger with the historic phases of this gradual synthesis but as one looks backward along the pathway, two distinct branches are apparent. One arose chiefly from man's reliance upon older Platonic ideas. It has been called by many names, but I think you are best acquainted with it under the terms of dualism, psychophysical parallelism, or the body-mind problem. The other is the conception to which I would call your attention. I have chosen to term it psychosomatic monism. Smuts, the South African Dutch scholar, has termed it "holism." You all are acquainted with it under the "body as a whole" idea.

Perhaps I can best start my rough outline of this situation by a quotation from Whitehead's *Science and the Modern World*. This Harvard professor of philosophy writes: "The concrete enduring entities are organisms, so that the plan of the whole influences the very characters of the various subordinate organisms that enter into it. In the case of an animal, the mental states enter into the plan of the total organism until the ultimate smallest organisms such as electrons are reached. Thus an electron within the living body is different from an electron outside of it by reason of the plan of the body. The electron blindly runs either

within or without the body, but it runs within the body in accordance with its characters within the body, that is to say in accordance with the general plan of the body and this plan includes the mental state."

Here you perceive there is no hedging on the matter. We are not asked to consider the action of the mind on the body, or the body on the mind—as the dualistic, psychophysical parallelism conception phrases it. Here the focus is upon a scientific teleology of the mental state as bringing about a unified adaptation of all the organ behavior, right down the line until we strike bottom in the electrons.

This also is not a new idea. The ancient Greeks put it very clearly. I shall not bother you with the historic details but shall again briefly cite this same writer, Whitehead, wherein he states: "The Pilgrim fathers of the scientific imagination as it exists today are the great tragedians of ancient Athens, Aeschylus, Sophocles, and Euripides. Their vision of *fate*, remorseless and indifferent, urging a tragic incident to its inevitable issue, is the vision possessed by *science*. Fate in Greek tragedy becomes the order of nature in modern thought."

Scientific thought as it envisages causality thus would emphasize that "remorseless inevitableness" which we, as physicians, are called upon to cope with in our daily work and which, I would urge, can most advantageously be envisaged through the hypothesis of psychosomatic monism.

Let me try to illustrate by a brief citation of one of those tragic situations about which much is written under the term "cardiorenal hypertension."

Some twenty or more years ago an old and valued friend came into my office with grave concern. "My God, Ely!"—for he called me by my household name—"you must save my wife. The doctors have given her only six months to live!"

"Yes!" I said, "and what do they call it?" "Chronic Bright's disease," he answered. "And what doctors?"

He named a number all well known and highly respected by me as well as my colleagues

Well, I said you know I am not what they usually term an internist and do not trust in my competency to deal with Bright's disease

He pleaded on the score of a lifelong friend ship and I compromised.

I said in essence you are an engineer and are well acquainted with problems of physics, of energy of stresses and strains and maybe we can translate this term Bright's disease into something your engineering can comprehend. At least let us get an inventory. So I sent her for a complete survey to one of our outstanding hospital and reputable internists for two weeks.

I have published some of the details of this situation¹ and will not bore you with the data of the factual findings of this inventory.

When I finally called on Dr. X. and went over all the figures with him I said Yes chronic Bright's all right, but why?

Hypertension 240/00 and other equally unpleasant variants from normal averages he emphasized.

"O K," says I and why the hypertension?

"Ah you see the kidney condition," says he.

Here I naturally could hardly repress a smile when I said, "Where do we get off?"

"We don't," he said and we parted miles away from any real psychosomatic monism. We had plenty of somatic end results but where in the language of Whitehead were the mental states?

When I told my friend of this impasse his engineering mind did not relish the dog chasing his tail—hypertension = renal disease and renal disease = hypertension syllogism. It was not good engineering and he pleaded with me for more understanding.

Here again I said O K. but give me two weeks for a different type of inventory taking so the wife came to my office for a look in on the mental states and chiefly not those known to her but the very ones that those Greek tragedians had emphasized, namely those experiences of life locked up in the mneme but not accessible to conscious verbalization—in short the unconscious where Fate and the Laws of Physics are but one.

You all know what Freud has claimed that of all the many roads into the unconscious, there is one, the royal road and that is the dream. So I asked her very soon with other things—had she had any dreams while in the hospital? Yes, she had one very vivid one. And this is a brief résumé of the dream.

She was at her country home. A path led from the house down to a country road at right angles

She saw approaching at great speed two men driving racing sulks from the right. They swept by the path she running toward them in great anxiety almost shouting for them to stop but they swept on up a steep hill to the left with terrific speed. As the one on the left got to the top of the hill he turned again to the left and horse and sulky and driver ran into a stone wall about two feet high and were smashed to bits.

So I said And suppose you did such a thing as this?

I'd be crazy, she said.

I think I quoted to her an ancient saying of one of the friends of those ancient Greeks, Heraclitus—who in a fragment left us—wrote

For the waking there is one common world but for those asleep each one turns aside to his own privacy. And do you imagine you can do with impunity what you dream? Is it not because you lie still and do not act that you can indulge your fantasies?

You are quite right this is a crazy fantasy—but what is there going on in the unconscious that wishes to wreck itself? At any rate here is something to work with a little further along the line that the tweedledee and tweedledum of the hypertension = kidney = hypertension formula. Here is an inkling of a mental state of self destruction that in the language already quoted leads down through the different organisms of the body until the electrons are reached and a biochemical bottom at least temporarily plumbed.

Whence came this wish for self-destruction? Who was the man in the sulky to begin with? Why this dirty dusty road? Why such dynamic urge and speed? Why to the left? Why the stone wall? Why two feet high?

I will not go over all the displacements, condensations distortions dramatizations, secondary elaborations of the dream work of this and other probings into the unconscious that revealed the stresses and strains the tragedies of maladaptation to the oldest of biologic mnemonic patterns i.e. the pattern of immortality of the race that is the reproductive pattern.

In the first place the man in the sulky was the father as every psychoanalytically oriented listener would have known and as free associations fully corroborated. He was fond of fast horses had a racing sulky, often took her out as a little girl for a race on the speedways of their native town. It was tremendously exciting but on the other hand how impatient she was to get home as after the race they walked back to the stable either to relieve a bursting bladder or to recover from her shame and chill of having wet her panties something not rare in her childhood and infancy.

Here was a clue to relevant activities connected with "water" holding and releasing. I shall not go into the details that revealed complete blocking of the *supremacy of the genital-zone development*. Although she had had four or five children, she never had had an orgasm, nor thrill, not even in masturbation. A gynecologist had suggested she try it. It was no use. The frigidity and fixation lay further back. It went back into the primitive *urethral eroticism*. Only one of the earliest prototypes of genital gratification had been reached and fixated and held on to. Hence innumerable water plays as a girl, yachting and water enjoyments when older, much—very much—water drinking. As I have already phrased it she drank gallons of water to get pints of urine with which to satisfy her excitement and frustrations at higher levels and here one gets a vista, not a complete picture of a dynamic happening where disjointed bits of the "house that Jack built" formula are apparent.

I know you are inquiring what could be done about it? Here was an infantile behavior pattern that had eaten its way into organic function and that could not be recalled. Irreversible cellular-biochemical patterns that we call Bright's disease had been established and could not be altered. It was too late to reverse the process.

Nevertheless I was intrigued to learn more of the dynamic libido situation and patiently and "unentgeltlich" worked at the problem. She did not die in six months, in fact, and here came in a bit of ironic humor, we sent her back to the hospital after six months with a reasonable blood pressure, no casts, and a much altered picture. So much so that when a re-inventory was taken, Dr. X said it was impossible, the internes had gotten their reports mixed. It was some other woman they had reported on.

For four years she was relatively healthy. Then another tragic re-entry of father fixation and frustration factors entered the scene and tore down the reconstructed edifice we had been building and she quietly finished her self-destruction.

Now permit me to rapidly outline another illustration that may bring into relief another aspect of the principle of psychosomatic monism.

This time the patient stands before you. I am my own experimental guinea pig. Here again I must plead guilty of a certain amount of duplication since in Lectures to the Lary at the Academy² last year, in discussing the background of psychiatry, I drew a full-length portrait of my iniquitous behavior. Some of you possibly may have heard me.

In short I related how within the past half dozen years or so I had slowly developed an annoying "spasmophilia." Often in response to a sudden sound, such as a slamming door, or a telephone ring, my body would suddenly shiver. If perchance my knee or foot was touched, a sudden kick would occur. To other sensory stimuli, a related type of exaggerated response would occur. I would suddenly turn my head as if to see something or someone behind me and just in time would realize it was a flicker in my glasses, or even an illusion arising from a straggling hair of my eyebrow.

More impressive and more amusing occasionally I would catch hold of a hallucinatory image. For instance, passing as I did at hourly intervals from my waiting room back to my office, as I would usher a patient back to my office at the rear of my house, I would pass through a room used by my secretary. Here at my right I would pass a stack of drawers in which I filed reprints. Each drawer was piled one above the other with its white label. Frequently a hallucinatory image of a footman such as one sees at restaurants or an apartment house, or of a bell hop in uniform would leap upon my spirit's stage, to be resolved immediately into its reality of my reprint cabinet. In short my reality tester, my Freudian ego, at once disentangled the illusory-hallucinatory picture into what was really there. Had this ego defense mechanism not been able to correct the image as already commented upon, or had I suddenly called "Here, boy, send up a bottle of Vichy and some glasses to room 66," I would have been a case to come under the administration of Dr. Brill or Dr. Gregory and reasoned it all out in Bellevue.

Here obviously was something wrong and something to be analyzed. That I was having my "tail pinched" and on the edge of a minor convulsion, even if only spasmophilic, is apparent.

So to the biochemist and my calcium metabolism (my electrons), since, as you all know, spasmophilia and calcium have some connection. But no, to use Cannon's phrase, my "homeostatis" was keeping my blood calcium within a proper range. Also happening to have a fibrositis in my right hamstring group, the x-ray was my next step and now the rat was in the bag, for this skull of mine was, as Dr. I. Seth Hirsch pronounced it, a beautiful Paget skull. It had had innumerable pilferings taken from it, obviously to keep up the blood calcium homeostatis.

This set me looking around for other sources of the trouble and I fell upon a peculiar idiosyn-

crasy of my breathing. In short, this consisted in a habit of taking deep inspirations and then rushing as many words out to the very end. I would squeeze every possible hilt of verbiage out of each of these deep inspirations. Thus you note there was a constant hyperventilation going on. Here we strike another level of adaptation. My acid-base equilibrium was always being put in jeopardy. To keep on the alkaline side, the CO_2 buffer was overworked and the call for calcium was incessant and insistent. There were many intermediary stages and also a host of mechanisms allied to the squeezing of everything out of each effort.

In writing in sentence formation in thinking this grasping for completion for a philosophic all-embracing finality. As I looked back over the years from early boyhood there was long distance running, sometimes lasting the greater part of a day that followed a similar pattern. I shall not weary you with all of the related identifications small and large of this process. I shall but intimate something about the prototype which undoubtedly extended away back to the polymorphous perverse level of the libido activity of the nursery. This must have concerned itself with bowel activity. Here is the man again doing what the infant and little boy must have been endeavoring to do. I was *trying hard* at the fecal level.

And without further ado the mental state is before you. There was some libido fixation at the oral anal stage of my libido organization. The motive or purpose aspect of the whole series of stages is now dimly envisaged and all of the organs of the body were caught up in the vicious process. In these days of endocrine super awareness naturally the parathyroids stand out as the major villains in the plot. The chain gang starts with the hyperventilation, then the CO_2 buffer needs reinforcement, then the calcium demand, and the speculations from its bony reserves. The parathyroid is being stimulated to its utmost—maybe it is adenomatous—and all because the infant in me is *trying hard*.

Had I the time and you the patience to hear a complete recital of the innumerable character traits that have flowed from this "try hard" anal sadistic investment it would further enlighten, and I believe would amuse you, but the hour is late and your guinea pig has told enough

about himself. Sufficient, I trust, to bring to clear perception the psychosomatic monism that runs through the whole process, which should it lack the purpose- or mental state quantum in the whole picture would leave but a series of disjointed, unrelated bits of organ activity running all the way from my startle, my kick, yes, even to a possible parathyroid bony pressure on my auditory nerve and deafness.¹

In closing I would not wish to leave with you the impression that every medical situation with which you come in contact requires such a complete unfolding that follows the nursery formula "This is the maiden all forlorn, who milks the cow with the crumpled horn, that tossed the dog, that chased the cat, that killed the rat, that ate the cheese that lay in the trap that sat in the house that Jack built."

With a tongue in my cheek may I suggest that the trap is physics, the cheese, chemistry, the rat, the cat and the dog, physiology. This brings us to the sorrowing maiden. Here we meet with ambivalent and apparently conflicting elements in the personality. As the female component in the biologic pattern, what maiden would not be forlorn had she only a "crumpled horn" at her disposal and, as for the opposite component, I am certain you agree that few real males wish to be loaded with such a castration complex.

I do hope, however, that in the two clinical situations so hastily sketched I have offered something in return for your patience in listening to the recital of my woes and at the same time given a glimpse of what I mean by psychosomatic monism.

64 West 56th St

ACCESSORY URETHRA

Report of Two Cases with a Review of the Literature

OSWALD SWINNEY LOWSLEY, M D , F A C S , New York City

(From the Department of Urology [James Buchanan Brady Foundation] of the New York Hospital)

ACCESSORY urethra is a rare anomaly. The literature on the subject is, however, quite extensive. Those who encounter such cases apparently feel that they should be placed on the record, if for no other reason than their rarity. Consequently, the collection of case records is fairly complete, and the reporting of additional cases, one feels, is not only justifiable but obligatory in order that the medical profession may be supplied with complete data on an interesting malformation that frequently assumes pathologic importance.

Literature

The literature has been carefully reviewed by Aievoli and Bonabitacola (1905), J. Leon Herman (1913), and Nové-Josserand and Gayet (1922). As far back as 1891 Taruffi made a study of this anomaly and established a classification that has been generally followed by later writers. He distinguished four types of accessory urethra, but his fourth group seems hardly necessary except to exclude certain congenital fistulas, resulting from cloacal defects in the embryo, which have been reported in the literature as urethras. His first three types are as follows:

1. The seminiferous canal. Vesalius was the first to record a case (seen at autopsy) in which there were two meatuses upon the glans through one of which seminal fluid was ejected, the other serving for the passage of urine. These are very rare, only three or four having been reported.

2. The blind-ending canal, either terminating on the surface of the penis or

opening into the normal urethra but not extending to the bladder. Of this type Taruffi mentions examples reported by Baillie, Monod, Luschka, Kuster, and Bollinger. The probable origin of these channels is either the embryonic transformation of a urethral gland into a canal that thereafter develops independently of the normal urethra, or some mechanical influence during the intra-uterine period which bifurcates the normal channel of the primitive urethra, the upper portion then losing its relation to the rest of the urinary tract and terminating blindly. There are two distinct types of blind-ending canals. Group (a) includes any accessory canal that opens on the surface of the penis but does not communicate with the normal urethra or bladder. These are common in hypospadias, the opening usually being on the under surface near the meatus, although a few have been reported as opening on the dorsum. Group (b) includes canals that open into the normal urethra but end blindly in the penile urethral tissue. These are undoubtedly embryologic defects and are not to be confused with the normal paraurethral ducts opening into the urethra and leading into short cul-de-sacs.

3. The uriniferous canal—an accessory channel communicating freely with the urethra at some point in its course and opening on the surface of the penis. This is the "urethra duplex" of which a number of cases have been recently reported, especially in German literature. "Double urethra" is a misnomer when applied to these cases, and is correctly used only when referring to duplication

*Read at the Annual Meeting of the Medical Society of the State of New York,
New York City, May 10, 1938*

of the entire urethra—an exceedingly rare anomaly. Young was able to find only 5 cases of true urethral duplication, with double penes, up to 1926. Two complete urethras in a single penis is almost equally rare. MacKenzie found only 7 cases up to 1916, and 2 more have been reported in recent years by Heymann (1933) and Delvigne (1934).

The earliest reports of accessory urethra, though very interesting, do not give sufficient data to permit their being classified. Even Aristotle left a record of such a case, and according to Vesalius the Arabs in their writings made mention of instances where the penis contained three canals—one for urine, a second for spermatic fluid, and a third for prostatic secretion.

Early in the eighteenth century Fabricius de Hilden wrote an account of a boy of twelve years who urinated with equal freedom from either of two orifices situated side by side, the passages into which they opened being separated by only a thin membrane. As there was at that time no means of satisfactory exploration, there was no way of determining whether the accessory urethra continued uninterrupted to the bladder, or whether, as is more probable, it opened into the posterior urethra below the prostate.

In the nineteenth century the great increase of interest in urology, especially in France, is reflected in the increased number of published observations upon urethral anomalies. Vidal de Cassis in 1834, reported the cases of Monod, and other writers who added to the literature at this period are Marchal Pigné, and Cruveilhier. Jerjavay's monograph on the male urethra (1856) also treats of anomalies of this passage and Verneul (1852), Guyon (1863), Lejars (1888), LeFort (1886), and Paul Delbet (1898) all described cases and contributed information upon the subject. Of more recent authors mention has already been made of those who have reviewed the literature in extenso to whom should be added David W. Mac

Kenzie, whose excellent work on urethral duplications of all types was published in 1916.

Etiology

The theories regarding the etiology of this anomaly are almost as numerous as the writers who have propounded them. The established embryology of the penis, while offering possibilities for developmental errors that would account for many of the types of accessory urethra that have been observed, fails to cover all the variations that have been recorded.

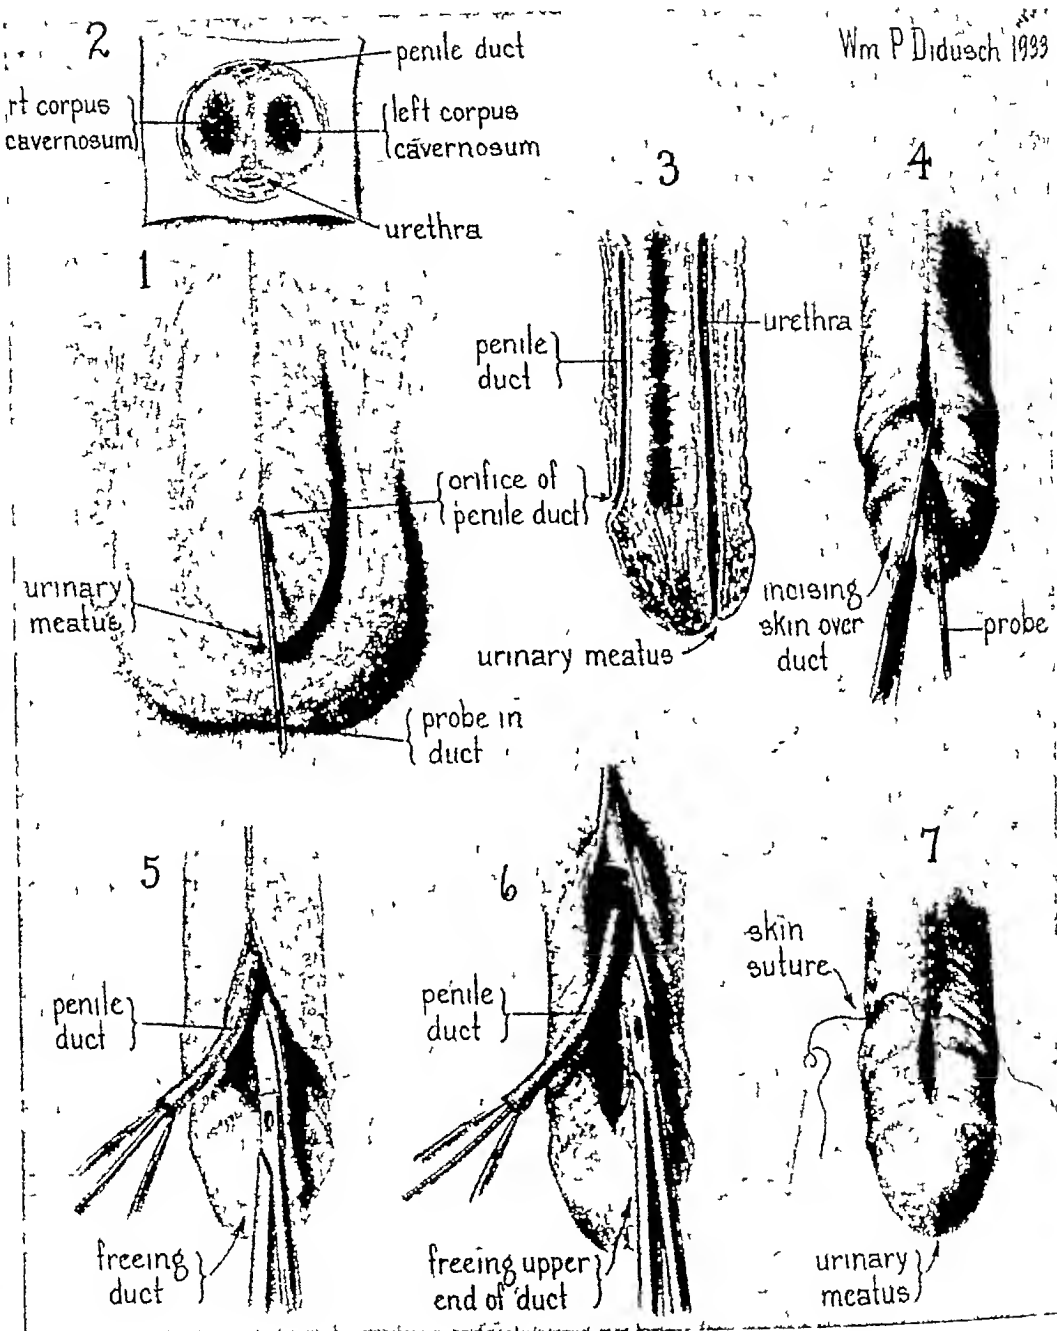

Nové-Josserand, in his contribution to the *Encyclopédie française d'urologie*, sums up the various theories by saying that these fistulas develop anomalously in the same manner as epispadias, but to a lesser degree. Inasmuch as epispadias results from a defect in the roof of the canal, it is rational to suppose that this defect might be only partial and limited to the cell masses on the upper surface of the epithelial layer that forms this covering. If a bud formed, with its growing direction toward the genital tubercle's dorsal surface, the abnormal channel would pierce the mass in a manner analogous to the growth of the true urethra, but might easily have no actual connection with it.

This hypothesis, Nové-Josserand thinks covers all cases no matter where the anomalous canal extends or at what point, if at all, it communicates with the normal urethra or with the bladder.

Case Reports

The 2 cases observed by the author belong in group 2(a) namely, the type of accessory canal that opens upon the surface of the penis but does not communicate with the urethra or the bladder. In 1 case there was gonococcal infection of the accessory canal. The other case was uninfected and is of interest solely because of the urethral anomaly.

A brief résumé of the history, physical findings and treatment follows.

Case 1 Plate 1 Fig 1 Shows a probe in accessory urethra Fig 2 Cross section of the accessory urethra above the corpora cavernosa Fig 3 Sagittal view showing the urethra and accessory urethra separated by the corpora cavernosa Fig 4 Incision over accessory duct Fig 5 Dissection of accessory duct Fig 6 Removal of accessory duct Fig 7 Skin suture

Case 1—S D, a white male, 27 years old, reported on October 3, 1933, complaining of discharge from the urethra

General physical examination showed the patient to be a healthy young male whose vital

organs were all in good condition Special examination disclosed a discharging fistula on the dorsum of the penis, the opening of which was about 1 cm above the normal urinary meatus Probing of this accessory duct showed it to

Case 2 Plate 2 Fig 1 Shows the orifice of the accessory urethral canal above the external urinary meatus. Fig 2 Sagittal view showing the accessory urethra and its relation to the urethra—both below the corpora cavernosa.

extend from the external orifice the entire length of the penile shaft down to the pubic hair. Examination of the discharge revealed numerous gram negative diplococci.

The patient was treated for three weeks with out benefit. On October 20 1933 he was taken to the New York Hospital and was operated upon the next day.

Operation—A probe was inserted into the accessory urethra, and an incision made in the midline of the dorsum of the penis. The anomalous meatus was separated from the surrounding structures grasped with Allis clamps and the entire accessory duct separated and removed. It was found to extend to the junction of the penis with the body wall and to have no connection whatever with the urinary passage. Bleeding points were ligated and the skin sutured with silkworm gut. The patient made an uneventful recovery and never developed gonorrhea in the urinary duct. He was discharged cured on November 2 1933.

Case 2—P. S. M. a white male 49 years old was first seen on March 20 1934 complaining of colicky pains in the left loin and groin. He

had had these attacks over a period of nine months.

General examination revealed nothing of moment. Special examination of the penis disclosed an accessory urethra the meatus of which began at the top of the glans penis about $1\frac{1}{2}$ cm. above the normal urinary meatus. Probing showed that this tubular structure extended backward and downward for a distance of approximately 4 cm. No connection with the urinary passage could be demonstrated. Cystoscopy and pyelography revealed a stone about 1 cm wide and $1\frac{1}{2}$ cm long in the left ureter opposite the end of the sacrum.

On March 29 1934 cystoscopic examination under spinal anesthesia showed the stone in the left ureteral orifice. The Lowsley rongeur was inserted and the stone and a part of the ureteral orifice were grasped in the instrument, but the stone slipped back into the ureter and the ureteral orifice was incised. The stone passed out of the ureteral orifice and examination on April 5 1934 under spinal anesthesia showed it to be in the posterior urethra and about the size of an olive pit. It was pushed into the

bladder and removed by the Lowsley rongeur.

The accessory urethra in this case was discovered by accident. The patient had noticed a slight groove on the end of the glans penis but had never paid any attention to it as it had never caused him any distress.

Summary of Study

The accompanying table includes only those reported cases in which the accessory urethra opens on the surface of the penis and has no connection whatever with either the bladder or the urethra.

An interesting feature of this review is the fact that many of the patients were unaware of the abnormality until they became infected with gonorrhea. The adult patients, as a rule, displayed no other abnormalities. In the very few seen earlier in life there were usually other abnormalities, for the correction of which the patient had come under observation.

In all, 42 cases have been collected, including the author's 2. The oldest patient was 64 years old and the youngest 9 years of age. All of these accessory canals were, of course, congenital, but in most cases the patient's attention was not drawn to the condition until adulthood. Of the 34 patients whose ages are given, 23 were between 20 and 30 years of age when they came under observation.

Fifteen of the accessory canals opened just above the normal urinary meatus. Next in frequency were those opening on the posterior surface of the penis, between the corona of the glans and the pubic hair line—10 in all. Six opened at the balanopreputial fold on its dorsal aspect, and 3 below the normal urinary meatus. Three interesting cases were found in which the orifice of the accessory canal began at the edge of the pubic hair on the dorsum of the penis. In 1 case the accessory urethra opened in the normal location of the urinary meatus, the urine flowing from a hypospadiac opening 2 cm. below and behind this point. In another case the opening was separated widely from the urethra—the author fails to state where.

The author presented a case in 1926

(Lowsley and Kirwin *Text-Book of Urology*, page 179) in which an accessory canal persisted in the median raphe of the scrotum, beginning at about the middle of the scrotum and ending just anterior to the anus. This case is not included in the study proper as it was not considered to be an accessory urethra, but rather a tubular structure growing in the median raphe of the scrotum.

Of the 42 patients listed in the accompanying table, 12 were operated upon. One of the author's cases belongs in this group. The operation consisted in excision of the accessory urethra in 6 cases and in incision of the canal with curettage of the epithelial lining in 6 cases. One of the reported cases was discovered at autopsy, and 4 of the patients were advised to be operated upon but refused operation. In the remaining 25 cases no operation was performed.

Twenty-six of the 42 patients suffered from gonorrhea, of these, 15 had infections in the accessory urethra only, 3 had the disease in the normal urethra only, and 8 had gonorrhea in both canals. Four other patients had nonspecific infection of the accessory duct. One patient suffered from retention of urine, 1 had ectopic testicle, and 1 ureteral stone. In 9 cases no mention of any lesion was made.

One realizes, as one studies these cases, that the discovery of the accessory canal lies with the doctor rather than with the patient, who usually has an orifice in plain sight but rarely pays any heed to it until infection of some sort focuses his attention upon the region.

Conclusions

1. Accessory urethra is a rare anomaly, and is of three types: (1) the seminiferous canal, (2) the blind-ending canal, either (a) opening on the surface of the penis or (b) opening into the normal urethra, (3) the uriniferous canal.

2. The 42 cases herein described, including the author's 2, belong to the second group—blind-ending canals opening on the surface of the penis.

3. The accessory urethra would prob-

ably be unnoticed by the patient in most instances if he did not become infected

4. In a number of the cases the urethral anomaly was discovered during examination for other causes

5 The treatment of choice, when the

accessory canal is infected, is complete excision

6 Palliative treatment with chemicals is ineffectual in every instance

7 Incision and curettage is not as satisfactory as excision

TABLE—ACCESSORY URETHRA BLIND-ENDING CANALS OPENING ON THE SURFACE OF THE PENIS

| Date | Author | Age | Condition | Operation | Other Treatment | Results and Remarks |
|------|------------|-----|---|--|--|--|
| 1797 | Baillie M. | | Canal beside urethra 2 in long opening on glans ending blindly | | | Cited as textbook example. No clinical details. Probably an topsy specimen |
| 1851 | Marchal | 27 | Abnormal opening 14 mm from normal meatus canal 78 mm long ending blindly in suspensory ligament | | For gonorrhea balsam and injections | Infection cleared up readily in normal urethra persisted long in accessory canal |
| 1858 | Picardet | | Supernumerary opening on dorsum of penis from which accessory canal palpable as a cord as far as the pubic arch | | For gonorrhea of accessory canal Normal urethra not infected | Eventual cure of both Cures of gonorrhea No attempt made to remove anomalous canal Patient a young soldier age not given |
| 1865 | Luschka | 19 | Opening at edge of pubic hair on dorsum of penis Canal 18 mm long ending in 4 "pores" that were excretory ducts of a "gland" believed to be an aberrant prostatic lobe | | | Autopsy specimen. Subject a suicide. The anomaly apparently involved the prostate as well as the urethra |
| 1866 | Vernoni | | Accessory opening on upper third of dorsum Canal felt as hard cord running to symphysis where it probably ended blindly | | For gonorrhea only | Patient a young soldier no age. Refused exploration by sound and disappeared. When seen later the infection was cured |
| 1867 | Tribram | 64 | Epispadias. Abnormal opening in front of balanopreputial fold leading to canal 3 cm long, having no connection with normal urethra | | Catheterization for retention | Patient had prostatic hypertrophy No urine passed through anomalous urethra but during ejaculation a thin fluid flowed from it |
| 1882 | Luzardo, R | 20 | Urinary meatus oval 3 orifices, 1 above and other Urine came from lowest. Upper led to canal 14 cm. long apparently ending blindly | | | Middle orifice apparently so tiny it was not explored |
| 1883 | Perkowski | 24 | Normal urethra. On dorsum of penis a gutter leading to an opening at root of penis which opened into a canal admitting a No 18 sound ending blindly at pubic arch | Canal laid open cauterized and sutured | Tinct of iodine | Only the supernumerary canal infected normal urethra healthy |
| 1888 | Englisk, J | 30 | 3 mm. opening on mid dorsum of penis. No furrow on superior surface of glans. Sound passed 12 cm. under septum of corpora cavernosa, stopped at pubis, apparently in cul-de-sac. No communication with normal urethra | | Lead and boric acid injections | Amelioration. Author remarks that cure impossible except by extirpation of the abnormal canal |
| 1888 | Lejars | 30 | Abnormal opening on dorsum behind corona giving on a canal of 4 mm. caliber ending blindly at symphysis | | For gonorrhea | Author regards this as anomaly of development due to failure of corpora cavernosa to establish normal relations to each other |
| 1888 | Ellenbogen | 27 | A furrow on superior surface of glans led to the balanopreputial fold where a 3 mm. opening gave entrance to a canal ending blindly at symphysis pubis subcutaneous throughout | | Normal urethra treated for gonorrhea | Part of prepuce congenitally absent; the part present hung down underneath like an apron. Glans curved into an S-form |

| <i>Date</i> | <i>Author</i> | <i>Age</i> | <i>Condition</i> | <i>Operation</i> | <i>Other Treatment</i> | <i>Results and Remarks</i> |
|-------------|-----------------------------|------------|--|--|--|--|
| 1889 | von Dittel | 28 | On back of penis an opening 2-3 cm behind the glans gave access to a canal admitting a sound for 6-8 cm, which had no communication with the normal urethra | | | |
| 1891 | Frigerio, L | | Open furrow on dorsum of penis Constricted near meatus, widened as it ran 3 1/2 cm on corona, where it formed a tiny tubercle behind which was an opening to a canal 4 cm long | | | Reported by Taruffi, Nothing but anatomic particulars given |
| 1892 | Englisch J | 31 | Back of corona, about 3 1/2 cm. in skin of prepuce an opening into a canal 4 3 cm long descending deeply along septum of corpora cavernosa to end in a cul-de-sac under pubic arch | Refused | Antiseptics for gonorrhea | In addition to accessory urethra at summit of glans the meatus was divided by a fold the upper orifice leading to a pocket 5 mm deep, the lower conducting to the true urethra |
| 1893 | Posner, C., and Schwyzer, F | 20 | Supernumerary opening 3 mm above meatus into which a sound was introduced 14 1/2 cm as far as the pubis, the canal being dorsal and median Unconnected with the urethra | Section of canal and excision of its lining Healed by second intention | Antiseptic treatment of gonorrhea | Left testicle undescended |
| 1893 | Meisels, V | 27 | A second canal above normal urethra had a separate meatus but pursued parallel course. A 4 mm sound penetrated 12 cm Beyond, like a fine thread, it extended to the bladder but had no connection with normal canal | Canal opening to root of penis, mucosa excised | Both canals infected with gonorrhea, no mention of treatment | |
| 1895 | Nohl | 22 | Two openings on glans, upper the entrance to a blind ending canal admitting No 3 sound for nearly whole length of shaft | | Both urethras infected with gonorrhea, which was treated | Brief anatomic report made to medical society, no details |
| 1895 | Martin G | 24 | On superior median part of glans a gutter led to opening admitting stylet which could be maneuvered to the symphysis but no farther Normal urethra healthy | | Permanganate of potash injections to accessory urethra for gonorrhea | |
| 1896 | LeFort, R | 21 | Small knob 2 cm from meatus with an opening on summit, from this on the median raphe a tiny cordlike structure palpable beneath skin on inferior surface of penis Cord appeared to end in the wall of urethra, to which it bent sharply at right angle Behind first opening was second knob with even smaller orifice Secretion from both orifices | Operation refused, greatly to regret of the author | For abscess and phimosis, no details (The hardness of the accessory canal was caused by gonorrhea) | This case appears to be unique in that it presented 2 openings to the accessory urethra which had no relation to the normal meatus or connection with normal urethra |
| 1898 | Stinson, J C | 17 | Glandulo-penile hypospadias Accessory orifice to left of normal meatus, 2 1/2 in long canal ending in a blind pouch | | Iodine and carbolic injections for gonorrhea | Apparently first case reported in America |
| 1898 | De Keersmaecker | 18 | Opening on dorsum permitted insertion of No 14 bougie, which penetrated 6-7 cm., indicating accessory canal parallel to urethra ending at symphysis No urine or seminal fluid from it | | Permanganate of potash injections for acute gonorrhea | |
| 1900 | I oew, L | 28 | Smaller meatus above normal one Bougie penetrated 14 1/2 cm through upper canal but did not reach the bladder Urine and sperm from normal meatus only | | No mention of treatment Methylene blue injected into bladder for diagnostic aid | Uroscopy showed no opening in normal urethra's wall Instruments in two canals did not touch |

| <i>Date</i> | <i>Author</i> | <i>Age</i> | <i>Condition</i> | <i>Operation</i> | <i>Other Treatment</i> | <i>Results and Remarks</i> |
|-------------|---------------------|------------|---|--|---|---|
| 1902 | Dubot, E. | 24 | Furrow on dorsum of penis led to opening in median line at reflection of penis admitted No 8 bougie which stopped at 1 1/2 cm. but filiform penetrated 9 cm. Canal apparently ended under the symphysis pubis | | Treatment for gonorrhea | |
| 1904 | Alevedi E. | 63 | Opening at reflection of prepuce to canal running toward pubis No. 16 sound passed 7 1/2 cm. No connection with normal urethra | | Permanganate irrigations for nongonococcal discharge | |
| 1908 | Heller J | 23 | Partial diphallus no meatus on right side on left glans a normal meatus with hypospadiac opening below The canal leading from this had no connection with either urethra or bladder | | Treatment for gonorrhea | |
| 1910 | Hessel H | 30 | Small opening on glans above normal meatus, leading to tiny canal 3.8 cm long running parallel with normal urethra but not communicating with it | As infection persisted in accessory canal it was extirpated entirely | Injection for gonococcal infection of both canals | Method of removal not described mentions "local anesthesia" |
| 1912 | Lenthaw, W | 34 | Thick membrane running from walls of urethra divided meatus into 2 openings lower ended in bladder, upper canal took No. 9 bougie only Did not communicate with lower (normal) canal patient had never passed urine through it Lower urethra infected with gonorrhea upper free | | Gonorrhea of deep urethra treated | Results not given although it is stated that the accessory urethra did not at any time become infected |
| 1913 | Herman, J L. | 24 | Accessory canal extended from opening just above normal meatus on glans to midpoint of root of penis diagonally—a thin tissue separating it from urethra. Passed down in front of symphysis and ended blindly | Under cocaine anesthesia accessory canal opened over canula suprapubic drain | Repeated infections of normal canal from accessory canal were treated for gonorrhea | Patient first seen in 1909 Operation done July 1912 Disappeared before cystoscopic examination could be done |
| 1913 | Fanti G | 26 | Opening 2 mm. wide 3 cm. behind corona led to canal 7 cm. long ending blindly under symphysis. No communication with bladder or urethra | | | Referred to surgical service for operation but at last minute refused. Collargol injection with x-ray confirmed findings |
| 1913 | Lewartowicz, J T | 28 | Node size of millet seed on lower surface of penis 2 cm. back of preputial fold. Pressure on this caused secretion to issue from tiny orifice under raphe. Ended cul-de-sac | Abnormal canal extirpated Convalescence normal | Gonorrhea confined to accessory urethra no mention of other treatment | One of the few instances of the accessory canal being on the under side of the penis |
| 1913 | Worms, G | | External appearance of glans as usual, but normal meatus gave on cul-de-sac 4-5 mm deep Urine from hypospadiac opening 2 cm. behind Third opening in middle of frenum admitting only 5 stylet to a canal running 8 cm. to end blindly near spongy portion of normal urethra | | Treatment for gonorrhea of accessory canal | Patient a young soldier no age Had never noticed that third orifice until the canal on which it opened became infected. In this case, also both abnormal openings were on under side of the penis |
| 1913 | Thompson-Walker J W | | | | | Case cited as a textbook example no clinical details Suggests laying tract open, destroying lining with caustery-dissection (preferred because scarring is less) or laying open a tract directly above normal urethra with scissors |

| Date | Author | Age | Condition | Operation | Other Treatment | Results and Remarks |
|------|---|-----|---|--|--|--|
| 1914 | Ferulano, G | 51 | Abnormal opening on glans at reflection of prepuce. Bougie No 14 entered 8 cm. Another instrument placed in normal urethra did not meet the bougie and the secretion from the abnormal orifice contained no urinary elements | | | |
| 1914 | Ponozz, M | | Accessory opening above normal meatus, opening into canal 12 cm long, which did not communicate with normal urethra | | Treatment by injections of both canals for gonorrhea | Patient a "gentleman" age not given |
| 1914 | Dufour and Jean, G | 22 | Orifice on corona on dorsal surface of glans, canal from it felt like cord running beneath the skin of penis. A bougie passed through it to pubic arch. No communication with bladder or urethra. Dissection showed that after lumen ended, the canal continued as a fibrous tract as far as Henle's ligament in the direction of the bladder | Cutaneous orifice freed and canal dissected out as one would a hernial sac | Treatment of gonorrhea attempted but permanganate and silver nitrate had no effect | |
| 1919 | Oudard and Jean, G | 19 | Small orifice on dorsum of penis, admitted a fine probe for 8 cm. No connection with any part of urinary tract | Tract laid open and curetted under spinal anesthesia | Preoperative injections for gonorrhea ineffectual | This accessory canal also extended as a fibrous cord to the prevesical tissues. Lined (as far as patent) with pavement epithelium |
| 1920 | Oudard and Esquier | 22 | Punctiform orifice at right of frenum in halanopreputial fold. Bougie passed beneath skin on right lower surface of the penis was halted in a cul de sac at about 6 cm. | Accessory urethra dissected out. (No connection with other parts of urinary tract) | Normal urethra treated for gonorrhea. No effect on accessory canal | |
| 1924 | Lefevre, G | 9 | Opening on dorsum of penis, so close to pubis it could only be seen by pulling penis down. Canal found to be 5 cm long on dissection although probe did not enter so far | Tract dissected out and patient circumcised | | Patient came under observation because of ectopic testicle which was successfully operated upon |
| 1930 | Strokov, F Peterschski B., and Schischov, L | 35 | Pinhead size opening $3\frac{1}{4}$ cm above normal meatus, from this a little gully $\frac{1}{2}$ cm deep ran toward urethral orifice. X-ray showed passage 8 cm long running from accessory opening ending in a widening, like a diverticulum. It paralleled the urethra but did not join it anywhere | Operation rejected by patient | | Nothing said about treatment. Authors interested only in roentgenologic aspects and give the only x rays of the condition in the series |
| 1932 | Robertson A L | | Opening was dorsal, proximal to coronary sulcus | Tract split open, edges sutured | Irrigations for gonorrhea. A relapse was treated surgically | |
| 1935 | Lowsley, O S | 27 | Small orifice on upper part of glans, discharged pus which showed gonococci. Probe passed to penoscrotal junction | Accessory tract dissected out under spinal anesthesia | Preoperative treatment of gonorrhea of no avail | Gonorrhea cured by removal of tract |
| 1935 | Lowsley, O S | 49 | Meatus of accessory urethra at top of glans penis about $1\frac{1}{4}$ cm from normal meatus. Canal extended backward and downward for 4 cm | | Nothing done to accessory urethra as it had never caused him any trouble | Patient treated for stone in ureter, which was removed from the bladder with the Lowsley rongeur. Accessory canal, in this case discovered by accident |

MEDICAL FRIENDS OF WINE

Seventy-eight members of the medical profession of San Francisco have organized a society for an objective new to the United States—the study and appreciation of wine. The new organization is named The Society of Medical Friends of Wine, and officially began its existence with an inaugural dinner held at the St. Francis Yacht Club San Francisco on February 24.

It is described officially as follows

The object of the Society of Medical Friends of Wine is to stimulate scientific research on wine, develop an understanding of its beneficial effects, and encourage an appreciation of the

conviviality and good fellowship that are part of the relaxed and deliberate manner of living that follows its proper use.

While the society is new to America, says *California and Western Medicine* it follows a precedent set many years ago in France, where under the leadership of Dr. Georges Portmann Professor of Medicine of the University of Bordeaux, members of the medical profession have a number of such societies. International congresses of European physicians interested in wine have been held under the title of Congrès International des Médecins amis du vin

STORK SLOWING UP

The decline in the nation's birth rate was considered on April 7 by the New York Academy of Medicine, with figures revealing that present rates are 5 per cent below the rate required for population replacement.

"To maintain our present population would require something over 26 children per married woman," Frederick Osborn anthropologist of the American Museum of Natural History told the Academy.

"Taking into consideration the number of sterile marriages, we find that couples capable of having children must average over three children

to provide replacement, Mr. Osborn said. Jewish families he declared are 50 per cent short of having enough children to replace their number in the next generation. He attributed this to concentration of the Jewish race in metropolitan centers with high educational standards.

Anglo-Saxons, because they are so numerous in the isolated rural sections of the South, are more than holding their own, Osborn declared.

"Mexicans and Indians the most isolated of our peoples are almost doubling their number in each generation."

Public Health Notes

J ROSSLYN EARP, L R C P , Dr P H
New York State Department of Health

Conference of State Health Officers

THE state health officers met in Washington with the provincial health officers of Canada on April 21 and 22, and with the Surgeon General of the U S Public Health Service on April 24 and 25. Besides the customary review of scientific advance in the field of public health they were reminded of the peaceful conflict going on all over the world regarding the best method of providing medical care and of the danger of armed conflict in the international political arena.

Surgeon General Thomas Parran reviewed the progress made under the provisions of the Social Security Act and the Venereal Disease Control Act. "This year," he said, "approximately 525,000 new patients with syphilis will have been brought under treatment." This represents a 104 per cent increase over 1936. In the same time the number of clinics has increased from 713 to 1,773. The number of doses of arsphenamines distributed by state health departments has increased from 1,321,000 to an estimated 3,750,000. Since February, 1936, public-health training given wholly or in part under the Social Security program has been given to 3,820 persons. Another 1,000 are being trained in the present fiscal year. At present only seven states have official cancer-control programs. On the other hand dental units have increased from 12 to 35 in the state health departments. "An increasing number" of states are engaged in pneumonia control. Incomplete state reports indicate a "material lowering of pneumonia mortality in 1938."

"Prevention must always be the first job of public health," said Dr Parran, "but against much sickness, prophylaxis is imperfect. For those conditions that cannot be prevented, but which because of their prevalence and their cost to the

community are of public-health concern, prompt and good treatment is the only present approach." He urged the state health officers to be aware not only of the movement in Washington for national health legislation but also of the developments at home growing out of the vigorous popular interest in better health. He expressed a belief that good medical care cannot be made attainable to large numbers of the population without both an improved health organization and a greater measure of public subvention.

A real opportunity is afforded by the Wheeler-Lea amendment to control misleading advertisements of food, drugs, and cosmetics. The medical profession cannot be indifferent to this opportunity. The expenditures of the public on cosmetics, perfumes, and dentifrices are estimated at \$400,000,000, on proprietary medicines at \$500,000,000, and on various health "gadgets" and "health foods" at another \$100,000,000. Not all of this billion dollars is wasted but much of it is spent to purchase more or less serious trouble. A great advantage of enforcement through the Federal Trade Commission is that cases are heard not before a susceptible jury but before a trial examiner. It is the policy of the commission that hearings be held in the locality from which the product originates. Dr K E Miller, who has been assigned by the Public Health Service to aid the commission, appealed to state health officers to help him secure the necessary expert medical testimony in such cases. He made two other suggestions. The control by federal agency can extend only to goods shipped in interstate commerce. Patent medicine vendors can avoid the provisions of the federal law by setting up a sales organization that operates exclusively within

the state. They are especially tempted to operate in this way in a state like New York which has a large population. It is therefore important that state legislation be adopted in the same sense as the federal legislation. Dr. Miller also suggested an exchange of information between state laboratories, which analyze drugs and cosmetics, and the federal laboratory to avoid unnecessary duplication of effort.

Further work at the National Institute of Health on trichinosis has brought the number of human diaphragms examined postmortem up to 3,870 of which 630 (or 16.3 per cent) were positive. An investigation into the practice of feeding raw garbage to hogs showed that of 397

cities where this method of disposal is in use only 20 require that the garbage be cooked. A resolution was adopted recognizing the importance of controlling this source of infection.

A dramatic coincidence occurred on the morning of April 26 when Secretary of the Treasury Morgenthau, addressing the conference, referred to the report (confirmed later in the day) that an executive order of the President might remove the Public Health Service from the Department of the Treasury. He admitted that the provision of funds for the New Deal program was a full time job but said that wherever it went the Public Health Service would always have his interest.

FLEA LABORATORY BATTLES PLAGUE

On the hillside back of the University of California Hospital was opened in March completely without ceremony a little concrete building that might be called a monument to the flea reports the *San Francisco Examiner*.

It is a pretty grim monument, however for of all the thousands of fleas already dwelling in it and of all the hundreds of thousands that will enter it later not one will emerge alive.

The building is dedicated to the halting of the sylvatic plague.

The sylvatic plague is a blood cousin to the bubonic plague the dread 'black plague', which one time spread a blanket of death over a huge portion of the civilized world and even after the turn of this century claimed literally millions of lives in the Orient.

The bubonic plague, modern science has learned was spread by the flea, carried by rats. The sylvatic plague too is spread by fleas. In America, cases of infection have been rare but the percentage of mortality after infection is perilously high.

But to bulwark against the day when the plague might rise up and strike down thousands and to cut down the chances of that occurrence to the lowest possible fraction, medical science is making elaborate preparations.

With the opening of the Hooper Foundation's flea laboratory made possible by a \$24,000 gift of the Rosenberg Foundation for research, San Francisco is the scientific center of the world in point of sylvatic plague lore.

Within the two-story concrete building are dozens on dozens of cages, containing every form of rodent from every spot in Western United States where plague has been found among the animals.

From the fur of these animals the fleas are industriously combed deposited in covered jars and buckets and allowed to live freely until their day of doom arrives.

On that day the ill-fated flea is pulled from his habitat by a suction pump killed and placed on a slide under a microscope. There, scientists skilled in the ways and looks of fleas can tell at a glance whether their subject is a human flea, dog-and-cat flea, squirrel flea or guinea pig flea.

Then this flea with a crew of his huckless cronies, is mashed up and cooked into a serum which is injected into a guinea pig. If the guinea pig comes down with the plague, it is a scientific triumph for the experimenter by consulting his case history can tell which animal carried the flea and where he came from.

This procedure now in its infancy as applied to fleas and their host animals will go forward swiftly in this new ultramodern laboratory. The result will be that very shortly the Hooper Foundation scientists will be able to draw an accurate map of plague occurrence in the United States, point out precisely which agencies carry the disease, and take direct steps to eradicate the carriers.

Medical News

Health Vigil for the Millions of Fair Visitors

THE New York City Department of Health has been busy during the last two years preparing to "throw every possible health safeguard" around the millions of visitors expected at the World's Fair, Dr John L Rice, health commissioner, writes in the May issue of *Neighborhood Health*, published by the health department.

These efforts have not been confined to the Fair grounds, but have been extended throughout the city, with attention concentrated on sanitation and food handling in hotels, restaurants, lodging houses, amusement places, transit lines, and buses, Dr Rice says

Under Dr John G Grimley, special deputy commissioner of health for the Fair, a branch office and laboratory of the department has been established on the grounds. The staff of thirty-six will include twenty-eight food inspectors, three sanitary inspectors, and an entomologist.

The department has laid twenty-six miles of waterpipe, a storm sewer of record capacity also twenty-six miles long, five and a half miles of sanitary sewer, and four miles of drain at the site. All of the 500 food and drink establishments at the Fair must have information on the source and condition of their supplies and have them ready for daily inspection. Food handlers at the Fair must pass a health examination every month.

In the magazine, Dr Grimley writes that utensils used for food must be washed with soap in water at least 100 degrees in temperature and rinsed for one minute in clear water at least 175 degrees in temperature.

Cooperating with the city health department, the Fair corporation has enrolled a medical staff to give first aid to the 40,000 persons expected to require it before the Fair is over. Dr J P Hoguet, medical director of the Fair, writes in *Neighborhood Health* that six first-aid stations have been set up, five motor

ambulances, one speedboat, and a streamlined x-ray truck have been acquired, and a corps of thirty physicians and forty nurses mobilized. All medical treatment on the grounds will be free.

One of the ambulances is equipped with special resuscitation devices to care for a patient suffering from asphyxiation on the way to a first-aid station, Dr Hoguet explains. The x-ray truck will be sent to a station in case of an accident involving fractures or internal injuries. Plates can be developed in the truck and handed to the doctor in five minutes.

With all these safeguards, Dr Rice expects the most prevalent ailment to be sore feet.

County News

Albany County

The Medical Society, County of Albany, was addressed on April 19 by Samuel Kleinberg, M D, F A C S, Attending Orthopedic Surgeon, Hospital for Joint Diseases, Lebanon Hospital, and Israel Zion Hospital, New York City, on "The Management of Structural Scoliosis."

Bronx County

The program of the Bronx County Medical Society on April 19 included addresses on "Medical Service Plans," by Mr Frank Van Dyk, and on "Compulsory Health Insurance," by Dr Emil Koffler, Dr John B Schwedel, and Dr Samuel Kopetzky. Discussion was opened by Dr Theodore Sanders.

"One of our physicians recently engaged the services of a well-known agency to collect an outstanding bill of twenty-six dollars. After collecting the bill and deducting the service charge, the company forwarded the doctor a check for \$21 dollars in full payment of the account. We congratulate the doctor in that the

balance, small though it may have been, was in his favor. Very often the doctor finds that he is indebted to the collection agency after the latter has collected the bill"—*Bulletin*

The North Bronx Medical Society enjoyed a dinner dance entertainment at Ben Riley's Arrowhead Inn on May 7

Dr Julius Weiss, a Bronx general practitioner who also specialized in obstetrics and gynecology, died on April 11 in St. Luke's Hospital. Dr Weiss, who was a founder and President of the Medical Board of the Bronx Maternity and Woman's Hospital, had his home and office at 1000 Grand Concourse, the Bronx. He was sixty-three years old.

A native of Rumania, he came to New York as a child. He was graduated from Cornell University in 1899 with a B.S. degree and from the Long Island College Hospital in 1902 with an M.D. degree. After practicing on Manhattan's East Side, he moved to the Bronx in 1912 and thereafter practiced there.

He helped to found the Bronx Maternity and Woman's Hospital in 1915 and served as president of its medical board from then until his death. He was attending obstetrician and gynecologist at the hospital.

Broome County

Mayor Kress, of Binghamton, recently addressed a letter to Dr Charles L. Pope, President of the Broome County Medical Society, asking the society to have a committee "conduct a survey of the present medical welfare system and make recommendations for revisions and improvements." The executive committee of the society, however, decided that, in view of certain legislation pending at Albany, it would be unwise to make recommendations until the legislative situation is made clear.

Dutchess County

The Dutchess County Medical Society gave a dinner at the Nelson House in Poughkeepsie on April 12 in honor of

Dr Robert W. Andrews, who has practiced medicine there for over forty years and will move shortly to Texas. Mayor Spratt, counsel to the society, was one of the speakers.

The scientific program was given over to a discussion on "Some Thyroid Problems" by Dr John C. McClintock, of Albany.

Erie County

A plan for care of the medically indigent, providing for fees for physicians treating such persons in Buffalo, was unanimously approved by the Buffalo Health Board at its meeting on April 13. At present no payment is provided for such work in Buffalo.

The plan has been approved after about six months' study by the committee on medical care, made up of unofficial representatives of the Medical Society of the County of Erie, the Edward J. Meyer Memorial Hospital, University of Buffalo, Buffalo Health Department, Erie County Board of Social Welfare, Erie County Department of Social Welfare, Buffalo Hospital Association, and Comitia Minor of the Medical Society of the County of Erie.

Routine care would be provided for Buffalo's medically indigent under the direction of the department of social welfare through employment of private physicians on a fee basis. Patients would be allowed to choose their own physicians who would be authorized to charge \$2 each for home calls and \$25 for confinements, with a maximum charge of \$50 per month per patient, exclusive of confinements. No payment would be provided for office calls.

Seven authorities in medicine addressed the medical alumni of the University of Buffalo at their fifth annual spring clinical day and sixty-fourth anniversary banquet on April 22, in the Hotel Statler.

At the morning session, the speakers were Dr Elmore B. Tauber, Professor of Dermatology at the University of Cincinnati, on "The Dermatologist Looks at Medicine", Dr E. Perry McCullagh,

Director of the Department of Endocrinology and Metabolism at the Cleveland (Ohio) Clinic, on "Obesity", and Dr Harry E Mock, Associate Professor of Surgery at Northwestern University Medical School, and Dr John L Lindquist, Associate in Surgery at Northwestern, on "The Management of Acute Cranial-Cerebral Injuries"

The round-table discussion at 11 o'clock was held in four sections, as follows cardiovascular, Dr Clayton W Greene, pediatrics, Dr Douglas P Arnold, nose, throat, and ear, Dr John F Fairbairn, and gastrointestinal tract, Dr Abraham H Aaron

A luncheon and business meeting was held at 12 30 o'clock. At the afternoon session, starting at 2 30, the following spoke

Dr Edward H Dennen, Clinical Professor of Gynecology and Obstetrics at New York Polyclinic Medical School and Hospital, on "Choice of Instruments in Delivery with Forceps," with film demonstration, Dr Horton Casparis, Professor of Pediatrics at the Vanderbilt University Medical School, on "Practical Management of Behavior Problems in Children", and Dr David L Thompson, Professor of Biochemistry at McGill University, on "Endocrinology in Urology for the General Practitioner"

Following the annual dinner, scheduled for 7 o'clock, the General Electric Company's "House of Magic" demonstration was presented

Dr Carroll Julian Roberts, of Buffalo, a front-line fighter in the war on pneumonia, died of the disease in Edward J Meyer Memorial (City) Hospital on April 6

Clinical director of the hospital, Dr Roberts had pioneered in the use of sulfapyridine to combat pneumonia and had reported marked success. But the new drug was unable to save his own life

He entered the hospital on April 4, and his case was typed as No 1 pneumonia. He was given the appropriate serum and sulfapyridine therapy to no

avail. He died after many hours under an oxygen tent

"He had been working a week when he should have been in bed," said Dr Nelson W Strohm, also a prominent pneumonia worker. "He was a wonderful man and he knew an awful lot of medicine"

"He was intensely keen to cut down the pneumonia toll and he was particularly interested in the new drug, sulfapyridine. Just two weeks ago he read a paper to the medical union detailing 33 cases treated with sulfapyridine, 32 of which recovered"

Franklin County

The spring meeting of the Franklin County Medical Association was held in Malone on April 12. Dinner was served at the Elks Club at 1 P M, and the scientific and business session was held in the nurses' classroom, Alice Hyde Hospital. Dr Robert S Macdonald, of Plattsburg, was the guest speaker, and the topic was "Endocrine Dysfunctions"—*Reported by Daisy H Van Dyke, M.D., Sec'y*

An interesting article in the Adirondack edition of the *Syracuse Post Standard* recalls that "Although the little logging settlement of Tupper Lake sprawled on the shores of Racquette pond had just mushroomed into existence a year or two earlier, and the incorporation of the village of Tupper Lake was not to come for more than a decade, Tupper's settlers decided the new town needed a board of health just forty-five years ago. Accordingly, the town board of Altamont, which had been set off from Waverly in 1890, met on April 6, 1894, and organized the first local board of health. Dr Eugene M Austin was appointed Tupper's first health officer—a post which he still holds today." Dr Austin is the present President of the Franklin County Medical Association

Jefferson County

Sixteen health officers of Jefferson County attended the annual spring conference of county health officers at the

Black River Valley Club on April 13. The meeting preceded the regular monthly meeting of the Jefferson County Medical Society at the club.

The health officers discussed the annual spring campaign for administering toxoid to children to prevent diphtheria and smallpox.

Dr Stanley W Sayer, of Gouverneur, district state health officer, who presided, particularly stressed the necessity of children being vaccinated against smallpox, emphasizing that the percentage of children so vaccinated has been dropping sharply.

Dr Frederick G Metzger, of Carthage, also discussed the campaign. Dr Metzger is chairman of the public-health committee of the medical society.

Kings County

The Kings County Medical Society has decided to back the pending state bill giving the medical grievance committee of the state board of regents the right to discipline all doctors, it is announced by Dr Charles F Pabst.

However, Dr Pabst pointed out, the organization put the stamp of approval on the measure, known as the Coudert-Stengut bill, with the reservation that the bill's definition of "unprofessional conduct" be redrawn to conform with that of the state medical society.

If the bill becomes a law it will bring under the disciplinary jurisdiction of the board of regents the 40 per cent of the practicing physicians here who are not members of the county and state medical societies. At present this group cannot be punished for violation of the code of ethics, it was said, while at the same time members of the various societies can be disciplined by the groups to which they belong. In March the county medical society went on record as disapproving of the Coudert-Stengut bill because of its definition of unprofessional conduct. At a meeting held later at the society's headquarters No 1313 Bedford Avenue the group reversed its stand providing the definition is amended to conform

with that adopted by the state medical society in 1931.

Passage of the bill will help prevent the lowering of the standards of medical practice in this state and will give the board of regents medical grievance committee blanket power to punish all physicians who violate the code of ethics, it was said.

The scientific program of the Medical Society of the County of Kings on April 18 included papers on "Experimental Aspects of Carcinogenic Substances," by Murray J Shear, Ph D, and on "The Implications, Implied and Expressed, of Tumor Grading," by Dr Stanley P Reimann.

The Friday afternoon lectures at the MacNaughton Auditorium included April 14—"Diagnostic and Therapeutic Aspects of Splenic Enlargement," by Dr Harry M Greenwald, April 21—"Recent Advances in the Diagnosis and Treatment of the Diseases of the Liver," by Dr Carl H Greene, April 28—"Colitis, Its Diagnosis and Treatment," by Dr Joseph Felsen. May 5—"Poliomyelitis: Diagnostic Aspects and Evaluation of Preventive and Therapeutic Procedures," by Dr Sidney D Kramer, and May 12—"Office Procedures in Gynecology for the General Practitioner," by Dr Horace E Ayers.

Dr George F Cahill, Attending Urologist at the Presbyterian Hospital in Manhattan, discussed the diagnosis of renal tumors at a meeting on April 10 of the Williamsburg Medical Society in the Leon Louria Memorial Auditorium of Jewish Hospital, St. Mark's and Classon Avenue. Dr Irwin E Siris president of the society, presided.

The program of the Brooklyn Thoracic Society on April 21 included papers on "The Modern Problems in the Diagnosis of Early Pulmonary Tuberculosis," by Dr Edgar Mayer and on "The Operation of Extra Plural Pneumothorax," by Dr Paul Geary.

The Ocean Medical Society on April 17 listened to addresses on the following

topics "Angina Pectoris as a Predominating Symptom in Spontaneous Hypoglycemia," by Dr Joseph Weinstein, of Brooklyn, "Problems in the Management of Children with Heart Diseases," by Dr Irving R Roth, of Manhattan, "Treatment of Heart Failure," by Dr Arthur C De Graff, of Manhattan, and "Trauma and Effort as a Cause of Coronary Thrombosis," by Dr Ernst P Boas, of Manhattan

Monroe County

The fight against infectious disease, described as "man's most unrelenting enemy," was discussed by Dr George D Berry, Professor of Bacteriology at the University of Rochester School of Medicine, in an illustrated lecture on April 16 in the Rochester Academy of Medicine

He told the dramatic story of efforts to control smallpox, diphtheria, typhoid fever, and other infectious diseases that have menaced mankind for centuries Dr Arthur M Johnson, city health officer, was one of the speakers on the program, which was planned by Dr Sol C Davidson

Nassau County

The Nassau County Medical Society, at its meeting on April 18, listened to an address by Dr Franklin M Hanger, of the Presbyterian Hospital, New York, on "Laboratory Aids in the Diagnosis of Liver Disease"

New York County

The meeting of the Medical Society of the County of New York on April 17 was devoted to a symposium on "Automobile Accidents Their Prevention and Treatment," with the following addresses 1 "What the New York City Police Department Is Doing to Reduce Street Accidents," by John J Seery, First Deputy Police Commissioner, New York City, by invitation 2 "Saving the Pedestrian," by Carroll E Mealey, Commissioner, Bureau of Motor Vehicles, New York State, by invitation 3 "Medical Control of Motor Vehicle

Drivers," by Dr David J Kaliski 4 "Eye Factors in the Prevention of Motor Vehicle Accidents," by Dr Conrad Berens 5 "Factors in the Treatment of Automobile Accidents," by Dr John J Moorhead Discussion was by Dr Charles J Dillon

Five noted scientists who have passed the age of sixty-five will withdraw before the end of the year from active connection with the Rockefeller Institute for Medical Research under a mandatory age-retirement regulation now being applied for the first time

A spokesman for the institute explained that all will be pensioned and that laboratory facilities will be placed at their disposal for independent research, but that their routine duties will be performed by younger men

Retiring are Dr Alexis Carrel and Dr Karl Landsteiner, both Nobel Prize winners, Dr Phoebus A Levine, chemist, and Dr Winthrop J V Osterhout, physiologist The institute disclosed that Dr Florence Rena Sabin, famous woman anatomist, withdrew several months ago when she reached the age of sixty-seven

Sir Alfred Webb-Johnson, C B E, D S O, M B, F R C S, (England), Hon F A C S, spoke on "The History of Surgery in England," (with lantern slides) on Wednesday, April 26, in the Blumenthal Auditorium of The Mount Sinai Hospital, New York City

Niagara County

Problems common to lawyers and physicians were discussed at a "medico-legal forum" held by the Niagara Falls Bar Association and the Medical Society of the County of Niagara on April 12 at the Hotel Niagara at Niagara Falls

A joint meeting of lawyers and physicians had not been held in the county for two years Jointly presiding were William H Hunt, president of the bar association, and Dr Harley U Cramer, of Lockport, president of the medical society

Speakers included Dr Ernest M G Rieger and Dr Richard H Sherwood, of Niagara Falls, and Dr Forrest W Barry, of Lockport, representing the physicians, and Francis T Findlay, Earl W Brydges, and Salem G Mansour, all of Niagara Falls, representing the lawyers

Onondaga County

A special committee of nine physicians who will work out a program of voluntary nonprofit health insurance was elected on April 4 at a meeting of the Onondaga County Medical Society at the College of Medicine, Syracuse University

Selected from a panel of twenty names submitted by the comitia minor, they are Dr Donald S Childs, Dr Leo E Gibson, Dr Gordon D Hoople, Dr Albert G Swift, Dr Leon E Sutton, Dr Brooks W McCuen, Dr Albert A Gelman, Dr E C Reifenshtein, Sr, and Dr Brewster C Doust.

Dr Louis C Kress, Assistant Director of the State Institute for Study of Malignant Diseases, told members that two reasons keep lay persons from consulting a doctor when they have cancer. Either they don't have pain, or they don't want to be told that they have cancer, he declared.

Dr Kress discussed the scope of the family doctor in the war on cancer, and the plans of the state in aiding the campaign.

He stressed the fact that the general practitioner is the one who can be of the greatest service, and should be given assistance in making the diagnosis by specialists who may later be at his command.

He stressed that when diagnosis of cancer is made, the condition should be treated as an emergency, as is acute appendicitis and other diseases.

Doctors can help stamp out the cancer quack by visiting the hopeless cancer cases and giving a word of comfort, he declared. Different types of cancer respond to different treatment, such as surgery x ray, or radium, sometimes, too depending on the location.

Queens County

The Medical Society of the County of Queens, on April 18, heard a paper on "The Use of the Free Full Thickness Dissected Skin Graft," by Dr J Eastman Sheehan, Professor of Plastic Surgery at New York Polyclinic Medical School and Hospital, Fellow Royal Society of Medicine, London, Professor Delade Academia Desanid Sanidad Militia Spain. It was discussed by Dr Arthur J Barsky, Assistant Plastic Surgeon, Polyclinic, Associate, Reconstruction, etc. and Dr George Sammis, Plastic Surgeon, Queens General Hospital.

Friday afternoon talks at 4 30 at the county society building, 112-25 Queens Boulevard, Forest Hills.

April 21—"Sacroiliac Disease," by Dr Charles D Napier, F.A.C.S., Chief Orthopedic Surgeon, St. Giles Hospital, Consulting Orthopedic Surgeon, Long Island College Hospital.

May 5—"Abnormal Bleeding in Females," by Dr Thurston S Welton, F.A.C.S., Obstetrician, Gynecologist, Greenpoint and Long Island College Hospitals.

May 10—"Symptoms and Diagnosis of Diabetes," by Dr Charles M Levin, and "Treatment of Diabetes," by Dr Miller A Sanders.

An open meeting of the Queensboro Surgical Society was held on Wednesday evening, April 19, at the medical society building. The speaker of the evening was Dr James A Cahill, Jr, Professor of Surgery at Georgetown University, Washington, D C. His subject was "Trauma of the Abdomen and Chest."

Richmond County

The Richmond County Medical Society held its annual dinner at Marconi's Hotel, Mill Road, New Dorp, on April 12.

Guests of honor were Dr Aaron Hood Thomasson and Dr Michael F O Shea. The society paid tribute to these men for their more than forty years in the profession.

Steuben County

The annual banquet of the Hornell Medical and Surgical Association was held at the Hornell Country Club with twenty-eight present, on April 12

Dr Glee W Cheesman, who leaves soon for California, was the honor guest

Tompkins County

Dr Wilbur George Fish, a native of Tompkins County and one of Ithaca's oldest physicians, died at Memorial Hospital in Ithaca Wednesday morning, April 12, after a long illness. He was eighty years old.

He was president of the Sixth District Branch of the state medical society, and was also president at one time of the Tompkins County Medical Society, of which he was later secretary and treasurer.

Warren and Washington Counties

Dr Arthur F Holding, Consulting Otolaryngologist of Memorial Hospital, Albany, stressed the importance of early diagnosis and treatment of cancer of the larynx at a joint meeting of the medical societies of Warren County and Washington County on April 12 in The Queensbury, at Glens Falls. More than seventy physicians of the two counties attended the meeting, which opened with medical and surgical motion pictures.

Those who discussed Dr Holding's paper were Dr John M Griffin, Dr Clair A Buck, Dr Harold A Peck, and Dr Morris Maslon, of Glens Falls.

Dr Edwin MacD Stanton, surgeon at Ellis Hospital, Schenectady, discussed legislative and economic problems with particular reference to proposals for compulsory health insurance. He said the

proposed \$850,000,000 health bill would add \$250,000 to the tax bill of Warren County.

Dr Dwight M Sawyer, of Glens Falls, President of the Warren County Medical Society, and Dr William Nuzzo, of Hartford, President of the Washington County Medical Society, presided.

Wayne County

The regular meeting of the Wayne County Medical Society was held on April 4 at the Newark State School on the invitation of Dr Hiram G Hubbell, the superintendent.

Before the meeting the members inspected the new x-ray equipment recently installed in the new hospital building. After the dinner meeting, Dr Rose R Donk reviewed a three-year survey of tuberculosis conducted at the school. Dr John C Hoeffler discussed congenital syphilis and presented several cases.

The main part of the evening discussion was then taken up in the matter of hospital insurance.

Westchester County

More than 200 persons heard Dr Harrison S Martland, Chief Medical Examiner of Essex County, New Jersey, and an authority on automobile safety work, address the Mount Vernon Medical Society in the Knolls April 13.

Dr Martland, introduced by Health Commissioner T A Jost, president of the society, told of interesting cases from the files of his office, and strange stories of accidents and murders.

Members of the Kiwanis, Rotary, and the Lions clubs, and the police department were present.

Deaths of New York State Physicians

| Name | Age | Medical School | Date of Death | Residence |
|--------------------|-----|--------------------------|---------------|------------------|
| Wilbur G Fish | 80 | Cleveland | April 12 | Ithaca |
| Charles H Goodrich | 66 | P and S | May 6 | Brooklyn |
| Charles C Mullin | 67 | Syracuse | April 16 | Syracuse |
| Carroll J Roberts | 59 | Buffalo, U of Pa, Berlin | April 6 | Buffalo |
| William C Thro | 64 | Cornell | April 6 | Long Island City |
| Julus Weiss | 63 | L I C | April 11 | Bronx |

Hospital News

To Isolate Pneumonia Patients

ISOLATION of all cases of pneumococcic pneumonia is advocated by Dr. Julien E. Benjamin, Dr. James M. Ruegsegger, and Fanny A. Senior, Cincinnati, in their article, "Cross Infection in Pneumococcic Pneumonia," in *The Journal of the American Medical Association* for March 25.

Although the disease has long been classed as contagious, the authors say, it is rarely reportable. The general failure to segregate or isolate patients with pneumonia implies that its contagiousness has been underestimated.

"It is essential that each patient be segregated in a cubicle and not treated in the open ward, the authors maintain. "Physicians and nurses should be required to observe the same precautions in caring for such patients as are usual in contagious disease wards.

"The wearing of gowns and masks and the washing of hands after each examination or treatment should be strictly enforced. Visitors should likewise be protected. Since these regulations have been adopted at the Cincinnati General Hospital, we have been convinced of their merits."

In support of their statements, the authors cite several instances of cross infection.

"There is abundant evidence that hospital contacts are frequently infected

from pneumonia sufferers. It has been shown that about 2 per cent of the hospital contacts contracted the same pneumococcic disease. This of itself would justify segregation of infected persons. Fifteen patients, treated in the medical wards of the Cincinnati General Hospital in two years, definitely contracted the disease from other patients in the same ward who had the same types of pneumonia.

'The following winter, after rigid precautions had been enforced only two patients had pneumonia which could be attributed to cross infection."

A case of a doctor who contracted pneumonia from a patient is cited and also two cases of infection contracted by laboratory workers.

About 20 per cent of the immediate family contacts with a pneumonia patient treated at home harbor the same strain of pneumococci in the nasopharynx," the three authors state. "The disease actually develops in a certain number of these carriers.

They conclude that "each patient with pneumonia should be regarded as a focus for the spread of the infection. The care of each patient should include those measures which have been found serviceable in the treatment of other communicable diseases."

Nurses Call New Bill Unfair

Vigorous opposition to the proposed amendment to the state education law in relation to nursing, which would provide for licensing an additional group of persons to be known as "child's nurse," is voiced by nearly 18,000 nurses as members of the New York State Nurses Association through their president, Mrs. Ethel G. Prince. "The amendment might have serious results because care

of sick children involves a great deal of skill and knowledge," Mrs. Prince said.

The new amendment, in the form of a bill, has been introduced to the Senate by Senator Walter J. Mahoney, and in the Assembly by Assemblyman Anthony J. Canney.

The nurses label the proposed legislation as 'unfair to young women who give fifteen months or more of service to an

institution and, when they leave, find that their practice is definitely limited to special types of cases rather than general practice of nursing." It would provide for a new nursing group known as "child's nurse" to care not only for well babies but also sick babies and maternity cases under the direction of a licensed physician. It would be much better for students to spend a few more months in training in an approved school of nursing where they would be prepared to care for all types of cases. Children may suffer from many kinds of ailments, including medical and surgical conditions, communicable diseases, and orthopedic defects. A maternity hospital or infants' home could not possibly give students experience in all these conditions.

Mrs Prince also stated "The title, 'Child's Nurse' is misleading. According to the definition found in the bill such a nurse would be permitted to care for maternity cases and the name signifies

that her field is limited to the care of children. If such a bill should pass, other institutions caring for special types of cases such as tuberculosis, mental or nervous diseases, would later seek similar legislation in order that they too may conduct courses and have student nurses to care for their patients. It would be difficult for the public to differentiate between a registered professional nurse, practical nurse, child's nurse and perhaps tuberculosis, psychiatric, and other nurses. The first two groups are trained in general hospitals and some have affiliations in special hospitals and can give satisfactory care to special cases.

"Because of the confusion to the public of additional classifications for nurses and because it is felt that the present nurse-practice law gives the public the necessary protection through ample provision for classification and training of nurses, the association is definitely opposed to this bill."

Newsy Notes

SYRACUSE HOSPITALS BADLY OVERCROWDED

A warning that the difficulty of getting patients into the crowded hospitals of Syracuse has become a serious public menace is sounded in the leading editorial of the *Bulletin* of the Onondaga County Medical Society. It says

"Many bitter complaints are being registered by the physicians of Syracuse and Onondaga County because of the frequent inability to get patients who are emergently ill into a hospital in Syracuse. Something is wrong, and what that something is needs to be discovered and rectified. Is it possible that patients are staying in hospitals longer than they formerly did, partly because of insurance which allows them a liberal stay? Or, are we actually in need of more hospital beds in Syracuse?"

"Two of our largest hospitals have frequently been unable to admit man, woman, or child on certain days, even though the emergent condition was fully

explained. There seems to be no letup in this state of affairs. The solution therefore would seem to be a shortening of length of stay of the individual in the hospital or an addition to the number of hospital beds in Syracuse. The best answer might be the building of an addition to one of our teaching hospitals which would care for ward patients. This would release a large number of beds for the use of private patients. The people of Syracuse should give some thought to this matter, for it is they who are likely to be mostly concerned. The matter has gone far beyond one of mere academic interest."

. . .

The walls of the upper floors of the new Triborough Hospital at Jamaica will be made of clear glass, to provide a maximum of sunlight

. . .

New York City hospitals had the first ambulance in the world, were the first to use cocaine, performed the first blood transfusion, prepared the first nursing text, and established the first medical laboratory, the first school for nurses, and the first school for midwives. These facts will be brought home to the visitor in the exhibit of the Department of Hospitals in the City Building at the big Fair.

A Catholic men's guild has been formed in Auburn to aid in financing the expenses of Mercy Hospital.

Endorsement by the Hospital Council of Greater New York of the \$2,907,000 construction program of Roosevelt Hospital was announced on April 2.

David H. McAlpin Pyle, chairman of the council, declared in a letter to Thomas S. McLane, president of the hospital's board, that the institutions plan to replace several old structures with modern buildings should serve as a "necessary and important contribution to the needs of West Side Manhattan."

"The hospital council considers the Roosevelt Hospital one of the essential voluntary hospital units in the area

where it is located," the letter said. "The generosity and quality of its services to the West Side community, the integrity of its board of trustees, and the standing of its medical staff have long been appreciated by those agencies which concern themselves with the development and maintenance of good hospital facilities."

Agreement on hospital rates, which compensation insurance companies will pay for the care of injured workmen, has been reached after a conference between representatives of the Hospital Association of New York State, compensation insurance carriers, and state officials.

Miss Frieda S. Miller, State Industrial Commissioner, and Louis H. Pink, State Superintendent of Insurance, have concurred in the rates, which will be in effect until Jan. 1, 1940. The rates are \$5.25 a day for New York City and the counties of Nassau, Suffolk, and Westchester, \$5 a day for the counties of Dutchess, Orange, Rockland, Putnam, Albany, and the cities of Schenectady and Troy, and \$4.50 a day for the remainder of the state.

Payments are to be made every thirty days and procedure for arbitration has been provided. All but 5 of the 267 participating hospitals were in full accord with the agreement.

Improvements

A modern, four-story, fireproofed hospital will rise this year to replace the present wooden buildings of the Nassau Hospital, Mineola, it is announced by the directors.

It is expected that the cost will exceed \$500,000 and will, when completed, make the Nassau Hospital an institution costing more than \$1,000,000.

Plans are being made to provide at least 250 beds in the new hospital, an increase of 58 more than the present maximum of 192.

The Nassau Hospital is the fourth in that region to consider launching a building program in recent months.

Others have been the Mercy Hospital at Hempstead, South Nassau Communities Hospital at Oceanside, and the Meadowbrook Hospital. The Meadowbrook plans have merely been under consideration while the Mercy and South Nassau institutions are actually proceeding with their development programs.

It is stated that funds will be available for the building program without necessitating any public drive or campaign.

The erection of an addition to the Henry Heywood Memorial Hospital in North Tonawanda will be a necessity in

the near future, according to the annual report of the trustees at the yearly business meeting

. . .

Possibility of reducing relief hospitalization costs in Elmira by building a municipal hospital is being studied by city officials and a group of Elmira business and professional men

The plan is in a formative stage and no decision has been reached. The hospital would be built as a WPA project and would house 50 to 75 beds

Under the plan, all relief hospital cases, falling in the medical category would be treated at the municipal hospital. Surgical cases would not be included at the beginning

The institution might also serve as an emergency hospital for Southside factories

City Manager Klches said that the municipal hospital plan had been suggested to him by a number of citizens

"The city is reducing other forms of relief and there must be a reduction in hospitalization," said the manager. "A municipal hospital may be the answer"

.

In furtherance of his efforts of the past two years to secure a general surgical veterans' hospital for the 29th New York District, and especially in Washington or Saratoga counties, Representative E Harold Cluett has given Gen Frank T Hines, Veterans' Administration Chief,

new data to support the claims of these regions

The latest move on the part of the congressman followed action taken by the various legion posts of Washington and Saratoga counties who have for some time been stressing the fact that the Hudson River or east central section of New York State is without a general surgical hospital, despite the fact that it has perhaps more veterans on a population basis than any other section of New York State that is not now serviced by a nearby hospital

New York counties in the proposed new hospital area are Rensselaer, Albany, Clinton, Columbia, Essex, Franklin, Fulton, Greene, Hamilton, Herkimer, Jefferson, Lewis, Montgomery, Oneida, Oswego, Otsego, Saratoga, Schenectady, Schoharie, St Lawrence, Warren, and Washington, and in Vermont Addison, Bennington, Chittenden, Franklin, and Rutland counties

. .

The latest and most effective x-ray equipment has been installed at the Fox Memorial Hospital in Oneonta at an expenditure in excess of \$10,000

The x-ray section has been remodeled and completely renovated under the direction of Dr L S House, roentgenologist at the hospital

The new equipment includes besides the general unit a portable machine that may be moved to any bed in the hospital for fluoroscopic or radiographic examinations

At the Helm

These hospital officials have been chosen

Henry F Howe, to be President of the Henry Heywood Memorial Hospital at North Tonawanda, re-elected

Arthur L James, to be President of Flushing Hospital and Dispensary, re-elected

Edward Neimeth, to be President of the Beth Moses Hospital, in Brooklyn

Dr Chrisman G Scherf, to be medical superintendent of the new hospital on Welfare Island, New York City

Abraham S Singer, to be President of the Jewish Sanitarium and Hospital for Chronic Diseases, in Brooklyn

Medicolegal

LORENZ J. BROSMAN Esq.

Council Medical Society of the State of New York

Malpractice—Bad Result Not Proof of Negligence

A FEW weeks ago the highest court of one of the western states handed down a decision that reaffirms a rule that has been previously the subject of these columns, namely, that in a malpractice action the mere fact that a bad result is obtained after treatment by a physician does not establish that he has been guilty of malpractice.*

The plaintiff in the case, one A, had been operated upon by doctors B and C for the purpose of attempting to correct an instability of his left knee. The operation was performed by Dr. B assisted by Dr. C, who participated to the extent of using retractors and the like. It consisted of the repair of the exterior lateral and posterior crucial ligaments, which had been torn and ruptured by a previous fall. The damaged portions of the ligaments were removed, and new material was substituted therefor which was obtained by the use of sections from the fascia lata and the biceps muscle of the left leg. The operation was, of course, performed under a general anesthetic.

After operation it was found that A began to suffer from a foot drop. He was unable to control lifting and sidewise movement of his foot, and complained of a numbness in an extensive area of the lower left leg. Physical examination by another physician indicated that the external peroneal nerve was severed near the knee.

A brought suit against both B and C to recover damages for personal injuries alleged to have been sustained as a result of their negligence in performing the operation. Upon the trial the plaintiff called, as his own witness, Dr. C who testified concerning the details of the operative procedure. He admitted that the peroneal nerve was in the operative

field and that ordinarily its position does not vary and stated that while the nerve can be isolated, such procedure is not ordinarily followed in the particular type of operation performed. He testified that he could not state positively whether he or Dr. B had severed the nerve, although he said he did not do any cutting in its precise neighborhood. Dr. C also stated that injury to the peroneal nerve is one of the difficult problems of surgery, and that it can be injured by "pulling on a blunt instrument alone and the problem as to whether or not that was true was our first problem after the operation."

When asked his opinion as to methods of protecting the nerve during the type of operation in question Dr. C answered that it should be retracted with its protective tissue, but explained that in doing so it might be stretched with temporary injury. He also said that although the peroneal nerve is not difficult to locate and identify, a surgeon might miss it and cause injury. He cited instances of such occurrences.

Among the defense witnesses were certain expert surgeons one of whom stated that in average surgical practice with the use of care and skill the peroneal nerve is cut in 5 per cent of operations such as was performed. Another surgeon put the proportion of severance in such cases at 8 or 9 per cent. The defense witnesses declared that standard technic permits leaving the nerve covered in its own protective tissue rather than exposing it, because exposure is likely to produce injury, and that proper conservative methods call for retracting the nerve with its tissues.

The testimony on behalf of the plaintiff amply supported the conclusion that the condition of the left foot and leg subsequent to operation was due to injury or severance of the peroneal nerve during

* *Engelking v. Carlson* 88 Pac. 2nd 695

the operation. The defendants made no attempt to controvert such testimony.

The trial judge dismissed the action as to B (the assistant) at the close of the plaintiff's proof, and at the end of all of the evidence directed a verdict in favor of C.

The plaintiff appealed, claiming that he had established negligence under the doctrine of *res ipsa loquitur*. He argued that he was unconscious, that defendants were in charge of the operation, that the result he sustained does not ordinarily occur, and that in the absence of an explanation by the defendants he was entitled to a verdict based upon their negligence.

The Appellate Court, however, affirmed the judgments appealed from, saying in the opinion:

"If this were the rule (that asserted by appellant), as a practical proposition, no surgeon could ever operate without being an insurer of a medically satisfactory result. The medical testimony in this case shows without any contradiction whatever that although the severance of the peroneal nerve is something which ordinarily does not occur in operations such as that performed by Dr. C, yet even when the precautions prescribed by the approved technic are taken, there is a break of or injury to it in between 5 and 9 per cent of the cases. There is nothing startling about such evidence and it affords no basis for the recovery of damages against a surgeon. Probably in every operation there is some hazard which the medical profession recognizes and guards against but which is not always overcome. To say that the doctrine of *res ipsa loquitur* allows the recovery of dam-

ages in every case where an injury does not ordinarily occur, would place a burden upon the medical profession which the law has not heretofore laid upon it. Moreover, such a rule is not justified by either reason or authority. "The law has never held a physician or surgeon liable for every untoward result which may occur in medical practice. It requires only that he shall have the degree of learning and skill ordinarily possessed by physicians of good standing practicing in the same locality and that he shall use ordinary care and diligence in applying that learning and skill to the treatment of his patient. Whether he has done so in a particular case is a question for experts and can be established only by their testimony. And when the matter in issue is one within the knowledge of experts only, and is not within the common knowledge of laymen, the expert evidence is conclusive. Negligence on the part of a physician or surgeon will not be presumed, it must be affirmatively proved. On the contrary, in the absence of expert evidence, it will be presumed that a physician or surgeon exercised the ordinary care and skill required of him in treating his patient."

Here what was done lies outside of the layman's experience. Medical evidence is required to show not only what occurred but how and why it occurred. That evidence establishes beyond question not only that the peroneal nerve may be injured even where due care is used but that this unfortunate result invariably occurs in a limited number of cases. The doctrine of *res ipsa loquitur* is, therefore, entirely inapplicable and no malpractice has been proved."

THE DOCTORS ORCHESTRAL SOCIETY OF NEW YORK

The Doctor's Orchestra will give its *première* performance in Town Hall, New York City, on May 26 at 8 30 P. M., with Ernest Schelling as guest artist. The proceeds will be donated to

the Physicians' Home and the Loan and Relief Fund of the County Medical Society of New York. Tickets are obtainable from Dr. William Spielberg, 235 East 22nd St., New York City.

Across the Desk

Medical Memories of the Old South

"WHEN Doctor Herbert come in de front doah, Ol'Man Pain step out de back doah," was what the colored folk thereabouts used to say, and the saying was adopted by the white people too. Dr Herbert wore a beaver stovepipe hat, and his furrowed face was fringed with a wavy, brown beard so that he looked rather like the pictures of Abraham Lincoln. Like Lincoln, too, he was over six feet tall, but he had the mellow, soft voice of the southland.

His gentle tones were matched by his gentle nature, and it was his boast that he had never sued nor would be sue anyone for a bill. If all his bills had been paid, he would have been the richest man in town, but when he died all he owned, house, furniture, horses, carriages, every thing, were worth only \$2,500. But he was rich in what money cannot buy, the love of all who knew him, and his funeral was the largest the county had ever known. He was a pronounced atheist, but was at the same time 'the most Christlike of men.'

That is the picture of an old-time Virginia doctor, drawn by Dr William B. Aughinbaugh in his book of reminiscences entitled *I Swear by Apollo*,* which is being read a great deal just now.

Mystery of Life Explained

It was Dr Herbert's influence, in fact, that decided young Aughinbaugh to study medicine, but in a rather peculiar way. The boy was already convinced at the age of six that the old doctor was a true magician, a seer, and a wonder worker, but one day when Willie had been strangely kept out of the house for hours, the doctor came out and said in his soft voice 'Well, Willie, I have just brought your mother a little sister for you to play with.'

'Where did you get her?' he asked solemnly, thus showing his scientific spirit getting an early start.

'Under a head of cabbage,' replied the doctor. 'A rabbit brought her there. As soon as he saw me, he ran away, and I took the little girl to your mother because I knew she wanted one as a companion for her boys.'

'Who brings boys?' pursued the relentless six year-old.

'Why, foxes bring little boys,' answered the physician, as he deftly avoided further questions by burrying off to his buggy.

This decided little Willie to be a doctor, for 'surely anyone who could heal the sick, postpone visits from Charon, cut off legs, find babies, and be on speaking terms with rabbits and foxes, was worthy of emulation.'

So the young man went to medical school, some years later, in Washington D C, and paid his way partly by working in a lawyer's office and partly by forming with four other students, the "Hippocratic Exhumation Corporation." "To speak precisely," he confesses frankly, 'we became nocturnal grave robbers—primarily to provide ourselves with funds for an education, secondarily to insure a steady supply of stiff.' The price was \$35 per. Thus the very bodies of those that medical science had failed to keep from the grave helped to educate future doctors to save others from going the same route.

A calf was the standard fee for bringing a baby into the world, the young Dr Aughinbaugh found when he came back to his home town in Virginia, hung out his shingle, and put his announcement in the local paper. Sometimes, on coming home from a long trip over terrible roads, he would find two or three calves tied up in his yard, with notes pushed under his door to tell who the donors were. Other patients paid in grain for the three hungry

horses, or in hams, chickens, eggs, or butter

"Snuffing Out" Babies

We often hear of life being "snuffed out," but not of babies being "snuffed out." This is where our obstetric experts can learn something. One day the young Virginia doctor had a hurry call from a physician in the next county, and when he arrived on the scene he found the patient's room in wild disorder, the doctor disheveled, sweating, cursing, chewing tobacco, his face purple, and a broken obstetric forceps on a chair.

"I can't do a damn thing more," he exclaimed. "I can't get that baby. Will you take charge?"

Aughinbaugh's efforts were equally futile. What to do?

Then the colored servant girl spoke up.

"Please let me send for Aunt Jinny—you all know what she done for Miss Lucy when her baby stuck."

"Go get Aunt Jinny quick!" shouted both doctors together.

In a few minutes Aunt Jinny was there, looking for all the world like the portly mammy on the box on pancake flour.

"Have you all tried 'snuffin' it out?" she asked, her arms akimbo.

"Snuffing it out?" gasped the doctors.

"Yes, sah, snuffin' it out—dat's de only way."

"Go ahead, try anything," exclaimed the men of baffled medical science.

A pound package of snuff was brought, and Aunt Jinny called out "Stan' back, gennemen!" and threw a handful in the patient's face. Instantly there was an explosion of sneezes, coughs, and cries—and the weak voice of a newborn baby! A simple Negro woman had won out where two educated physicians had failed. "The snuff had relaxed the abdominal muscles, which we doctors had made tense."

Now will the next textbooks tell how to "snuff them out?"

Old Man Taylor's Leg

In addition to Aunt Jinny there was Aunt Nancy, who lived down by the swamp and was reputed to be a voodoo doctor and a witch. She dealt in charms, potions, spells, love powders, and such, and her terms were cash on the nail. The colored population went to her first, and to the young M.D. when Nancy had failed or their money was used up. Aughinbaugh found it was a losing battle.

And the white folks had their home remedies and cures, too. The climax came when Old Man Taylor broke his leg. Aughinbaugh set it and put it in a "fracture box," only to have Taylor take "that damned coffin" off his leg and put on a mass of sowbelly and cabbage. The leg healed somehow with only a slight limp, and Taylor, in his frequent jags, would lambaste all doctors as fools, while the bystanders guffawed.

That was the last straw, and the young physician left to begin a series of medical experiences and adventures in many lands and to end in our own picturesque Greenwich Village in New York City.

The swelling stream of medical memoirs are coming better and better, richer and racier. They are crashing the best-seller lists. The doctors have the printing presses running nights, while the publishers' checks buy them shiny new cars and trips to the Riviera. Beyond a doubt hundreds of silver-haired, not to say baldheaded, M.D.'s are scanning their old casebooks and ledgers and wondering if "thar's gold in them thar bills" and the memories they recall.

"Every man has a book in him," they say. The craze for doctors' reminiscences may not last forever.

Get going! Good luck!

W S W

Training the baby as the book advises is a good idea. All you need is a different book for each baby—*Medical Record*

Without health life is not life, it is only a state of languor and suffering—an image of death—*Rabelais*

AWARDS

Scientific Exhibits

The Committee on Awards after careful study of the many excellent scientific exhibits at the recent Annual Meeting begs to report the following as its final opinion of the merits of individual exhibits classified in three appropriate groups

GROUP I SCIENTIFIC RESEARCH

- First Award* William A. Groat, M D
Stella M Zimmer, R.N
Rachael E Field, M.A.
College of Medicine Syracuse University and Hazard
Memorial Laboratory Syracuse Memorial Hospital
Syracuse
Acute Basophilic Leukemia—Development of the Baso-
phil
- Second Award* Henry D Niles, M.D
Skin and Cancer Unit New York Post-Graduate Medical
School and Hospital New York
Cutaneous Manifestations of the Diseases of the Blood
Forming Organs
- Third Award* O W H Mitchell, M D
College of Medicine Syracuse University Syracuse
Incidence of Gas Bacillus Infection in New York State.

GROUP II CLINICAL RESEARCH

- First Award* Benjamin Jablons, M.D
Polyclinic Hospital and City Hospital New York
Clinical Diagnosis and Treatment of Peripheral Vascular
Disease.
- Second Award* Maurice L. Mallins, M D
Sydenham Hospital New York, and
John C Ruddock, M D
University of Southern California Los Angeles
Peritoneoscopy
- Third Award* C. R. Straatsma, M.D
New York Post-Graduate Medical School and Hospital and
Manhattan Eye, Ear and Throat Hospital New York
Plastic Surgery (of head neck and extremities)

GROUP III CLINICAL INVESTIGATION

- First Award* C. O Davison, M D
Vassar Brothers Hospital Poughkeepsie
A Review of Special Positions in Roentgenographic Study
of Bones and Joints
- Second Award* P A. Robin, M.D
O C. Hudson, M.D
C. A Hetteshelmer, M.D
Nassau Hospital Hempstead
Causalgic Backache
- Third Award* Harry J Brayton, M.D
Antonio G Gandia, M D
David I. Sidnam, M D
Herbert R. Diaso M D
Onondaga Sanatorium Syracuse
X Rays of Interesting Cases

Books

Books for review should be sent to the Book Review Department at 1313 Bedford Avenue, Brooklyn, N Y. Acknowledgment of receipt will be made in these columns and deemed sufficient notification. Selection for review will be based on merit and the interest to our readers.

RECEIVED

The Vaginal Diaphragm Its Fitting and Use in Contraceptive Technique By Lemon Clark, M D. Octavo of 107 pages, illustrated. St. Louis, C V Mosby Co., 1939. Cloth, \$2.00.

Clinical Gastroenterology By Horace W Soper, M D. Quarto of 314 pages, illustrated. St. Louis, C V Mosby Co., 1939. Cloth, \$8.00.

Doctor, Here's Your Hat! The Autobiography of a Family Doctor By Joseph A Jerger, M D. Octavo of 279 pages. New York, Prentice-Hall, Inc., 1939. Cloth, \$2.75.

Clinical Biochemistry By Abraham Cantarow, M D, and Max Trumper, Ph D. Second edition. Octavo of 666 pages. Philadelphia, W B Saunders Co., 1939. Cloth, \$6.00.

Gonorrhea in the Male and Female A Book for Practitioners By P S Pelouze, M D. Third edition. Octavo of 489 pages, illustrated. Philadelphia, W B Saunders Co., 1939. Cloth, \$6.00.

Economical Administration of Health Insurance Benefits Part I "The Principle of Economy in the Administration of Health Benefits" By Dr Walter Pryll. Octavo of 187 pages. Geneva, Switzerland, 1938. Paper.

Medical Uses of Radium Summary of Reports from Research Centres for 1937 Privy Council, Medical Research Council. Octavo of 48 pages, illustrated. New York, British Library of Information, 1938. Paper, 30¢.

Practical Dermatology and Syphilis By Harry M Robinson, M D. Octavo of 397 pages, illustrated. Philadelphia, P Blakiston's Son & Co., 1939. Cloth, \$4.50.

Emotions and Bodily Changes A Survey of Literature on Psychosomatic Interrelationships, 1910-1933 By H Flanders Dunbar, M D. Second edition. Octavo of 601 pages. New York, Columbia University Press, 1938. Cloth, \$5.00.

English, German, French, Italian, Spanish Medical Vocabulary and Phrases By Joseph S F Marie. Oblong 16mo of 358 pages. Philadelphia, P Blakiston's Son & Co., 1939. Cloth, \$3.00.

The Natural History of Population. By Raymond Pearl. Octavo of 416 pages. New York, Oxford University Press, 1939. Cloth, \$3.50.

End-Results in the Treatment of Gastric Cancer An Analytic Study and Statistical Survey of Sixty Years of Surgical Treatment By Edward M Livingston, M D, and George T Pack, M D. Quarto of 179 pages, illustrated. New York, Paul B Hoeber, Inc., 1939. Cloth, \$3.00.

The Physiology of Exercise A Textbook for Students of Physical Education By James H McCurdy, M D, and Leonard A Larson, B A. Third edition. Octavo of 349 pages. Philadelphia, Lea & Febiger, 1939. Cloth, \$3.75.

The Circulation of the Brain and Spinal Cord. A Symposium on Blood Supply Volume XVIII of a Series of Research Publications of the Association for Research in Nervous and Mental Diseases Octavo of 790 pages, illustrated. Baltimore, Williams & Wilkins Co., 1938. Cloth, \$10.00.

Preclinical Medicine. Preclinical States and Prevention of Disease By Malford W Thewlis, M D. Octavo of 223 pages. Baltimore, Williams & Wilkins Co., 1939. Cloth, \$3.00.

Angina Pectoris Nerve Pathways, Physiology, Symptomatology, and Treatment. By Heyman R Miller, M D. Octavo of 275 pages, illustrated. Baltimore, Williams & Wilkins Co., 1939. Cloth, \$3.25.

Failure of the Circulation By Tinsley R Harrison, M D. Second edition. Octavo of 502 pages, illustrated. Baltimore, Williams & Wilkins Co., 1939. Cloth, \$4.50.

The Clinical Diagnosis of Swellings By C E Corrigan, M D. Octavo of 313 pages, illustrated. Baltimore, Williams & Wilkins Co., 1939. Cloth, \$4.00.

Manual of Toxicology By Forrest R Davison, M B. Duodecimo of 241 pages. New York, Paul B Hoeber, Inc., 1939. Cloth, \$2.50.

Medical Leaves, 1939 A Symposium on Jewish Medical Problems Dr Abraham Levinson, Editor in Chief. Quarto of 196 pages. Chicago, Medical Leaves, Inc., 1939. Cloth.

Pulmonary Tuberculosis in Adults and Children. By James A Miller, M.D. and Arvid Wallgren M.D. Octavo of 193 pages illustrated. New York, Thomas Nelson & Sons 1939 Cloth \$3.50

You Can't Eat That! A Manual and Recipe Book for Those Who Suffer Either Acutely or Mildly (and Perhaps Unconsciously) from Food Allergy By Helen Morgan. Octavo of 330 pages. New York, Harcourt Brace and Co 1939 Cloth \$2.50

Community Health Organization. A Manual of Administration and Procedure Primarily for Urban Areas. Edited by Ira V Hiscock. Third edition Octavo of 318 pages New York

The Commonwealth Fund 1939 Cloth \$2.50

The Wisdom of the Body By Walter B Cannon M.D. Revised and enlarged edition Octavo of 333 pages illustrated New York W W Norton & Co 1939 Cloth \$3.50

The Diabetic Life Its Control by Diet and Insulin A Concise Practical Manual for Practitioners and Patients By R. D Lawrence M.D. Eleventh edition. Octavo of 246 pages Philadelphia P Blakiston's Son & Co 1939 Cloth \$3.00

Hypertension and Nephritis. By Arthur M Flehberg M.D. Fourth edition Octavo of 779 pages illustrated Philadelphia Lea & Febiger 1939 Cloth \$7.50

REVIEWED

Alcohol in Moderation and Excess. A Study of the Effects of the Use of Alcohol on the Human System. By J A Waddell, M.D. and H B Haag M.D. Octavo of 184 pages illustrated Richmond, Virginia The William Byrd Press Inc. 1938 Cloth \$1

This small book was prepared in response to a resolution passed by the General Assembly of Virginia. The book is intended to serve as a guide for the State Board of Education in the selection of material in regard to alcohol to be taught in the public schools. As far as the reviewer knows, this is the first attempt made by any state to present an impartial evaluation of the effects of alcohol in the hope that its future citizens would benefit by the knowledge.

The authors are both professors of pharmacology. They have enlisted the aid of various members of the faculties of the medical schools of Virginia in the selection of their material.

The authors stress the effect of alcohol in moderation and excess on the various body systems such as the central nervous system, circulatory, urinary, etc. They also include an adequate introduction to the properties and manufacture of alcohol and alcoholic beverages.

Since the book is intended for laymen, especially for students below college age, an attempt has been made to be as non technical as possible and wherever medi-

cal or technical terms have been used a satisfactory explanation of them has been included. There are some drawings and statements to which one might take exception (i.e., delirium tremens is due to withdrawal of alcohol). But on the whole the book is well written, pithy, and will be found of service to all who desire to instruct the younger generation in the effects of alcohol on the body.

JOSEPH L ABRAMSON

Diseases of the Ear, Nose and Throat. By Francis L Lederer M.D. Quarto of 835 pages illustrated Philadelphia, F A Davis Co 1938 Cloth \$10

In Dr Lederer's text we note a definite departure from the older type of book to which we have become accustomed. In practically every instance clinical presentations are correlated with anatomic, physiologic, and developmental data that bear directly upon the subject at hand. The didactic value of this departure is obvious. The accompanying illustrations are superb, both artistically and from a practical point of view, especially the schematic projections and composites, which convey graphically the third dimensional effect. The photographic plates are better than average, and the author's use of charts for quick comparative study is a helpful innovation. Dr Lederer reveals his preference of

European nomenclature in describing certain clinical entities not usually recognized in previously published American texts

Here, then, we have a complete, up-to-date text from the pen of an experienced and unbiased observer and teacher, which can be used to advantage by the student and practitioner, as well as the specialist

HARRY MEYERSBURG

The Treatment of Fractures By Charles L. Scudder, M D Eleventh edition Octavo of 1208 pages, illustrated Philadelphia, W B Saunders Co, 1938 Cloth, \$12

This is truthfully a revision of a previous edition There is an imposing list of new contributors on special subjects, a list that contains but one name from the contributors to the tenth edition The subtitle of the tenth edition, "With Notes upon a Few Common Dislocations" has been omitted and the only dislocation listed in the index is "Dislocations of Vertebral Column" The subject matter has been approached differently, the first 300 pages being devoted to the fundamental principles and pathology of fractures instead of the immediate consideration of special topics

If it be noted that the tenth edition is dated 1927, the eleventh, dated 1938, may be expected to show certain changes either in the treatment itself, or in the attitude toward these changes One will look for a more complete discussion of the operative treatment of fractures and the indications and advantages of skeleton traction—and the reader will not be disappointed There are six successive chapters, of about 100 pages, on the various aspects of operative treatment, which do not include the description of the application of these principles to special fractures

It is rather significant that the author has placed under (a), in the chapter devoted to the consideration of treatment of intracapsular fractures of the femur, "Steel internal fixation, the method to be used when possible" In his foreword, the author addresses himself to students

and practitioners, but it is felt that this book will have an appeal to all surgeons who include the care of fractures in their practice

J RAPHAEL

The Principles and Practice of Medicine Designed for the use of Practitioners and Students of Medicine By the late Sir William Osler, M D Revised by Henry A Christian Thirteenth edition Octavo of 1424 pages New York, D Appleton-Century Co, 1938 Cloth, \$9

A rich tradition enwraps this book

The first edition appeared in 1892 and was enthusiastically received Its therapeutics were outstandingly conservative, but the clinical views were sound and scientific, and the underlying pathology thoroughly presented

Six more editions by Osler, then three more with the assistance of Thomas McCrae The 10th, 11th, and 12th editions were kept on a high plane by McCrae, whose death followed in 1935

This, the 13th edition, is revised by Henry A Christian, of Harvard friend, teacher, and mentor to so many All changes and additions are his own, and thus the new edition carries on with high personal guidance.

The pneumonias open the book with fine thorough discussion Serum, sulfanilamide, caffeine, coramine, digitalis, and oxygen are evaluated The carping critic would suggest that the patient is not "kept out of doors" today and that atropine for pulmonary edema can hardly be "useful" and "probably do little or no good" at the same time (see page 32)

On focal infection (page 45), "the earlier belief in its great frequency and importance as an explanation of many subacute and chronic diseases now is on the wane many are skeptical of this relationship except in relatively few patients" Thus does sanity return to us

Twenty-two diseases are grouped as due to viruses among them are acute coryza, influenza, herpes zoster, measles, rubella, smallpox, chickenpox, and acute poliomyelitis This etiologic grouping,

now common in most textbooks, illustrates the advance made in the study of the causes of infectious diseases.

Diabetes is monographically handled in 20 pages, a broad grasp of the subject is evident, with discussion of the pituitary, adrenal, and thyroid influences on the pancreas. Hyperinsulinism is not overlooked.

"Catarrhal jaundice" still is preferred over "benign hepatitis" to the reviewer's regret (p. 694).

Cancer of the colon is inadequately handled and indexed. Incidentally, the indexing on the whole can be improved. Diseases appear under 'A' as acute or 'C' as chronic, rather than under the disease name.

Paying his compliments to the many classifications of Bright's disease, the editor remarks that there is now more and more agreement as to the essential features, and that it is no longer difficult to interpret the terminology of the various classifications. Christian has always been very outspoken in regard to Bright's disease.

In 21 pages Bright's disease is thoroughly discussed. We quote a final paragraph of advice: 'In Chronic Bright's disease death is inevitable. With this in mind take care not to make the patient's last days unhappy, disturbed, and uncomfortable by reason of treatment, which at best scarce does more than prolong the days of discomfort.'

The discussion of anemia is excellent.

Chronic arthritis, as presented also in 10 pages, is still a mélange of two distinct diseases. It is to be hoped that in the next edition these very different diseases will be separately presented.

This edition is an old friend in new binding and format. Henry Christian is its able editor, stalwart, outspoken, emphatic. There is presented a great wealth of clinical fact, basic theory, and applied pathology. The editor's aphorisms give the volume zest and sweep.

The book will lie open on many desks.
FRANK BETHEL CROSS

Clinical Roentgenology of the Digestive Tract. By Maurice Feldman M.D. Octavo of 1014 pages illustrated. Baltimore: William Wood & Company 1938. Cloth \$10.

This book is crammed with valuable information. It is the only volume of its kind in all English medical literature representing a lifetime of work and study into the many problems confronting us in the application of the x-ray to clinical investigation of the digestive tract. The material is well written and the illustrations excellent. No library of individual, school, college, or hospital can be considered to be complete without a copy of this book on its shelves.

BENJAMIN M. BERNSTEIN

Illustrations of Anatomy for Nurses. By E. B. Jamieson M.D. Octavo of 62 pages illustrated. Baltimore: William Wood & Company, 1938. Paper \$3.

This small volume comprising 62 full page plates illustrates regional anatomy of the human body. The plates are in color and were taken from illustrations of *Regional Anatomy* published in 1934. The B. N. A. nomenclature is used throughout. Each plate has each structure lined and named which makes it easy for identification and most excellent for the student. This should be an excellent supplement to any textbook of anatomy, and, although it is primarily printed for nurses, the clear-cut pictures make it an excellent adjunct for the student of anatomy. Dr. Jamieson's anatomic works are well known in this country and, we believe, those who are teaching anatomy to nurses will be highly pleased with this volume.

HERBERT T. WIKLE

The Foot. By Norman C. Lake M.D. Second edition. Octavo of 366 pages illustrated. Baltimore: William Wood & Company 1938. Cloth, \$4.50.

The author gives a fairly accurate review of his own book in the first sentence of the preface to the second edition: "That it is too long that it is too short—that it is too scanty—that it is very complete."

The section on the evolution, development, and anatomy is too long and too complete for the general practitioner and too short and too scanty for the specialist and real student of the subject.

The sections on club foot, operations, and injuries of the foot are good as far as he goes, but far too scanty

However, the discussion of the so-called minor lesions is good, and for this alone the book is a valuable addition to the literature. It is particularly useful to the general practitioner, for whom it is highly recommended

JOSEPH B L'EPISCOPO

Adventures in Respiration. Modes of Asphyxiation and Methods of Resuscitation. By Yandell Henderson. Octavo of 316 pages. Baltimore, Williams & Wilkins Co., 1938. Cloth, \$3

This interesting volume can be read with profit by all physicians and many lay people as well. The discussion of the processes of oxidation is a refresher course useful to all members of the medical profession. The account of Dr Henderson's struggles and eventual success in bringing the subject of asphyxia to the foreground is extremely interesting. This applies particularly to his work in popularizing the use of carbon dioxide in anesthesia and asphyxia. He realizes the importance of asphyxia neonatorum, and presents the latest evidence regarding intrauterine respiration. While the space devoted to the resuscitation of the newborn seems inadequate to the reviewer, it is well worth careful consideration. When one has started reading this volume, the interest is held until the end.

ROBERT A WILSON

Surgical Pathology. By William Boyd, M D. Fourth edition. Octavo of 886 pages, illustrated. Philadelphia, W B Saunders Co., 1938. Cloth, \$10

In the presentation of his 4th edition of *Surgical Pathology*, William Boyd maintains the pace he has set by his previous books. The general excellence of the work is decidedly impressive. The

style is somewhat subdued, perhaps mellowed by the continued observation of an abundant material and the review of an enormous literature. As previously, the subject matter is well arranged, and clearly and concisely treated. Many new features have been added, and others modified to harmonize with the current trend of thought in surgical pathology.

An attempt has been made to interject a practical aspect. This is especially employed by the introduction of a chapter on the surgeon and the laboratory. The material is treated too briefly and superficially to be of any real value to either surgeon or pathologist. Indeed, it is a question whether it actually belongs to the field of pathology.

However, the book contains so many admirable features, that any criticism must fall short of detracting from its incomparable place in the practice of surgical pathology by both surgeon and pathologist. The illustrations are uniformly clear and illustrative. The color plates are excellent.

This reviewer looks forward to any future books or revisions of old editions of his works with pleasant anticipation. Certainly, this last product of his activities is a necessary adjunct to any medical man's literary armamentarium, no matter what his specialty may be.

MAX LEDERER

Aids to Bacteriology. By William Partridge, F I C. Sixth edition revised by H W Scott-Wilson, B M. 16mo of 300 pages. Baltimore, William Wood & Co., 1938. Cloth, \$1.50

This handy little volume deserves high praise. It is a brief yet comprehensive survey of the entire field of bacteriology brought up to date. The classification of the Society of American Bacteriologists is employed with few exceptions, so that the book may be read with ease by Americans. The very reasonable price will enable practitioners who have bought no bacteriology text since medical school days to bring their knowledge to date at low cost.

NEW YORK STATE JOURNAL *of* MEDICINE

VOLUME 39

JUNE 1 1939

NUMBER 11

Editorial

To Die of Improvements

Our mothers and fathers had a racy expression for the dangers of overzealous reform. When change came too fast and furiously and enthusiasm seemed likely to overrule common sense, they bethought themselves that it was no pleasanter 'to die of improvements' than any other way—and called a halt.

Today, unless the brakes are applied to ill considered tinkering with the structure of medical care, American medicine is in grave danger of "dying of improvements." The ambiguous Wagner National Health Bill opens the door to almost absolute control of public health methods by a small group of lay administrators. Instead of implementing specifically the accepted features of the National Health Program, it lays down a vague formula that can father as many abuses as beneficial services.

If the Wagner bill is adopted in its present form, the sick public too, may find itself dying of improvements. When it comes to helping the common man, the kindly senior Senator from New York believes that the sky's the limit as far as costs are concerned. Unfortunately, in the long run the common man must pay for the benefits extended to him. It will prove of little benefit to the public health to provide elaborate institutions for the prevention and treatment of problematical illness at the price of oppressive taxation entailing malnutrition and unsanitary housing for the small wage earner.

There are many desirable and necessary reforms to be made in our medical services but they must be effected gradually as part of a carefully considered, flexible program. We must not sacrifice the proved benefits of the present system for the theoretical advantages

of untried schemes Above all, we must encourage continued professional experimentation with various methods of distributing medical care, and refuse to freeze practice in the rigid, mediocre mold of compulsory insurance In other words, we must make every effort to improve short of that injudicious frenzy for change that is death to all improvement

Threat to Health

The advertisement of laxatives over the radio has assumed disquieting proportions As its volume soars to new highs, its quality drops to ever lower levels

To hear the ecstatic descriptions of the taste, efficacy, and safety of numerous products ballyhooed over the air, one might think that the use of laxatives is normal and entirely harmless That this is far from the truth is demonstrated in an article appearing in a recent issue of the *Journal of the American Medical Association*

Among 1,000 adult cases of appendicitis occurring in Cleveland between 1931 and 1936, the death rate in the acute suppurative type jumped sharply over the preceding five years because of delayed surgery The authors of the report—Drs F R Kelly and R M Watkins—attribute the fatal delay in seeking surgery “to economic factors and use of home remedies, including laxatives ” In the 1925–1930 series of cases, 42 per cent tried laxatives prior to medical aid In the 1931–1936 series, this percentage jumped to 67

Dr Kelly and Dr Watkins point out that they are not alone in the serious view they take of the unsupervised use of laxatives for abdominal pain In a report on a series of 306 fatal cases of acute suppurative appendicitis, Dr J O Bower, of Philadelphia, observes that 147 had taken laxatives at the onset of pain The percentage is 91.6 in another series of 214 patients who died of acute diffuse peritonitis following appendicitis

This is only one, albeit an extremely serious, aspect of the unsupervised use of laxatives The development of normal eliminative habits is of primary importance to health, particularly in childhood To start a child on the laxative habit is a crime against nature Yet ten or twelve times a day the biggest and best radio stations permit advertisers to urge parents to give their children this or that wonderful cathartic One tastes like delicious candy, another works like a miracle, a third cements affectionate relations between mother and child No reason is too mane or fallacious In all the arguments advanced there is an arrant deception in the implication that the use of laxatives is without harmful consequences

The laxative habit is one of the serious problems of American

public health education. There is little hope of breaking its grip until newspapers, magazines, and radio broadcasting stations develop enough social conscience to reject this type of advertising.

Esophageal Carcinoma

Until such time when the actual cause of cancer will have been definitely established, radical surgical removal of the neoplasm together with its lymphatic tributaries constitutes the mainstay of all methods at our disposal for the treatment of this disease. Frequently the technical procedure necessary for the removal of the neoplasm is of such magnitude that physicians in general are loath to accept the proposed surgery as the treatment of choice, and other measures—surgical or otherwise—are resorted to, which are either inadequate or merely palliative. This is the status of the management of carcinoma of the thoracic esophagus at the present time. Even in the earliest cases, where difficulty in swallowing has been the complaint for but a short time, and where a positive diagnosis has been established by esophagoscopy and biopsy, radical removal of the growth by surgery is seldom undertaken. Radiotherapy alone, or coupled with a gastrostomy, are the means usually employed in treating this lesion.

That esophagectomy is seldom undertaken may be attributed to the technical difficulties which attend the operative procedure, the poor general condition of the patient, and, until the recent work of Garlock,¹ the prohibitive mortality rate which hitherto has been associated with the operation. His series of 6 esophagectomies, which comprise approximately one-third of all reported cases of surgical removal of esophageal cancer, has been accomplished with *only 1 operative mortality*. The technic described by Garlock, which is based on the pioneer work of Torek,² not only removes the malignancy of the thoracic esophagus, but subsequently permits the intake of food by the normal process of swallowing, in this manner preserving for the patient the *enjoyment* of eating. One of Garlock's cases, a schoolteacher aged fifty three, has remained well for over two years, has resumed her profession, and eats normally with no difficulty.

This exceptional progress in the treatment of esophageal cancer can be attributed to several factors. Of prime importance is the early detection of the lesion, and in this connection Garlock's admonition that "one should regard with great suspicion any change in the act of swallowing in a person past forty years of age" promises to the therapy for esophageal cancer the same success that has been achieved in the treatment of laryngeal carcinoma which followed

the warning of Chevalier Jackson on the importance of hoarseness as a symptom in the same age group. This must eventually lead to earlier esophagoscopy, and where a malignancy is manifest, careful preliminary preparation, an expertly administered anesthesia, painstaking attention to the operative technicalities and the post-operative care will result in a reduction of the mortality from carcinoma of this portion of the digestive tract

Current Comment

"Modern medicine is, in fact, less than a hundred years old, but the social sciences are less than half of that. Assuming that they are in the experimental stage through which medical science has passed, valuable service to society may, in time, be expected of them. But that reasonable expectation is hardly warrant for delivering the body politic into the hands of even the most conscientious social-service practitioners"—Dr. J. B. Conant is credited with the foregoing statement

. . .

"Of course our brethren will whimper when they find themselves legislated out of the right for a decently remunerative private practice of medicine. Particularly loud will be the plants of that great lethargic majority of every medical society who fail to vote on vital questions. Bagpipes at bedtime will sound as a lullaby in comparison to the injured squeaks that will be heard, and the cries of 'Why were we not warned? Why didn't someone do something? What is wrong with the medical society?' The answer will be that they were warned—many did many things—and that the only thing wrong with the medical society is that it is composed of so many torpid drones. The ballot is laid on the desk by the post office, and there it lies

"The American doctor may be congenitally shy of politics, or may have no idea of the practical meaning of planned medicine, but it behooves him to cast aside his timidity and whatever stupidity

it is that prevents him from learning about his own business. The least he can do is to attend meetings where votes are to be taken or to fill out ballots and questionnaires that come to his desk." —From the *Pittsburgh Medical Bulletin* of April 29, 1939.

. . .

"The general public has little realization of the tremendous amount of effort expended annually by individual physicians and by organized medicine in combating pernicious legislative measures sponsored by misguided enthusiasts and by those with ulterior motives. There isn't a legislature in America which does not annually have bills presented for consideration which would, if enacted, destroy health protection. The opposition of medicine to such measures is based on its obligation to protect the public health, and to protect scientific and clinical investigation into the nature of disease

"In its opposition to measures that threaten the public welfare, medicine employs no lobby. To accomplish its purpose, it must depend on the influence of enlightened public opinion. American facilities for medical care are unsurpassed but much remains to be accomplished before the ideals of medicine are realized. In their realization, society has obligations no less than those of medicine"—Dr. William H. Homes, of Northwestern University Medical School, brings home an important point

THYROID DISORDERS VIII OPERABILITY OF THE HYPER- THYROID PATIENT AS INDICATED BY THE RESPONSES TO OPERATION

EMIL GOETSCH, M D , Brooklyn, New York

(From the Department of Surgery Long Island College Hospital and Long Island College of Medicine)

THE operability of patients with hyperthyroidism is naturally dependent upon their tolerance to operative procedures. This tolerance is, in general, dependent upon the clinical condition of the patient and the severity and duration of the hyperthyroidism. Hyperthyroid patients are well known to be highly sensitive to operation and in spite of all our methods of preoperative preparation and technical safeguards, an occasional postoperative crisis, which may prove fatal, is encountered. Our most useful criteria of operability have commonly been clinical data obtained from the history and examination and the basal metabolic rate. Unfortunately they have not been entirely reliable. Notwithstanding a most careful consideration of these criteria and the evaluation of the clinical data and the intensity of the hyperthyroidism, the surgeon is often surprised to find a brisk, unanticipated postoperative reaction. There is a fundamental hypersensitivity which cannot always be appreciated after our ordinary methods of examination and which is the primary factor in the operability of the hyperthyroid patient. Accordingly an attempt was made in the studies, to be reported, to evaluate this hypersensitivity and thus add another valuable criterion of operability to those that we have in the clinical data and the metabolic rate.

This hypersensitivity of the hyperthyroid patient is revealed in characteristic physiologic responses before, during, and after operation. These responses were subjected to detailed study in a large number of patients with goiter. A preliminary report of the results of this

study was made in 1934 (Goetsch and Ritzmann).¹ These results indicated that the responses to operation are precisely of the same character and degree as those that can be evoked by the administration of adrenalin in the same patient before operation. They are characterized by increased apprehension, vasomotor changes, tremor, and tachycardia, followed almost immediately after the beginning of operation or the subcutaneous injection of adrenalin, respectively, by a sharp rise of the systolic blood pressure, pulse pressure, pulse, and often of respirations. Simultaneously there is an increase in the total leukocyte count and a change in the differential count characterized by a mononucleosis and a fall in the polymorphonuclear count. There is also an increase in the blood sugar and the body temperature. These responses reach their maximum in about twenty minutes and thereupon in the average moderately toxic case gradually subside to the previous normal levels. It had long been known that patients with hyperthyroidism are unusually hypersensitive to adrenalin (Goetsch),² and it appears that the role of adrenalin is a most important factor in the hypersensitivity to operation. That this hypersensitivity is secondary to the stimulating influences of adrenalin upon the sympathetic nervous system, previously rendered hypersensitive by the excessive thyroid secretion, receives physiologic support from the experiments of Cannon,^{3,4} who showed furthermore that fear, painful stimuli, and anesthesia, which are inherent in every major opera-

CHART 1 (CASE 1) Negative operative responses during excision of tuberculous cervical glands in a control, nonhyperthyroid patient Preoperative basal metabolic rate -9 per cent. Nitrous-oxide-oxygen anesthesia.

tion, are capable of producing increased secretion of the adrenal glands

It seemed advantageous to interpret the operative responses in the hope of finding an index of hypersensitivity and thus a further criterion of operability. Detailed studies have been made of these responses during operations on many hundreds of thyroid patients admitted to the Long Island College Hospital. The reactions of blood pressure, pulse, and respiration are routinely recorded by an experienced anesthetist before and at five-minute intervals during the operation. A graph of these findings is plotted and is constantly available to the surgeon. These responses are felt to be sufficient, for practical purposes, to enable the operator to judge the degree of sensitivity. Control patients with various common surgical conditions and patients with colloid, exophthalmic, and toxic adenomatous goiters of varying degrees of toxicity were included in the studies and the various factors incidental to the operative procedures were carefully controlled. The anesthetics were administered by anesthetists of wide experience with goiter patients. The preliminary preparation with morphine and atropine was uniform and the gas anesthetics employed were nitrous oxide and cyclopropane. Avertin by rectum (supple-

mented by gas) and local (novocaine) anesthesia were also employed. In the following report of the clinical studies representative cases of exophthalmic goiter of varying degrees of sensitivity and toxicity have been chosen. An analysis and a graphic chart of each case are presented. The operative reactions produced by excision of adenomatous goiters will not be considered in this report. Suffice it to say that they are of the same general character as those seen in exophthalmic goiter but are relatively far less intense. The postoperative responses are correspondingly of less severity.

Clinical Studies

NEGATIVE OPERATIVE RESPONSES DURING EXCISION OF TUBERCULOUS CERVICAL GLANDS IN A CONTROL NONHYPERTHYROID PATIENT NITROUS-OXIDE-OXYGEN ANESTHESIA Operative responses were observed in control nonhyperthyroid patients upon whom operations comparable to thyroidectomy were performed. These responses, in a representative instance, are graphically illustrated in Chart 1, and were observed during resection of tuberculous cervical glands in the following case:

Case 1 Chart 1—A woman, aged 25, was admitted to the Long Island College Hospital on

CHART 2 (CASE 2) Negative operative and postoperative reactions in a control hemithyroidectomy for removal of a carcinomatous nodule in the right lobe of an otherwise normal thyroid gland. Preoperative basal metabolic rate -15.3 per cent. Nitrous-oxide-oxygen anesthesia.

March 5 1933 with the diagnosis of tuberculous cervical adenitis. Her general health was good. Four months previously following a sore throat a swelling appeared immediately below the left ear and slowly increased in size. General physical and clinical examinations were negative except for the presence of a moderate anemia. A mass of enlarged lymph glands, approximately the size of a golf ball, was found below the left ear. The basal metabolic rate was -9 per cent.

Excision of tuberculous cervical glands Nitrous-oxide-oxygen anesthesia March 6, 1933

Operative Reaction—The systolic blood pressure before operation is 110 mm. Hg (Chart 1). There is a gradual fall to 84 at the beginning of the operation. Thereupon minor fluctuations are seen and at the end the pressure is 86. The normal diastolic pressure is 72. It falls to 40 at the beginning of operation and remains approximately at this level to the end. The pulse pressure is 28 at the start and maintains this level throughout operation. There is a slight rise of respirations from 24 to 30 during operation.

Comment—In the nonhyperthyroid patient, operation, comparable to thyroidectomy, produces a negative response on the part of the blood pressure, pulse pres-

sure, pulse, and respirations. The post-operative course was uneventful, the highest temperature was 99.6°F and highest pulse, 108. Subjectively she was comfortable.

CONTROL HEMITHYROIDECTOMY FOR REMOVAL OF A CARCINOMATOUS NODULE IN THE RIGHT LOBE OF AN OTHERWISE NORMAL THYROID GLAND. NEGATIVE OPERATIVE AND POSTOPERATIVE REACTIONS. PREOPERATIVE BASAL METABOLIC RATE -15.3 PER CENT.

Case 2 Chart 2—Mrs L., aged 28, was admitted to the Long Island College Hospital on November 28 1934 with the complaint of a small nodule the size of a hazelnut in the right thyroid region. There were no symptoms or findings indicative of hyperthyroidism. General physical examination was negative except for the presence of a firm nodule the size of a hazelnut in the superior pole of the right thyroid lobe. There were no glandular metastases. The pulse was 80. The basal metabolic rate following the preoperative administration of iodine was -15.3 per cent.

Radical right lobectomy Nitrous-oxide anesthesia November 28, 1934 Microscopic examination of the excised nodule confirmed the preoperative diagnosis of carcinoma. The patient made an uneventful convalescence. The basal metabolic

CHART 3 (CASE 3) Moderate operative and postoperative reactions in thyroidectomy for exophthalmic goiter with moderate hyperthyroidism Good clinical remission following preoperative iodine Basal metabolic rate + 13.2 per cent

rate, twenty days following operation, was -10.3 per cent

Operative Reaction—In this nonhyperthyroid patient, right hemithyroidectomy produces the following responses After anesthesia is established there is a moderate fall of systolic and diastolic pressures which then rise slightly above the preoperative levels Thereupon the systolic pressure falls slightly below while the diastolic pressure remains slightly above the preoperative level There is a slight decrease in the pulse pressure Both systolic and diastolic pressures remain below their preoperative levels during the postoperative period The pulse is moderately accelerated soon after operation is begun, the peak is only briefly maintained, and then a fall occurs at the end of the operation to a level moderately above the preoperative level

Postoperative Period—The pulse during the first two postoperative days is well below the rate maintained during operation The respiratory rate, which was moderately accelerated during operation, declines to its normal level immediately after operation There is a minimal and temporary response of the

blood pressure to hemithyroidectomy Immediately after the close of operation and during the postoperative period, all the responses fall to a level below their preoperative levels There was no elevation of the pulse and the highest rectal temperature was 99.4 F The patient was entirely comfortable

Comment—There is thus a completely negative response to hemithyroidectomy in the nonhyperthyroid patient and the postoperative reaction is similarly negative In other words, a mild or negative operative response is followed by a negative postoperative reaction

MODERATE BUT TEMPORARY OPERATIVE REACTIONS DURING THYROIDECTOMY FOR EXOPHTHALMIC GOITER IN THE AVERAGE PATIENT EXHIBITING MODERATE HYPERTHYROIDISM No PREVIOUS MEDICAL TREATMENT WITH IODINE GOOD CLINICAL REMISSION AND BASAL METABOLIC RATE OF +13.2 PER CENT FOLLOWING PRE-OPERATIVE INTENSIVE TREATMENT WITH IODINE

Case 3 Chart 3—Mrs L B, aged 40, came for examination on March 18, 1938, complaining of symptoms of hyperthyroidism which

began three months previously following a "cold." A basal metabolic rate of +36 per cent was reported at that time. She had lost 8 pounds in weight. Judging from the symptoms and course of the disease one would consider the hyperthyroidism to be of moderate intensity. She had received no medical treatment with iodine.

Upon examination slight exophthalmos which was more definite on the left, was noted. The thyroid gland was diffusely enlarged and presented definite vascular signs. Her pulse was 90 and her weight 141 pounds. Operation was advised and she was given Lugol's solution in doses of ten minims three times daily for fourteen days. After this treatment there was a slight gain in weight and she felt much improved. The pulse was reduced to 80 and extrasystoles which had been frequent before the treatment with iodine disappeared. The thyroid gland became firm and the vascularity was definitely diminished. A good clinical remission was obtained and the basal metabolic rate was +13.2 per cent after the treatment with iodine.

Double lobectomy for exophthalmic goiter. Cyclopropane anesthesia. April 8 1938

Operative Reaction—The systolic pressure, which had been 130 mm Hg, falls to 120 just before operation as a result of the preliminary sedative. There is no increase in the pressure as patient comes to the operating room. Immediately after the beginning of anesthesia and to the time of the incision, there is an elevation of pressure followed promptly by a further increase to a height of 106 at the beginning of the right lobectomy. Thereupon there is a moderate fall to the time when left resection is begun, following which there is a progressive moderate decline to the preoperative level of 138 mm Hg.

The diastolic pressure, just before operation, is 60 mm Hg. From the time the patient comes to the operating room to the beginning of anesthesia, there is a progressive elevation to a maximum of 100 when the resection of the right lobe is begun. It is then sustained at this level to the time of the left lobectomy after which there is a decline to 80 mm Hg at the close of the operation. The pulse pressure accordingly does not rise above its preoperative level.

The pulse before operation is 90 and falls to 74 before and after anesthesia is established. From this level it rises to a maximum of 108 during the right lobectomy and then declines to 96 during the remainder of the operation. There is no significant change in respirations.

Postoperative—During the four postoperative days the systolic pressure, which was 138 mm Hg at the close of operation, slowly declines and at the end of four days is 128. There is also a gradual decline of the diastolic pressure from 90 to 78 mm Hg. The pulse which was 96 at the close of the operation gradually declines to 80. The temperature which before operation was 98 F rises on the third day following operation to its highest point of 100.6 F by rectum. The postoperative subjective reaction was entirely comfortable. There was no nausea or vomiting. She took nourishment well and made a rapid uneventful recovery.

Comment—This case illustrates the following. A patient with exophthalmic goiter, previously untreated with iodine and with moderately severe hyperthyroidism, reacts with a good clinical remission and a satisfactory fall of metabolic rate following the preoperative treatment with iodine. She represents, perhaps, the average moderately toxic case of exophthalmic goiter untreated medically with iodine. The operative response to double lobectomy is moderate. There is a progressive fall of blood pressure and pulse after the maximum reaction is past, early in the operation. The postoperative manifestations were moderate and the subjective status of the patient was entirely comfortable. A prompt recovery followed. Patients belonging to the group, of which this case is an illustrative example, are characterized by exhibiting a moderate operative response to thyroidectomy which is followed, in the great majority of instances by a moderate uneventful postoperative reaction.

MODERATE AND SUSTAINED OPERATIVE AND POSTOPERATIVE REACTIONS IN THY

CHART 4 (CASE 4) Moderate and sustained systolic and pulse pressures and fairly sharp postoperative responses in thyroidectomy for exophthalmic goiter with fairly marked hyperthyroidism exacerbated by the prolonged treatment with iodine. Poor remission following preoperative iodine. Preoperative basal metabolic rate +68.5 per cent. Avertin and cyclopropane anesthesia.

ROIDECTOMY FOR EXOPHTHALMIC GOITER ASSOCIATED WITH FAIRLY MARKED HYPERTHYROIDISM EXACERBATED BY THE PROLONGED TREATMENT WITH IODINE POOR REMISSION FOLLOWING PREOPERATIVE TREATMENT WITH IODINE

Case 4 Chart 4—Mrs M. C., aged 32, complained of typical symptoms of hyperthyroidism, which had been present for one year and which grew progressively worse. Small doses of potassium iodide, together with iodex injections, were given over a period of seven months until one month before her first examination by me on February 4, 1938. She had lost 12 pounds in weight. The thyroid gland was definitely enlarged, and showed moderate vascular signs. The pulse was 134. Lugol's solution in doses of five minims three times daily was administered for fifteen days preceding operation. A poor clinical remission followed and the basal metabolic rate, following the preoperative treatment with iodine, remained high, registering +68.5 per cent.

Double lobectomy Avertin and cyclopropane anesthesia February 21, 1938 Avertin was chosen because of the presence of a fairly marked hyperthyroidism and a mitral cardiac lesion.

Operative Reaction—Contrary to the usual experience when gas anesthesia alone is employed, a brief fall of both systolic and diastolic pressures occurs as the patient comes to the operating room. Immediately after the incision is made a sharp rise of both occurs. The usual effects of avertin are dissipated and the stimulating influences of the operative procedure make themselves felt. At the beginning of anesthesia there is a sharp psychic rise of pulse, which thereupon shows a marked fall after anesthesia is established. During the remainder of the operation the pulse rate rises briefly and then declines to a moderate rate. The systolic blood pressure is maintained at the high level of 154 mm Hg, the diastolic falls toward the end of the operation, and the pulse pressure accordingly is definitely increased. The respiratory rate is moderately increased during operation.

Postoperative—The postoperative manifestations are moderately acute and characterized by a definite rise of systolic and a fall of diastolic pressures and a

CHART 5 (CASE 5) Sharp responses in thyroidectomy for exophthalmic goiter associated with fairly marked hyperthyroidism. The hypersensitivity of the patient to operative procedure persists in spite of a good remission following preoperative treatment with iodine and a preoperative basal metabolic rate of +13 per cent. Sharp postoperative reaction.

fairly definite and irregular increase in the pulse rate. The respirations gradually become less rapid. Subjectively the patient at this time was fairly comfortable. The early restlessness soon disappeared, following which nourishment was well taken. There was no vomiting. The highest rectal temperature, which occurred twenty four hours after operation, was 102 F and the highest pulse, 120. The postoperative reaction would be considered moderately active and proportional to the operative response.

Comment—This case illustrates the behavior of the operative responses during double lobectomy for exophthalmic goiter in certain patients who have been continuously treated over long periods of time with iodine with a resultant moderate exacerbation of symptoms. A poor clinical remission commonly follows the preoperative treatment with iodine and the metabolic rate may remain high. The operative response is sharp but not so severe as to preclude the assumption of the risk involved in the double lobectomy. The postoperative response is fairly sharp but not severe.

SHARP OPERATIVE AND POSTOPERATIVE REACTIONS DURING AND AFTER THYROIDECTOMY FOR EXOPHTHALMIC GOITER ASSOCIATED WITH FAIRLY MARKED HYPERTHYROIDISM. NO PREVIOUS MEDICAL TREATMENT WITH IODINE. GOOD REMISSION FOLLOWING PREOPERATIVE TREATMENT WITH IODINE BUT HYPERSENSITIVITY OF THE PATIENT PERSISTS.

Case 5 Chart 5—Mrs. L. Y. aged 34 suffered with a fairly toxic hyperthyroidism of one year's duration. She did not receive treatment with iodine. There was a loss of 40 pounds in weight during the two years preceding her first examination by me on September 20, 1933. The thyroid gland was diffusely enlarged and showed the usual vascular signs. The pulse was 110 and the basal metabolic rate +49 per cent. Preoperative treatment with Lugol's solution was given in doses of ten minims three times daily for ten days. Intravenous injections of 10 grains of sodium iodide were given daily for three days preceding operation. As a result, a good clinical remission was obtained. The basal metabolic rate registered +12 per cent and the pulse 110.

Double lobectomy Nitrous oxide-oxygen anesthesia October 2, 1933 The

CHART 6 (CASE 6) Sharp but brief reactions during the first fifteen minutes of thyroidectomy for exophthalmic goiter with fairly marked hyperthyroidism. Moderate iodine exacerbation. Poor clinical remission following preoperative administration of iodine. Basal metabolic rate of +28 per cent. Inasmuch as the maximum reaction is brief and is followed by a sharp and early decline of pressures and pulse, second lobectomy is safely performed. Uneventful postoperative period.

typical colloid, exophthalmic gland seen after treatment with iodine was found.

Operative Reaction—There is a moderate fall of the patient's normal systolic and diastolic pressures and pulse as she comes to the operating room. (This is doubtless due to the preliminary administration of morphine.) From the start of anesthesia to the time of the incision a definite rise of pressure and pulse occurs, the systolic pressure reaching a peak of 164 mm Hg, the diastolic 85 mm Hg, and the pulse 135. Thereupon there is a fall and at the end of operation the systolic pressure registers 138 mm Hg, the diastolic 85, and the pulse 108. The respiratory rate is moderately increased during operation. (A fairly sharp operative reaction is seen in a patient with fairly marked hyperthyroidism. The hypersensitivity continues even though a good postiodine remission was obtained.)

Postoperative—The postoperative responses are also fairly marked with the highest points reached as follows—systolic

pressure 158 mm Hg, diastolic 90, pulse 110, and rectal temperature 102.5 F. The subjective status of the patient was proportionate to the operative reaction. She complained considerably of nausea, of pain in the operative field, and of "gas on the stomach." She was very restless for twenty-four hours but on the following day she was fairly comfortable.

Comment—This case is illustrative of a certain group. Occasionally patients with exophthalmic goiter untreated with iodine and with fairly toxic hyperthyroidism react with good clinical remissions and a marked fall in the basal metabolic rates following the preoperative treatment with iodine. It would seem from previous experiences that the operative responses during thyroidectomy should be moderate, and should be followed by a moderate and comfortable postoperative reaction. However, in spite of the apparently good clinical condition of a patient in this group, the operative re-

sponse is decidedly sharp and the post operative period definitely uncomfortable. The hypersensitiveness of the patient persists even though the clinical symptoms and the basal metabolism are controlled by the preoperative treatment with iodine. The relatively low preoperative metabolic rate is not a reliable criterion of the intensity of reaction to be expected during thyroidectomy.

SHARP BUT BRIEF OPERATIVE AND MILD TO MODERATE POSTOPERATIVE REACTIONS IN THYROIDECTOMY FOR EXOPHTHALMIC GOITER WITH FAIRLY MARKED HYPERTHYROIDISM. PREVIOUS IODINE THERAPY AND MODERATE IODINE EXACERBATION. POOR REMISSION FOLLOWING PREOPERATIVE ADMINISTRATION OF IODINE.

Case 6 Chart 6—Mrs. E. K., aged 72, was first seen by me on September 24, 1934. She suffered with definite symptoms of hyperthyroidism for a period of ten months during the last six of which she lost 20 pounds in weight. She had taken Lugol's solution in doses of five minims three times daily for six weeks preceding her first visit. She was considered to be in a moderate "iodine exacerbation." She was given Lugol's solution in doses of ten minims three times daily for thirteen days, following which there was a poor clinical remission and the metabolic rate was +28 per cent. The thyroid gland was diffusely prominent and firm as a result of accumulation of colloid and showed moderate vascular signs. The pulse was 112. The diagnosis of exophthalmic goiter was clear.

Double lobectomy Nitrous-oxide-oxygen anesthesia October 12, 1934

Operative Reaction—The blood pressure and pulse immediately rise as the patient comes to the operating room, and continue elevating to a maximum about twenty minutes after the incision is made. The systolic pressure, which is 154 mm. Hg at the beginning, reaches a maximum of 220 mm. Hg, the diastolic 110 mm. Hg, and the pulse 186. The pulse pressure, however, increases only 24 mm. Hg. The changes in the respiratory rate are not significant. The responses, having passed their maximum before the left resection is begun, promptly decline, indicating that the stimulating

forces have spent themselves, whereupon the resection of the left lobe is completed. This early secondary sharp fall of pressure and pulse during operation is followed by a comfortable and moderate reaction.

Postoperative—The response, in spite of the early, sharp, severe but temporary operative reaction, is only mild to moderate. The highest systolic pressure during the early hours is 142 mm. Hg, the maximum pulse 128, and rectal temperature 102.8 F. Subjectively the patient was fairly comfortable. There was no unusual restlessness and she complained little, except for some soreness of her throat. During the first ten postoperative days a gradual subsidence of pulse and temperature occurs, whereas the systolic pressure remains approximately 135 mm. Hg. Ninety days after operation the systolic pressure returns to its former preoperative level of 155 to 158 mm. Hg, the pulse is 78, and the basal metabolic rate -2.1 per cent.

Comment—An elderly woman, with exophthalmic goiter, developed a moderately acute iodine exacerbation following treatment for six weeks with Lugol's solution. She received intensive preoperative treatment with iodine for thirteen days, following which a poor clinical remission was obtained though the basal metabolic rate was only +28 per cent. She had a sharp psychic reaction on coming to the operating room followed by sharp and dramatic increases of pulse and of systolic and diastolic pressures. This augmentation of signs is, however, brief and in twenty minutes, when the resection of the right lobe is almost completed, there is a sharp fall in pulse rate and pressure. This, together with the fact that at this same time the pulse pressure has increased only 24 mm. Hg, encouraged the operator to complete the double lobectomy with the feeling that no great risk was involved. Had the reaction been sustained at the level of its maximum or approximately 220 and, in particular, had there been a greater increase in the pulse pressure,

CHART 6 (CASE 6) Sharp but brief reactions during the first fifteen minutes of thyroidectomy for exophthalmic goiter with fairly marked hyperthyroidism Moderate iodine exacerbation. Poor clinical remission following preoperative administration of iodine Basal metabolic rate of +28 per cent Inasmuch as the maximum reaction is brief and is followed by a sharp and early decline of pressures and pulse, second lobectomy is safely performed Uneventful postoperative period

typical colloid, exophthalmic gland seen after treatment with iodine was found

Operative Reaction—There is a moderate fall of the patient's normal systolic and diastolic pressures and pulse as she comes to the operating room (This is doubtless due to the preliminary administration of morphine) From the start of anesthesia to the time of the incision a definite rise of pressure and pulse occurs, the systolic pressure reaching a peak of 164 mm Hg, the diastolic 85 mm Hg, and the pulse 135 Thereupon there is a fall and at the end of operation the systolic pressure registers 138 mm Hg, the diastolic 85, and the pulse 108 The respiratory rate is moderately increased during operation (A fairly sharp operative reaction is seen in a patient with fairly marked hyperthyroidism The hypersensitivity continues even though a good postiodine remission was obtained)

Postoperative—The postoperative responses are also fairly marked with the highest points reached as follows—systolic

pressure 158 mm Hg, diastolic 90, pulse 110, and rectal temperature 102.5 F The subjective status of the patient was proportionate to the operative reaction She complained considerably of nausea, of pain in the operative field, and of "gas on the stomach" She was very restless for twenty-four hours but on the following day she was fairly comfortable

Comment—This case is illustrative of a certain group Occasionally patients with exophthalmic goiter untreated with iodine and with fairly toxic hyperthyroidism react with good clinical remissions and a marked fall in the basal metabolic rates following the preoperative treatment with iodine It would seem from previous experiences that the operative responses during thyroidectomy should be moderate, and should be followed by a moderate and comfortable postoperative reaction However, in spite of the apparently good clinical condition of a patient in this group, the operative re-

appear subsequently, the operative and postoperative reactions were definitely acute.

Operative Reaction—In referring to Chart 7 one notes a prompt and progressive elevation of the systolic blood pressure as the patient comes to the operating room and to the time of the incision. Thereupon it progressively rises and reaches a peak of 188 mm. Hg when the resection of the second lobe is begun. Note that the systolic pressure is well sustained, being 182 mm Hg at the end of operation. The pulse rate is markedly accelerated and reaches a maximum of 160 soon after anesthesia is begun and then falls to a level of 110 when the resection of the second lobe is begun, only to begin a secondary rise to 140 at the end of operation.

There is an initial fall of the diastolic, followed by a rise approximately to 85 mm. Hg, which is maintained to the end of operation. Note further that the pulse pressure augments markedly from 60 mm. Hg before operation to 102 mm Hg during the summit of the reaction. There is a moderate increase of respirations. In brief, one sees a sharp elevation of systolic pressure which tends to be maintained at a high level, there is a sharp augmentation of pulse at the beginning and a subsequent fall followed by a secondary rise, to the end of the operation, and a definite increase of respirations. These operative responses indicate a reaction of marked intensity.

Postoperative Period—Soon after the completion of the operation the heart begins to fibrillate, and twenty six hours later the apical rate is 180 and the radial 170. Four hours later the cardiac rhythm is again regular, the pulse rate declines and finally, forty-eight hours after operation, the pulse is 120, the systolic pressure is maintained at a high level of 174 mm Hg, and the diastolic is 75, producing thus an augmented pulse pressure of 99 mm Hg. During the succeeding days the systolic and pulse pressures decline to levels below those preceding the operation.

A stormy period of forty-eight hours followed operation. The patient was extremely restless and appeared to be in crisis. The heart fibrillated and the pulse was extremely irregular, the apical beat being 180 at its highest and the radial 120. He was constantly clearing his throat and complaining of various annoyances. The highest rectal temperature during this period was 104.2 F. His condition gave considerable concern. Recovery was gradual and the patient left the hospital twelve days after operation. On the thirtieth postoperative day the general condition is excellent and, as noted in Chart 7, the systolic blood pressure has fallen to 140 mm Hg and the diastolic to 78. The pulse is 80. Temperature and respirations are normal and the basal metabolic rate +4.4 per cent.

Comment—This case illustrates the behavior of certain patients who have been treated over prolonged periods with iodine in alternating minimal and maximal doses. Wide fluctuations in the severity of the symptoms and in the basal metabolic rates are noted. A fairly acute iodine exacerbation finally develops. Following further intensive treatment with iodine, the clinical status is not improved and the basal metabolic rate is +38 per cent. When compared with the previous case, the following differences are noted. In the present instance, acute aggravation of symptoms was precipitated by the administration of varying amounts of iodine for nine months whereas in the previous patient treated continuously over a period of six weeks with moderately large amounts of iodine the exacerbation was only mild to moderate. The metabolic rate, however, was only 10 per cent higher. Furthermore, the operative reaction was considerably more intense in the following respects. The marked augmentation of the systolic pressure was sustained to the end of the operation. Similarly the increase in pulse pressure was marked and sustained. The pulse rate was sharply accelerated during the first few minutes of the operation. A decline and a sharp secondary rise to

CHART 8 (CASE 8) Extremely acute operative and postoperative responses associated with hemithyroidectomy for exophthalmic goiter in a patient with severe hyperthyroidism and in critical iodine exacerbation. Note the marked increase in pulse pressure. Postoperative crisis and death, fourteen and one-half hours after operation.

the end were then noted. The respiratory rate was also definitely increased. This intense reaction anteceded a severe postoperative reaction, virtually a crisis, which was the cause of considerable anxiety for forty-eight hours. Had the operator anticipated the possibility of such crisis, hemithyroidectomy would have been done. Operative reactions of the type described are now interpreted as warning signals. The basal metabolic rate would hardly have made one suspect such unusual hypersensitivity in this patient.

EXTREMELY INTENSE OPERATIVE AND POSTOPERATIVE REACTIONS ASSOCIATED WITH HEMITHYROIDECTOMY FOR EXOPHTHALMIC GOITER IN A PATIENT WITH SEVERE HYPERTHYROIDISM AND IN SEVERE IODINE EXACERBATION. POSTOPERATIVE CRISIS AND DEATH

Case 8 Chart 8—Mrs. L. A., aged 53, suffered with symptoms of hyperthyroidism, the acute onset of which occurred two months previous to her first examination by me on November 5, 1934. Two weeks after the beginning of symptoms the basal metabolic rate was +61 per

cent. At this time treatment with Lugol's solution, in doses of five to ten minims, was given three times daily over a period of five weeks and then discontinued for a week preceding her first visit. Progressive aggravation of the symptoms followed. Upon examination it was evident that she was in a phase of acute iodine exacerbation. She was extremely nervous. During a period of eight weeks she had lost 12 pounds in weight, the heart was fibrillating, the apex beat being 160 and the radial 120, and the pulse deficit was 40. She complained of epigastric distress and nausea. Definite diffuse enlargement of the thyroid gland, which showed mild to moderate vascular signs, was noted. She weighed 104 pounds. General supportive measures were given. Lugol's solution was again administered in doses of five minims three times daily and sodium iodide was given intravenously. No remission of symptoms occurred. She continued to lose weight, the heart continued to fibrillate, the apical rate increased to 168, and the radial to 128. The toxemia progressively increased, causing frequent vomiting spells. The basal metabolic rate on November 30, 1934, was reported as +91 per cent. (This reading may have been erroneously high since the patient was not inclined to be cooperative.) The hyperthyroidism was evidently intense and attrib-

able at least in part to the interruption in the treatment with iodine.

In view of the improbability of securing improvement from further general measures, *ligation of the right superior thyroid artery under novocaine anesthesia was done on November 19, 1934, and ligation of the left superior thyroid artery on November 23, 1934*. These operations were fairly well tolerated, though there was a sharp operative reaction in each instance, the pulse rate increasing to 180 and more. There was no appreciable improvement following these procedures. The excitability of the patient continued and evidences of mental aberration appeared. The alternative presented itself of abandoning all operative measures and condemning the patient to a hopeless outcome or making some further attempt with more radical measures. The pre-operative basal metabolic rate was +71.7 per cent. The heart continued to fibrillate, the apical rate being 120 and the radial 105. In virtual desperation and with full appreciation of the dangers inherent in further operative measures, *right lobectomy under nitrous-oxide-oxygen anesthesia was performed on December 3, 1934*, nine days after the second ligation operation. A large vascular gland containing a considerable amount of colloid was found. The general condition of the patient was critical at the end as it had been at the beginning of operation.

Operative Reaction—Immediately upon the arrival of the patient in the operating room there is a sharp and continuous increase in the pulse rate (Chart 8). Forty minutes after the incision is made it registers 200 and finally reaches its maximum of 206. There is no tendency of the pulse rate to subside toward the end of the operation. The systolic pressure augments acutely from 100 mm. Hg before operation to 180 ten minutes after the incision is made. Thereupon there is a temporary fall to 140 and a subsequent secondary rise to 165 mm. Hg. The diastolic pressure rises from 72 mm. Hg to 105 and then gradually falls to 75. There is a marked augmentation of pulse pres-

sure during operation to 75 mm. Hg, as compared with 26 mm. Hg before operation. Respirations increase from 24 to a maximum of 35 at the peak of the operative reaction.

The extremely intense operative response is characterized by the precipitous rise of pulse, blood pressure, and respirations and by the failure of these to abate from their unusually high levels by the time the operation is completed.

Postoperative Period—One and one half hours following operation the apical pulse rate subsides to 145 and the radial rate to 125. A collapse of the blood pressure is noted, the systolic declining to 95 mm. Hg, while the diastolic is not definitely obtainable, being indicated as 12 mm. Hg. Thereupon, ten hours after operation while the heart is still fibrillating, there occurs a precipitous increase of the apical rate to 182 and of the radial to 155. The systolic pressure rises to 130 mm. Hg and the rectal temperature to 100.8 F.

During the postoperative period the patient was semiconscious and extremely restless. It was evident that she was in extreme crisis. The excitability was uncontrollable even by large amounts of sedatives, and in spite of all available therapeutic measures, she died fourteen and one-half hours after operation.

Comment—Though the result of hemithyroidectomy was disastrous, this case is instructive. A woman with exophthalmic goiter, who was in a phase of acute and severe iodine exacerbation in part, at least, due to discontinuance of the prolonged use of iodine before she appeared for surgical treatment, failed to improve after further intensive treatment with iodine. In fact, a progressive aggravation of symptoms occurred. Ligations of the superior thyroid arteries effected little or no improvement. As a last desperate measure and with full appreciation of the dangers on the part of the operator, right hemithyroidectomy was done. This precipitated a critical operative reaction that is evident in Chart 8. The extreme and sustained

CHART 9 (CASE 9) Sharp reactions in hemithyroidectomy for exophthalmic goiter in a chronic state of "iodine saturation " No improvement with further preoperative treatment with iodine. The hyperthyroidism appears to be controlled but there is a persistence of marked hypersensitivity requiring stage operations Preoperative basal metabolic rate +35 per cent Nitrous-oxide-oxygen anesthesia Severe postoperative reaction

operative responses are continuous with similar postoperative reactions An intense immediate postoperative crisis followed from which the patient died

Crisis thus appears to be a direct result of critical phenomena precipitated by operation and characterized by intense and sustained augmentation of blood pressure, pulse pressure, pulse, and respirations Similar, intense reactions are characteristic of postoperative crisis

STAGE OPERATIONS, PERFORMED IN INSTANCES IN WHICH THE OPERATIVE REACTIONS ARE SHARP AND WOULD SEEM TO INDICATE THAT DOUBLE LOBECTOMY WOULD NOT BE SAFE HEMITHYROIDECTOMY FOR EXOPHTHALMIC GOITER, IN A CHRONIC STATE OF "IODINE SATURATION," AFTER PROLONGED PERIODS OF TREATMENT WITH IODINE PERSISTENCE OF HYPERSENSITIVITY TO OPERATIVE MEASURES

Case 9 Chart 9—Miss R, aged 23, was first seen by me on October 4, 1934 She complained of symptoms typical of moderate hyperthyroidism which began nine months to a year previously She had lost 43 pounds in weight

during the preceding year and a half Her weight before onset of the hyperthyroidism was 205 pounds Following the administration of Lugol's solution in doses of ten minims three times daily, from November, 1933, to February, 1934, there was only minor improvement. The basal metabolic rate was +21 per cent Iodine treatment was then discontinued During August, 1934, she again received Lugol's solution in doses of twenty minims daily When she was first seen in October, 1934, she was apparently in a state of moderate chronic hyperthyroidism induced by large doses of iodine administered to the point of iodine "saturation" over prolonged periods during the preceding eleven months The thyroid gland was large, bulging, and firm to palpation Vascular signs were definite The pulse rate of 82 was surprisingly low Definite exophthalmos was present and the diagnosis of exophthalmic goiter was clear The administration of Lugol's solution, in doses of ten minims three times daily for eleven days, failed to produce definite improvement The basal metabolic rate on October 22, 1934, was +35 per cent and the pulse 94 Resection of the thyroid gland was advised

Right lobectomy and excision of the isthmus Nitrous-oxide-oxygen anesthesia October 22, 1934

Operative Reaction—The normal systolic pressure is 115 mm Hg (Chart 9). It increases to 136 as the patient comes to the operating room, then declines to 108 at the time of the incision. Thereupon there is a precipitous ascent to 156. Within a period of twenty or twenty five minutes, when the resection of the right lobe is completed, it is still higher, being 160. The operation is restricted to right hemithyroidectomy, whereupon the systolic pressure gradually subsides to 130 at the end of the operation. The diastolic pressure before operation is 70 mm Hg. It drops slightly until the incision is made then rises to a maximum of 84 during the right resection and then declines gradually to 74 at the end. The pulse pressure before operation is 45 mm Hg and at the height of reaction advances to 76 mm Hg. The pulse rate at the beginning is 82, rises to 94 when patient is brought to operating room, and during induction of anesthesia mounts promptly to 120. Thereupon it falls to 85 when the incision is made and again rises abruptly to 120 upon completion of the hemithyroidectomy. Thereupon a more extensive procedure is not considered advisable. The pulse decreases to 108 at the end. The respirations rise from 22 before operation to 36 at the summit of the reaction and then decline to 26 at the end.

Postoperative—The sharp operative response with a temporary moderate subsidence toward the close of operation is followed promptly by a sharp postoperative reaction. The systolic pressure, which declines to 125 mm. Hg thirty minutes after completion of operation, augments during the succeeding eight hours to 146. Thirty two hours later, at the maximum, the systolic pressure again increases to 146, after which there is a decline approximately to the preoperative normal, in fifty two hours. During this same postoperative period there is an early increase in the diastolic pressure which subsequently declines to an average of 60 mm Hg. The definite increase of pulse pressure observed during operation is sustained during the early postoperative period.

At the peak of the postoperative response, the pulse pressure is 86 mm Hg, as compared with 76 during, and 45 before operation. The pulse, in general, parallels the behavior of the systolic pressure, rising from 105 to 120 during the peak of the response and declining to 98 at the end. The highest postoperative rectal temperature is 103.0 F. The respirations average 32.

During the first two postoperative days the subjective and objective manifestations were characteristic of a sharp reaction. The patient was unusually nervous and excitable. She perspired freely and was annoyed by considerable nausea and vomiting. Thereafter convalescence was satisfactory. Twelve days after operation the systolic blood pressure is 112 mm Hg, the diastolic 60, the pulse 102, respirations 24, and temperature 99 F.

Comment—This case illustrates the following points. A patient with exophthalmic goiter, having been treated with iodine for eleven months, with alternating periods of interruption of treatment, finally appears to be in a state of chronic controlled moderate hyperthyroidism, the symptoms of which are not alarming. The thyroid gland appears to be 'saturated' with iodine. At any rate, further treatment fails to produce improvement. The clinical manifestations, the pulse of 94, and the basal metabolic rate of +35 per cent, seem to indicate that a double lobectomy could be done without hesitation or anxiety. There had been, however, a marked loss of weight. Nevertheless during right hemithyroidectomy, the operative reaction is so sharp and sustained beyond the time of completion of the right resection that, in accordance with previous experiences, it seems best to restrict the operation to a unilateral lobectomy. Sharp responses of this character and intensity are not uncommonly followed by dangerous postoperative crisis. Even though the hyperthyroidism appears to be controlled and the metabolic rate satisfactory, the hypersensitivity to operation persists. It is this factor that seems so definitely related to the degree of postoperative re-

CHART 10 (CASE 10) Persistence of marked hypersensitivity of a patient with acute iodine exacerbation who develops progressively severe hyperthyroidism during prolonged treatment with small doses of potassium iodide. Stage procedures felt to be definitely indicated. Basal metabolic rate before the first hemithyroidectomy +45 per cent. Avertin and cyclopropane anesthesia. Note the diminished sensitivity evidenced in the chart of the second hemithyroidectomy.

sponse that one may expect. That good judgment was exercised was indicated by the severity of the postoperative response.

STAGE OPERATIONS FOR EXOPHTHALMIC GOITER IN A PATIENT WITH MARKED HYPERSENSITIVITY AND IN ACUTE IODINE EXACERBATION WHO DEVELOPED PROGRESSIVELY SEVERE HYPERTHYROIDISM DURING PROLONGED TREATMENT WITH SMALL DOSES OF POTASSIUM IODIDE

Case 10 Chart 10—Miss E. L., aged 17, noted nervousness and loss of 10 pounds in weight at the beginning of her illness ten months before she was first examined by me on October 5, 1937. She had been suffering with characteristic symptoms of hyperthyroidism for four months, during the last three of which her physician had given her two minims of a potassium iodide solution daily. After five weeks of this treatment she had regained some weight and the basal metabolic rate was reported to be +22 per cent. Thereupon the hyperthyroidism definitely increased and she became highly nervous. When she was first seen by me her pulse was 128, systolic pressure 122, and diastolic 58 mm Hg. Marked tremor of the hands and generalized jerky movements were noted. Three days later

the basal metabolic rate was +40 per cent. She became nauseated, appeared ill, and it was evident that there was an acute iodine exacerbation. A marked exophthalmos was noted. In the hope of controlling the exacerbation, treatment with iodine was continued during the following three weeks in the form of Lugol's solution administered in doses of five minims three times daily. This failed to produce any appreciable remission. In fact, the symptoms became more intense and the pulse rate increased from 128 to 144. There was a further loss of 4 pounds in weight, while the basal metabolic rate rose from +40 to +45 per cent. The thyroid gland was large, prominent, firm, and showed marked vascular signs. The diagnosis of exophthalmic goiter in the phase of acute "iodine exacerbation" was made.

Right lobectomy Avertin-cyclopropane anesthesia October 27, 1937 Because of the extreme nervousness exhibited by the patient, a moderate dose of avertin was given by rectum, followed by inhalation anesthesia with cyclopropane.

Operative Reaction—The systolic pressure augments from 138 to 160 mm Hg as preparations are made to give the avertin (Chart 10). The latter causes a

transient fall of pressure to 125, followed by a prompt increase to 150 and finally to 160 mm. Hg. Thereupon the systolic pressure subsides to 150, where it is maintained to the end of the operation. The normal diastolic pressure of 58 mm Hg declines slightly under avertin anesthesia and then, at the beginning of operation, rises to 96. Synchronous with the maximum increase in systolic pressure it falls to 75, producing thus a secondarily increased pulse pressure. This increased pulse pressure is then maintained to the end of operation. The pulse rate, beginning at 136, advances to 144 and then, after the avertin is administered, falls to 100. Following the incision there is a progressive rise to 146 at the end of the operation. The respirations are mildly accelerated at the beginning and again toward the end of operation.

Comment—The operative reaction in this instance is sharp, as indicated by the definite and sustained secondary increase of blood pressure, pulse, pulse pressure, and respirations during operation and by the tendency for these to be sustained at high levels until the end of operation. At no time during the progress of the operation is there a tendency of the operative responses to subside.

This case illustrates several points. A patient with exophthalmic goiter suffers with progressively toxic hyperthyroidism as a result of the administration of small amounts of potassium iodide over a period of three months. She finally suffers with an acute iodine exacerbation. The further administration of large amounts of iodine fails to produce a clinical remission and the metabolic rate remains elevated at +45 per cent. In order to reduce as far as possible the psychic and operative shock, avertin per rectum is used and is supplemented by cyclopropane. The secondary response to the operative procedure is sharp and sufficient to counteract the initial depressing effects of avertin. As a result one sees a sharp and sustained operative response continuing at elevated levels to the end of operation. Reactions of this degree of intensity indicate that the operation is ad-

vantageously restricted to a single lobectomy to avoid a dangerous postoperative reaction.

Postoperative Course—The patient was extremely nervous and restless during the first two days of the postoperative period. Liberal amounts of sedative were required, and generalized tremors were noticeable even during the short periods of sleep. Vomiting spells were frequent. Rectal temperature rose to 104.2 F four hours after operation, at which time the systolic pressure increased to 175 mm Hg, the respirations were 25, the diastolic pressure was 50, and the pulse pressure was augmented by 25 mm Hg. After the second day the reaction gradually subsided. The postoperative response was unusually intense and it was felt that had double lobectomy been done the result might well have been disastrous.

Further History—Following operation the administration of Lugol's solution in doses of five minims three times daily was continued. One month after right lobectomy the patient was still highly nervous and restless and the pulse was 140. She had, however, regained a good appetite and 5 pounds in weight. During the succeeding four months progressive improvement in the severity of the hyperthyroidism was noted. The pulse rate declined to 82 per minute, there was a further gain of 15 pounds in weight. The nervousness almost entirely disappeared and she was feeling well. The basal metabolic rate at this time was reported as -22 per cent. This did not correspond with the clinical appearance and was later found to be an error in the determination. In spite of the satisfactory clinical appearance of the patient and the undoubted definite reduction in the metabolic rate, it was felt that resection of the left lobe should be done.

Left lobectomy Cyclopropane anesthesia March 7, 1938

Operative Reaction—A glance at Chart 10 is convincing of the fact that the operative reaction during the second stage is far less acute than it was during the preceding right resection. This is in accord

CHART 11 (CASE 11) Severe operative responses influencing the surgeon to adopt stage operations in exophthalmic goiter. Clinical symptoms were acute and the patient showed a high degree of hypersensitivity to the first operation even though a moderate clinical remission and a satisfactory fall of the metabolic rate had been obtained following the preoperative iodine. Preoperative basal metabolic rate +32.2 per cent. Cyclopropane anesthesia. Note the milder responses during subsequent left lobectomy.

ance with the marked clinical improvement that followed the right lobectomy. The systolic pressure, while the patient is in her room and after the preliminary hypodermic administration of morphine, is 88 mm Hg. The psychic stimulus of transport to the operating room causes the pressure to advance to 130, it then increases to 138 shortly after the incision is made and then declines to its normal level of 130, which is maintained to the end of operation. The curve of diastolic pressure is approximately parallel to that of systolic pressure. It begins at 50, then increases to a maximum of 100, and thereupon returns to and is maintained at 96 mm Hg. The pulse pressure, which before the operation is 38, does not increase at any time during the operation, in marked contrast to the definite secondary augmentation of pulse pressure during the first-stage operation. The preoperative pulse rate is 76. It increases to 85 at the time of the incision, following which there is no further rise but rather a fall to the preoperative level that is main-

tained to the end of operation. The respirations increase slightly during the operation.

Postoperative—The postoperative reaction was uneventful. There was an entire absence of acute manifestations in marked contrast to the restlessness and nervousness following the right lobectomy. The greatest elevation of the pulse and temperature occurred on the second postoperative day when the pulse was 96, and the rectal temperature did not rise above 100.2 F. This response is to be compared with the sharp intense reaction following the first lobectomy and described above.

Comment—The stage procedure of right lobectomy, which it was felt was indicated because of the marked hypersensitivity of the patient while in the phase of acute iodine exacerbation, was followed by a strikingly marked improvement during the following four months. Thereupon left lobectomy was done, during which there was a mild operative response in marked contrast to the sharp

reaction seen during the first stage lobectomy. The postoperative period is similarly free of all manifestations of acute response. Thus acute iodine exacerbation often necessitates stage procedures in instances when the operative responses point to the possibility of a dangerous postoperative period were double lobectomy to be performed. The hypersensitivity is diminished by the first stage procedure and renders the second hemithyroidectomy virtually free of all dangerous sequelae.

STAGE OPERATIONS ON THE PATIENT WITH EXOPHTHALMIC GOITER ASSOCIATED WITH WHICH THERE IS A HIGHLY TOXIC HYPERTHYROIDISM AND A PERSISTENCE OF HYPERSENSITIVITY TO OPERATION EVEN THOUGH A MODERATE CLINICAL REMISSION AND A SATISFACTORY FALL OF BASAL METABOLIC RATE ARE OBTAINED FOLLOWING THE PREOPERATIVE TREATMENT WITH IODINE

Case 11 Chart 11—Dr H F aged 30 always of highly temperamental nature was first seen by me on October 19 1936 when he gave the following history. During the preceding four months his neck became larger and the acutely toxic symptoms of hyperthyroidism grew progressively worse. He lost 32 pounds in weight. The basal metabolic rate three weeks before he was first seen and before administration of iodine was +64 per cent. One week later treatment with Lugol's solution in doses of five to ten minims three times daily was instituted and continued for two weeks after which the basal metabolic rate decreased to +33 per cent. A fairly definite clinical improvement was noticeable.

Upon examination he was found to be extremely nervous, tremulous, and weak. Slight exophthalmos on the left was noted but the right eye appeared normal. A moderate, diffuse enlargement of the thyroid gland, which showed definite vascular signs was present. The pulse varied between 140 and 160. His weight which had been 165 pounds four months previously was now 135 pounds. Administration of Lugol's solution was continued for three days more in doses of ten minims three times daily after which the basal metabolic rate was again +32.2 per cent. A fairly good though not entirely satisfactory clinical remission was obtained. The pulse declined from 160 to 100 and the systolic pressure from 165 to 140.

Right lobectomy Cyclopropane anesthesia October 23, 1936

Operative Reaction—The systolic blood pressure rises from 135 to 170 mm Hg as the patient is transported to the operating room (Chart 11). Immediately following the start of anesthesia, there is a prompt and abrupt rise, which advances after the operation is begun and reaches a maximum of 230 mm Hg within twenty minutes. This high pressure is well sustained to the time of completion of the right lobectomy. The diastolic pressure increases sharply from 80 mm. Hg at the beginning of anesthesia and continues to advance to a maximum of 120 mm. Hg. Fifteen minutes later, during the latter part of the resection, a decline occurs and at the end of operation it is 90 mm Hg. The pulse pressure, which at the beginning of operation is 55 mm Hg, increases to 110 mm. Hg in the middle of the operation and then progressively augments to 135 mm. Hg at the end. (This progressive increase in pulse pressure is a significant fact.) The pulse rate, which normally was 150, subsides to 102 following the preliminary sedative treatment, then advances abruptly to 185 as the patient comes to the operating room. Thereupon a secondary fall occurs soon after the anesthesia is begun, to be followed promptly by a sharp rise to 200, fifteen minutes later. Again a fall is seen with a subsequent increase to 192 at the close of operation. The respirations increase from the preoperative level of 20 to 34 during operation and are maintained at this level to the end.

Comment—The sharp and sustained rise of systolic pressure, the progressive increase in the pulse pressure, the marked progressive and irregular increase in the pulse rate, and the definite increase in the respirations during operation indicate that there is a fundamental hypersensitivity that may persist even though an apparently satisfactory clinical remission and fall of basal metabolic rate are obtained by the preoperative treatment with iodine. Accordingly, the extremely brisk operative reaction acted as an admonition

of the likelihood of a sharp postoperative reaction, and the operation was consequently limited to right lobectomy

Postoperative Reaction—There is no tendency of the operative responses to abate during the first half hour following the close of operation and the blood pressure, pulse pressure, pulse, and respirations are maintained at their abnormally high levels

Postoperative Period—During the first twenty-four hours following operation the patient was highly nervous, restless, and uncomfortable. He vomited several times and was continually attempting to get out of bed. The highest rectal temperature was 101 F and the highest pulse 140. The postoperative reaction was considered to be definitely sharp, though not alarming. Accordingly, it is seen that an unusually sharp subjective and moderate objective postoperative reaction followed a sharp operative response. Treatment with iodine was continued and after the lapse of eight days the second-stage operation was undertaken. The basal metabolic rate was +32 per cent.

Left lobectomy (second-stage operation) Cyclopropane anesthesia October 31, 1936, eight days after right lobectomy There was a slight clinical improvement following the right hemithyroidectomy

Operative Reaction—The systolic blood pressure (Chart 11), which is 136 mm Hg while the patient is in his room, rises promptly as he is taken to the operating room and at the time of the incision it is 156 mm Hg. Thereupon a sharp rise to 192 occurs at the time of completion of the resection, following which one sees a decline to 174 mm Hg at the close of the operation. A level of 176, definitely above the preoperative level, is maintained during forty-five minutes of the early postoperative period.

The diastolic pressure, beginning at 80 mm Hg, drops to 70 at the beginning of anesthesia, then rises promptly to a maximum of 116 within twenty minutes, or just before completion of the resection, and then declines to 100 mm Hg at the close of the operation. It is maintained at 96 mm Hg during the early postop-

erative period. The diastolic curve thus runs approximately parallel to the curve of systolic pressure. The pulse pressure at the start is 56 mm Hg and increases 20 mm Hg to 76 at the summit of the reaction, as compared with an increase of pulse pressure of 80 points during the right hemithyroidectomy. This slight increase during the second-stage operation is in accordance with the clinical improvement and the diminished sensitivity that followed the first operation.

The pulse rate before operation is 80, advances abruptly to 120 as the patient comes to the operating room, declines momentarily at the beginning of anesthesia, and then returns to the level of 120. Toward the close of operation it rises to 132 and is maintained at this level during the early postoperative period.

A comparison of the pulse and respiratory rates during the first-stage with those of the second-stage hemithyroidectomy illustrates in a convincing manner the diminished sensitivity of the patient consequent upon the resection of the first lobe. Respirations begin at the level of 20 and, with minor variations in rate, average 20 during operation. An increase to 24 is seen during the early postoperative period.

Postoperative Course—Aside from nausea and vomiting, which was more than ordinarily annoying, the patient was fairly comfortable. He was not excessively nervous or restless. The highest postoperative pulse was 128 and the highest rectal temperature 100.2 F. The blood pressure, which was 165 mm Hg as the patient returned to his room, dropped to 138 within six hours. The postoperative reaction was thus considered moderately severe, but of much less intensity than that observed after the first lobectomy.

Comment—A man, aged 30, suffered with an acutely toxic hyperthyroidism due to exophthalmic goiter and of four months' duration. There was no therapy with iodine. A rapid and marked loss of weight occurred. The basal metabolic rate before the preoperative administra-

a cold Four months later enlargement of the thyroid gland and exophthalmos were noted She was seen four months after potassium iodide, presumably in saturated solution and in doses of one to twelve minims daily, had been administered by her physician Progressively acute hyperthyroidism followed

Upon examination the patient appeared extremely nervous, "fidgety" She exhibited jerky movements of the shoulders and trunk and complained of frequency of bowel movements An unusually large, firm thyroid gland, which showed marked vascular signs, was found Marked pulse and thrill were felt at the poles and over the gland, and definite bruits were audible Exophthalmos was present The pulse was 180 and a marked tremor of the hand was noted She appeared to be in a state of acute severe "iodine exacerbation" Treatment with Lugol's solution in doses of eight minims three times daily was given for ten days without appreciable improvement in her general condition The basal metabolic rate at this time was +25.3 per cent Because of the failure to obtain any clinical remission, primary resection of the thyroid gland could not be entertained Accordingly, on October 1, 1934, after ten days of treatment with iodine, the right superior thyroid artery was ligated under novocaine supplemented with nitrous-oxide gas There was an unusually sharp operative response and the postoperative reaction was moderate Four days later, on October 5, 1934, ligation of the left superior thyroid artery was done, the patient's condition having remained the same

Ligation of the left superior thyroid artery Novocaine anesthesia supplemented with nitrous-oxide gas October 5, 1934

Operative Reaction—Chart 12 graphically portrays the response The systolic pressure, which normally was 128 mm Hg, drops slightly to 118 as she comes to the operating room, recovers, and advances abruptly to 152 mm Hg from the time of the infiltration of the skin to the end of the operation The diastolic pressure, which at the beginning registers 70 mm Hg, falls to a level of 40, then rises to a peak of 78 during operation and at the end is 74 mm Hg

The pulse pressure, which augments 30 mm Hg during operation, increases progressively from 58 at the beginning to 80 at the end

The preoperative pulse is 105 It rises abruptly as a result of nervousness and apprehension to 186 and following the infiltration of the skin and during operation advances to 208, after which it declines to 160 at the end.

The respirations increase from 24 before operation to 35 during the procedure and at the end they register 32

Postoperative Reaction—The reaction during the first forty-eight hours following the ligation was definitely active

The highest temperature was 99.4 F and the highest pulse rate was 145

Several illustrative facts are brought out by this case A young girl with exophthalmic goiter had an exacerbation of symptoms while under treatment with potassium iodide in small doses over a period of four months Further treatment for ten days with Lugol's solution failed to produce any appreciable clinical remission, though the basal metabolic rate was only +25.3 per cent In view of the evidently severe hyperthyroidism, hemithyroidectomy is considered to be too extensive Accordingly, preliminary ligation of the superior thyroid arteries is done in stages The true hypersensitivity of the patient, in the phase of acute iodine exacerbation, is revealed in the extremely sharp operative reaction to the ligation of a single artery under novocaine anesthesia The operative responses are no less intense under local anesthesia than when general gas anesthesia is employed Even though the operative procedure is brief, a moderately active postoperative response follows The preoperative basal metabolic rate of +25 per cent does not afford the surgeon a reliable criterion of the operability of such patients under the circumstances described The extremely sharp reaction, during the ligation of a single artery, indicates further that an operation of greater extent, such as hemithyroidectomy, might readily have been followed by a dangerous postoperative crisis Following the ligation operations, the clinical course continued to be acute and necessitated further stage procedures Right hemithyroidectomy was performed nine days later and left hemi-

thyroidectomy was done after the lapse of six months. A satisfactory result was finally obtained. It seems without doubt that multiple stage operations were thus made necessary by the acute iodine exacerbation which was caused by the prolonged administration of potassium iodide and which could not be controlled by the further intensive preoperative treatment with large doses of Lugol's solution.

Discussion and Summary

The operability of the patient with hyperthyroidism depends upon three principal factors. The hypersensitivity to operative procedures, the general clinical status, and the basal metabolic rate. This hypersensitivity expresses itself in the varying intensity of operative responses on the part of the systolic pressure, pulse pressure, pulse, and respirations. Many other physiologic responses have been observed in previous studies and are not of practical significance to the surgeon at the time of operation. The operative reactions are similar to those following the administration of adrenalin and it is accordingly believed that the hypersensitivity is, in a very large measure, an expression of the influence of adrenal activity during operation. Thus, by evaluating the operative responses, or in other words the influence of the adrenal factor, the surgeon is enabled to appreciate the degree of hypersensitivity present. This hypersensitivity has been shown to be, in a general way, proportional to the intensity of the hyperthyroidism present. If this were always true, the basal metabolic rate would be an infallible index to sensitivity and thus to operability. Unfortunately, however, the basal rate often fails to guide the surgeon adequately.

The postoperative reaction is very closely proportional to the intensity of the preceding operative response, which in turn is a visible expression of the sensitivity of the patient. Accordingly, by realizing the degree of hypersensitivity present, the surgeon is enabled to anticipate or foresee the intensity of the post-

operative response. The hypersensitivity, while in a general way proportional to the degree of hyperthyroidism as expressed by the basal metabolic rate, has been found to persist in a fair number of instances in which both the clinical status and the metabolic rate would appear to permit a double lobectomy with safety. However, such severe reactions may be noted early during the operation, that the surgeon is influenced to adapt the procedure to the patient's evident hypersensitivity and to restrict the extent of operation. Thus a dangerous postoperative crisis is avoided.

The basal metabolic rate, which is only one factor in the disease, is indicative of the degree of oxidation present at any moment and does not indicate the operative tolerance, which is primarily dependent upon the general hypersensitivity. Thus, it has been found that a severe reaction may follow thyroidectomy on a patient in whom there has been a good clinical remission following preoperative treatment with iodine and in whom the basal metabolic rate is well within safe limits. The metabolic rate is thus not an entirely reliable criterion of operability.

The common misuse of iodine in the therapy of hyperthyroidism has introduced complications in the determination of operability. After prolonged treatment of the hyperthyroid patient with iodine, the true operability may be obscured. In occasional instances of this kind it has been found that the metabolic rate may appear reasonably low, however bilateral thyroidectomy may precipitate a severe postoperative reaction, which could have been avoided by a stage procedure if the operator had had a proper appreciation of the true hypersensitivity. While the factor of hyperthyroidism may be reasonably controlled, the fundamental hypersensitivity may not necessarily be. When iodine in minimal doses is given over prolonged periods, when it has been administered in varying amounts, or when treatment with iodine has been frequently interrupted, a so-called "iodine exacerbation" commonly results. Further

a cold Four months later enlargement of the thyroid gland and exophthalmos were noted She was seen four months after potassium iodide, presumably in saturated solution and in doses of one to twelve minims daily, had been administered by her physician Progressively acute hyperthyroidism followed

Upon examination the patient appeared extremely nervous, "fidgety" She exhibited jerky movements of the shoulders and trunk and complained of frequency of bowel movements An unusually large, firm thyroid gland, which showed marked vascular signs, was found Marked pulse and thrill were felt at the poles and over the gland, and definite bruits were audible. Exophthalmos was present The pulse was 180 and a marked tremor of the hand was noted She appeared to be in a state of acute severe "iodine exacerbation" Treatment with Lugol's solution in doses of eight minims three times daily was given for ten days without appreciable improvement in her general condition The basal metabolic rate at this time was $+25.3$ per cent Because of the failure to obtain any clinical remission, primary resection of the thyroid gland could not be entertained Accordingly, on October 1, 1934, after ten days of treatment with iodine, the right superior thyroid artery was ligated under novocaine supplemented with nitrous-oxide gas There was an unusually sharp operative response and the postoperative reaction was moderate Four days later, on October 5, 1934, ligation of the left superior thyroid artery was done, the patient's condition having remained the same

Ligation of the left superior thyroid artery Novocaine anesthesia supplemented with nitrous-oxide gas October 5, 1934

Operative Reaction—Chart 12 graphically portrays the response The systolic pressure, which normally was 128 mm Hg, drops slightly to 118 as she comes to the operating room, recovers, and advances abruptly to 152 mm Hg from the time of the infiltration of the skin to the end of the operation The diastolic pressure, which at the beginning registers 70 mm Hg, falls to a level of 40, then rises to a peak of 78 during operation and at the end is 74 mm Hg

The pulse pressure, which augments 30 mm Hg during operation, increases progressively from 58 at the beginning to 80 at the end

The preoperative pulse is 105 It rises abruptly as a result of nervousness and apprehension to 186 and following the infiltration of the skin and during operation advances to 208, after which it declines to 160 at the end

The respirations increase from 24 before operation to 35 during the procedure and at the end they register 32

Postoperative Reaction—The reaction during the first forty-eight hours following the ligation was definitely active.

The highest temperature was 99.4 F and the highest pulse rate was 145.

Several illustrative facts are brought out by this case A young girl with exophthalmic goiter had an exacerbation of symptoms while under treatment with potassium iodide in small doses over a period of four months Further treatment for ten days with Lugol's solution failed to produce any appreciable clinical remission, though the basal metabolic rate was only $+25.3$ per cent. In view of the evidently severe hyperthyroidism, hemithyroidectomy is considered to be too extensive Accordingly, preliminary ligation of the superior thyroid arteries is done in stages The true hypersensitivity of the patient, in the phase of acute iodine exacerbation, is revealed in the extremely sharp operative reaction to the ligation of a single artery under novocaine anesthesia The operative responses are no less intense under local anesthesia than when general gas anesthesia is employed Even though the operative procedure is brief, a moderately active postoperative response follows The preoperative basal metabolic rate of $+25$ per cent does not afford the surgeon a reliable criterion of the operability of such patients under the circumstances described The extremely sharp reaction, during the ligation of a single artery, indicates further that an operation of greater extent, such as hemithyroidectomy, might readily have been followed by a dangerous postoperative crisis Following the ligation operations, the clinical course continued to be acute and necessitated further stage procedures Right hemithyroidectomy was performed nine days later and left hemi-

adrenalin in the hyperthyroid patient. The intensity of these responses and the period for which they are sustained serve as an index of the hypersensitivity, which cannot in all cases be judged from the clinical data and the metabolic rate alone. The present studies indicate that the dominant factor in these responses is one of adrenal activity.

3 The postoperative reactions are remarkably proportional to the intensity of the operative responses, which reveal varying degrees of hypersensitivity. This increased sensitivity during the early period of operation when properly interpreted is a more reliable criterion of the extent to which operation can be safely permitted than the metabolic rate alone. The surgeon is thus enabled to anticipate the intensity of the postoperative reaction and to avoid crisis by resort to stage operations. The basal metabolic rate per se, frequently fails to reveal the true sensitivity of the patient.

4 The misuse of iodine in the treatment of toxic goiter frequently complicates the surgical treatment of hyperthyroidism by masking the fundamental hypersensitivity of the patient. A correct estimate of operability is therefore difficult to make.

Discussion

Dr Martin B. Tinker, Jr., Ithaca, New York—At the outset of this discussion may I take occasion to felicitate Dr Goetsch on his timely and interesting presentation of an important proposition. Preliminary iodimization has minimized the number and severity of reactions following thyroidectomy but it has failed to eliminate them which gives importance to the paper we have just heard

Dr Tinker Sr. and I are in hearty accord with Dr Goetsch in regard to the emphasis which he places upon the behavior of the patient during the operation as a criterion of the degree of postoperative storm. It is however not infallible and in no way excuses thorough pre-operative investigation and study. We have observed that a close watch during operation is likely to be unreliable in patients previously treated with therapeutic x-ray recurrent cases mostly from inexperienced operators as well as in those who are iodine fast.

Our observation coincides with that of Lahey who uses stage operations in desperate risk cases which constitute one third of his series. We expand indications for this method to include those presenting other doubtful or critical pictures: goiters of excessive size especially when associated with signs suggesting the presence of exophthalmic areas within the gland and patients with crippled hearts (auricular fibrillation, myocardial fibrosis as shown by B. K. G. coronary sclerosis or spasm etc.) we place in this category as likewise cases of advanced age (70 years plus). The factor of safety is greatly increased if these are done in stages.

Dr Tinker Sr. first suggested that thyroidectomy could be done in stages and presented the idea in a paper before the American Medical Association in Los Angeles about 1912. Dr Lahey of Boston credits Dr Tinker Sr. with this contribution and emphasizes its importance. It has not been adopted in the form originally proposed however. At any time when the condition of the patient seems poor we stop at once and place a pack of gauze wrung out in 1:1000 acriflavine under the flaps and suture the flaps over it with four or five doubled and interrupted stitches of fine black silk pulling portions of the gauze out through the interstices between the stitches. The advantages are that this arrests oozing or moderate hemorrhage allows for free drainage which seems to reduce toxicity and for getting out promptly. From five to seven days later when the febrile reaction has subsided we open the neck again. If the reaction has not been too severe, we remove the second side. Otherwise we merely close. The skin edges and granulations on the flaps are trimmed off prior to closure. We have had no severe and only occasionally mild infection following this procedure. The skin scar is usually surprisingly creditable.

Blood tests of 78,388 undergraduates in more than 500 American colleges indicate that 2 out

of every 1000 are infected with syphilis, according to the American Social Hygiene Association.

treatment with iodine is not followed by clinical remission, and the hyperthyroidism, as indicated by the basal metabolic rate, may appear to be reduced. These patients not uncommonly react badly to operation. They exhibit an augmented hypersensitivity that indicates their lack of tolerance to the commonly employed operative procedures. The misuse of iodine in the treatment of toxic goiter has accordingly necessitated the more frequent use of stage operations.

The indices of unusual hypersensitivity are an early *psychic rise* of blood pressure, pulse, and respirations when the patient comes to the operating room. This is followed by a further sharp and continuous increase to *unusual heights* of systolic and pulse pressures, pulse, and respirations after anesthesia is established and the incision has been made. Further characteristics of such hypersensitivity are a *sustained high level* of the responses beyond the first fifteen to twenty minutes of the operation. Particularly important here is a markedly increased and *sustained pulse pressure*. Such manifestations, which are commonly followed by intense postoperative reactions, are warnings to the surgeon who should then restrict operation to a stage procedure. Of these responses, the rises in *blood pressure* and *pulse pressure* are more significant than the increase in the pulse rate. They are incidentally characteristic expressions of the response of the hyperthyroid patient to adrenalin. In the average moderately toxic case of exophthalmic goiter, uncomplicated by other than the preoperative treatment with iodine and with a good preoperative clinical remission, these responses are moderate and are followed by only moderate postoperative responses and a comfortable convalescent period.

Severe postoperative reactions and even crises, practically without exception, have been proportional and subsequent to sharp operative responses. In other words, given a moderate response the surgeon may proceed with a double lobectomy without fear of a dangerous

postoperative crisis. When the early operative response is intense, he is accordingly warned. Postoperative crisis is a continuation and intensification of phenomena precipitated during operation and is thus in the nature of a magnified operative response. Both the operative response and postoperative crisis appear to be produced by the same stimuli.

The operative reactions are not greatly influenced by the different forms of anesthesia. Nitrous oxide, cyclopropane, light ether, avertin, and novocaine have been used. With rectal (basal) avertin there is an early fall of blood pressure and pulse but the period of depression is much shorter in the hyperthyroid than in the nonthyroid patient, and the stimulating influences of the operation on the blood pressure and pulse make themselves felt very soon. When local anesthesia is employed, the operative responses seem to be augmented over those seen when general anesthesia has been given. This is doubtless due to the factor of psychic stimulation and to emotional factors.

Clinical data and the basal metabolic rate are naturally very valuable criteria of operability. They are, however, not entirely infallible. Proper evaluation of the patient's hypersensitivity based on data gathered during the course of operation is a most valuable additional criterion of operability. Furthermore, a proper appreciation of this hypersensitivity is of great help to the surgeon in avoiding distressing and even dangerous postoperative manifestations. The occasional fatal postoperative crisis may thus be virtually eliminated.

Conclusions

- 1 The operability of the patient with hyperthyroidism depends primarily upon the characteristic hypersensitivity to operative measures.

- 2 Certain physiologic responses are produced by operation in toxic goiter and are characterized by brisk increases in blood pressure, pulse pressure, pulse, and respirations. These responses are remarkably similar to those evoked by

adrenalin in the hyperthyroid patient. The intensity of these responses and the period for which they are sustained serve as an index of the hypersensitivity, which cannot in all cases be judged from the clinical data and the metabolic rate alone. The present studies indicate that the dominant factor in these responses is one of adrenal activity.

3 The postoperative reactions are remarkably proportional to the intensity of the operative responses, which reveal varying degrees of hypersensitivity. This increased sensitivity during the early period of operation when properly interpreted is a more reliable criterion of the extent to which operation can be safely permitted than the metabolic rate alone. The surgeon is thus enabled to anticipate the intensity of the postoperative reaction and to avoid crisis by resort to stage operations. The basal metabolic rate, per se, frequently fails to reveal the true sensitivity of the patient.

4 The misuse of iodine in the treatment of toxic goiter frequently complicates the surgical treatment of hyperthyroidism by masking the fundamental hypersensitivity of the patient. A correct estimate of operability is therefore difficult to make.

DIPHTHERIA OF THE PLEURA

WILLARD J DAVIES, M D , F A C P , Rockville Centre, New York

THE diphtheria bacillus as a rule is assumed to be a bacillus whose normal habitat is the nasopharynx and its immediate vicinity, but the report of the following case and a search of the literature shows that, although very rarely, it does infect the lungs and pleura. These are cases of frank empyema due to diphtheria bacillus and are not to be confused with the pleurisies, dry and serofibrinous reported with and after diphtheria. The latter, in great part, when proved by puncture are "almost always due to streptococcus."

Only 6 cases of diphtheritic empyema are reported in the medical literature. The first case was reported by Savy and Rendu¹ in 1912. This case was a boy of 5 years with typical diphtheritic membrane covering the uvula, tonsils, and pharynx. Culture was positive for diphtheria and antitoxin was given. Autopsy revealed an effusion on the right with a loculated empyema between the upper and middle lobe. Cultures showed the effusion to be due to diphtheria bacillus with staphylococci and streptococci in lesser amounts.

The second case was that of Goldschmidt² in 1920. His patient, a girl of 3 years, had a suppurating discharge from the nose, strongly suggestive, but true diphtheria bacilli could not be demonstrated. Two thousand units of antitoxin were given. The patient developed a consolidation of the left lower lobe and two weeks later an empyema developed that was positive for Loeffler's bacillus. Death occurred within thirty-six hours. A bacteriologic study of the pus showed streptococci and a diphtheria-like bacillus that was definitely identified as diphtheria bacillus culturally.

Lyter³ reported the third case in 1925, and the first and only case to be reported in American literature to date. His case was a young girl of 16 years. Her initial

symptoms were cough, expectoration of mucopurulent sputum, chills, and fever. Two days later she had a marked laryngeal soreness with hoarseness. Eleven days later she had a sudden, severe, inspiratory pain in the right axilla. The sputum was sanguinopurulent and contained numerous diphtheria bacilli. This was confirmed by smear and growth on Loeffler's medium. The right pleural cavity was aspirated and greenish white pus was evacuated which proved to be diphtheritic by stain, guinea pig, and Loeffler's medium. The patient was given 20,000 units of antitoxin. Recovery followed in due course after thoracotomy.

The fourth case as reported by Irrmann and Schmidt⁴ was that of a 51-year-old female who was admitted to the hospital for thoracotomy. Her husband had pulmonary tuberculosis. Pus was obtained on puncture from the right chest. The pus was very fetid, and examination showed diphtheria bacilli, as did the smear from the throat. Wicks were placed within the empyema cavity and saturated with antitoxin. The suppuration gradually ceased. Four months later a laparotomy was done and the surface of the intestine was covered with tubercles. This is a rare association of tuberculosis and diphtheria.

Vahala and Stolzova-Sutorisova⁵ reported the fifth case. This case resembles the author's very closely. The patient, a man of 33 years, had a bronchopneumonia, followed by an empyema of the left thoracic cage. The bacterial examination at that time showed the presence of a mixed infection with enterococcus and pneumococcus.

The patient remained afebrile and was recovering. Two weeks after operation the wound became edematous and hard, and the surrounding parts of the wound became necrotic, were liquefied, and gave a very fetid odor. The secretion from the

surrounding parts and the pleural cavity was examined and diphtheria bacillus was found. Antitoxin was given without avail. Necropsy showed an involvement of the pleura, mediastinum, and pericardium from which diphtheria bacilli were obtained. The tonsils had been removed and neither the throat, pharynx, nor larynx showed any inflammatory change.

In 1932, Desmeules⁶ reported the sixth case, that of a boy 5 years old, admitted to the hospital with a thoracic fistula on the right side. The fistula healed only to have an abscess reform one month later with a return of the fistula. A diagnosis of tuberculosis was made, though tubercle bacilli could not be found in the pus. However, the smear did show a streptococcus and a gram positive bacillus that proved to be diphtheria. A guinea pig was inoculated and died in thirty two hours, and the usual lesions of diphtheria were found. Smear of the throat was positive for diphtheria bacilli. Antidiphtheria serum was injected into the pleural cavity.

The seventh case is the one reported in this paper.

C. R., a white male aged 40 was admitted to South Nassau Communities Hospital October 23 1935 with a perforated gastric ulcer. He was operated upon soon after admission by the late Dr. Holcomb. The perforation was closed and a drain inserted. The temperature rose to 103 F., but returned to normal within three days.

The temperature continued a spiking course and the patient complained of a cough. The white blood count on admission was 3,450 with 80 per cent neutrophils, 14 per cent large lymphocytes, 5 per cent monocytes and 1 per cent basophiles. Successive urine examinations were negative.

One week later x ray showed a small effusion at the right base. Several days were allowed to follow the course of the effusion, but as it continued to form, aspiration was done November 6, 1935. The fluid showed gram positive cocci and a few gram positive diplococci. This was not elaborated upon. The culture showed staphylococci and streptococci.

Rib resection was done December 23 and a

transfusion of 300 cc whole blood followed. The emission from the thoracotomy wound continued to slough and enlarge.

Seen on January 6 1936 a large opening within the chest showed the lung and pleura shrunk within the cavity. The entire pleural cavity was covered with a thick dirty gray membrane. The edges of the incision were red and edematous. The stench from the discharge was extremely foul. Smears taken from the discharge and membrane were positive on smear and culture for Loeffler's bacillus. Cultures were taken to two laboratories for a check, both were positive for diphtheria. A virulence test was not done.

Questioning of the patient revealed that he had had diphtheria as a youth. The patient expired January 18 1936.

The age incidence of diphtheria of the pleura varies from 3 to 51 years. No predilection for either sex is shown. All cases but 1 were diagnosed before death but no form of treatment seems to prevail, only 2 of the cases survived. Antitoxin was used in various forms in all but 2 cases. In 1 of the recovered cases, wicks saturated with antitoxin were placed in the empyema cavity. In the other, antitoxin was used and the chest drained.

In all the cases the pleuritis are latent and probably the diphtheria bacillus is a secondary invader. With the exception of the 2 recovered cases, the diphtheria infection was associated with streptococci of some type.

The author wishes to express his thanks to Dr. R. H. Dixon, Miss Julia Hewitt, of the Nassau Hospital Laboratory, and to Mr. Albert Gans, of the South Nassau Communities Hospital Laboratory.

THE CLINICAL SIGNIFICANCE OF PRERENAL AZOTEMIA IN DIGESTIVE TRACT DISEASE

HENRY A. RAFSKY, M D , F A C P , and MICHAEL WEINGARTEN, M D , New York City
(From the Lenox Hill and Beth Israel Hospitals, New York City)

EVIDENCE of kidney dysfunction, characterized by the presence of nitrogen retention, with or without a diminution in the urinary output, is not infrequently encountered in various diseases. In many of these patients the impairment of the renal function cannot be explained on the basis of intrinsic kidney damage. This form of nitrogen retention, which has been ascribed to causes affecting the circulation or composition of the blood before it reaches the kidneys, has been termed prerenal azotemia.¹

In this paper we are primarily concerned with the presence of prerenal azotemia in diseases of the digestive tract. Although this renal aspect is encountered with comparative frequency in these affections, its clinical importance has not been sufficiently emphasized.

In 1913, Tileston and Comfort² noted the presence of an increased nonprotein nitrogen of the blood in intestinal obstruction. Fishberg,³ as well as Wohl and Brust,⁴ emphasized the importance of differentiating primary and secondary azotemia. Heyd⁵ reported cases of "liver death," accompanied by an increase in the nonprotein nitrogen, after cholecystectomy. Wakefield, Mayo, and Borgen⁶ described an enterorenal syndrome in 10 patients with intestinal symptoms and elevated blood urea. Christiansen⁷ found hyperazotemia in intractable hemorrhages, and Clausen⁸ reported the presence of marked nitrogen retention in cases of gross gastric hemorrhage.

The explanation for the development of prerenal azotemia is problematic. In patients with peptic ulcer who develop alkalosis as a result of excessive alkali therapy, kidney impairment is often thought to be due to the alkalosis. In patients with pyloric obstruction, evi-

dence of renal dysfunction has been explained by the loss of chlorides from the gastric contents, as a result of the vomiting, producing a hypochloremia. In gastrointestinal hemorrhages, the nitrogen retention has been ascribed to dehydration and increased protein absorption. Low arterial pressure, decreased renal flow, and increased protein destruction have also been advanced as causes for the development of prerenal azotemia in abdominal diseases. While no doubt the above mentioned factors do play important roles in producing prerenal azotemia in some patients, still their absence in many others makes it questionable whether the impairment of renal function can be explained solely on this basis.

While the pathogenesis of prerenal azotemia may still be problematic, certain factors are definitely known, namely, the dangers of prerenal azotemia, the importance of its recognition, and the therapeutic indications for its possible prevention and treatment. It is to emphasize these facts that we offer this presentation.

Clinical Study

This study is based on a series of 43 patients suffering from digestive tract disease, who at some time during the clinical course showed evidence of nitrogen retention. The latter was determined by the estimation of the nonprotein nitrogen or urea nitrogen of the blood. The normal values of the former were regarded as between 25 to 40 mg and the latter as between 12 to 15 mg in 100 cc of blood. In some of the patients there was no disturbance of the urinary output, while in others a diminution of varying degrees was observed, and at times even an anuria.

was present. The specific gravity of the urine was high, as a rule, becoming lower as the nitrogen levels fell. Albuminuria and casts were not always present. Twenty nine of the patients were males and 14 were females. The ages ranged from 21 to 67 years. Twelve of the patients suffered from gross hemorrhages due to a duodenal or gastric ulcer, 9 had pyloric obstruction resulting from a duodenal ulcer, 2 had cholelithiasis, 5 suffered from severe enterocolitis, 3 had cancer of the stomach, 7 had intestinal tumors, 1 had atrophic gastritis and avitaminosis, 3 had hypertrophic gastritis with hyperchlorhydria, and 1 had a subacute pancreatitis.

In patients with gross gastric hemorrhages due to a peptic ulcer the non-protein nitrogen varied from 41 to 71 mg per 100 cc. of blood. The hemoglobin of the patients, upon admission to the hospital, ranged from 38 per cent (5.5 Gm.) to 71 per cent (10.3 Gm.). The nitrogen retention did not seem to bear any relationship to the degree of anemia. As, for example, patient I. B., with a hemoglobin of 38 per cent (5.5 Gm.), who had a nonprotein nitrogen of 48 mg., while patient M. H., who succumbed to a severe gastric hemorrhage, had a hemoglobin of 46 per cent (6.7 Gm.), and a nonprotein nitrogen of 71 mg. Recently, a patient with a severe bleeding ulcer was seen who had a hemoglobin of 47 per cent (6.8 Gm.), and a nonprotein nitrogen of 28 mg. The urine was negative in each case. A persistently high nitrogen in patients with gross gastric hemorrhages indicated a bad prognosis, even though they seemed to be improving clinically.

In patients with pyloric obstruction due to a peptic ulcer, the blood nonprotein nitrogen varied from 42 to 80 mg and the blood urea from 18 to 25 mg in 100 cc of blood. As a rule, a hypochloremia was present. The degree of kidney dysfunction seemed to bear a definite relationship to the amount of gastric retention, which was revealed by the roentgenographic examination. As, for example, patient H. A., suffering from a

prepyloric ulcer, who upon his first admission to the hospital had only a slight gastric retention, at which time the non protein nitrogen was 42 mg. One year later the patient returned with a recurrence of his symptoms, the x ray examination showed a large gastric residue. This time the nonprotein nitrogen had increased to 80 mg.

Nine of the patients in this series succumbed from two to eight days after operation. The nitrogen levels in these patients varied from a blood urea of 23.8 to 142 mg in 100 cc. of blood. Five of the patients (3 with a duodenal ulcer in whom subtotal gastrectomy was performed and 2 with cholelithiasis, in whom cholecystectomy was done) presented after operation a clinical picture simulating that described as 'liver shock.' These patients, postoperatively, developed a rapid pulse, high temperature, cyanosis, diminished urinary output, and increasing blood nitrogen levels. The urine showed a trace of albumin and a few casts. The most pronounced case of nitrogen retention that was seen in any of the patients who succumbed after operation was observed in a Mrs. E. B., with cholelithiasis, on whom a comparatively simple cholecystectomy had been performed. Her urea nitrogen was 142 mg two days after the operation. In these fatal surgical cases the preoperative evidence of kidney dysfunction was comparatively slight, when present at all.

Evidence of marked dehydration, with comparatively slightly increased blood urea or nonprotein nitrogen, was observed at times in patients who were to be operated upon. As, for example, patient M. W., suffering from a duodenal ulcer, who had a hemoglobin of 136 per cent (19.6 Gm.). His urea nitrogen was 22.5 mg. After he received 5,000 cc. of fluid daily for three days, his hemoglobin dropped to 92 per cent (13.5 Gm.). He was then operated upon and a gastroenterostomy was performed. His urea nitrogen eventually went to 12.5 mg.

In patients who developed a post-operative prerenal azotemia and who re-

covered, the nitrogen retention levels returned to normal comparatively slowly, notwithstanding the fact that the proper measures were employed to combat the renal dysfunction. Even when the nitrogen retention was not very pronounced, it sometimes took as long as fourteen to eighteen days before a normal blood urea or nonprotein nitrogen was again present.

In patients with severe enterocolitis, an elevation in the nonprotein nitrogen levels was also observed. In 1 of the patients, a Mr J L, 45 years old, the nonprotein nitrogen of the blood was 120 mg upon his admission to the hospital. The blood chlorides were 450 mg. The specific gravity of the urine was 1,020, a heavy trace of albumin and a few granular casts were present. The blood count was hemoglobin 108 per cent (15.7 Gm), red blood cells 4,960,000, white blood cells 6,650, polys 81 per cent, and mononuclears 19 per cent. As soon as the diarrhea stopped, the water balance was restored, the nutritional disturbance was overcome, and the nonprotein nitrogen of the blood fell to 27 mg. The specific gravity of the urine went to 1,009, the albumin and casts disappeared.

The patients with obstructive tumors of the gastrointestinal tract and increased blood urea or nonprotein nitrogen did not show any unusual features. The following cases, however, did present interesting clinical data.

Case Reports

Case 1—Mr L N, a 41-year-old male, entered the hospital complaining of pain in the epigastrium and the right lower quadrant which had been present at periodic intervals for the past fourteen years. In 1923, a Polya-Mayo resection had been performed at another hospital for a prepyloric ulcer. Since that time the patient had had periodic attacks of his ulcer symptoms, but repeated x-ray examinations revealed only a hypertrophic gastritis that was confirmed by gastroscopy. Upon the patient's present admission, the physical examination was negative. His gastric analysis showed a hyperchlorhydria with hydrochloric acid going to 75 units and the total acidity to 95 units, benzidine reaction was slightly positive for blood. The feces were negative for blood. The non-

protein nitrogen, upon admission, was 52 mg and the blood chlorides were 512 mg. The specific gravity of the urine was 1,020, few casts were present. The blood count was hemoglobin 82 per cent (11.9 Gm), red blood cells 4,800,000, white blood cells 12,100, polys 80 per cent, lymphocytes 18 per cent, and eosinophiles 2 per cent. The patient was treated by alkali medication but was not relieved until he received daily gastric lavages with a one-to-three hydrogen peroxide solution. The nonprotein nitrogen then gradually fell until on the day of his discharge it reached a level of 40 mg.

Case 2—M C, a 27-year-old white female was admitted to the hospital on January 2, 1938. She gave a history that she had not been eating well for the past year. The patient seldom felt hungry and often skipped meals. She had periodic attacks of nausea and vomiting during that time. Five days prior to admission she began to complain of a sore throat, difficulty in swallowing, and vomiting.

An attempt to swallow liquids or food was followed by vomiting of large amounts of greenish material. The vomiting stopped the day the patient was admitted. A history was obtained that the patient frequently indulged in alcoholic excesses. Physical examination revealed a well-developed and well-nourished female who looked acutely ill. The temperature was normal. The tongue was quite red. The throat was also red and parts of it were covered by a membranous material. The skin of the hands were rough and scaly, presenting the picture of a brownish scaly dermatitis that was pellagra like in appearance. The clinical impression was that the patient was suffering from an atrophic gastritis and avitaminosis. The blood count was hemoglobin 104 per cent (15.8 Gm), red blood cells 5,790,000, polys 90 per cent with 31 immatures, and lymphocytes 10 per cent. The blood chemistry on January 4, 1938, was urea nitrogen 90.9 mg, creatinine 3.1 mg, uric acid 7.3 mg, blood sugar 124 mg, and the carbon dioxide combining power of the blood plasma was 56.7 per cent by volume. The urine showed a specific gravity of 1,020, a trace of albumin and an occasional cast were present. The blood chlorides, examined three days later, were 445 mg. The patient was treated by the use of synthetic vitamin B₁ (thiamin chloride), liver extract, saline administered parenterally, and a high vitamin diet. The nitrogen retention gradually decreased so that on February 8, 1938, the blood chemistry was urea nitrogen 11.3 mg, creatinine 0.5 mg, blood sugar 82 mg, carbon dioxide combining power of the blood plasma 49 per cent by volume; and the blood

chlorides 478 mg. The blood count was hemoglobin 94 per cent (13.7 Gm.) red blood cells 4,600,000 white blood cells 11,400 polys 82 per cent with 3 per cent immatures, lymphocytes 18 per cent. The specific gravity of the urine fell to 1.012, the albumin and casts disappeared.

Case 3—S. K., a 60-year-old male entered the hospital with a history that for six days prior to admission he had suffered severe generalized cramps. He was nauseated and vomited everything he ate. He had had no bowel movement during the past six days. Baemas were ineffectual. A right herniotomy and a hemorrhoidectomy had been performed ten years ago. Physical examination revealed an elderly, poorly nourished asthenic, and slightly cyanotic male who looked acutely ill. A systolic murmur was heard at the apex and it was transmitted to the axilla. The blood pressure was 140/100. The abdomen was slightly distended soft, and somewhat tender throughout. No masses were felt. The liver and spleen were not palpable. The stool was clay colored and had a foul odor. Laboratory examination revealed the following: the nonprotein nitrogen was 60 mg. carbon dioxide combining power of the blood plasma 57.5 per cent by volume. cholesterol 115 mg. and the blood diastase 10 units. The blood sugar varied between 83 to 100 mg., rising on the day when the patient's temperature rose and falling to normal levels on the days when the temperature dropped. The leucocyte index was 9.1. The blood count was hemoglobin 100 per cent (14.5 Gm.) red blood cells 4,010,000 white blood cells 6,820 polys 71 per cent, lymphocytes 20 per cent mononuclears 8 per cent. The sedimentation rate was 2 mm. in forty five minutes. The Wassermann was negative. The urine showed a specific gravity varying between 1.012 to 1.032. glucose was positive at times, albumin was negative. faint traces of acetone were present and an occasional red blood cell was found. The urinary diastase was 63 units. The stools were negative for blood, bile, and undigested fat. enzymes were present. A flat plate of the abdomen was negative. Loewi's test was positive. The clinical history—fluctuating hyperglycemia, fatty stools increased urinary diastase, positive Loewi's sign, and the temperature suggested the presence of a subacute pancreatitis. Since the surgical division did not regard the patient as a good surgical risk, he was treated medically. The stomach and duodenum were decompressed with duodenal intubation. Saline and 5 per cent glucose were instilled into the duodenum and were also given intravenously. The patient's symptoms disappeared and he made an unevent-

ful recovery. The nonprotein nitrogen dropped to 37 mg. and the blood sugar remained normal. The urinary diastase fell to 10 units. Subsequent roentgenographic examination of the gall bladder and gastrointestinal tract were negative.

Treatment

The treatment of prerenal azotemia in abdominal diseases consists first, in the removal of the cause, and second, in the use of measures to overcome the renal dysfunction. In patients with peptic ulcer who develop azotemia after excessive alkali therapy, the latter must be discontinued and antacids employed that will not disturb the acid base equilibrium of the blood. In these patients, as well as those with pyloric obstruction the alkalosis with its resultant hypochloremia can be combated by the use of saline administered parenterally. Peters and Van Slyke⁹ are of the opinion that while chloride deficiency and consequent alkalosis are not unimportant effects of pyloric obstruction, they are of less importance than dehydration and base deficit, all of which can be overcome by sodium chloride solution.

In patients with gastrointestinal hemorrhages or profuse diarrhea, the dehydration was treated by the use of proctoclysis, hypodermoclysis, or venoclysis of saline or Ringer's solution containing 5 per cent glucose, in addition to what was permitted by mouth. Transfusions were advised when the hemoglobin went below 50 per cent (7.25 Gm.). The nutritional disturbance was overcome by the use of a liberal protein diet and the administration of vitamins by mouth or parenterally. It is not advisable to keep patients with bleeding ulcers on too restricted a diet when once the vomiting has stopped. This limited diet further weakens the patient and does not tend to decrease the blood nitrogen levels. In our experience, duodenal alimentation, in which about seven eggs, sixty four ounces of milk, four ounces of lactose, one or two liters of water, and vitamins B and C were given daily, or the Meulengracht diet, which was employed in 3 patients, seemed

covered, the nitrogen retention levels returned to normal comparatively slowly, notwithstanding the fact that the proper measures were employed to combat the renal dysfunction. Even when the nitrogen retention was not very pronounced, it sometimes took as long as fourteen to eighteen days before a normal blood urea or nonprotein nitrogen was again present.

In patients with severe enterocolitis, an elevation in the nonprotein nitrogen levels was also observed. In 1 of the patients, a Mr J L, 45 years old, the nonprotein nitrogen of the blood was 120 mg upon his admission to the hospital. The blood chlorides were 450 mg. The specific gravity of the urine was 1,020, a heavy trace of albumin and a few granular casts were present. The blood count was hemoglobin 108 per cent (15.7 Gm), red blood cells 4,960,000, white blood cells 6,650, polys 81 per cent, and mononuclears 19 per cent. As soon as the diarrhea stopped, the water balance was restored, the nutritional disturbance was overcome, and the nonprotein nitrogen of the blood fell to 27 mg. The specific gravity of the urine went to 1,009, the albumin and casts disappeared.

The patients with obstructive tumors of the gastrointestinal tract and increased blood urea or nonprotein nitrogen did not show any unusual features. The following cases, however, did present interesting clinical data.

Case Reports

Case 1—Mr L N, a 41-year-old male, entered the hospital complaining of pain in the epigastrium and the right lower quadrant which had been present at periodic intervals for the past fourteen years. In 1923, a Polya-Mayo resection had been performed at another hospital for a prepyloric ulcer. The nitrogen retention gradually decreased so that on February 8, 1938, the blood chemistry was urea nitrogen 113 mg, creatinine 0.5 mg, blood sugar 82 mg, carbon dioxide combining power of the blood plasma 49 per cent by volume, and the blood

Discussion

A series of patients with diseases of the digestive tract was observed in whom evidence of prerenal azotemia was seen at some time during their clinical course. In most of the patients the normal function of the kidneys was restored.

The pathogenesis of prerenal azotemia is still problematic. Hypochloremia has often been advanced to explain the impairment of the renal function. However, notwithstanding the popular term "hypochloremic azotemia," a decrease in the blood chlorides is not a prerequisite for prerenal azotemia. In patient L N, the nonprotein nitrogen was 52 mg, while the blood chlorides were 512 mg. In patient J L, the nonprotein nitrogen of the blood was 120 mg, while the blood chlorides were 450 mg. On the other hand, a hypochloremia can exist without evidence of an azotemia, as was illustrated in a patient (Miss D D), who was suffering from a severe ulcerative colitis with six to ten bloody stools daily. In this patient the nonprotein nitrogen of the blood was 30 mg, while the blood chlorides were down to 333 mg.

Dehydration is one of the most frequent causes of prerenal azotemia. While often associated with excessive vomiting or diarrhea, dehydration may also occur without these symptoms. Wilbur and Snell¹³ have emphasized the fact that deficiency states occur in gastrointestinal diseases due to an inadequate dietetic intake as a result of various digestive symptoms. When patients suffer from more or less constant abdominal pain or other gastrointestinal symptoms, they are apt to limit not only their food intake but their fluid consumption as well. In addition, a restricted diet will form less water due to the lessened food intake. These factors will bring on dehydration over a period of time, which may eventually result in nitrogen retention. Patient L N (Case 1), as soon as his pain was relieved, consumed sufficient food and fluids to restore his water balance and reduce his nitrogen levels. In Mrs M C (Case 2), who showed clinical evidence of a de-

ficiency state, the nitrogen retention was much more pronounced than one would expect from the amount of vomiting and the blood chlorides present. In this patient the markedly increased nitrogen level was probably due to dehydration, resulting from the lack of food and fluid intake over a long period of time. We must also remember that there are normal individuals who, as Ashe and Mosenthal¹² pointed out, take little fluid and who have a high normal blood urea nitrogen. If these individuals develop a disease of the digestive tract they are much more likely to develop prerenal azotemia in view of the already disturbed water balance.

Dehydration also plays a most important role in the development of postoperative prerenal azotemia. This fact cannot be emphasized too strongly, as its recognition will materially tend to lessen surgical mortality. Important as it is to maintain the water balance after operation, it is still more important to overcome water depletion before operation. Dehydration should be energetically combated before operation, even if the nitrogen levels are normal or only comparatively slightly increased as a marked degree of water depletion may exist in the tissues before there is evidence of nitrogen retention in the blood. If we wait to combat the water depletion until after the operation, when definite evidence of renal impairment is present, it may be too late to save the patient. For, as stated earlier in the paper, even in those patients who recovered after the development of a postoperative prerenal azotemia, the blood nitrogen levels returned to normal comparatively slowly, notwithstanding the fact that the necessary measures were employed. Maddock and Coller¹¹ demonstrated in their experimental normal individuals, who were dehydrated that when these subjects were restored to a normal water balance, the water supplied was first used to relieve the depleted tissues, secondly, for vaporization, and lastly, for kidney function.

The factors of dehydration and hypo-

to bring about a comparatively quicker recovery than the Sippy dietetic plan. The liberal protein diet did not increase the nitrogen levels but on the contrary seemed to decrease them comparatively more rapidly than when the Sippy régime was used.

In patients who are to undergo abdominal operations, signs and symptoms of dehydration should be looked for. The renal function as determined by the non-protein nitrogen or urea nitrogen of the blood and the concentrating power of the urine should be ascertained as a routine procedure. It must be borne in mind, however, that a normal blood nonprotein or urea nitrogen in these patients does not preclude the possibility of an azotemia after operation. The presence of an elevated nonprotein nitrogen of the blood, however, especially when accompanied by a comparatively high specific gravity of the urine, should be regarded as a danger signal and should be combated energetically even if the operation has to be temporarily postponed. In patients with vomiting or diarrhea, the blood chlorides and the carbon dioxide combining power of the blood plasma should also be determined.

The preoperative and postoperative maintenance of the water balance is essential if the dangers of postoperative azotemia are to be prevented. The amount of fluids that the patient will require before operation will vary with the type of case and the extent of the dehydration present. Excessive vomiting or diarrhea will increase an already existing water depletion. When a patient enters the hospital, the amount of dehydration present is rather difficult to estimate. This dehydration, plus the usual loss of fluids during the operation and the minimal water requirement of 3,500 cc necessary during the first twenty-four hours after the operation,¹⁰ must be taken into account when appraising the water balance preoperatively and postoperatively. Maddock and Collier¹¹ estimated that patients with serious dehydration were depleted of an amount

equal to approximately 6 per cent of their body weight. We found that a good working rule in the average case, in order to overcome dehydration before operation, was to supply fluid parenterally daily to the extent of 3 to 4 per cent of the body weight, although at times as high as 8 per cent was given, twenty-four to forty-eight hours before the surgical procedure. This parenteral fluid was administered in addition to that which was allowed by mouth. It is safer to give a little more than too little during this comparatively short preoperative period. The parenteral fluids were given by the intravenous drip method, the rate of flow being about 500 cc per hour. Ringer's solution containing 5 per cent glucose was most often used for the parenteral administration. If the infusions had to be given for more than three days, Ringer's solution was alternated with 5 per cent glucose in distilled water. Transfusions may also be necessary before and after operation to prevent surgical shock, which may be accompanied by prerenal azotemia. As a rule, however, if the patient has been properly prepared before operation, a lessened amount of parenteral fluids will be necessary postoperatively although this, of course, will vary with each case.

In patients who are to be operated for biliary tract disease, another factor in addition to the water balance must be taken into account, namely, the glycogen saturation of the liver, for very often when gallbladder disease has been of long standing, there is an associated latent hepatitis that cannot be detected clinically or at operation. This latent hepatitis may be the cause of a postoperative azotemia. Therefore, a safe rule to follow before all gallbladder operations is to give carbohydrates liberally by mouth and also parenterally.

A venoclysis of about 1,500 to 2,000 cc of Ringer's solution with 5 per cent glucose by the drip method seventy-two and twenty-four hours before the operation is advisable as a routine measure in all gallbladder cases.

Discussion

A series of patients with diseases of the digestive tract was observed in whom evidence of prerenal azotemia was seen at some time during their clinical course. In most of the patients the normal function of the kidneys was restored.

The pathogenesis of prerenal azotemia is still problematic. Hypochloremia has often been advanced to explain the impairment of the renal function. However, notwithstanding the popular term 'hypochloremic azotemia,' a decrease in the blood chlorides is not a prerequisite for prerenal azotemia. In patient L N, the nonprotein nitrogen was 52 mg, while the blood chlorides were 512 mg. In patient J L, the nonprotein nitrogen of the blood was 120 mg, while the blood chlorides were 450 mg. On the other hand, a hypochloremia can exist without evidence of an azotemia, as was illustrated in a patient (Miss D D), who was suffering from a severe ulcerative colitis with six to ten bloody stools daily. In this patient the nonprotein nitrogen of the blood was 30 mg, while the blood chlorides were down to 333 mg.

Dehydration is one of the most frequent causes of prerenal azotemia. While often associated with excessive vomiting or diarrhea, dehydration may also occur without these symptoms. Wilbur and Snell¹² have emphasized the fact that deficiency states occur in gastrointestinal diseases due to an inadequate dietetic intake as a result of various digestive symptoms. When patients suffer from more or less constant abdominal pain or other gastrointestinal symptoms, they are apt to limit not only their food intake but their fluid consumption as well. In addition, a restricted diet will form less water due to the lessened food intake. These factors will bring on dehydration over a period of time, which may eventually result in nitrogen retention. Patient L N (Case 1), as soon as his pain was relieved, consumed sufficient food and fluids to restore his water balance and reduce his nitrogen levels. In Mrs M C (Case 2), who showed clinical evidence of a de-

ciency state, the nitrogen retention was much more pronounced than one would expect from the amount of vomiting and the blood chlorides present. In this patient the markedly increased nitrogen level was probably due to dehydration, resulting from the lack of food and fluid intake over a long period of time. We must also remember that there are normal individuals who, as Ashe and Mosenthal¹³ pointed out, take little fluid and who have a high normal blood urea nitrogen. If these individuals develop a disease of the digestive tract they are much more likely to develop prerenal azotemia in view of the already disturbed water balance.

Dehydration also plays a most important role in the development of postoperative prerenal azotemia. This fact cannot be emphasized too strongly, as its recognition will materially tend to lessen surgical mortality. Important as it is to maintain the water balance after operation, it is still more important to overcome water depletion before operation. Dehydration should be energetically combated before operation, even if the nitrogen levels are normal or only comparatively slightly increased, as a marked degree of water depletion may exist in the tissues before there is evidence of nitrogen retention in the blood. If we wait to combat the water depletion until after the operation, when definite evidence of renal impairment is present, it may be too late to save the patient. For, as stated earlier in the paper, even in those patients who recovered after the development of a postoperative prerenal azotemia, the blood nitrogen levels returned to normal comparatively slowly, notwithstanding the fact that the necessary measures were employed. Maddock and Collier¹¹ demonstrated in their experimental normal individuals, who were dehydrated, that when these subjects were restored to a normal water balance, the water supplied was first used to relieve the depleted tissues, secondly, for vaporization, and lastly, for kidney function.

The factors of dehydration and hypo-

chloremia did not seem to account for the azotemic syndrome that developed in the patients who succumbed after cholecystectomy. Schutz, Helwig, and Kuhn¹⁴ found in 4 patients, who died in uremia following cholecystectomy, severe damage to both the liver and kidney, even though there was no preoperative evidence of renal impairment. They concluded from this and also from experimental evidence, that the diseased liver produced a toxin that acted more or less specifically on the kidneys. A certain number of patients with gallbladder disease do show evidence of hepatitis. It is quite possible that a latent hepatitis that cannot be demonstrated may be stimulated by the operation, producing the severe picture of liver damage described by Schutz, Helwig, and Kuhn.¹⁴ But we are not convinced that this damaged liver necessarily produces a toxin specific for the kidneys. For it is a known fact that in some of these so-called "liver deaths" after cholecystectomy, no definite renal pathology could be found, although nitrogen retention was present in the blood. It is a generally accepted procedure at the present time to give all gallbladder patients large amounts of glucose preoperatively to prevent the dangers of hepatitis and secondary renal dysfunction. Experience has shown that when the liver cells are "padded with glucose" before operation the postoperative mortality is decidedly lessened. The question that arises in some patients is whether the carbohydrates taken by mouth will be sufficient to accomplish this purpose. Many of these patients for various reasons will not take an adequate amount of glucose when told to do so. Furthermore, it is questionable in gallbladder patients whether a sufficient amount of the glucose will be absorbed from the small intestine as a result of the oral administration of the sugars. It has been shown experimentally that a lessened glucose absorption takes place in animals suffering from a deficiency of the vitamin B complex.¹⁵ Many apparently normal individuals show varying degrees of mild vitamin deficiency.

It is therefore possible that patients who have been on restricted diets for a long period of time, as these gallbladder patients so often are, may have a greater degree of avitaminosis. It is likewise possible that this deficiency state, while subclinical, may be sufficient to interfere with the absorption of glucose from the small intestines. It is therefore advisable, in order to adequately protect the liver against the dangers of hepatitis and secondary renal dysfunction in gallbladder surgery, to give glucose parenterally as well as by mouth before the operation.

Conclusions

1 Evidence of prerenal azotemia is comparatively frequently encountered in digestive tract disease.

2 The treatment of prerenal azotemia in these affections consists first, in the removal of the cause and second, in the use of measures to overcome the renal dysfunction.

3 Dehydration that gradually develops over a long period of time may be a causative factor in increasing the blood nitrogen levels in patients with digestive tract disease.

4 Therapeutic measures have been outlined to prevent or materially lessen the dangers of postoperative prerenal azotemia.

IMPETIGO CONTAGIOSA COMPLICATED BY ACUTE NEPHRITIS

SEYMOUR H. SILVERS, M.D., Brooklyn, New York

(From Kings County Hospital)

IMPETIGO is so frequently encountered that complications of this skin ailment are rarely envisioned. The more local complications, such as pyoderma, abscess formation, lymphangitis, and gangrene are rarely encountered and hardly ever stressed. There is, however, a more serious internal complication of which few are aware and which should be kept in mind by physicians. Acute nephritis as a complication of impetigo contagiosa has not received the attention it warrants, yet impetigo ranks as one of the more important etiologic factors of acute nephritis.

The first report linking impetigo with nephritis was that of Salvioni,¹ who in 1879 reported from postmortem observation a case of glomerular nephritis with a generalized impetiginous eruption in which he saw a causal relationship. However, the relationship was not very clear, for he had not followed the clinical course of the case, nor was there any statement in his report on the treatment that the patient had received. Sirugues,² in 1881, reported cases in which he observed acute nephritis as a complication of impetigo of the head. Boyer³ was able to find 7 cases of nephritis in which impetigo was the etiologic factor. Muller⁴ saw a case of nephritis following an impetiginous eruption after vaccination. Fontanee⁵ stressed the fact that hematuria may be seen not infrequently in cases of impetigo in children. Brocq,⁶ in his textbook on skin diseases, also writes of the possible kidney complication in impetigo. Guard⁷ reported 2 cases of nephritis following impetigo. He observed that the nephritis cleared up as soon as the impetigo was cured. He also observed that nephritis may be present in

a very mild form and, therefore, overlooked. The prognosis in both his acute and mild cases was usually good. The first report on this subject found in American literature was by Phillips,⁸ in 1910. He reported 2 cases of nephritis following impetigo and emphasized that it was the duty of the physician to examine the urine in all cases of impetigo in children, and that in nephritis of obscure origin, impetigo should be considered as a possible etiologic factor. In his first case, nephritic symptoms appeared eight days after the eruption first appeared on the chin. Farah⁹ reported a number of cases of nephritis following impetigo, some mild and some severe. Sieben¹⁰ saw a patient, aged 18, who developed acute nephritis after impetigo. Schaefer¹¹ stresses the favorable prognosis in acute nephritis following impetigo. Sutton¹² reported 5 cases of acute nephritis, all preceded by impetigo.

It is not always possible to determine in each case the etiology of acute glomerular nephritis. Students of kidney diseases are agreed, however, that in the great majority of cases the disease is a manifestation of an infection in some part of the body. Longcope *et al.*¹³ were able to demonstrate infection foci in 84 per cent of their series of cases of acute nephritis. Southby and Stanton¹⁴ investigated acute nephritis in 103 children and found that 29 had tonsillar or peritonsillar infection preceding the onset of acute nephritis. In 27 cases no etiologic factor was discovered, 17 cases had impetigo, 15 were preceded by measles, 11 were preceded by pneumonia, and the remainder were due to a variety of causes. Hill,¹⁵ in a similar study among 51 children, found that in 15 cases no

etiologic factor could be established, 14 were preceded by tonsillitis, 4 by scarlet fever, and 4 had impetigo. Lichtwitz¹⁶ stressed the importance of skin infections as foci in acute nephritis. He collected 97 cases of acute nephritis in five years. Among these, 19 cases were due to pyoderms of the skin. Kaumheimer¹⁷ found that among his series of 223 cases of nephritis, 21 were due to impetigo. He stressed the fact that skin infections play an important role in causing nephritis. He observed that older children were more vulnerable than infants. The prognosis in his cases was invariably good. Lindenstrauss,¹⁸ too, observed that very young children were not as easily affected by impetigo nephritis as older children. He observed that impetigo nephritis is similar in its course to the acute nephritis following scarlet fever.

Since Tillbury Fox first described impetigo contagiosa as a distinct clinical entity, many observers have studied the causative organism. It is generally agreed that both the streptococcus and staphylococcus can be isolated from the lesion, but that in the majority of cases the streptococcus is the causative organism. Farley and Knowles¹⁹ believe that streptococci can be isolated in all cases of impetigo. Hiemke²⁰ found that only 9.2 per cent of his series of cases yielded staphylococci, the rest showed streptococci on culture. Smith and Burky²¹ studied 9 cases in children. In 6 cases they isolated a hemolytic streptococcus, and in 3 they found the staphylococci.

That impetigo contagiosa causes a generalized body reaction was shown by Towle and Swartz.²² They studied the blood counts in 25 cases of uncomplicated impetigo. In 24 cases investigated, they found an increase in the white blood corpuscles of over 10,000 per cu mm. In 10 of these cases, the count was over 15,000.

Case Report

M. A., a 17-year-old white schoolboy, entered Kings County Hospital on June 15, 1937, complaining of a generalized eruption of seven-days'

duration, hematuria of four-days' duration, and vomiting and diarrhea of three-days' duration.

He had always been well. The father had pulmonary tuberculosis, but did not live at home with the boy. The patient rarely had colds or sore throats. There was no history of scarlet fever, rheumatic fever, or of venereal disease. The tonsils and adenoids had been removed about a year before admission.

The present illness was not preceded by any cold or sore throat. One week prior to admission a "sore" appeared on the hand and face. This was diagnosed as a "ringworm" infection and treatment was prescribed. The eruption spread very rapidly and involved larger areas of the skin. Three days after the onset of the eruption, he began to pass red urine. Within another two days he began to vomit and had about four watery stools daily. The legs and face became swollen. There was no complaint of headaches or diplopia.

Examination revealed an acutely ill boy with a lethargic appearance. The pasty, edematous face was covered with numerous crusted, oozing, red lesions of varying size. Similar skin lesions were also present on both the upper and lower extremities and on the neck and ears. The legs showed edema. The pupils reacted to light and accommodation. The tongue was moist, and the teeth in fairly good condition. The tonsils were small, not red or inflamed, and the throat was negative for inflammatory lesions. The heart was of normal size, the sounds clear and regular, the rate normal. No murmurs were heard, the A² was louder than the P². Blood pressure was 160/120. The lungs showed no abnormal findings. The abdomen was flat. No masses or fluid were felt. The genitals were normal. The reflexes were hyperactive. The boy appeared ataxic. There was present a bilateral Babinsky.

The diagnosis was that of acute glomerular nephritis and impetigo contagiosa.

The roentgen diagnosis of the lungs on June 18 showed hyperventilation of lung fields with slight impairment of illumination of the left base. The pulmonary findings were considered secondary to the acute nephritis.

The urine was bloody on admission and had a specific gravity of 1.015. The albumin was 3+. The urine was loaded with white and red blood cells and showed granular casts. The abnormal urinary condition gradually cleared before the patient was discharged.

The urea nitrogen was 96 mg per 100 cc. of blood upon admission, and a week later increased to 180 mg. A week before the patient was discharged, the urea nitrogen was 40 mg. The

creatinine, on admission, was 1.8 mg. increased later to 2.0 and was 1.38 upon discharge. Blood sugar was normal. Total protein per 100 cc of serum was 3.134 albumin 2.06 and globulin 0.474. Blood count on admission showed 65 per cent hemoglobin 3 720 000 r.b.c. 8 000 w.b.c. 64.6 per cent polymorphonuclear, 30 per cent lymphocytes 2 per cent large mononuclears and 4 per cent eosinophiles. The blood pressure on admission was 160/120 three days later was 160/110, and before discharge it dropped to 135/80.

The temperature range while in the hospital was between 100 and 101 F. Pulse rate ranged between 70 and 90 and respiration between 20 and 24.

Treatment in the hospital consisted of the application to the skin lesions of a 2 per cent solution of gentian violet twice daily. General treatment consisted of phenobarbital gr. $\frac{1}{2}$ and codeine occasionally. Fluid intake was restricted to 1,000 cc. daily. Diet consisted of salt-free and low protein foods. Rest in bed was enforced. Intake and output of fluid was constantly checked. The output was consistently greater than the intake. The patient gradually lost the edema, and the skin lesions cleared up at the same time.

The patient was discharged free of both diseases about five weeks after his admission.

Comment

The incidence of acute nephritis following impetigo contagiosa is probably very small, yet it is important for the practitioner to be on the alert in a search for this complication. We have come to consider acute nephritis following throat infections as an established entity, yet the total number of such cases expressed on a percentage basis is probably not larger than the number of cases of acute nephritis following impetigo.

In most of the reported cases in which acute nephritis complicated impetigo, the eruption was usually severe and extensive. This was also borne out by our case, where the eruption was generalized. As a rule, the acute nephritis clears up as soon as the skin lesions disappear. Since most cases of impetigo are usually cured very rapidly, few, if any physicians examine the urine. There may, however, be some transitory kidney damage in a

considerable number of cases. This might be revealed if a systematic search were made. Thus, Guard⁷ found that many cases of impetigo showed a transitory hematuria without other symptoms.

It is also worth while to note that mercury compounds, while very effective in the treatment of impetigo, should be used with care and forethought because of the possibility of additional mercurial damage to an already injured kidney.

Conclusion

1 Impetigo contagiosa and pyodermic skin infections are important in the etiology of acute nephritis.

2 A case of acute nephritis complicating generalized impetigo is reported, with a review of the literature.

3 The prognosis of acute nephritis complicating impetigo contagiosa is usually good.

INDUSTRIAL EPIDIDYMITIS AND EPIDIDYMO-ORCHITIS

GEORGE E. SLOTKIN, M D , F A C S , Buffalo, New York

THIS study is based on the observation that a paucity of information exists today regarding the occurrence of an acute epididymitis and epididymo-orchitis in industry, which is not due to direct trauma, is nonvenereal in origin, and is created by so-called "strain."

It seems somewhat strange that in the past five years some 30-odd cases have been collected in this series and no previous report of the existence of such a condition or the possibility of its relative importance, both to the employee and employer, is noted, except for a small notation by Hinman,¹ who says "Insurance companies, commissions of industrial medicine, and physicians regard acute affections of the testicle and epididymis arising on the basis of industrial injury or strain as primarily venereal and, therefore, nonindustrial. This is unfair to the workman. The prevalence of chronic gonorrhea does much to discredit such claims. It is the duty of the physician to differentiate the venereal exacerbations, for which they are not entitled to compensation, from the purely traumatic lesions to which they are entitled." Therefore, to promote further discussion on this important subject, this series of personal cases is presented.

Heavy industry seems to have been the chief offender. However, there is always a provocative background underlying the etiology of these cases. A recent symposium at the last meeting of the American Urological Association disclosed that the question of pyogenic prostatitis is a pertinent one. One must only refer to this subject to appreciate its importance.² Among the careful investigations Wesson³ states that 25 per cent of prostatitis is nonvenereal, of these cases, 75 per cent have a remote

or recent history. Cumming and Chittendon⁴ state "chronic prostatitis is a manifestation of a general focal infection. It must be located and eradicated." A. A. Kreutzmann,⁵ in his experiment, determined conclusively that a reflux of urine into the vas may occur similar to the ureter. If the urine is sterile, no infection above takes place.

Mason⁶ determined that the prostate is a toxic factor in trauma, 35 per cent of all men have prostatic trouble, 72 per cent of focal infections have secondary prostatic infection.

Wesson⁷ in his summary declares that "traumatic epididymitis is due to a non-specific prostatitis and vesiculitis." All of the cases noted occurred in active workers, subjected to occupations requiring straining, tugging, or strenuous lifting. Pus is forced into the vas by action of the perineal muscles into the tail of the epididymis. In a similar manner, if the prostate only is involved in this previous infection, there is a reflux up the ejaculatory duct to the vesicle, which becomes infected, and then down the vas to the epididymis. The previously congested ejaculatory duct becomes impervious and the secretion is dammed back to the epididymis.

The cycle of events creating this disease is typical and dramatic. The patient has been employed in his present vocation for some time. Suddenly during these routine duties, while lifting or moving some heavy object, and without a direct blow, a sudden stabbing pain is felt in the groin on one side, immediately incapacitating the patient from continuation of his work, or under difficulty if attempted. Later, or on the following day, he notices a dragging in his scrotum which is aggravated by bending, lifting,

*Read at the Annual Meeting of the Medical Society of the State of New York,
New York City, May 10, 1938*

or standing, and upon his own inspection it is noted that the scrotum is swollen, tender, and hot. The symptoms are sudden in onset, the strain similar in all cases, and the cause of disability uniform. Disturbance of urination is variable, slight dysuria and some frequency being the chief complaint, when it occurs. Some of the patients attempt to continue work and can do so, others cannot, depending upon the amount of disability. Usually these cases have been reported to the plant physician within a few days, depending on the extent of the involvement and the amount of disability created.

There is no argument, I believe, that hundreds of similar cases have occurred with inequity to the employee. The controversy is to establish a definite cause and relation of the disability to the alleged indirect injury. I believe that in spite of the apparent disability, hundreds of cases have been overlooked because the relation to employment has been slighted. These patients have been unjustly ignored and disbelieved, most unfortunately, because the disability is rather fleeting, and not permanently disabling, they have wrongfully been slighted. When a testicle is lost, I believe the time has arrived to establish this disease as a definite clinical entity, despite the occasional controverted case and refusal to assume liability of such a condition.

It is of primary importance to eliminate the previous or present existence of venereal infection. These cases must be definitely nonspecific in character and only by careful bacteriologic study of the urine and prostatic and vesicular smears can this fact be established. The chief offenders were found to be, first, staphylococcus groups, second, bacillus coli, third, streptococcus. The condition is always secondary to a previously existent, quiescent, nonvenereal vesiculitis or prostatitis with some extraurologic focus. A careful and painstaking history must be obtained. The truthfulness of the patients' statements and a primary focus sought in the teeth, tonsils, throat,

chronic infected hemorrhoids, or a previously acquired furuncle will supply this.

The urine always contains pus cells in varying degrees, and these must have been present previous to the inception of the disease. It could have been detected if the employee had been carefully investigated previous to his employment and at stated intervals during this period. I have pleaded for several years with the carriers to have such careful urinalysis routinely, because of the failure to obtain such an examination the present morbidity exists. This is one of the important prophylactic measures neglected and should be established routinely if further cases are to be avoided.

The cycle of events in the pathology developed is analogous to that of the complications following a venereal infection in its extension. There exists a previous low grade, symptomless, and overlooked prostatitis and vesiculitis. A low grade pyuria is present in the urine. A sudden indirect strain or jar forces the infected material either into or from the vesicle down the vas to the tail of the epididymis, the ejaculatory ducts, which have previously been draining the vesicle sufficiently, are aggravated by the sudden pressure and strain to which they are subjected by the unusual lifting, become congested, and close. A nondraining cul-de-sac is thus created and an acute swelling and an acute inflammation of the epididymis, testes, or both results.

Examination discloses the typical signs of such an involvement: white blood cells in the urine and a large, tender, swollen epididymis on the side involved. There is variable urethral discharge. The question of gonorrhea must immediately be discounted by smear and culture, and the disease probably catalogued as a nonspecific one. The urinary symptoms may or may not be aggravated, depending on the amount of drainage and the size of the vesicles and prostate. A smear of the expressed material from these parts discloses clumps of pus cells and in addition, a voided specimen of urine after such a stripping contains

myriads of purulent shreds, plugs, and debris

Of the 33 cases in this series, the age incidence covered the span of from 19 to 62 years. One was 19, 3 under 30, 10 from 35 to 40, 10 from 45 to 50, 6 from 50 to 55, and 3 from 60 to 63—an average age incidence of 45 years. One was an unmarried youth of 19, who vehemently denied any sexual intercourse, 3 were unmarried, 4 were widowers with families, 25 married with families.

A volunteered history of previous gonorrhea was obtained in 2 cases: 1 aged 50, the other aged 42. Both were married and the fathers of 2 and 3 children, respectively, and had their specific infection 28 and 18 years before, respectively. Thirty-one absolutely denied any previous infection. Five of the cases had an accompanying scanty urethral discharge that was negative for the presence of gonorrhea, both by Gram stain and culture. The urine was cultured and smears obtained from expressed secretion from the seminal vesicles and prostate in all cases. Four showed streptococcus anhemolyticus, 21 showed staphylococcus albus, 5 showed pure *B. coli*, and in not a single case was a positive smear or culture for gonorrhea obtained.

Every case disclosed pus cells in the urine to a varying degree from a minimum of single pus cells of 5 to a field to clumps and myriads of clumps. Twenty-five of the 33 cases disclosed disturbance of urination, varying from frequency and dysuria of every hour, both day and night, to only a nocturia of twice a night. Three of the cases disclosed terminal hematuria and tenesmus after voiding, in 2 of these the streptococcus was the offending organism. The disability varied from a minimum of two weeks to six weeks, with an average of three weeks for complete resolution and ability to return to work.

One case, the 19-year-old neophyte, developed the severest condition. He went on to the formation of an abscess in the testicle, which required extirpation. All of the cases received subsequent treat-

ment to the seminal vesicles and prostate with rapid response and evacuation of its infected contents. Foci of infection were found in 32 cases out of 33. The single exception was again in the 19-year-old boy.

As so frequently happens in individuals of the laboring class, disorders of the teeth were prominent, varying from infected gold caps, diseased broken roots, and dental caries, to a greater or less degree in all of the cases. Infected tonsils were noted in 6 of the cases, with the ability to express purulent material from them and the complaint of recurrent sore throat. One gave a history of a recent attack of marked furunculosis four months previous to the onset of the condition.

The treatment is threefold: the relief of the acute symptoms, draining the seminal vesicles and prostate of its contents, and the removal of all foci of infection. The strain on the cord can be relieved by rest in bed, or if the patient is ambulatory, the application of a proper fitting suspensory or a Bellevue binder. The injection of calcium gluconate or calcium levulinate (10 cc of the 10 per cent solution) intravenously daily, gives ready and immediate relief. Proper massage and stripping to establish drainage to the prostate and vesicles is indicated immediately. I have not used sulfanilamide in these cases where the organism is a streptococcus or staphylococcus, as I found it unnecessary. The condition is self-limited, responds rapidly in from two to three weeks, and in only 1 case have I found it necessary to employ surgery. The total disability of the patient is less than four weeks and I have seen no cases of permanent disability arising from the condition.

A typical case history with development of the most aggravating symptoms, would, I believe, be of interest.

This is the youngest boy in the series, aged 19, employed as a machinist, who states that six days before he was seen he had been working all day pulling on some heavy wrenches, and while

walking home had noticed a severe pain in the right testicle. This continued all night and the following morning on reporting to work he found that the pain and swelling had become so severe as to prevent him from further employment. He made a report to his boss and has been home since. The past history of this young man shows that he has always been in good health has never had any serious illness or operations, had his tonsils removed at the age of 8. He states that eight weeks before his present trouble he suddenly developed frequency which steadily became aggravated until a terminal hematuria with severe dysuria developed. He consulted a physician and was treated expectantly with gradual improvement of his condition until complete disappearance of all symptoms two weeks previous to the development of the present condition.

This boy absolutely denies sexual exposure at any time. When I saw him he had a temperature of 101.2 F and there was no evidence of hernia. A voided specimen of urine was cloudy, containing no albumin or sugar but loaded with white blood cells. He had frequency every two hours and nocturia once. The right scrotum was enormously enlarged by an acute suppurative orchitis with secondary edema of the cellular tissues surrounding the scrotum and extending over to the left side. The seminal vesicles could be felt. The prostate was soft full and boggy. His tonsils are out, his throat was clean, and there was no evidence of infected food. The patient was sufficiently ill to warrant hospitalization.

He received routine treatment while in the hospital by suspension of the scrotum intravenous injections of calcium levulinat (10 cc 10 per cent daily) but with only moderate response. Within ten days a pointing abscess developed in the testicle which was incised and drained. A culture at this time showed a pure staphylococcus albus. Within a week he had 3 draining abscesses and it was then decided because of the suppurative orchitis present, to perform an orchidectomy. His urine cleared immediately after the orchidectomy. Pathologically the testis disclosed a suppurative epididymitis and orchitis. Within ten days he was discharged as cured. He subsequently received prostatic massage over a period of five weeks, at which time his urine was absolutely negative chemically and microscopically.

In spite of the clear-cut history of injury, the disability involved and the destructive pathology that resulted, this

case was controverted by the industrial commission most unjustly, I believe, to the employee. It is, however, under appeal at the present time, and should, in fairness to the patient, be decided in his favor.

Summary

A study is presented, based on the observation that epididymitis and epididymo-orchitis can occur in industry as a result of a strain that is definitely nonvenereal in origin and not due to a direct blow. The premise is based on the study of 33 cases observed over a period of several years, and verifies that conclusion. In fairness to the employee and employer, a careful inquiry and study must be made in this type of case to clarify it properly as industrial or nonindustrial.

A more painstaking examination should be made of all candidates for employment by the plant physician or other delegated person, with a careful survey of focal infections and urinalyses. If found positive, the applicant should be advised of the condition and corrected before employment. Only by this means can the morbidity of this industrial disease be controlled.

Conclusions

- 1 Nonvenereal, nontraumatic epididymitis and epididymo-orchitis from strain is a distinct and definite entity, occurring in industry.

- 2 Many such cases have in the past been ignored or overlooked.

- 3 In justice to the employee, a careful preliminary examination at the time of his application must be made to avoid future disabling accidents involving the genitourinary tract.

- 4 Unless proved otherwise, the employee should receive the benefit of the doubt as to the fundamental basis and causative factors for this condition.

- 5 A pre-existent prostatitis and vesiculitis, or both, and the presence of a low grade pyuria is provocative in the development of this disease.

Discussion

Dr Allen L. Parlow, M.D., Rochester, New York—Dr Slotkin has presented a subject that is definitely of interest to every man practicing medicine in an industrial community. I wish to congratulate him on the excellent presentation of his paper, the manner with which he has approached the subject, and the well-drawn conclusions that he has reached.

In my experience, a true epididymo-orchitis has been rather uncommon. This type of condition always follows direct trauma and man seems most fortunately able to protect himself from blows on the testis. Crane,* in 1935, reporting on 100 consecutive cases of industrial affections of the epididymis and testis, found only 3 that could be definitely called a true epididymo-orchitis. The remainder of his series were all infections of the epididymis, the infection having been carried along the vas from previously infected seminal vesicles. Dr Slotkin has reported only 1 case of epididymo-orchitis in his series of 30 cases. It is obvious here that the involvement of the testis followed the development of an abscess of the epididymis. It should be emphasized that nongonococcal infections of the epididymis are very apt to rapidly cause an abscess, with secondary invasion of the testis. Early recognition of the presence of an abscess and immediate drainage is the only manner in which the testis may be saved. The entire series reported by Dr Slotkin is composed of cases in which infection has been carried from the seminal vesicles along the vas to the epididymis. Infection then is the inciting factor. I feel that it is most essential, therefore, to differentiate early between epididymitis and epididymo-orchitis.

The prostate and seminal vesicles become infected in a great variety of ways. Gonococcal infection of the urethra, of course, is the most common manner. Obstructions to the output of urine from the bladder, such as hypertrophy of the prostate, contracture of the vesical orifice, median bar, stricture of the urethra, etc., are all accompanied by prostatovesiculitis. Of course, to these most frequent causations must be added

infected urine descending from the upper urinary tract, urethral instrumentation, sexual strain, prostatic calculi, and metastasis from foci of infection.

The bacteria-producing prostatovesiculitis are of special interest. The gonococcus, the staphylococcus aureus and albus, the streptococcus, the colon bacillus, and the tubercle bacillus are the most commonly found organisms. It is uncommon to find the gonococcus in the prostatic secretion of an infected individual after three years. After that time it is usual to find that the infecting organisms are the staphylococcus and the colon bacillus, i.e., a mixed infection. In hematogenous infections of the prostate the infecting organisms are, of course, the staphylococcus, the streptococcus, and the tubercle bacillus. I note with interest that in his series of cases Dr Slotkin has obtained a pure culture in each case. It is also noteworthy that he was able to find a focus of infection in all cases but 1. To definitely state, however, that these cases were all secondary to the foci of infection demonstrated to have been present, I feel that the organisms obtained by smear and culture of the urine and prostatic secretion should also have been proved by similar methods to have been present in the designated foci of infection. Without this information one cannot be definite as to the mode of introduction of the bacteria into the prostate and the seminal vesicles.

It has been my experience that by far the greater number of individuals suffering with epididymitis are able to recall a strain or a blow obtained while carrying out some form of labor. One must be most careful, therefore, to procure a history of injury and an accurate past history when dealing with a working man. Later, when the epididymitis will have subsided, it is most essential to rule out obstructions or infection elsewhere in the urinary tract. All foci of infection must, of course, be removed and cultured because on this information alone can one determine whether or not the prostate and seminal vesicles were infected by the hematogenous route. I have yet to see a patient having epididymitis of a nontuberculous nature in which the individual did not have a co-existing prostatovesiculitis.

I agree with Dr Slotkin that many working men are discouraged from seeking compensation for acute affections of the epididymis on the basis that these affections, in the main, are venereal. On the other hand, many, many cases in which a definite venereal history has been obtained have been given compensation on the ground that a strain suffered while working

* Crane, Jay J. Epididymo-orchitis in Industrial Surgery. J Urol, 34 477 (1935)

produced an exacerbation of the pre-existing lesion namely the expression of pus from the prostatic urethra or seminal vesicles along the vas to the epididymis. The only manner that I know of that will prevent these injustices on either side is to have all employees given a thorough periodic physical examination.

Dr William J Kennedy, *Gloversville New York*—Dr Slotkin's paper, dealing with this rather controversial subject, is especially timely in view of the recent changes in the medical care of compensation cases. Until recently almost all claims for this type of injury were treated by industrial surgeons and rarely seen by the urologist.

I have several times in compensation hearings heard the existence of traumatic epididymitis enthusiastically affirmed by general surgeons and denied with equal enthusiasm by urologists.

About ten years ago Wessen, under title of "Traumatic Orchitis, A Misnomer" analyzed 70 cases of alleged testicular injury but was unable to convince himself that trauma was a causative factor in a single case.

More recently Crane found 3 authentic instances in 100 consecutive alleged claims.

It has been my practice when investigating testicular injuries to look for certain well defined diagnostic criteria.

- 1 A history of definite direct trauma.
- 2 Visible evidence of scrotal trauma.
- 3 Severe pain that is immediately disabling.
- 4 Some degree of shock.
- 5 Involvement of both the testis and epididymis.

Obviously a diagnosis made on these points

excludes cases in which strain is an alleged etiologic factor.

Men engaged in heavy industry are constantly subjected to strain and slight trauma and sometimes honestly attribute to injury such lesions as testicular tumor, spermatocele, early tuberculosis and syphilis of the testis the prior existence of which they were unaware until attention was focused thereon by some slight trauma or strain.

In the case of the 19-year-old boy mentioned by Dr Slotkin it seems to me that there may be some doubt regarding trauma as an etiologic factor.

Eight weeks prior to his present disability he presented a chain of symptoms that may well have been due to an acute prostatovesiculitis which subsided under expectant treatment, but no evidence is presented that the prostate and vesicles were free from infection. This might easily be merely an acute exacerbation entirely independent of any trauma.

In compensation hearings the question invariably arises whether or not a pre-existing pathologic condition could have been aggravated by the alleged trauma or strain. It has long been accepted practice to prohibit strenuous physical activities in persons suffering from gonorrheal prostatovesiculitis or posterior urethritis in an effort to prevent the infection extending through the vas to the epididymis. It makes no difference whether the organism is the gonococcus, staphylococcus or colon bacillus—the mode of extension is the same in each instance.

Therefore, if our assumption that excessive physical activity predisposes to extension of infection in venereal prostatovesiculitis is correct, it seems to me that it is not unreasonable to assume that the same factors may produce an extension in nonvenereal infection.

THE FAMILY DOCTOR AND CANCER

While surgery and radiology are contesting ownership in the meager salvage of cancer victims the general practitioner is standing on the sidelines and wondering where he comes into the cancer picture. Unless he has performed the fifty major operations required to secure the benediction of the American College of Surgeons, or owns a roentgen ray machine and a few milligrams of radium all too often his function seems to be limited to signing a yellow sheet negotiating with the mortician, and condoling with the family. Moreover when all the bills have been paid for surgical skill, radiation hospital charges, nursing and burial there is often little left in the estate to recompense the family doctor for merely finding the case

and forwarding it along orthodox channels.

Yet to the thoughtful alert physician there are still some important services and substantial rewards in the cancer field if one regards the problem from a broader standpoint.

The physician can perform a service of extreme value by informing himself about the results of treatment which may be available to his patient. He can thus advise or prevent unwise efforts to cure advanced cancer may substitute palliative for aggressive measures, select good surgery instead of poor radiation or vice versa, and, in general exercise a wise disinterested control of the fate of his patient which after all is the finest expression of the art of medicine.

—James Ewing M.D. *Pa Med J* vol 25

A STUDY OF 63 PATIENTS BEFORE AND AFTER WEIGHT REDUCTION

EDGAR C BECK, M D , and ROGER S HUBBARD, Ph D , Buffalo, New York

THE need for weight reduction in the obese is well established. In the first place, physical improvement accompanies weight loss. It was shown in a previous communication¹ that the symptoms—dyspnea, easy fatigue, and dizziness—that the obese frequently show, were ameliorated or cured in the majority of instances. In a large percentage of the patients who suffered from edema or hypertension, these conditions were also improved after treatment. Secondly, it was shown that the penalties of obesity, particularly the cardiovascular complications, are less apt to occur after weight reduction. These observations are in accord with those of other investigators.

Various types of low caloric diets have been advocated for weight reduction. As long as dietary treatment does not violate the general fundamental principles of nutrition, its particular nature seems to make but little difference. Metabolic stimulants, if used, must be employed cautiously.

In most instances weight reduction is not a difficult problem if the proper cooperation of the patient can be obtained. This usually holds true whether the overweight condition is primarily exogenous or endogenous in origin, or whether it is due to a combination of the two. Even in an outpatient department it has been found possible to obtain the necessary degree of cooperation.

In spite of the number of articles dealing with the technic of weight reduction and the results obtained, there are very few that discuss the fate of the obese person after his weight has been reduced to a normal level. It is not only of scientific interest to consider this

phase of the question, but it is of great importance to the patient to know whether or not his improvement will be permanent.

It is probably the general opinion that the obese patient must adhere to caloric restriction for the rest of his life. Aub² states that if a patient returns to an unrestricted diet there is no gain for one to two weeks, but that then he regains weight. He says the patient must always subsist on a low caloric diet so that he shall not reacquire bad dietetic habits.

We thought that it would be of value to study a group of obese people who had attained normal weight to see what would happen to them when their diets were increased. We also wish to report at this time the results of certain quantitative studies made upon a group of obese patients when they were first seen and repeated when their weight had been reduced to normal.

The diet that we used for weight reduction consisted of carbohydrate 40 Gm, protein 80 Gm, and fat 40 Gm. Food materials were selected to supply an adequate intake of vitamins and minerals. Thyroid extract in small doses (0.02–0.045 Gm daily of desiccated thyroid) was used in most of the cases. In addition, ammonium chloride or potassium chloride was administered when it was thought necessary.

The patients were treated in the outpatient department of the Buffalo General Hospital. The work was done in collaboration with Dr Roger S Hubbard. We did not have perfect cooperation from any single patient and are of the opinion that the time for reduction to ideal weight was materially lengthened for this reason.

*Read at the Annual Meeting of the Medical Society of the State of New York,
New York City, May 11, 1938*

By the methods described, we have been able to reduce to approximately normal weight 63 of 245 patients (29 per cent)

Chart 1 shows that this group of 63 obese people lost an average of 54 pounds over an average period of 314 days. At the end of this time they averaged 89 per cent over the ideal weight as taken from Davenport's³ height-weight-age tables. The maximum excess was 18 per cent. We appreciate the fact that any table of this sort cannot be wholly satisfactory because it does not take body build into consideration. We believe that many of these patients were nearer to their ideal weight than the comparison with the table indicated.

Chart 2 demonstrates the effects of increases in diet on patients whose weight had been reduced to normal. In this chart, the 63 patients have been divided into four groups. Group A, which consisted of 11, or 17.6 per cent, gained weight when the diet was increased. Seven of them are again reducing weight on subcaloric diets and 4 have discontinued clinic care. In Group B there were 15 patients (23.8 per cent) who stopped attending the clinic. Five of them had valid reasons for doing this. Group C consisted of 11 patients (17.6 per cent) whose weights are within a high normal range but who are still on low caloric diets. Group D was made up of 26 patients (41 per cent) whose weight has remained within normal limits for an average period of 11.8 months after their diets had been increased.

In Chart 3 a more detailed study of these 26 patients is given. Nine of these people were on unrestricted diets for a period of approximately one year. A number of these patients gained some weight (the maximum was 16 pounds) but all stayed within a normal weight range. The remaining 17 were placed upon a diet consisting of carbohydrate 300 Gm, protein 80 Gm, and fat 40 Gm. Upon this diet most of them showed no increase during an average period of

one year. Such gains as were noted were small, especially when the previous weight loss was taken into consideration. This diet, which can be classified as a moderately liberal one, seemed to satisfy our patients so that they desired no further increase.

In Chart 4 are given our results with the 21 patients of the group who had

blood pressures that could be considered elevated. In borderline cases the examination of the retinal vessels was regarded important in reaching a diagnosis. Of these patients, 9, whose age averaged 50 years, showed a return to normal blood pressure after weight reduction. This happened in some instances when retinal arteriosclerosis was present. The remaining 12 of the hypertensive patients showed some reduction in blood pressure, but not to normal levels. There was a general improvement in those symptoms that could be attributed to the hypertension. These results conform with those of others who have made similar investigations.

In Chart 5 there is a comparison between the average of those whose blood pressure dropped to normal and those whose blood pressure did not reach normal levels. In 9 of these the blood pressure was lowered to normal from an average of 178/108 to 135/74. In the remaining 12 the pressures were reduced from 197/107 to 172/95, as shown by the heavier lines.

Chart 6 shows a comparison of the glucose tolerance curves taken on 25 patients before and after weight reduction. There was a definite improvement in the curve after weight loss. These figures have been checked by standard statistical methods and the differences have been proven significant. These 25 patients were then given a high carbohydrate diet and another series of glucose tolerance tests were taken, with even further improvement in the curves. A more detailed report of this study will be given in a subsequent paper.

Chart 7 shows basal metabolic rates taken on 24 patients before and after weight reduction. It is well known that basal metabolic rates are within normal limits in the majority of obese patients. In our own series, 2 (Cases 1 and 11) had moderately elevated rates. One of these (Case 11) had had a previous thyroidectomy. There were also 3 cases of hypometabolism in this series (Cases 21, 22, 23). After weight reduction,

8 patients (Cases 2, 6, 8, 11, 14, 15, 17, and 18) showed elevated metabolic rates. All but 2 of these patients had received thyroid extract in small doses. Such medication was not given to Case 11 who had had a previous thyroidectomy. It is obvious that several factors enter into the significance of the figures in Chart 7. As has been previously pointed out by Strang and Evans,⁴ Wilder, Smith, and Sandiford,⁵ and Short and Johnson,⁶ the measurement of the basal metabolic rate, which depends upon estimations of the body surface and so upon the weight of the patient, does not serve as an accurate index for comparing results before and after weight reduction. The actual increases in metabolism were certainly less than those shown in the table. To what extent this factor and the administration of thyroid substance are responsible for the increases cannot be determined. It is worthy of note that none of the patients showed clinical signs of hyperthyroidism. It is also perhaps significant that the 3 patients with hypometabolism, who received somewhat larger doses of thyroid than did the others in the series, failed to show appreciable increases in the basal metabolic rate in spite of the reduction in weight and in consequence, of the estimated value of the body surface.

In Chart 8, circumferential measurements of the neck, biceps, bust, waist, hips, and buttocks before and after weight reduction are shown. Outside of the neck measurements, the percentage of loss in all measurements was approximately the same (17 per cent).

Conclusions

1 It was possible to reduce 20 per cent of all the admissions to an outpatient department obesity clinic to normal weight.

2. Approximately 50 per cent of those reduced to normal weight could maintain such weight on fairly liberal diets (low fat) for one year.

3 The systolic and diastolic blood pressure could be reduced in most cases

CHART 7

BASAL METABOLIC RATES BEFORE AND AFTER WEIGHT REDUCTION

CHART 8

AVERAGE MEASUREMENTS OF 35 PATIENTS (WOMEN)
MEASURED BEFORE AND AFTER WEIGHT REDUCTION

| | NECK | BUST | WAIST | HIPS | BUTTOCKS |
|-----------------------|------|-------|-------|-------|----------|
| AVERAGE ORIGIN WEIGHT | 20.4 | 81 cm | 74 cm | 85 cm | 85 cm |
| AVERAGE FINAL WEIGHT | 17.1 | 68 cm | 62 cm | 71 cm | 71 cm |
| AVERAGE LOSS | 3.3 | 13 cm | 12 cm | 14 cm | 14 cm |
| PERCENTAGE OF LOSS | 16% | 16% | 16% | 16% | 16% |

In 43 per cent of the patients the blood pressure dropped to normal levels.

4 There was an approximation of the glucose tolerance curves toward normal levels after weight reduction.

5 The basal metabolic rates, expressed as percentages of the normal values tended to increase moderately. To what extent this was due to changes in the body surface, to the small amounts of thyroid extract used during the period of weight reduction, and to other unknown factors could not be determined.

6 In general, the weight reduction was accompanied by equivalent reduction in circumferential body measurements.

Discussion

Dr Herbert Pollack, *New York City*—The treatment of obesity is dependent upon the recognition of the fact that the law of the conservation of energy holds true in the human being as well as in the laboratory. Naturally, if the caloric intake is less than the caloric expenditure, the body will have to draw upon its reserves to make up the deficiency. Consequently, the rate of weight loss in individuals will depend upon the difference between the intake and the output. Since there is a minimum caloric intake to which people can be limited, somewhere in the neighborhood of 600 to 800 calories, various schemes have been devised to increase the caloric expenditure of the individual, or to include such foods in the diet that have a high satiation value, or to hasten the passage of food through the gastrointestinal tract, and, consequently, limit the percentage of absorption. Among the former schemes, that is, those designed to increase the caloric expenditure, were dinitrophenol, thyroid extracts, cold douches, steam baths, and short-wave hyperpyrexia. Then there is the Strang-Evans type of diet, which takes advantage of the specific dynamic action of proteins, which may raise the metabolism of the body as much as 30 per cent. This type of diet also has the advantage of including large portions of meat with their high satiation values. Among the latter schemes belongs the banana and skimmed-milk diet.

There is no question about the fact that the obese person should be re-educated in regard to his eating habits, so that after the initial weight-reduction period is over the patient will have a permanent carry-over to prevent the return of the obesity. Therefore, it is essential that all reducing régimes be based upon the choice of foods normally available to the individual at home and in the restaurants. It is up to the physician and dietitian to educate the patient, rather than to merely reduce him. The teaching of the obese patient should be planned on the same basis as that of the diabetic patient. He should be taught the source of hidden calories. He should know that the pat of butter thrown on his vegetables in the kitchen adds 90 calories to the value of the food, that an extra 90 calories a day for a period of a year, means a gain in body weight of over 5 pounds. It is amazing to me how constant the body weight actually does remain in most people. As Du Bois says, "A man aged 40, now weighing 165 pounds, weighed the same about twenty years ago. If during that period he has consumed an average of

2,500 calories daily, the total for twenty years would amount to over 18,000,000 calories. The amount of fat stored in, or lost from the body, could be no more than 1 pound, or 4,500 calories. This means that the total intake of food was adapted to the total expenditures, with an error of one-fourth of 1 per cent." Since a man, when he took an extra pat of butter, automatically compensated by extra heat loss in one form or another, the real problem is that most people err in their choice of foods. Perhaps the work of Rich on the relationship of vitamin B₁ to the selective choice of foods will give us a partial answer. During the past four years at Mt Sinai Hospital in our nutrition clinic we have had occasion to treat over 3,000 obese patients. Our results, in relationship to blood pressure and glucose tolerance, are completely in accord with Dr Beck's. I should like to mention the unpublished works of Newburgh and his associates at Michigan, showing that the hyperglycemia and glycosuria of the obese is a manifestation of liver dysfunction, rather than of true diabetes mellitus.

Long-time reducing programs must include the supplementary use of vitamin concentrates. Our studies show that patients develop real vitamin A insufficiencies after eight weeks of restricted caloric intake. We are at present determining the vitamin B₁ balance in this group of patients.

The question of spontaneous or intermittent hypoglycemia as a cause of obesity must also be borne in mind. This, however, is part of a vicious cycle set up by the excessive caloric intake. In all of our experience, I can recall only one serious complication to a reducing régime. That is the case of a 310-pound female whose weight was reduced to 190 pounds in twelve months' time. At the end of this period, the patient developed a bilateral inguinal hernia and a strangulated femoral hernia, which necessitated surgical intervention. At the time of the operation it was easily seen that the hernial orifices had been tremendously dilated, due to the intra-abdominal pressure from the mesenteric fat. This fat accumulation had apparently acted as plugs in the dilated orifices. When the accumulation had been consumed, there was no longer anything to stop the intestines from being forced through the orifices.

Besides adequate vitamin protection, a positive nitrogen balance must be maintained. Constipation commonly originates when the total intake of food is restricted. This is more than likely related to the vitamin B insufficiency rather than to lack of bulk. The actual weight curve does not always reflect the loss of body fat.

We have seen patients maintain a fairly constant weight for a period of thirty days when there was a period of definite caloric deficiency. At the end of this time, diuresis would set in spontaneously and the weight loss in two days would equal the expected weight loss for the month. These observations are of importance to the physician so that he may encourage the conscientious patient to the time of actual weight loss when the expected fails to materialize. A limited salt and fluid intake helps a great deal preventing such temporary positive water balances.

Dr J J Short, *New York City*—There is value in having a clinic specially devoted to the treatment of obesity. At the Post Graduate Hospital such a clinic was formed about seven years ago. An esprit de corps is created that insures better cooperation upon which success of treatment depends. Our results have been very similar to those reported by Dr Beck.

The average rate of reduction has been 8 to 10 pounds a month. We have seen no ill effects in even more rapid weight reductions nor should any be experienced if diets contain the essential elements.

I was glad that Dr Beck referred to metabolism in relation to total surface area. Although basal metabolisms are initially generally within the range of normal the total heat output is tremendous compared to that after normal weight has been attained. Within the first few weeks after submaintenance diets are instituted there is a sharp drop in metabolism both total and basal characteristic of starvation. At this point we institute thyroid therapy to restore the basal metabolism to normal and maintain a steady weight loss. Eventually with loss of weight and restoration of normal surface area the total heat production becomes normal. There is no limit to the extent to which weight may be reduced safely. Our prize patient is one

who reduced 239 lbs. from 395 to 156 with general improvement and no adverse symptoms.

My congratulations to Dr Beck on his interesting paper.

Dr Louis Banman, M.D., *New York City*—Dr Beck is to be congratulated on his successful results. To reduce 1 out of 4 patients to normal weight is quite an achievement since success depends so much on the attitude and will power of the patient.

In my own experience at the Presbyterian Hospital I have found that few patients are steadfast enough to continue the rigid discipline for ten months—and to maintain normal weight once achieved for any considerable period is infinitely more difficult. Our average weight loss based on 2 000 cases is about 4 or 5 pounds a month.

As obesity is a forerunner of a number of serious diseases its prevention becomes one of the duties of the medical profession. In this we are hampered by tradition. Such high caloric foods, such as ice cream candies cakes pies olive oil butter cheeses nuts macaroni and the like are still favored by many. These foods were consumed by our forefathers to supply the 3 000 or more calories that they required for their ordinary daily activities. Modern conveniences of transportation and other labor saving devices have reduced our caloric requirements to about one-half or two-thirds.

Obviously the prevention of obesity is an educational problem. The desirable chef of the future will be he who can prepare attractive low caloric dishes containing satisfactory amounts of essential minerals, proteins and vitamins.

Our experience with obese hypertensive patients indicates that while weight loss will not always lower blood pressure yet it obviously reduces the burden imposed on the circulatory system and is therefore clearly indicated in this condition.

SILK INSTEAD OF CATGUT

How the use of silk instead of catgut in closing surgical wounds has made the after-operation period much easier for the patient and reduced the hospitalization period was described by Dr Donald Guthrie, Sayre, Pennsylvania surgeon, who was guest speaker of the 133rd annual Meeting of the Medical Society of the State of New York. Dr Guthrie said in part:

"Using the silk technic, wounds have been

uniformly closed without drainage serum accumulations have been infrequent, and no infections have developed. Hospitalization periods have been reduced four to six days.

He said that when catgut was formerly used in appendectomy the hospitalization period was usually nine days whereas using silk, the patient was up in four days and went home in seven days.

ELECTROCARDIOGRAPHY

The Values and Limitations

HERMAN TARNOWER, M D , Scarsdale, New York

(Assistant in Medicine, Columbia University, First Medical Division, Bellevue Hospital)*

THE important place that electrocardiography holds in cardiology is undoubtedly well merited, but those cardiologists who advocate it as a routine examination and hail it as a prophet would do well to remember one of Sir James MacKenzie's biblical quotations, "This wicked and adulterous people seeketh a sign, but none shall be given them." It cannot be too often stressed that without a careful consideration of the clinical features no laboratory test can acquire its full significance. This is especially true of electrocardiography. Fortunately or unfortunately, medicine has not degenerated to the extent that we may diagnose merely by means of a "sign."

It is not the purpose of this paper to describe or illustrate the various electrocardiographic changes that may occur in health and disease, but rather to indicate to the general practitioner, who may be confused by the enormous amount of literature on the subject, what help he may expect to gain through its use.

Although the electrocardiograph is the most precise means at our disposal for investigating the state of the myocardium, it must not be regarded as a court of last appeal. The degree of electrocardiographic abnormality does not always parallel the amount of cardiac damage, for it depends not only on the amount of damage present, but also on the site. A small localized lesion in one of the branches of the auriculoventricular bundle will cause an extensive alteration in a tracing, whereas a much larger lesion in the wall of the ventricle may cause little or no change. The inadequacy of electrocardiography in the diagnosis of valvular disease is a classic example of how

completely it may fail to give evidence of gross pathology.

Arteriosclerotic Heart Disease

All organs undergo structural changes as the result of arteriosclerosis, the majority of which are recognized only by the pathologist. In the heart, the electrocardiograph is capable of demonstrating evidence of such minor degenerations through slight alterations in the QRS complex and T wave. Are we justified in calling this arteriosclerotic heart disease when there are no clinical signs and the patient is free of symptoms?

Angina Pectoris—Abnormal ventricular waves are frequently found in patients suffering with angina pectoris but an electrocardiogram that is considered normal will no more exclude angina pectoris than a negative physical examination, nor will a record denoting severe myocardial damage infer that a patient is suffering with anginal attacks. Whether we consider angina pectoris as a clinical entity or a symptom complex, there can be no doubt that it must be recognized and diagnosed on a careful analysis of the patient's symptoms. Electrocardiographic changes have been shown to occur during brief attacks of angina pectoris.²⁰ These, however, are not constant and are difficult to demonstrate. The onset of anginal seizures may date from the time of a coronary thrombosis, or, as is often the case, they may cease entirely after recovery from such an episode. It is worth bearing in mind that a tracing may suggest (not diagnose) an old myocardial infarction when there has been no clinical evidence of a past coronary occlusion.¹⁴

Coronary Thrombosis—Ever since 1920, when Pardee²¹ first described his sign of coronary artery obstruction, the electro

* Bowen Fellow of the New York Academy of Medicine

FIG 1 Case of acute myocardial infarction. (A) Rapid auricular fibrillation, Q_1T_1 , Q_2T_2 type of occlusion (B) Return to normal rhythm on following day (C) Inverted T_1 suggests that patient suffered previous anterior apical occlusion

cardiogram has been an important aid in the diagnosis of myocardial infarction.² Undoubtedly the great majority of coronary occlusions can be easily recognized clinically, but the valuable confirmatory evidence gleaned through electrocardiography is certainly worth while, and may be of considerable aid in a differential diagnosis. Changes have been detected within a few minutes following a coronary closure, but for practical purposes, where there is no need for haste, it is best to take a tracing eight to twelve hours after the suspected attack. A single tracing may fail to give evidence of a myocardial infarction, but if serial records are taken, very few if any will neglect to show electrocardiographic changes.^{4,16} Serial tracings can also be of value when one has difficulty in determining whether the changes are recent or old. Where follow-up tracings are necessary they may be done on or after the second day.

The sequence of an elevated ST segment to an inverted T, to an upright T, as described by Parkinson and Bedford²¹ is pathognomonic of myocardial infarction, but one does not often see the complete picture in private practice because few patients can afford serial tracings. It is important to realize that any of the above changes can be caused by a great number of conditions. Otherwise, serious errors in diagnosis may easily be made, i.e. a coronary occlusion may initiate a paroxysm of fibrillation, flutter, or tachy-

cardia, on the other hand, after such a paroxysm, in the absence of an occlusion, the T wave is often temporarily inverted, hypertensive individuals with left preponderance frequently have an inverted T wave in lead one²⁰, a right preponderance may be associated with inversion of the T in lead two, luetic aortitis involving the coronary ostia and inciting severe anginal pain is frequently associated with inverted T waves, digitalis usually causes characteristic alterations in the ST and T complexes, but they may be confused with the coronary²² T, acute rheumatic fever and pericarditis cause elevated ST segments and inverted T waves²⁴, various acute infections and drugs will cause inversion of the T, etc.¹⁸⁻²⁰ The localization of myocardial infarctions as either anterior or basal by the Q_1T_1 or Q_2T_2 type of record is fairly accurate.¹⁴³ Such a characterization, as far as we know, has no prognostic significance, but it has given us a better understanding of the electrocardiographic changes that follow multiple thromboses.⁴⁴

The reports up to the present indicate that the fourth lead should be employed when myocardial infarction is suspected,^{7,14,18,20} but that the conventional leads alone will suffice for all other conditions. A single record with the conventional leads is sometimes normal at a time when the fourth lead would suggest a coronary occlusion and vice versa, they are thus a valuable check on each other.

ELECTROCARDIOGRAPHY

The Values and Limitations

HERMAN TARNOWER, M D , Scarsdale, New York

(Assistant in Medicine, Columbia University, First Medical Division, Bellevue Hospital)*

THE important place that electrocardiography holds in cardiology is undoubtedly well merited, but those cardiologists who advocate it as a routine examination and hail it as a prophet would do well to remember one of Sir James MacKenzie's biblical quotations, "This wicked and adulterous people seeketh a sign, but none shall be given them." It cannot be too often stressed that without a careful consideration of the clinical features no laboratory test can acquire its full significance. This is especially true of electrocardiography. Fortunately or unfortunately, medicine has not degenerated to the extent that we may diagnose merely by means of a "sign."

It is not the purpose of this paper to describe or illustrate the various electrocardiographic changes that may occur in health and disease, but rather to indicate to the general practitioner, who may be confused by the enormous amount of literature on the subject, what help he may expect to gain through its use.

Although the electrocardiograph is the most precise means at our disposal for investigating the state of the myocardium, it must not be regarded as a court of last appeal. The degree of electrocardiographic abnormality does not always parallel the amount of cardiac damage, for it depends not only on the amount of damage present, but also on the site. A small localized lesion in one of the branches of the auriculoventricular bundle will cause an extensive alteration in a tracing, whereas a much larger lesion in the wall of the ventricle may cause little or no change. The inadequacy of electrocardiography in the diagnosis of valvular disease is a classic example of how

completely it may fail to give evidence of gross pathology.

Arteriosclerotic Heart Disease

All organs undergo structural changes as the result of arteriosclerosis, the majority of which are recognized only by the pathologist. In the heart, the electrocardiograph is capable of demonstrating evidence of such minor degenerations through slight alterations in the QRS complex and T wave. Are we justified in calling this arteriosclerotic heart disease when there are no clinical signs and the patient is free of symptoms?

Angina Pectoris—Abnormal ventricular waves are frequently found in patients suffering with angina pectoris but an electrocardiogram that is considered normal will no more exclude angina pectoris than a negative physical examination, nor will a record denoting severe myocardial damage infer that a patient is suffering with anginal attacks. Whether we consider angina pectoris as a clinical entity or a symptom complex, there can be no doubt that it must be recognized and diagnosed on a careful analysis of the patient's symptoms. Electrocardiographic changes have been shown to occur during brief attacks of angina pectoris.²⁰ These, however, are not constant and are difficult to demonstrate. The onset of anginal seizures may date from the time of a coronary thrombosis, or, as is often the case, they may cease entirely after recovery from such an episode. It is worth bearing in mind that a tracing may suggest (not diagnose) an old myocardial infarction when there has been no clinical evidence of a past coronary occlusion.²¹

cardiogram has been an important aid in the diagnosis of myocardial infarction.² Undoubtedly the great majority of coronary occlusions can be easily recognized clinically, but the valuable confirmatory evidence gleaned through electrocardiography is certainly worth while, and may be of considerable aid in a differential diagnosis. Changes have been detected within a few minutes following a coronary closure, but for practical purposes, where there is no need for haste, it is best to take a tracing eight to twelve hours after the suspected attack. A single tracing may fail to give evidence of a myocardial infarction, but if serial records are taken, very few if any will neglect to show electrocardiographic changes.^{1,2} Serial tracings can also be of value when one has difficulty in determining whether the changes are recent or old. Where follow-up tracings are necessary, they may be done on or after the second day.

The sequence of an elevated ST segment to an inverted T, to an upright T, as described by Parkerson and Bedford,³ is pathognomonic of myocardial infarction, but one does not often see the complete picture in private practice because few patients can afford serial tracings. It is important to realize that any of the above changes can be caused by a great number of conditions. Otherwise, serious errors in diagnosis may easily be made, i.e. a coronary occlusion may initiate a paroxysm of fibrillation, flutter, or tachy-

cardia, on the other hand, after such a paroxysm, in the absence of an occlusion, the T wave is often temporarily inverted, hypertensive individuals with left preponderance frequently have an inverted T wave in lead one²⁰, a right preponderance may be associated with inversion of the T in lead two, luetic aortitis involving the coronary ostia and inciting severe anginal pain is frequently associated with inverted T waves, digitalis usually causes characteristic alterations in the ST and T complexes, but they may be confused with the coronary²¹ T, acute rheumatic fever and pericarditis cause elevated ST segments and inverted T waves²², various acute infections and drugs will cause inversion of the T, etc.^{1,18-20} The localization of myocardial infarctions as either anterior or basal by the $Q-T_1$ or $Q-T_2$ type of record is fairly accurate.^{1,23} Such a characterization, as far as we know, has no prognostic significance, but it has given us a better understanding of the electrocardiographic changes that follow multiple thromboses.²⁴

The reports up to the present indicate that the fourth lead should be employed when myocardial infarction is suspected,^{7,14,18,25} but that the conventional leads alone will suffice for all other conditions. A single record with the conventional leads is sometimes normal at a time when the fourth lead would suggest a coronary occlusion and vice versa, they are thus a valuable check on each other.

FIG 2 Sixty-year-old female who experienced prolonged attacks of paroxysmal tachycardia and responded satisfactorily to acetyl-*b*-methylcholine (A) Common type of bundle-branch block (B) Paroxysmal tachycardia of nodal origin (C) Lead 2, taken immediately after administration of acetyl-*b*-methylcholine shows change to normal rhythm

The introduction of the cathode-ray oscillograph as an instrument for observing and recording the electrocardiogram may open a new era in bedside electrocardiography²⁷ This instrument flashes the tracing upon a fluorescent screen where it remains for a sufficient period of time to be read A permanent record can be taken at the same time Its advantages are that it is simple, and an opinion can often be given before any records have been developed At present, it has the disadvantage of being too sensitive, it is more apt to record muscle tremors than the string galvanometer, and it does not work as well with an alternating current.

Acute Rheumatic Fever

Electrocardiography is a very useful aid in the diagnosis and management of acute rheumatic fever Few patients will fail to show electrocardiographic changes sometime during their illness^{3,25} A partial auriculoventricular block is the most common finding The elevated S T segment, another frequent manifestation, may occur to such a marked degree that it is possible to mistake it for a coronary occlusion Inverted T waves may appear, especially when pericarditis is present The important thing to realize is that

the electrocardiographic changes are not pathognomonic, but where the clinical features would lead one to suspect the presence of rheumatic fever, the confirmatory electrocardiographic evidence is practically diagnostic As a rule, the electrocardiographic changes clear up as the rheumatic infection subsides The fourth lead has been recommended as an additional aid in diagnosis¹⁶ Its value, however, is very controversial and doubtful^{9,23,24}

Cardiovascular Syphilis

There are no electrocardiographic changes that may be considered helpful in the recognition of luetic heart disease The slurring and notching of the QRS complex and the inverted T waves which are frequently found in one or more leads are the result of narrowed coronary ostia and secondary myocardial changes It is interesting to note that whereas a bundle branch block is a fairly common finding in aortic insufficiency of luetic origin, it is extremely rare in rheumatic aortic insufficiency

Disturbances of Cardiac Rhythm and Heart Block

It is in this group of disorders that electrocardiography gives its most accu

FIG 3 Case of widely patent foramen ovale (proved at autopsy) showing auricular fibrillation and slight right axis deviation

rate information. Through its use we have come to have a clearer understanding of the underlying pathologic physiology.¹⁰ There are rare instances when more than one tracing is necessary for a correct interpretation. For the most part, they can be accurately differentiated with ease.

In medicine, our interest in any field invariably increases when an efficacious therapeutic agent becomes available. Though the treatment of heart disease is not within the scope of this paper, mention will be made of a few drugs to emphasize the importance of a careful diagnosis, which in many instances can only be satisfactory with the aid of electrocardiography.

A simple sinus arrhythmia seldom, if ever, requires a tracing for diagnosis. Rarely one encounters difficulty in distinguishing extrasystoles from auricular fibrillation.*

In flutter of two-to-one or three to-one block a tracing may be the only means of recognition. Mention may be made here of Lian's precordial lead¹¹ which exaggerates the auricular component of the

electrocardiogram. (The right arm electrode is placed on the manubrium sterni and the left arm electrode is put at the junction of the right border of the sternum with the fifth intercostal space.) It is very useful in identifying indefinite P waves of small amplitude.

It is extremely important to distinguish the auricular and nodal paroxysmal tachycardias from the ventricular type, since the former two frequently start spontaneously in the absence of any underlying myocardial pathology, while the latter rarely, if ever, occurs without the presence of some cardiac damage¹², the inciting cause is often a coronary thrombosis. In the treatment of auricular and nodal paroxysmal tachycardias, which do not subside spontaneously and fail to respond to ordinary vagus stimulation, acetyl *b*-methylcholine^{13,14} and magnesium sulfate¹⁵ have been shown to be quite effective. Quinidine, in large doses, is the drug of choice in ventricular tachycardia.

Complete auriculoventricular block offers another illustration that emphasizes the value of a precise diagnosis. The Stokes-Adams attacks that occur in this condition have until recently always been considered to be the result of ventricular arrest. We now know that ventricular fibrillation (or flutter) may also cause

*I recently saw a patient in a well known cardiac clinic who had had digitalis for two years because of what was considered to be auricular fibrillation. A tracing was taken for permanent record and to the chagrin of all concerned it merely showed numerous auricular extrasystoles.

FIG 4 Case of constrictive pericarditis showing progressive diminution in voltage over period of two years (A) taken during stage of acute pericarditis shows convex ST segments and inverted T waves in lead 1 and 2

such fainting episodes^{8,12} The importance of this differentiation is readily realized when the therapy is considered Epinephrine is certainly the drug of choice when the former condition is present, but in the presence of ventricular fibrillation it is definitely contraindicated While visiting the wards of Dr Camille Lian at the Tenon Hospital in Paris, I had the pleasure of seeing acetyl-*b*-methylcholine administered for the latter condition with excellent results It seemed capable of terminating and preventing the seizures Obviously, it would be dangerous to give acetyl-*b*-methylcholine in the presence of ventricular arrest.

Occasionally one encounters a confusing record with gross irregularity due to overdigitalization In such instances, startling results are witnessed through the use of $\frac{1}{80}$ gr of atropine

An electrocardiogram should most certainly be made where the nature of a cardiac irregularity is obscure It will identify parasystole, the various types of extrasystoles, the different degrees of auriculoventricular block, etc, but it must not be expected to indicate the etiology or in any way serve as a complete cardiac investigation

The gallop rhythm and double apical impulse have been popularized as clinical signs of bundle-branch block, and al-

though they do suggest its presence, a definite diagnosis can only be made through electrocardiography

Bundle-branch block has been observed as a temporary sign during acute infections, angina pectoris, coronary thrombosis, and various toxic states When it develops as the result of a coronary occlusion it is likely to be permanent, in which case all other electrocardiographic evidences of the infarction are obscured The most common cause of a bundle-branch block is coronary atherosclerosis Accompanied by low voltage in all three leads, it is designated as an arborization block, the exact pathology of which is uncertain

The combination of a bundle-branch block and short P-R interval, occurring in healthy young adults who are prone to have attacks of paroxysmal tachycardia or auricular fibrillation, has been described by Wolff, *et al*⁴⁵ They believed the condition to be due to a hypertonic vagus I have seen a number of older patients with bundle-branch block secondary to myocardial "damage" who have had attacks of paroxysmal tachycardia following the administration of digitalis One case with the ventricular type of paroxysm may be worth citing

A female, aged 45, had an aneurysm of the left ventricle and a left bundle-

branch block (uncommon type) as the result of one or more coronary closures. She was always in mild failure, and invariably with a change of house officers digitalis was ordered. On three occasions, after receiving approximately 12 gr of digitalis, the patient had a paroxysmal ventricular tachycardia that passed off within ten hours after digitalis was discontinued. These three attacks were the only ones she experienced over a period of four months.

It is conceivable that the digitalis had an effect similar to that described by Wolff, *et al*.⁴⁶ Because of this and similar observations, I believe that digitalis should be given cautiously in the presence of a bundle-branch lesion.

The value of bundle branch block as regards prognosis is entirely dependent on the etiology,⁴⁷ i.e., when of luetic origin, the prognosis is usually grave, as a congenital lesion, it may be comparatively good. Since it is impossible to recognize the cause of a bundle-branch block by its form on a tracing, we must rely on the clinical findings for a final interpretation.

Congenital Heart Disease

With the aid of fluoroscopy and electrocardiography, the diagnosis of congenital heart disease has become very satisfactory.⁴⁷ The majority of congenital heart lesions in individuals who survive the first two years of life can be accurately diagnosed.

Congenital lesions may produce unusual electrocardiographic tracings with inverted T waves, high S T segments, complete auriculoventricular block, auricular flutter, etc. The most common manifestation is a right preponderance of wide excursion. In fact, a marked right axis deviation should always suggest the possibility of a congenital heart. Dextrocardia, the Eisenmenger complex, pulmonary stenosis, or atresia of the pulmonary conus, with or without other lesions (Tetralogy of Fallot), are among the most common causes of such a deviation.

Where the x ray and physical signs would lead one to suspect a widely patent

foramen ovale, a slight right preponderance with or without auricular fibrillation is a valuable aid in the diagnosis. It is interesting that auricular fibrillation is common with this defect, thus distinguishing it from all other congenital cardiovascular malformations.⁴⁸

An interventricular septal defect can cause a partial or complete auriculoventricular block or a bundle-branch block, but a normal tracing does not exclude this possibility. A cor trilocular atrium may fail to give any electrocardiographic evidence.*

An electrocardiogram is of no aid in the recognition of a patent ductus arteriosus, coarctation of the aorta, or an abnormal course of the great vessels.

Miscellaneous

A tracing will give very little evidence of the cardiac reserve. It is impossible to diagnose congestive heart failure by merely reading an electrocardiogram. Where low voltage is present in all three leads, hypothyroidism, constrictive pericarditis,⁴⁹ and widespread myocardial fibrosis secondary to coronary sclerosis should be especially considered.^{44,47} The fact that proper therapeutic measures will abolish the low voltage of the first two mentioned is evidence that it can be present without real or permanent myocardial pathology. Large excursions of the QRS complex are not a sign of good myocardial efficiency, nor have they any bearing on the prognosis. A failing hypertensive heart may show enormous left axis deviation up to the time of exitus. When asked whether the electrocardiogram had any value in prognosis, Sir James MacKenzie is said to have responded, "A heart is, laddie, what a heart'll do."† I believe that still holds true.

Almost any acute infection is capable of causing temporary alterations in the ventricular waves. With the exception of the varying degrees of auriculoventricu-

enemies, unless it be by men and nations, or threatened with failure of facts to justify our confidence in a continuance of the most encouraging progress of the past decade, the best of a half century of improving national health, we can afford to take stock of what we have created to make the medical sciences practically and economically effective. Disregarding for the moment, as a matter of common knowledge, the still overwhelming part played by the physician as private practitioner in care of the sick and in directing persons and families in the ways of health from the cradle to the grave, or as some would have it, from the womb or before to the tomb and thereafter, let us see what devices society and the state, or medicine and government, have created to bring the consumer and producer of medical services together, and to meet all reasonable demands within the means of the community and the individual to pay for them.

With the growth of specialization in medical training, skills, and experience, and in part as a sequel to the elaboration and great expense of apparatus for diagnosis and treatment of disease, and still more because of inclusion of the application of preventive and curative medicine among the functions of civil government, there has been an increasing diversion of professional personnel and of collective financial resources from the individual to the organized use of medical arts and sciences.

Almost all graduates of medicine, dentistry, and nursing, and their technical associates in the fields of biology, physics, and chemistry, have during their academic or clinical training taken part in the work of some medical service organization, and a very large proportion of them nowadays spend their entire professional careers as working members of some institution or agency devoted to preventive or curative medicine.

Many persons are familiar with the objects, methods, organization, and results of some particular medical ad-

ministration with which they are connected in an employed capacity, and it is obvious that a large proportion of any American community, whether urban or rural, comes into personal relation with one or more of the voluntary or governmental agencies of medical service each year, whether seeking personal care in sickness or receiving, in a remote way, some protection through the local or state health department.

Few physicians or representatives of the laity are, however, even superficially acquainted with the wide scope, varied character, and close interrelationship of the many public facilities for organized care of the sick and for public health.

Just as the individual physician in his private relationship with his patients distinguishes in the emphasis and occasion of his interest in preventive and curative activities, at the same time recognizing the necessity and value of the closest possible correlation of the two for the benefit of the patient and family, so in the field of administrative medicine, institutions and agencies do generally and properly select and equip themselves to meet the needs of some one particular specialty within the fields of sickness care and health protection while each organization shares in some degree in advancing both.

While for publicity, and perhaps for political convenience, there is some excuse for including both under the one label of public health, there seem to be compelling reasons of function, cost, and specialization of personnel, objectives, and techniques that justify a clear distinction between such organized services as are intended primarily for the determination of a diagnosis and provision of treatment for the sick individual, and those intended to protect the public health.

The term "Organized Care of the Sick" will be sufficiently defined by listing those special functions served by institutions and agencies generally found in a mature urban society of today, and recognized as necessary to meet our ambition for humane, competent, and economical

care of the sick, namely hospital care for bed patients, outpatient care for the ambulatory sick, convalescent homes to complete recovery, institutional care of the chronically ill, visiting nurse service for the sick at home, ambulance service, medical social service, home medical care.

For a precise definition of public health as a community service I offer the following. Public health services consist of the application of the sciences of preventive medicine through civil government for social ends. For military needs and under certain conditions of emergency or catastrophe, the health of the civilian population is protected by other than the resources of civil government. Diagnosis and care of the sick, particularly of persons who must be isolated to prevent the spread of communicable disease, may be included among the duties of a public health service as an incident in the accomplishment of its main objectives. Voluntary or nonofficial agencies may take a part in communal services more properly the function of civil government, but such agencies are or should be in all instances enjoying a privilege as nonprofit corporations, serving public purposes under the law and thus essentially within the control of government. With these qualifications, however, the definition offered appears to be accurate and sufficient.

The public health, while merely an expression of the composite health of many individuals, is a social rather than an individual objective. Not the person but the crowd is the preoccupation of the health department of local and state government, and to this end a half-dozen functions are found indispensable. Recording, tabulating, analyzing, interpreting, and publishing the natality, morbidity, and mortality experience of the community—so-called vital statistics, control and prevention of communicable diseases, control of environmental factors related to health, i.e., sanitation or public health engineering, public health laboratory service, protection of mater-

nity, infancy, and childhood, public health education.

However much the practitioner of medicine in his personal and individual capacity may share from choice or by legal obligation in one or many of the administrative functions of organized care of the sick or of public health, there will remain important, and I believe invaluable, distinctions between his services as privately engaged at the request of patients seeking his opinions, skills, and the free exercise of his judgment, and such activities as he undertakes as a member of an organization, bound, limited, and controlled by group decisions, adjustments, standards, and terms of employment. There is no greater compulsion upon the physician, or safeguard for the protection of the patient, than the unequivocal and universal acceptance under the law of the physician's personal responsibility for his every professional act, unless it be his moral and public acknowledgment of adherence to the Oath of Hippocrates. Corporate practice of medicine is illegal, hazardous, and irresponsible in the professional sense. Financial or commercial profit intervention between physician and patient is inconsistent with the best interests of the patient.

Administrative medicine through its social instruments, its institutions and agencies, seeks to increase their utility and economy, and expand to universal availability the services of those trained in medical arts and science without loss of that quality of personal competence and responsibility which the law requires of the doctor of medicine as an individual practitioner.

This is not the time or place to deal with the elaborate systems of coordination among the hospital and health agencies separately, and between these two groups of public utilities, by the mechanism of community councils and similar central, controlling, policy forming, or fund raising agencies. Hospital and health councils are a peculiarly American product, indigenous in most large cities, and essen-

tial for the proper interrelation and smooth functioning of the member agencies. In this way, competing institutional interests are reconciled with those of the supporting and served fractions of the public.

The relations among the several categories of institutions, between those of like kind, and with the public and the medical profession are intricate, delicately balanced, and in general well adjusted in the process of community organization, in response to steadily increasing technical demands for excellence, and under the pressure of financial necessity. The familiar pattern of organization of voluntary institutions serving a medical purpose is that of a nonprofit corporation with a board of trustees responsible for property, and a medical board responsible for professional standards, personnel, methods, and results, the physician on duty in all instances acting in his professional capacity in direct personal relation to the patient. Governmental institutions for the sick, whether local, state, or federal, operate under substantially similar forms, public authority of the appropriate political jurisdiction taking the place of the corporate board of trustees of the voluntary institution, the medical staff representing often a form of unitary rather than group control, and financial support being wholly in the form of appropriation of tax monies.

The capital investment in institutions and agencies for care of the sick in the eleven-and-a-half million people of the urban and suburban New York metropolitan area amounts to about \$62.52 per capita and the annual maintenance cost of these facilities including depreciation is equivalent to \$10.17 per capita. While these figures are probably somewhat higher for this, the largest of the world's urban aggregates, than for the United States as a whole, or for smaller cities, it is probable that equivalent sums will have to be spent by any modern community if it decides to avail itself of all the resources of modern medicine as New York has attempted to do.

For organized official and nonofficial agencies, local, state, and federal, serving the standard public health functions as defined, a little less than \$1.00 per capita is spent on the average annually by the people of the United States. Of this amount about 60 cents is paid through local and state government, 22 cents through federal government, 10 cents through voluntary or nonofficial health agencies, and 3.5 cents through philanthropic foundations. The cost of water purification and sewage works, which are considered engineering services and not functions of health departments, amounts to an additional 38.5 cents per capita.

At present, grants-in-aid to the states through the United States Public Health Service and the Children's Bureau for specified health purposes and for medical care of certain categories of persons, vary from 11 cents per capita in the states of New York and Pennsylvania, up to \$2.02 per capita in the State of Nevada.

While there are important differences in the number and scope of health functions performed by the departments of health of the forty-eight states, and while methods of budgeting and accounting for state appropriations for these services lack a desirable comparability, nevertheless the range of variation in the per capita expenditures for official health purposes by states in 1938 suggests essential differences that cannot be equalized by federal grants or administrative pressure without what many will consider extravagance. At the lowest expenditure level we find Kansas with 3 cents per capita, and Nebraska and Oregon with 4 cents, the highest per capita expenditure, \$1.31, being in Delaware, 79 cents in Massachusetts, and 43 cents in New York. The *how* and *by whom* and *what for* are at least as important as *how much* is expended for public health.

With the resources and cooperation of the private practitioner of medicine, and the organized institutions and agencies referred to above, the people of the United States have achieved an unprecedented improvement in health in the past three-

quarters of a century. Without entering here upon the details of the record it is certainly true that the increase in average age at death, the reduction of incidence and death rates from the known preventable diseases, and the improvement in probability of survival of the child bearing woman and her offspring, have been uninterrupted in all the years of our most serious, extensive, and enduring economic and social confusion from 1920 to date. Furthermore, it is apparent that for the nation as a whole, and, with rare and insignificant exceptions, for each of its major regional, state, urban, and rural political jurisdictions, for that great fraction of our wage-earning population included among the industrially insured, and for each economic and racial group in our population, the year 1938 stands out as the healthiest in our history. In fact it can be said without fear of contradiction that not before in man's recorded history has so large a population under one government, so varied in race, economic circumstances, climatic and employment conditions, enjoyed so much security, protection, and relief from the natural causes of death. The 130,000,000 people of our nation have found ways, according to their means, to obtain by private individual initiative, through their local and state governments, and with the protection in interstate and international commerce of the federal government, an increased quantity, improved quality, and a greater personal and social security in the field of health than has been attained by any comparable population under other forms of government, or by other methods of distribution or organization, or support of the curative and preventive resources of the medical sciences.

Among the many experiments and proposals evolved by officers of the federal government since 1933 to recapture industrial prosperity, financial stability, and social contentment and to set us on a new and broader highway of progress so much desired by both patients and doctors (as Kipling once defined the two

groups under which all people may be classified), our active federal administration has suggested a great extension of the role of the Public Health Service, of the Children's Bureau, and of the but recently created Social Security Board as builders, administrators, and pay masters for health services.

With the health objectives hoped for all will be in sympathy. With the evidence or claims of past failure and limited success of existing services and resources for their support, some of us may hesitate to agree. We are now immediately concerned with the methods proposed, for they appear to threaten the further development of some of our best tried and most productive agencies for the care of the sick, also to replace relationships delicately adjusted and carefully balanced among local, state, and federal governments and between physician and patient, with administrative devices and financial control that are untested in domestic experience and not invariably credited with improvement in the quality of medical care for the sick or a superior character of health services in other countries, or at all certain to keep the medical sciences in our own country free from the blight of officialdom.

There appear to me some fallacies in the assumption upon which the extension of federal spending for sickness care and health protection seem to be based. It is assumed that the health of the people of the United States is neglected and of a low order. The record is consistent to the contrary effect. There are obvious inequalities in the health status of some considerable groups of the population, those suffering from inadequate service of a medical and sanitary nature are certainly also handicapped in practically all other respects. The causes are not principally those of failure of medical administration but are inherent in the social, economic, and educational disadvantages of these same people. Increased spending by government for medical care will serve no permanent good where economic and social stagnation prevail. Improve-

ment in medical services whether for the sick or the well is more likely to result from increase in productive employment, in education, and in standards of living than to be the cause of these. Such social backwardness, delay in economic development, and public niggardliness as have deprived some states and more limited areas, counties, and cities of the best fruits of the medical arts have not been due to the failure of the medical profession to offer, organize for, or promote these ends so much as to the low levels of understanding, ambition, and financial resources of the people. The final and total remedy of these undesirable situations will come through the slow processes of economic and social, educational and ethical reconstruction rather than from immediate and, in some respects, extravagant federal subsidy for medical services which the people of the particular localities cannot sustain and are not socially prepared to demand or make competent use of.

A second assumption, which has been sedulously broadcast as if based upon good evidence, and used by the President, by his departmental chiefs, and by the senatorial proponent of enabling legislation to implement the principles of the proposed program for national health by immediate national expenditures on a large and rapidly increasing scale, is that about one-third, or some 40,000,000, of the people of the United States are unable to obtain, and in fact need, but cannot get, medical care in sickness. This assumption comes from an uncritical and unjustified reading of the records of the so-called "National Health Survey," which in fact although national in the statistical sense was as far as possible from being a survey of health.

In collecting the original information included under the title "National Health Survey," a record was made by persons untrained in the vicissitudes of medical history-taking of the illnesses causing interference with usual work or activities for seven days or more, remembered by some adult in each of 700,000 families

for the last twelve months' experience of about 2,300,000 members of these households. Varying with income status there were from 70 to 83 per cent of the remembered illnesses of which it was reported that the sick person had been served by a physician or medical institution. So far as practicable these reports of service were verified. As was to be expected, reports of more cases of sickness, and of less professional attendance were found among the sick with annual incomes of less than \$3,000, or on relief, than among those whose income was \$3,000 or over.

What was not asked by the army of surveyors was why the remembered case of illness did not have medical attention. Certainly there are many persons at all economic levels who know enough of their medical needs and have preferences of sufficient strength in the matter of treatment of their ills, to justify at least in their minds their not calling upon, or being visited by a physician. Wherever there exists in an American community a visiting nurse service, the sick will call for their skilled assistance, and in a good proportion of these calls the nurse finds that medical attendance or her own return visit would not profit the patient. In the last 11,000 calls upon a visiting nurse service in three large boroughs of New York City, and in these by the poorest people in the community, only 13 per cent of the cases lacked medical care of an acceptable kind. There are multitudes of people who dose and diet and manipulate themselves for even long periods of illness and not mainly because of the lack of the price of the doctor's visit. There is certainly a great deal of seven-day-or-more disability from illness or injury for which time, patience, and courage are as likely to help the patient as generous application of diagnostic resources to give a label to the disease and therapeutic means to relieve passing and perhaps unavoidable discomfort. There can be no doubt in the minds of persons engaged in the practice of general medicine that many

people prefer not to have a doctor for their familiar illnesses. While it is clear from the published reports of this extensive study that the authors have not made unreasonable deductions but have limited themselves to the relation of the facts of record, those persons in of ficial and social life concerned with federal policy formation, with propaganda, with politics, with promotion of social attitudes and support of legislation, have not hesitated to declare that a third or more of our population lacks medical attendance, and to imply in familiar and subtle ways that the chief reason for this is the lack of competent distribution and organization of physicians to meet the public needs. You will find this idea spread throughout the free and the official press that 40,000,000 Americans lack needed medical care. This statement has been commented upon in foreign periodicals.

What has been read out of the "National Health Survey" by officers in prominent positions in our federal government, as it has been used to influence public policy and bring discredit upon the humanity, competence, and service of the medical profession in our country appears to me to be contrary to widespread experience, both medical and lay, which shows that those who need medical care and want it are receiving it, except where poverty and sparsity of population groups have prevented physicians from settling among them, or distance and delay in transportation have made immediate medical services impracticable.

On the basis of the two assumptions of poor and neglected national health and lack of medical care for forty millions of our people, another is built, namely, that much increased expenditure for sickness and health services will make great improvements in general well being, regardless of the pre-existing and still continuing economic and social inequalities that afflict a large part of the population.

Experience of local and state health officers is that in general, appropriations

for health have increased absolutely and in relation to other items of cost of civil government in the past thirty years about as fast as local and state communities have been able to afford, and as widely as trained personnel have been obtainable to carry out the increasingly difficult and responsible technologic procedures.

Furthermore, it must be recalled that all tax money withdrawn from a state by the federal government to be allocated for purposes determined to be preferentially desirable by chiefs of federal bureaus, after subtraction of a portion to maintain federal officers and offices and supervisory and controlling functions, hampers the state by just this amount in its own self determined policies of local government. No one will cavil at the helping of less fortunate states by granting them aid from their wealthier neighbors through the medium of some single competent federal health agency. But when each of the three federal grantors of subsidies selects two major objects of expenditure, almost everywhere recognized as functions of state and local government, and in the main provided for up to the limit of local resources and for this sixfold purpose through a tripartite administration from Washington demands greatly increased tax revenue from each state to return according to a balanced formula in some proportion to each state, then we have a right to consider if the original and secondary assumptions are sound. Grants to the needy states are quite a different matter from turning over income from all states to be doled out to all states by persons less acquainted with the wishes and needs of the respective localities than are the officers of the communities themselves.

And yet even this entry into and interference with local self determination might be understood and accepted with good grace if there were any real support for a fourth assumption that has been exploited on the basis of what was called a

National Health Conference," namely, that there is a widespread, spontaneous,

informed demand by the laity, and particularly by the unemployed, the unemployable, the relief and subsistence-level wage earners, by organized labor, by agricultural laborers and others, for an amount and quality of medical care and health protection not now available to them, and not to be obtained for them by the usual and traditional channels of local and state government, and from their own tax-supported institutions and agencies. Surely a hand-picked collection of a couple of hundred persons, even though representing influential groups of both consumers and producers of medical care, but be it noted in no instance designated to speak with authority on behalf of their constituencies on the merit of the facts or proposals, surely such a group cannot be thought of as competent to endorse so considerable an innovation in governmental practice and balance, even if it had had time and opportunity to read, hear, study, and discuss the enormous mass of matter presented under the aegis of the Interdepartmental Committee and its technical aids, which was not the case. General, free, open discussion was impossible from the very time limitations under which the members met. There was no *conference*, there was no adjustment, compromise, concession, or agreement undertaken or arrived at. The formula and pattern of the occasion were familiar. Predigested material widely publicized by advance agents of the government was delivered in concentrated form to an audience mostly heavily conditioned by careful selection, and weighted in favor of the proposals, under circumstances that forbade serious arguments pro or con. Furthermore, until the form that enabling legislation was to take had been determined upon, all the conferees could say was "interesting if true, and what is to happen next?" Instead of an impression of an informed popular demand, we see the carefully manipulated results of ingenious, persistent, organized, and costly federal propaganda and publicity, the chief object of which would appear to be to

create in the public mind a sense of abuse, of neglect, of dissatisfaction with present medical care for the poor and the wage-earner, and with health services for everyone.

Now that we have the expression of a federal health policy before us in legal phraseology in the Wagner National Health Bill, Senate Bill 1620, we can determine the extent to which opposition and support has been brought to bear.

There is an assumption inherent in the conditions of the Wagner bill that appears to be of major importance, namely, that the health officers and their staff of state and subordinate jurisdictions of civil government who have in the main been appointed, trained, and qualified for expert services for health protection, where not selected only on political qualifications, can, by virtue of increased appropriations, more particularly federal grants to the states and under federal regulation and restrictive standards, deal expertly with the elaborate services required for the sick in hospitals, dispensaries, and in individual homes, in spite of their lack of clinical qualifications or familiarity with diagnosis and treatment of general medical and surgical conditions. The state health officer is the person who will be responsible on behalf of the state to receive and expend the increased federal and matched state monies called for under the Wagner act. It will be his duty to direct state employees in the general practice of obstetrics, pediatrics, and orthopedics, as well as to serve his usual functions as executive officer of a department of public health.

A clear distinction should be made and accepted between the functions of public health to be carried out under officers trained and experienced in this specialty of applied medical science, and the care of the sick, which with very rare exceptions, state, city, and county health officers are unqualified to undertake or direct. Health officers are chosen, where they are appointed on the basis of professional qualifications, not because they are highly skilled in diagnosis and treatment

of general illness, medical, surgical, and clinical specialties, but because they have trained themselves in the administrative application of preventive measures of sanitation, communicable disease control, and in the fields of maternity and child hygiene and in industrial hygiene. One might as well call on the cobbler to repair the radio set as to expect the health officer to be a leader in management of general disease in the community.

It is not now, and it should not be allowed to become, the function of a local or state department of health to engage in the practice of general curative medicine, which should continue to be as it is now, a function of the medical profession and of the medical institutions and agencies created by society and local government by voluntary and official resources for the purpose of affording good care for the sick.

Health departments should not be expected to engage in the practice of obstetrics, pediatrics, or orthopedics. These are functions of the medical profession and medical institutions, and only under rare and backward conditions of social and economic development will the health authorities find it necessary to administer, by physicians and nurses under their official direction, medical services for women and children, which in the usual standards of life in the United States are carried out through the private relationship between family and family physician, and wherever available with the assistance of the visiting nurse.

Some familiarity with state and local health officers convinces me that the quality and attention to their principal duties, i.e., prevention of disease and promotion of health, will suffer deterioration if the major expenditures under their jurisdiction and hence public and political and political interest, are for the care of general sickness. A slight acquaintance with the performance of health services will reveal to any critical physician many crudities and omissions that can be remedied best by concentration of the attention of experts on sani-

tation and preventive medicine. Public health is a vocational specialty of administrative medicine which has begun to emerge from the undifferentiated mass of medicine as did the clinical specialties. Organized care of the sick, as known to hospital administrators and medical boards and the clinical specialties requires at least as much expertness and experience as does the direction of a health department. Few indeed are the health officers or departments of cities, with health and hospitals under one director, where excellent health work in either field can be found over any considerable period of time.

Again the vicissitudes of partisan politics and the irresponsibility of elected governors of many of our states in the appointment and dismissal of the state health officer makes any thoughtful citizen, particularly if he be a physician, hesitate to vest in such an appointive officer responsibility for duties, decisions, and policies requiring a high degree of permanence of position, and freedom to exercise professional rather than political discretion. Consideration of the terms of office, length of services, qualifications, and accomplishments of the state health officers of the past two decades will, I believe, persuade an unprejudiced student of government of the unwisdom of loading upon the officer or person of state health commissioner the burden of organized care of the sick at government expense, while the service for health still falls so far short of its optimum and possible performance in a good many states, and among these some of our largest in both area and population.

There is one further assumption that is less clearly expressed but nevertheless has been voiced with some emphasis among proponents of expansion of federal functions in the medical field. I refer to the suggestion that by the use of federal funds the education of physicians, sanitarians, nurses, and other related personnel required in the public health field can be extended and hastened.

better by federal subsidy to individuals and favored institutions, than by independent development of student bodies and institutions now engaged in professional education

There is no experience, accomplishment, or leadership in the field of professional education among the officers or employees of the federal government of a quality equal to what is to be found in the nonpolitical state and endowed institutions in the United States today

Every draft of tax funds from the states to be distributed according to some federal formula or departmental criterion starves and hampers the states that have means to carry their own loads and share with their neighbors, and replaces self-dependence and local initiative and resourcefulness in the backward and impoverished states by encouraging their dependence upon federal doles for purely local and state functions for care of the sick and for public health

Fortunately, I believe, the Wagner National Health Bill does not provide for a federal compulsory sickness insurance scheme, but it is important to note that if any state adopts for its people such a plan for medical care of low income groups, large federal funds would be available if authorized and appropriated under such an act to assist in initiating it and giving it financial stability. If any such state legislation should become effective we should probably find that the device of federally abetted state compulsion of sickness insurance schemes upon certain classes of the population, who are especially dependent because of low earning power and lack of facilities for effective voluntary association to carry the cost of sickness, would represent a mere repetition of the unsatisfactory systems of medical services developed in the era of social deception and central governmental dominance by Bismarck and Lloyd George, neither of which has brought adequacy, superiority, or professional or lay satisfaction to Germany or Great Britain

It is my present opinion that the provisions of the Wagner Health Bill are such that if it were enacted and the appropriations were authorized as intended, public health would be set back rather than advanced. It seems to me that the policy of which this bill is the first specific federal expression would tend to destroy the strongest motives of self-reliance and local and state responsibility by creating a sense of dependence upon remote federal officers, unfamiliar with the respective needs, ambitions, and capacities of the widely varied state populations and governments

Only a threatened social calamity of catastrophic proportions would seem to me to justify such a revolution in the proper control over functions reserved by the Constitution to the police powers of the states.

There is much that can and should be done by and within the federal government which might raise the prestige and improve the performance of administrative medicine for the sick and for health throughout the nation. It would appear by the wording of Executive Order 7481 of October, 1936, that the President expected his Interdepartmental Committee to prepare a plan for better coordination of the health and welfare functions of the federal government. This committee appears to have been more concerned with using federal money to affect the performance of health services in the states than with putting the federal health house in order

The following are suggested as desirable changes in organization and classification of policies which might improve the nation's health through a federal health service

- 1 An inclusive, all-embracing department of health with a Secretary of the President's Cabinet at its head and a permanent commissioned medical officer in charge of all its executive functions. With the exception of the Division of Vital Statistics of the Bureau of the Census and the medical services of the Army and Navy, all medical care and

public health functions of the federal government should be under this department, and all grants-in aid to the states for medical and health purposes should issue through an officer of this department and not through three bureaus as at present.

2 Grants-in aid to the states should be made only to those states that can be shown to be so disadvantaged by economic, racial, or sanitary factors that they cannot provide even a reasonable minimum or necessary quantity and quality of health protection for their population or to assume reasonable health protection for the people of contiguous states

3 Research in the medical sciences should be developed at the highest level and in any fields where it is evident that state or local, voluntary or official resources are insufficient to make the best

use of the expanding fields of knowledge for prevention of disease

4. Channels of communication and means of distribution should be developed for the widest educational use of information which will be helpful to the laity and to the professions concerned with the application of the medical sciences. Among the uses of educational publicity should be included information upon the shortcomings and reasons therefore which prevent the people of a state or states from reaping the benefits of competent health services

5 The federal government should refrain from using its powers of taxation to usurp police powers reserved to the states by the Constitution, and should avoid even the appearance of coercion by the use of grants in aid to lead state governments into the practice of so-called general curative medicine.

Deaths of New York State Physicians

| Name | Age | Medical School | Date of Death | Residence |
|-----------------------|-----|--------------------|---------------|---------------|

HOUSE OF DELEGATES

MINUTES OF THE ANNUAL MEETING

April 24 and 25, 1939

The 133rd Annual Meeting of the House of Delegates of the Medical Society of the State of New York was held at the Syracuse Hotel, Syracuse, New York, on Monday, April 24, 1939, at 10 15 A M

Dr James M Flynn, Speaker, Dr Louis H Bauer, Vice-Speaker, Dr Peter Irving, Secretary, Dr Edward C Podvin, Assistant Secretary

SPEAKER FLYNN The House will be in order

1 Report of the Reference Committee on Credentials

SPEAKER FLYNN The Chair recognizes Dr Peter Irving, Chairman of the Reference Committee on Credentials

SECRETARY IRVING Mr Speaker, there are no disputed delegations, and all those seated are entitled to vote

SPEAKER FLYNN I now declare the 133rd Session of the House of Delegates open for the transaction of business

2 Roll Call

The Secretary called the roll by counties and stated "There is a quorum present"

3. In Memoriam of Three Departed Members

SPEAKER FLYNN Will the members of the House kindly rise in memory of three who have passed on since the last session Arthur G Root, Frederick H Flaherty, and Carl Boettiger The members rose and stood for a moment in silence in memory of these departed members

4 Approval of the Minutes of the 1938 Session

SECRETARY IRVING I move that the reading of the minutes be dispensed with, and that they be approved as published in the JOURNAL in the June 15, July 1, July 15, and August 1, 1938, issues

The motion was seconded, and unanimously carried

5 Reference Committees

SPEAKER FLYNN Mr Secretary, please read the appointments of the reference committees

SECRETARY IRVING I move you, sir, that the reports of the officers and committees which have been published and distributed to the members of the House be referred to the respective reference committees without reading

The motion was seconded, and there being no discussion, was put to a vote, and was unanimously carried

The reference committees for 1939 are as follows

REFERENCE COMMITTEE ON CREDENTIALS

Peter Irving, *Chairman*, New York
Edward C Podvin, Bronx
John L Sengstack, Suffolk
Arthur C Hartnagel, Tioga
Bernard S Strait, Yates

REFERENCE COMMITTEE ON REPORT OF PRESIDENT

Robert Brittain, *Chairman*, Delaware
William W Street, Onondaga
Coburn A L Campbell, Suffolk
Howard Fox, New York
Herbert H. Bauckus, Erie

REFERENCE COMMITTEE ON REPORT OF COUNCIL—PART I

Introduction
Postgraduate Medical Education (also supplementary report)
Public Health Matters
Maternal Welfare
Walter D Ludlum, *Chairman*, Kings
Horace M Hicks, Montgomery
John J Buettner, Onondaga
W Grant Cooper, St Lawrence
Stephen H Curtis, Rensselaer

REFERENCE COMMITTEE ON REPORT OF COUNCIL—PART II

Medical Care Surveys in New York State
Medical Relief
Thomas M Brennan *Chairman*, Kings
William Hale, Jr, Oneida
Walter P Anderton, New York
Edgar O Boggs, Lewis
Stephen R. Monteath, Rockland

REFERENCE COMMITTEE ON REPORT OF COUNCIL—PART III

Medical Expense Nonprofit Indemnity Insurance (also supplementary report)
Workmen's Compensation (also supplementary report)
Leo F Simpson, *Chairman*, Monroe
Edward C Wood Westchester
Andrew Sloan, Oneida
Harvey P Hoffman, Erie
John B D'Albora, Kings

REFERENCE COMMITTEE ON REPORT OF COUNCIL—PART IV

Legislation (also supplementary report)
Publication and Medical Publicity
Charles A. Anderson, *Chairman*, Kings
Edgar Bieber, Chautauqua
Charles C Trembley, Franklin
Samuel B Burk, New York
Morris Maslon, Warren

REFERENCE COMMITTEE ON REPORT OF COUNCIL—PART V

Annual Meeting Arrangements
The late Dr Frederick H Flaherty
'M D' License Plates
New York State Board Nominations
Malpractice Group Plan Insurance
Revision of Principles of Professional Conduct (special committee)
Homer J Knickerbocker, *Chairman*, Ontario
Frances N Kimball, New York
Damel J Swan, Queens
Willard H. Veeder, Monroe
Thurber Le Win, Erie

REFERENCE COMMITTEE ON REPORTS OF SECRETARY, CENSORS, AND DISTRICT BRANCHES

Louis A. Van Kleeck *Chairman*, Nassau
William B Cornell, Albany
J Stanley Kenney, New York
William A. MacVay, Monroe
Albert A. Gartner, Erie

REFERENCE COMMITTEE ON REPORTS OF TREASURER AND TRUSTEES

Supplementary Report of Treasurer
Frederic E. Sondern Chairman New York
Aaron Sobel, Dutchess
Peter J. DiNatale, Genesee
William Klein, Bronx
John J. Rooney Monroe

REFERENCE COMMITTEE ON REPORT OF LEGAL COUNSEL

Edward H. Conniffe Chairman Bronx
Harry C. Guco, Erie
Alfred M. Hoffman, New York
Albert G. Swift, Oneonta
Morris E. Maryland, Westchester

REFERENCE COMMITTEE ON NEW BUSINESS A

George Baehr Chairman New York
William C. Treder Schenectady
G. Scott Towne, Saratoga
Arthur F. Heyl, Westchester
Richard H. Sherwood Niagara

REFERENCE COMMITTEE ON NEW BUSINESS B

Frederic C. Conway Chairman Albany
Emily D. Barringer New York
James M. Dobbins, Queens
Lawrence D. Redway Westchester
Clarence V. Costello, Monroe

REFERENCE COMMITTEE ON NEW BUSINESS C

Floyd J. Atwell, Chairman Otsego
J. Lewis Amster Bronx
Alec N. Thomson, Kings
George A. Burgin Herkimer
Leo F. Schaff Clinton

SPEAKER FLYNN There are tables in the rear of the room and also in the balcony for each and every reference committee, and each one is plainly marked. In the rear of the room there are stenographers waiting to type the four copies that are needed of resolutions and reports of reference committees. I take this occasion to advise all of those who wish to submit resolutions or any of those wishing to take up business with the committees to consult them in their different places where they will conduct the business of the committee.

Are there any supplementary reports?

SECRETARY IRVING Mr Speaker there have been distributed mimeographed sheets to every member, which contain a supplementary report on legislation from the Council Committee on Legislation and a supplementary report to Part III on Medical Expense Indemnity Insurance from the Council.

6. Supplementary Report of Council Committee on Legislation—Part IV

Section 74

The annual report of the Council Committee on Legislation appearing in the March 15 issue of the *New York State Journal of Medicine* is incomplete, because even at this writing the Legislature is still in session and obviously therefore, a final report cannot be given as to the disposition of the bills in which we as medical men are interested. Perhaps through a last minute bulletin we may keep you informed.

For the sake of emphasis on the extreme importance of having a closely knit legislative setup and, even at the risk of repetition, we should like to explain briefly our plan. All bills introduced in Albany in which there is even the most remote possibility of medical interest are reviewed by our Executive Officer

Dr Joseph S. Lawrence, and through his very efficient secretary Miss Briggs, mailed to the members of the Legislative Committee and County Chairmen and are reviewed for the members of our bulletin mailing list. Bulletins are mailed frequently by the Committee indicating our action in short briefs, and when possible the legislative action on the various bills.

County Chairmen are asked to have committees large enough to detail one member to each legislator in the district. Every member of the County Committee is an important cog in the machinery and if he fails to contact his legislator or does not familiarize himself with the bill under discussion there is a distinct breakdown in our system.

The Legislative Committee is deeply grateful to all of the County Legislative Chairmen and members of their committees for their close cooperation and hard work. We wish to exhort them never to become discouraged, for not infrequently despite many contacts, we find that bills which we have either opposed or approved vigorously are adversely voted upon by almost all of the members of one or the other political party. This malady is apparently incurable.

The Committee studies every bill very carefully in order to decide whether to support or oppose it and all comments received from County Committees and bulletin readers are likewise carefully considered before a decision is reached. If a bill relates only to a particular field in the practice of medicine, advice is sought from leading physicians in those specialties.

No one can deny that organized medicine is being continually placed in a defensive position. Magazines, radio newspapers, propaganda organizers and orators, even from our own ranks, seem to have banded together to disseminate reams of misinformation. Are we sufficiently aroused as to the type of propaganda and technique on our own doorsteps? Consider for a moment Bill S-1620 introduced in the United States Senate by Mr. Wagner. This bill is also known as the National Health Act of 1939. It has been said that in some respects this measure is a greater menace than such previously Wagner sponsored legislation as the NRA and the National Labor Relations Act. It is also stated that the sponsors of this bill consider its passage at this session of Congress unimportant but that it is the opening gun of a fight that will be carried through 1940.

For eight months, preparation by movies, radio and other means of propaganda, including criminal prosecution of medical associations and physicians, has been under way. An attempt has been made to create the impression that American Medicine is inadequate, that a crisis in medical care is imminent and, that the only solution of the entire problem is State Medicine.

In our own state we have the Goldstein and recent Wagner bills. Both are subtle and adroit enabling bills which allow federal agencies at their discretion to allocate funds to the states on a basis of population or of the financial resources of the state. This would give Mississippi and Arkansas (low income states) two federal dollars to each state-expended dollar at the expense of the more populous states such as New York State. Bills like the Goldstein and Wag-

ner, Jr, have a large popular appeal, the backing of labor and a huge group of socialistically inclined individuals. Such bills have already been introduced in seven states.

It must be apparent that our Legislative Bureau is one of the most important branches of our activities. Every member of our Society should consider himself or herself a member of a vast legislative committee. Someone has said that at some time a doctor enters every home. Do we realize our potential strength?

We are fortunate indeed that our Legislative Bureau is under the efficient guidance of Dr Joseph S Lawrence, a veteran in the service and one thoroughly familiar with legislative procedure. In order to fortify and make our position at Albany more secure, the Committee on Legislation has a suggestion to make. We feel that we should have been seriously embarrassed last winter in the event that anything had occurred, as for instance illness, to deprive us temporarily of Dr Lawrence's services.

There are many more contacts and perhaps closer ones that could be made with our county units if the Executive Officer were provided with an assistant. Much of the detail work, such as compiling information for bulletins, routine office work, etc., could be done by such an officer.

Various individuals have suggested that the Executive Officer and the Legislative Bureau should have legal representation in Albany. I would call your attention to the fact that the counsel for the Medical Society of the State of New York has always given freely and cheerfully as much of his time as was needed. In addition to this, a retired Judge of the Supreme Court, living in Albany, examines and gives his opinion to the Executive Officer on all medical legislation.

The business of the Medical Society of the State of New York at Albany has always been conducted in a dignified and honorable way and the Council Committee on Legislation feels that the Society should never be officially represented there except by a graduate in medicine.

In our zeal to combat outstanding objectionable legislation, we are likely to forget that many other bills are presented to the Legislature which also need attention. Thus far thirty-nine bills have been reported killed in committee this year. Many of these were opposed by us. A few of those killed we had approved. Particularly among these were the radiology bill and several automobile insurance bills. The chiropractic bill could not be killed in committee, but was defeated on the Assembly Floor. The osteopathy bill could not be defeated in the Assembly Committee, either, and it passed the Assembly, but with no marginal votes. Seventy-six votes are required for the passage of a bill in the Assembly and the osteopaths mustered just exactly that number of votes. Our lien bill and full-citizenship bill were reported by their respective reference committees to the Committee on Rules in the Assembly. We hope that they will in time be reported out.

The amendment to the Insurance Law, which will permit organization of medical indemnity corporations, has passed the Assembly and is with the Insurance Committee in the Senate.

In spite of serious efforts to change the amendment by the representatives of the hospital insurance corporations, so as to permit of one corporation supplying both hospital service and medical indemnity insurance, the bill was not amended and remains as we had approved it last summer. The prospects of this bill being enacted into law are very good.

There still remain before the Assembly seventy-two bills in which we have more or less interest and several of these are outright health insurance bills, while some others are modified propositions for socializing medicine. So long as the Legislature remains in session it is possible that bills will continue to be introduced and now it seems as though there is little prospect of adjournment before the middle of May.

7 Supplementary Report of Council on Medical Expense Indemnity Insurance—Part III

Sections 30, 67

In the field of Medical Expense Insurance, the Council presents for discussion the following

Tentative Basis and Suggestions for Plans for Medical Expense Indemnity Insurance

- 1 It must be nonprofit
- 2 It should involve cash indemnity and not medical service
- 3 Patients must have absolute freedom of choice in selecting a duly qualified physician from all those qualified to practice and willing to give service within the locality covered by the operation of the company
- 4 No third party may be permitted to come between the patient and his physician in any medical relation. The method of providing service must retain a permanent confidential relation between the patient and the physician
- 5 The fees should not be below those of the Workmen's Compensation schedule, but there must be no interference with higher fees being charged to the higher income group
- 6 All features of medical service must be under the control of the medical profession. This includes all medical phases of institutions involved in the service, it being understood that hospital service is but the extension of the equipment of the physician. Also there should be no restriction on treatment or prescribing not formulated and enforced by the organized medical profession
7. The eventual aim of any plan should be to cover medical care in the office, home, and hospital, although at the start it may not be possible from an actuarial standpoint to cover all of these in one policy.

SECRETARY IRVING. There will also come from the Council, to be presented by Dr Thomas P Farmer, Chairman of the Council Committee on Public Health and Education, a report from that Committee, which I think should be read at this time. It has not been distributed.

8 Supplementary Report of Council Committee on Public Health and Education—Part I

Section 46

DR. THOMAS P. FARMER The Council wishes to make the following supplementary report in regard to certain recommendations made to the Council by its Committee on Public Health and Education at the last meeting of the Council on April 18

Four-day Institute on Dietetics—For a long time, the Council Committee on Public Health and Education, and its predecessor, the Standing Committee on Public Health and Medical Education, have given consideration to plans for the extension of the State Medical Society's program on medical education for physicians. These committees have felt that it would be desirable to establish graduate courses in residence at various centers throughout the state. The success of the Pneumonia Institutes held during the past two years have encouraged the Committee to feel that such courses would be enthusiastically received by the profession and of practical advantage to the physician. The Council Committee on Public Health and Education is now prepared to organize a course of lectures on Dietetics which would include twelve lectures on the relationship of diet to health and various diseases given by well known authorities in this field, with each lecture supplemented by demonstrations on practical dietetics by capable dietitians. An outline for such a course has been prepared through the cooperation of the Committee and the New York Dietetic Association. This proposed Institute could be organized to be given in the fall of this year at one of the universities of the state, in cooperation with its College of Medicine and its College of Home Economics and if successful could be readily repeated in other places. It is proposed to have these lectures given in four whole-day sessions, with three subjects considered each day. An attendance of from fifty to one-hundred physicians could be cared for. The Committee suggests that a registration fee of ten dollars be charged, not only to aid in defraying the expenses of this Institute in whole or in part, but also to assure a regular attendance and to assure those who have registered that they will not be disturbed by a vacillating attendance. The Commissioner of the State Department of Health has intimated that this plan would receive financial support from that Department. The Council would like from the House of Delegates an expression as to their approval of the plan in regard to the various matters mentioned.

Reallocation of School Funds—This subject was brought to the attention of the Council through a resolution received from the Westchester County Medical Society. This resolution called attention to the fact that school authorities placed an unnatural emphasis on attendance records in order to avail themselves of the largest amount of state funds possible and leads these authorities to cause children to attend school who are afflicted with minor non-disabling but highly contagious physical conditions and that this condition is dangerous from

the standpoint of public health both for the child afflicted and for his schoolmates. The Council Committee on Public Health and Education has discussed this matter with a group representing physicians school administrators school teachers, public health authorities and representatives of the State Departments of Health and Education. While there is unanimity of opinion that it is highly undesirable for children afflicted with any illness, regardless of its disabling character to be allowed to attend school on the other hand it is still questionable whether a change in the method of the allocation of state funds for common schools would accomplish this result. Furthermore until a satisfactory alternative method for allocating these funds has been proposed which would not have this drawback it would seem undesirable to recommend such a change. In the meanwhile it does seem desirable to draw to the attention of the school authorities teachers, and physicians the fact that the prompt exclusion of all children suffering from any illness is essential from the standpoint of public health and results in higher annual attendance according to reliable experience. The Committee also recommends that steps be taken to remedy conditions whereby a community suffering from a local epidemic would not be penalized because of this in the matter of granting state funds.

School Health Work—The recent inquiry made by the State Board of Regents as pertains to school health work. At the same time that the Council Committee discussed the matter of the reallocation of school funds, it considered this question with the same group. It was the consensus of opinion of the group that because several suggestions made in this study were of doubtful value and that other methods than those proposed in the report should be studied this was a matter of importance to all physicians and the Committee should continue its conferences on this subject.

Sulfanilamide—Restriction of the Sale of Sulfanilamide and its Derivatives as well as other drugs, to sale on physicians' prescriptions only. The Council Committee recommended some time ago to the Council that proper steps should be taken to have necessary regulations included in the Sanitary Code, by the Public Health Council to accomplish these results. The Secretary of the State Society has informed the Public Health Council of this action but it is questionable whether the Public Health Council has the authority to proceed in this matter or whether the proper regulations can be effected by the State Board of Pharmacy. If this can not be done the Council Committee recommends the initiation of proper legislation for this purpose.

SPEAKER FLYNN That will be referred to Reference Committee on the Council—Part I

9 Supplementary Report of Council Committee on Workmen's Compensation—Part III

Section 68

DR. DAVID J. KALISKI I am not going to read a supplementary report. I merely wish to announce that I have available a number of matters for the Reference Committee. Among

those are certain uniform standards for the qualification of physicians which we have been working on for more than a year and which are now available for consideration.

We also have the partial results of a questionnaire which was sent out to the various County Societies of the state asking their opinion about various aspects of the Workmen's Compensation Law.

We have to announce that a conference between the insurance carrier's organization and the hospitals throughout the state has resulted in a uniform standard of fees for hospital service both in the metropolitan area and in the upstate area.

We wish also to announce that with the co-operation of counsel we have instituted a suit, or we are about to institute a suit, against an insurance carrier for violation of certain provisions of the Workmen's Compensation Law in regard to the sending out of lists of physicians. Efforts with the Industrial Council and the Industrial Commissioner have not availed in abating this unfair practice, so the only thing that we could do under the circumstances was to institute a suit against this organization.

There are a number of other matters which are pending with the Council in regard to hospital care bills, and these are in the hands of the Council at this time.

We also wish to announce that we have made an effort to have the Industrial Commissioner remove the 5 per cent discount which is now permitted for the payment of physicians' bills within a thirty-day period.

There is only one final matter of importance, which I have been asked to present to the House more as a matter of information than anything else.

Under date of April 11, the Hon. Michael J. Murphy, Deputy Industrial Commissioner, Department of Labor, has submitted to your Director copy of a memorandum submitted by Mr. Murphy to the Director of the Division of Statistical Information of the Department of Labor requesting him to make a study of closed compensation cases in which the medical reports (C-104, C-4) were filed within the period required by law.

I am attaching hereto a report prepared by the Department of Labor which indicates that both forms were on file in the Department in only 54.5 per cent of the cases investigated, it further indicates that in only 43.6 per cent of the cases was the C-4 form received by the Department of Labor within the twenty-day period as required by law.

The investigation was made to ascertain whether the complaint was justified that the failure to file reports promptly was one reason for the delay in the payment of compensation to the injured workmen and also for the excessive number of notices of controversy filed with the Department.

The statistics cover an examination of one thousand New York City closed compensation cases, of accidents occurring on or after January 1, 1938, two and a half years after the new compensation law went into effect.

This examination was made in March of 1939 and includes only data from reports filed by the first attending physician. The reports of other

attending physicians on the same cases were not included.

Of the 1,000 cases examined 545, or 54.5 per cent, contained both C-4 and C-104 forms, 326 cases, or 32.6 per cent, contained only the C-4 form, 75 cases or 7.5 per cent contained only the C-104 forms, and 54 cases or 5.4 per cent did not contain either a C-4 or C-104 form. The C-4 form was filed in 871 cases or 87.1 per cent, and the form C-104 in 620 cases or 62 per cent of the 1,000 cases examined. In 61.3 per cent of the cases the C-4 forms were signed within the twenty-day period by the first attending physician, but in only 43.6 per cent of such cases were these forms received by the Department of Labor within twenty days or less. In 63.2 per cent cases they were received between 20-30 days, in 73.1 per cent within 40 days, in 88 per cent of all cases the physicians signed the C-104 form within two days or less, but in only 40.5 per cent of these cases were the forms received by the Department within two days or less. However, in 80.4 per cent the Department received the forms in from three to five days. The tables (pages 1131, 1132) give the data on file.

From these reports and studies, it would seem that after two and a half years from the date the new law went into effect, many physicians throughout the city were not complying with the rules and regulations of the Department of Labor and the law in filing their reports on time, and were thus prejudicing the interests of the injured claimant, in so far as prompt payment of compensation for time lost is concerned.

The complaint of the insurance carriers that the delay in paying compensation is occasionally due to the failure of the attending physician to file the necessary reports on time in order to enable the carrier to adjudicate the patient's claim for compensation seems to be justified.

It is obvious that the insurance carriers are overlooking the strict letter of the law of section 13-a(4) which states:

"No claim for medical or surgical treatment shall be valid and enforceable, unless within forty-eight hours following the first treatment the physician giving such treatment furnish to the employer and Industrial Commissioner a preliminary notice, and within twenty days thereafter a more complete report. The Industrial Commissioner may excuse the failure to give such notices within the designated periods when it finds it to be in the interest of justice to do so."

In very few instances have insurance carriers insisted that physicians who have failed to file their reports on time appear before the Industrial Board for excuse in accordance with the above section.

Under the circumstances and in view of the results of dilatory filing, which prejudice both the claimant's and the doctor's interests, medical societies and Workmen's Compensation Boards throughout the state should make a concerted effort to bring home to all those who have been qualified under the Workmen's Compensation Law the necessity of prompt submission of the required reports on the acceptance of treatment of a compensation claimant.

I will make available to the Reference Committee the complete report.

TABLES NEW YORK STATE DEPARTMENT OF LABOR
Division of Statistics and Information

Special Procedure Study Promptness in Filing Forms C-4 and C 104 by First Attending Physician
(Based on 1,000 closed compensated cases—New York City Office—for accidents occurring on and after January 1 1938)

TABLE 1—NUMBER AND PER CENT OF TOTAL CASES WITH FORMS FILED BY FIRST ATTENDING PHYSICIANS

| Cases with | Number of Cases | Percentage of Total |
|--------------------|-----------------|---------------------|
| Both C-4 and C 104 | 545 | 54.5 |
| C-4 only | 36 | 3.6 |
| C 104 only | 76 | 7.6 |
| No C-4 or C-104 | 54 | 5.4 |
| Total | 1000 | 100.0 |

SPEAKER FLYNN This report or address by the President-Elect will be referred to the Committee on the Report of the President, Dr Brittain, Chairman

14 Introduction of Delegates from Other State Medical Societies

Are there any delegates from Connecticut, New Jersey, or Vermont present?

SECRETARY IRVING There are delegates appointed from all three of those State Societies, but so far I have only heard of Dr George G Marshall, of the Vermont State Society, being present

SPEAKER FLYNN Will you kindly rise, Dr Marshall?

(There was applause as Dr Marshall rose)

SPEAKER FLYNN I extend to you the courtesy of the floor

SECRETARY IRVING Are there any delegates here from Connecticut and New Jersey?

(There was no response)

SECRETARY IRVING Dr Charles H Turkington, of Litchfield, and Dr D Chester Brown, of Danbury, have been appointed by the Connecticut State Society, Dr E Zeh Hawkes, of Newark, and Dr Frederic J Quigley, of Union City, have been appointed by the New Jersey State Society They may appear later, Mr Speaker

15 Amendments and Revision of Constitution and Bylaws

Sections 58, 89

SPEAKER FLYNN If there is no objection from the floor, the Chair will rule that the subject of amendments and revision to the Constitution and Bylaws be taken up as the first business of the evening session

(There was no dissent)

SPEAKER FLYNN Since there is no objection, it is so ordered

The floor is now open for the introduction of resolutions

16 Race, Color, and Creed Restrictions on Physicians

Section 49

DR. PETER M MURRAY, New York Mr Speaker and Gentlemen of the House of Delegates of the Medical Society of the State of New York, I wish to introduce one or two resolutions, but before doing so I want to make a few remarks explaining them

This House of Delegates is an inspiring sight, and as I sat here and listened to each speaker and heard reference made to the need of affiliation of every ethical practitioner with organized medicine, a great many thoughts ran through my mind When I think of the conditions in the State of New York and the liberality and honesty with which the democratic principle is administered so far as membership in organized medicine is concerned, I have every reason to be grateful because in other parts of this country those same conditions do not obtain I need not say to you anything more in support of a movement to include and enlist every ethical practitioner in the entire United States of America into the ranks of organized medicine. You men who control organized medicine realize that better than I

There are thirteen million colored people in the United States of America There are over 5,000 colored doctors There more than 350 colored doctors in New York State. Now, what is the relation between the two? As liberal as the State of New York has been toward accepting members of my race into membership, there are still areas in which the medical profession of the State of New York can improve its treatment of minority groups I refer specifically to the opportunities as afforded in the clinics and the medical schools and the hospitals and the various public health enterprises But beyond that, on a wider horizon, lie the vast areas of this country where membership and affiliation in organized medicine is impossible, for below the Mason-Dixon Line members of my race are systematically excluded from the benefits and responsibilities of organized medicine Then, it must naturally follow that these thirteen million people, who provide the keenest health problems of any racial group in this great democracy, must of necessity receive a lowered quality of medical care if the men who are charged with their care cannot enjoy and benefit by the privileges and opportunities which organized medicine confers

There is one word that I wish to say about the political aspect in the various proposals for the care of public health which are now before us for consideration A great deal of missionary work and, I dare say, propaganda has been done among the people of my group to get them to favor all phases of the Federal Health Program We have stood out against it because we know that the welfare of the American people in general, and the welfare of my racial group in particular, will not be conserved under the proposed Federal Health plans (Applause)

It is true that there are certain aspects of those plans, especially those relating to the indigent group, that would inure to our benefit, but in the plans calling for the care of those above the indigency level and for whom compulsory health insurance has been proposed, their care will suffer The public health of the group to which I belong will suffer immeasurably by the adoption of any such compulsory health program, and we are unitedly against any such proposal But we can fight more effectively if we are within the ranks We will not be such easy prey to misrepresentation and propaganda.

When I tell you that a great political issue may hang on the balance of the votes of the people of my group in the various border states, you can see how important it is that those people be deprived of the issue that the Negro doctor is not treated fairly and squarely by the American Medical Association They discount the fact of the liberality of such states as New York but they do point to the fact of the narrowness and the bigotry of the other parts of the country I cite you as a specific instance the District of Columbia, the capital of our great nation, where we have a grade "A" medical school and where the American Medical Association is now under fire, and where it is a rigid and absolute rule to exclude all Negroes from participation in the affairs of organized medicine through membership in that County Society Gentlemen, that is a condition that New York cannot sit and observe with equanimity without realizing

that it is a weakness in the democratic structure which may imperil the entire structure. I want to offer the following resolutions

WHEREAS, a rapidly changing social order is demanding a reorientation of the attitudes and responsibilities of individuals and agencies engaged in providing for the medical care of the public, and

WHEREAS, the entire strength of all elements engaged in the practice of medicine should present a united front in facing and solving these problems in the interest of the public health and

WHEREAS the Negro physician numbering more than 5 000 in the United States and about 350 in New York State, bears the direct responsibility for the care of approximately thirteen million citizens whose collective health problems form one of the most challenging areas in the entire battle line against sickness and disease and

WHEREAS, these physicians have not only demonstrated individually and collectively their ethical and professional fitness to shoulder their just responsibilities, but have shown a zeal and a devotion to the health problems of their people worthy of the best traditions of American medicine, and

WHEREAS, the best interests of the entire medical profession and indeed of the entire public, demand that they receive identical opportunity for medical education for professional experience in hospital and clinic for participation in public health programs, public and private in short all of the rights, privileges, and responsibilities inherent in regular membership in organized medicine and

WHEREAS the County Medical Society is the basic unit of the A.M.A. membership in which is a prerequisite for membership in the A.M.A. and

WHEREAS, south of the Mason Dixon Line, Negro physicians are generally and systematically excluded from County Medical Society membership making membership in the A.M.A. and affiliation with organized medicine impossible, and

WHEREAS, this exclusion along racial lines strikes at the fundamental rights of this large group of physicians and indirectly lowers the quality of medical care which they must deliver to an already underprivileged group whose health problems admittedly press more firmly for solution than those of any other racial group and

WHEREAS, these Negro physicians have time and again demonstrated their constancy and heroic devotion to the democratic form of government and all which that term implies and have strongly recorded their position toward the pending medico-economic issues as identical with that of organized medicine therefore be it

Resolved that the Medical Society of the State of New York through its House of Delegates, records as its considered opinion that any and all restrictions imposed on any minority group solely on the basis of race or religion is not only inimical to the cause of the public health with which we are so deeply concerned

but dangerous to the entire body politic of our democratic form of government for, if these restrictions can be imposed with impunity on any helpless minority today who knows to what group it may spread tomorrow and be it further

Resolved that the members of the New York State Medical Society especially those in positions of key responsibility in educational charitable and public health enterprises such as medical schools, hospitals clinics etc. be, and are hereby urged to seriously consider the removal of these restrictions as a matter not only of simple justice, but in the light of their inherent capacity to hamper and restrict the entire medical profession in rendering the best possible service to the public and further that they be urged to use their good offices and influence in removing all restrictions based solely on race or religion to the end that our proud boast of a truly democratic form of government a truly liberal and unselfish medical profession be less honored in the breach than in the observance and be it further

Resolved that the House of Delegates of the Medical Society of the State of New York instruct its delegates to the House of Delegates of the American Medical Association to present at its next meeting and to use every honorable means to secure its passage, the following resolution to wit

Resolved that the House of Delegates of the American Medical Association declare its belief that membership in the various constituent County Societies of the American Medical Association should not be denied to any person solely on the basis of race color or religion

SPEAKER FLYNN This resolution of Dr Murray's is referred to the Reference Committee on New Business B of which Dr Fred Eric C Conway is Chairman.

The Speaker takes this occasion to advise you that those who wish to present further resolutions should have them typed according to form four copies and that this will be taken care of by the stenographers in the rear of the hall

17 Physicians' Home Inc.

Section 55

SECRETARY IRVING The Council recommends the adoption of the following resolution

WHEREAS, the Physicians Home, Inc has formally asked the Medical Society of the State of New York to nominate a number of physicians for appointment to its Board of Directors and

WHEREAS, the Physicians Home was incorporated with an endowment by bequest for the following purposes (a) to create and maintain in the State of New York a home for aged indigent physicians and their wives or widows and to give assistance financial or otherwise to such physicians and their wives and widows and orphans and needy minor children of physicians and (b) to do all things necessary suitable and proper to accomplish and further the purposes described in (a) above and particularly to receive and acquire by grant gift purchase devise, bequest or otherwise property

of all kinds and to hold, maintain, invest, accumulate, and dispose thereof or the income therefrom for said purposes, all in the manner prescribed or permitted by applicable law, and

WHEREAS, the Home is at present caring for five aged physicians who are without funds, and

WHEREAS, nominations to its Board of Directors will in no way make the Medical Society of the State of New York responsible for the conduct of this work, financially or otherwise, and

WHEREAS, the objectives of the Home are highly meritorious, therefore be it

Resolved that the House of Delegates of the Medical Society of the State of New York accede to the request of the Physicians' Home, Incorporated, for nominations to its Board of Directors, and be it further

Resolved that the House of Delegates instruct the Council to make nominations for the Board of Directors of the Physicians' Home, Incorporated, when sought

SPEAKER FLYNN This resolution of the Council is referred to the Reference Committee on New Business C, of which Dr Floyd J Atwell is Chairman

18 Principles of Professional Conduct for New Licensees

Section 42

DR FRANCIS N KIMBALL, *New York* The Medical Society of the County of New York has requested that the following resolution be presented

Resolved that the Secretary of the State Board of Medical Examiners be requested to send to the Secretary of the Medical Society of the State of New York the name of each person to whom they issue a license to practice medicine in the State of New York, and be it further

Resolved that the Secretary of the Medical Society of the State of New York be and is hereby instructed to send a copy of the Principles of Professional Conduct of the Medical Society of the State of New York to each person to whom a license is issued to practice medicine in the State of New York, together with a letter of explanation and an invitation to join the local County Medical Society

SPEAKER FLYNN This resolution of Dr Kimball's is referred to the Reference Committee on New Business A, of which Dr George Baehr is Chairman

19 Changes in Administration of Welfare Medical Relief Practice

Section 80

DR M R BRADNER, *Orange* This resolution is submitted by Orange County in the interest of the practice of medicine in public welfare cases and as a suggestion for the economy of the taxpayers of the state It is not anticipated that the following resolution should conflict with the Council Report on Medical Relief Practice It simply goes a step farther!

WHEREAS, the economic disturbances in this

country have greatly increased the previous number of persons who found it financially difficult or impossible to provide for themselves adequate medical care, and have so produced a volume of work far beyond the financial ability of hospitals and doctors to maintain under the head of charity, as was previously done, and therefore have produced a problem requiring the use of public funds and the enactment of laws for appropriation and administration, and

WHEREAS, the application of these laws has developed a vast mechanism of administration, which it is believed costs far more than the cost of actual services rendered to the poor, and

WHEREAS, this total Bill of Relief has become a serious burden upon the taxpayer and also, with the unnecessary complications of report and record, together with the failure on the part of certain localities to accept and enforce certain of these welfare laws, has produced a serious hardship upon the medical profession, and

WHEREAS, indigents and partial indigents do receive medical care where needed, in spite of the refusal on the part of certain public welfare officials to pay physicians and hospitals for their services, as is provided for by the existing laws, and

WHEREAS, this chaotic state is due to a lack of uniform, fair, and efficient methods of application of the existing law in cities, counties, and townships, with overemphasis on centralized administrative control in the State Department, and

WHEREAS, the general public has been encouraged in placing the blame for the existing confusion and expense upon the medical profession with the result that further laws and complications are at present being suggested, which cannot fail to work a greater hardship to the taxpayer, the patient, and the doctor, therefore be it

Resolved that the Medical Society of the State of New York denies responsibility for the present state of affairs in matters of medical relief, and that

This Society believes that certain modifications of the existing welfare laws in this state, together with radical changes in their administration, can effect a vast economy in operation and provide adequate medical care for all those who require public assistance, and that these basic changes should include

1 An agreement entered into between this Society and the Government of the State of New York combining the acceptance on the part of the physician of the care of all properly authorized welfare patients under the guidance and discipline of the respective County Medical Societies, and the acceptance on the part of the State of a minimum charge fee schedule to be agreed upon, for the treatment of these public welfare patients in office, home, or hospitals, and

2 An agreement entered into between the State Hospital Association and the Government of the State of New York, standardizing a basic charge per day for hospital services rendered

3 An agreement between the Government of the State of New York, the State Medical Society, and the State Hospital Association,

to decide all disputes arising through the interpretation of the law as applied to concrete instance through decisions of a board maintained for that purpose in each county composed of a representative membership of these three agencies, and

4. A uniform organization in each county under a County Commissioner for the complete administration of welfare law direction and coordinating local township welfare agencies, and concentrating records and accounting satisfactory for audit in the county by the State Commissioner's representatives and

5. A concentration of agencies and institutions in each county for the purpose of coordination, cooperation, efficiency and economy and

6. The establishment of uniform principles of township welfare organization including the specified type of official acceptable for appointment, and provision for adequate salary and funds for office maintenance and

7. The discontinuance on the part of the State Department of Social Welfare of all the present elaborate methods of accounting and administration, and in place of this the development of this State Department as an agency for guidance and audit from the standpoint of reimbursement to counties from state or federal funds, to the end that the present enormous cost of centralized administration be applied to measures of direct relief, and

8. The adoption of the same system to function in the case of cities in large city to be organized as a county the boroughs being its townships, and a small city to be treated as though it were a separate township in its county and be it further

Resolved that these resolutions be drafted in the form of a bill and presented to the State Legislature.

SPEAKER FLYNN This resolution of Dr Bradner is referred to the Reference Committee on New Business C, of which Dr Floyd J Atwell is Chairman.

20. Appointment of Special Committee on Ophthalmological Public Relations

Section 47

DR. STANLEY KENNEY *New York* As a result of the pernicious propaganda of the optical groups in New York the Chairman of the Advisory Committee on Ophthalmological Public Relations of New York County asked that this resolution be introduced by the delegates of this Society with the approval of the New York County Society

Resolved that the Medical Society of the State of New York be requested to appoint a special Committee on Ophthalmological Public Relations at the next meeting of the House of Delegates

SPEAKER FLYNN This resolution of Dr Kenney is referred to the Reference Committee on New Business B of which Dr Frederic C Conway is Chairman.

21. School Health Work

Section 48

DR. ARTHUR F HEYL, *Westchester* This is a

resolution presented by the Medical Society of the County of Westchester

WHEREAS the medical profession should not only participate but assume leadership in determining the future of the school health program in New York State and

WHEREAS the recent Inquiry of the State Board of Regents found that the present program is almost entirely uncorrelated with the educational program as a whole and unrelated to any broader community responsibilities and pointed out the need of important changes of policy many of which involve the school physician and the medical profession in the community and

WHEREAS there is an evident need for an immediate reconsideration of

1 the economic factors underlying the school medical service

2 the educational qualifications of school physicians and the establishment of professional supervision of their work

3 the professional status of the school physician in the school system and his relationship to his colleagues in the community

4 the proper basis of remuneration for the school physician and the proper scope of his required services

5 the desirable functions of the school physician in health education therefore be it

Resolved that the Medical Society of the State of New York appoint a special commission representative of school physicians, private physicians and experts in health education and charge this commission with the duty of formulating recommendations for the House of Delegates looking toward a practical program in answer to the following question

What changes are needed in law and in administrative practice to place the school health service upon a sound economic and professional basis, to equip the school physician for leadership in health education, to correlate the school health program with the educational program as a whole and to correlate the school health inspection service with the official health agencies and the medical profession in the community?

SPEAKER FLYNN This resolution of Dr Heyl is referred to the Reference Committee on New Business B of which Dr Frederic C Conway is Chairman

22. Investment of Principal in Equities

Section 93

DR. WILLIAM H ROSS This is a resolution presented by the Board of Trustees

Resolved that the Board of Trustees be authorized to invest an additional 25 per cent of the Society's investment principal in equities.

SPEAKER FLYNN This resolution of Dr Ross is referred to the Committee on Reports of Treasurer and Board of Trustees of which Dr Frederic E Sondern is Chairman.

23. Public Medicine Assembly Bill Int. 523

Section 43

DR. BENJAMIN DAVIDSON *Kings* This is a

resolution not introduced by Kings County but by a minority of one I do not expect any large approval but I am putting this in, perhaps, for the benefit of some future historian (Laughter)

WHEREAS, the remarkable progress and achievements of modern scientific medicine and modern medical education make possible medical facilities and personnel sufficient and competent to provide adequate care in health, illness, and disability for all our people, and

WHEREAS, despite this medical science, facilities and personnel, millions of the people still receive inadequate medical care, and frequently no such care at all, while, at the same time, tens of thousands of our doctors and associated workers are insufficiently employed in their calling and insufficiently remunerated for the professional services rendered by them, and

WHEREAS, the fundamental cause of this public and professional state of affairs is caused by the inability of most of our people to purchase adequate or any medical care for themselves, and primarily due to the private individual or institutional method of rendering medical care on a commodity or fee-for-service basis, and

WHEREAS, the people's health is essentially the people's concern, not less important than education, property protection, or any other public service, and therefore fundamentally is a social or state interest and obligation, no longer to be left to the economic and medical uncertainties of our mercantile methods of securing or providing medical care, with all the evils that necessarily follow therefrom, therefore be it

Resolved by this House of Delegates that we approve the reorganization of medical care and practice so as to provide all the medical care needed by our people, and so as to realize in full the true functions and purposes of medical science and art, at the same time assuring to the medical profession and the allied workers concerned in medical care with economic security and adequate conditions needed for the proper pursuit of their professions, and be it further

Resolved that we endorse the Bill for Public Medicine known as Assembly Int 523 in order to realize the program outlined above

SPEAKER FLYNN This resolution of Dr Davidson's is referred to the Reference Committee on New Business A, of which Dr George Baher is Chairman

24 Women Physicians' Representation in the American Medical Association

Sections 50, 91

DR EMILY D BARRINGER, *New York* I have a message here from the women physicians and I have been asked to read the following resolution which was unanimously passed at a regular meeting of the Women's Medical Association of New York City on March 8, 1939

WHEREAS, it is a critical time in the history of American medicine when it is important that all physicians should unite in safeguarding the interests of the profession, and

WHEREAS, the American Medical Association especially needs at this time the active interest and loyal support of all its members, and

WHEREAS, there are about 8,000 to 9,000 women physicians in the United States, many of them eligible for membership in the American Medical Association, and many of them already members thereof, and

WHEREAS, these women physicians have in many states organized city associations, state associations, and there is also a national organization known as the American Medical Women's Association and the members thereof have found it difficult to build a powerful organization because of the relatively few women and lack of large funds, and furthermore it is undesirable to segregate the women physicians' interests from the interests of the profession as a whole, and

WHEREAS, the ratio of women physicians to men physicians is so small that the chance of representation in the House of Delegates of the various State Medical Societies is almost nil, and

WHEREAS, we believe that the women's medical organizations have much to give in big visioned ideas, vigorous work, and loyalty if their wishes can only be made articulate, therefore be it

Resolved that the Women's Medical Association of New York City in Executive Session, respectfully request and urge the House of Delegates of the Medical Society of the State of New York to recommend to the House of Delegates of the American Medical Association that they grant a seat to a woman delegate in the House of Delegates, that this position shall be permanent and be filled each year by the President or President-Elect of the American Medical Women's Association

SPEAKER FLYNN This resolution of Dr Barringer's is referred to the Reference Committee on New Business B, of which Dr Frederic C Conway is Chairman

25 Milmoë Osteopathic Bill—Assembly Int. 1428

Section 54

DR IRWIN E SIRIS, *Kings* This resolution is presented by the Medical Society of the County of Kings

WHEREAS, osteopathy is a system of treating disease wherein drugs are not used or surgery with instruments performed, and

WHEREAS, there is a bill—Milmoë Assembly Introductory No 1428—which has passed the Assembly and which would permit osteopaths to use drugs, antiseptics, and biological products and perform minor surgical procedures, and

WHEREAS, the bill is indefinite in its construction and we believe impossible of administration, therefore let it be

Resolved that the House of Delegates of the Medical Society of the State of New York hereby express its concern for the public welfare and the standards for medical education should this bill become a law,

Resolved that this House of Delegates communicate its concern to the Committee on Education of the Senate and inform them of the dangers of permitting unqualified men, the majority of whom have not had the educational requirements established by the Regents of the

State of New York for those who prescribe drugs and perform minor surgery

I move the adoption of this resolution, that a copy be telegraphed to Roy M. Page, Chairman Committee on Education and to Senator Joseph Hanley and John Dunnigan Majority and Minority leaders, respectively of the State Senate, and that the telegrams be confirmed by letters by our State Secretary Dr. Irving

SPEAKER FLYNN The resolution of Dr. Sirls is referred to the Reference Committee on New Business C, of which Dr. Floyd J. Atwell is Chairman.

26. Council to Forward Report of Action of Each Meeting to County Societies

Section 41

DR. EDWARD C. WOOD *Westchester* This resolution is presented by the Medical Society of the County of Westchester

WHEREAS it is desirable that the County Medical Societies be directly and currently informed of all actions and policies of the interim-governing body of the State Society therefore be it

Resolved that the House of Delegates hereby instructs the Council or other interim governing body to forward a complete record of the actions taken at each meeting of the said governing body to the Secretary of each County Society such report to be forwarded within ten days after each such meeting

SPEAKER FLYNN This resolution of Dr. Wood's is referred to the Reference Committee on New Business A, of which Dr. George Baehr is Chairman.

27 Foreign Physicians

Section 80

SECRETARY IRVING This resolution was received from the County of Niagara

Resolved that the Medical Society of the County of Niagara hereby resolve to request the House of Delegates to oppose admission to New York State of foreign or alien physicians

SPEAKER FLYNN This resolution from the Medical Society of the County of Niagara is referred to the Reference Committee on New Business B of which Dr. Frederic C. Conway is Chairman.

Before we recess, I wish to announce that the Afternoon Session will be held in this room, the Evening Session in the small ballroom on this floor and tomorrow's Session at the Plymouth Church.

We will now recess until two o'clock so that the Reference Committees may function. If you have business with them they will be in the balcony and in the rear of the hall and you can appear before them and present your views.

(At 11:50 A.M. a recess was taken.)

Afternoon Session

Monday, April 24, 1939

The session convened at 2:30 o'clock, pursuant to recess.

SPEAKER FLYNN The House will be in order

28. New York State Library

Section 56

SPEAKER FLYNN I have a telegram here which I wish to read

Please call Society's attention to fact that proposed 15 per cent cut in already insufficient appropriation for state library means drastic cut in service to physicians because of reduced staff and purchase fund. Prompt protest to Senator Thompson would be appreciated here.

(Signed) Joseph Gavit Acting Director

SPEAKER FLYNN I will refer this telegram to the Reference Committee on New Business C of which Dr. Floyd J. Atwell is Chairman. Are there any further resolutions?

29 To Amend the Education Law, in Relation to the Practice of Roentgenology

Section 82

DR. THEODORE WEST *Westchester* I should like to present the following resolution

WHEREAS, 1 The Education Law (Art. 48 Section 1250) says "A person practices medicine within the meaning of this article who holds himself out as being able to diagnose any human or physical condition and who shall either offer or undertake by any means or method to diagnose any human disease or physical condition, and

WHEREAS 2 The Sauser Case decision (Sauser v. Health Department of the City of New York 242 NY 60) says "making an x-ray photograph is not diagnosis nor (is) mere explanation of what such photograph shows diagnosis" and

WHEREAS 3 The court ruling has nullified the Education Law as it relates to the use of x-rays in medical diagnosis and

WHEREAS, there is a bill Williamson-Senate Int. 1893 No. 2297 which defines roentgenology as the practice of medicine and will correct the error in the Sauser Case decision therefore be it

Resolved that the House of Delegates be requested to give its approval to this bill and a copy of this resolution be sent to our Executive Secretary Dr. Joseph Lawrence.

SPEAKER FLYNN The resolution of Dr. West's is referred to the Reference Committee B on New Business, of which Dr. Frederic C. Conway is Chairman.

30 Amendment to the Medical Expense Indemnity Insurance Resolution

Sections 7 67

DR. W. S. COLLENS *Kings* This is in reference to the matter in the supplementary report of the Council in connection with the subject of medical expense indemnity insurance. Item 6 in the criteria and provisions and suggestions for plans for medical expense indemnity insurance states

All features of medical service must be under the control of the medical profession.

That statement is somewhat too ambiguous and vague and does not in itself create an opportunity for organized medicine to play any kind of a part in the regulation and control of these

medical activities Although left to the medical profession, it may be left to a group of unofficial physicians who represent themselves as a group to conduct this type of venture I wish to amend Item 6, therefore, as follows

"That all phases of medical activity in each county be under the control of its own board elected by the individual County Medical Societies and to function in a fashion similar to that of the Compensation Boards of the various counties These functions to include qualifications of physicians and specialists, determination of fee schedules, arbitration, censorship, expulsion, inspection of cases, regulation of conduct, and ethics "

SPEAKER FLYNN Dr Collens' resolution is referred to the Committee on the Report of the Council—Part III, Dr Leo F Simpson, Chairman

31 Free Choice of Physicians in Medical Relief

Section 79

DR ALFRED H NOEHREN, *Erie* I have been asked by the Erie County Medical Society to present this resolution

WHEREAS, free choice of physician is the crux of our future destiny,

WHEREAS, the care of the certified medical indigent is becoming a colossal and permanent project,

WHEREAS, this condition will continue to exist by at least 50 per cent of the load today, even if industrial conditions should become better,

WHEREAS, the social welfare agencies are advising and initiating without legislation, by ruling only, more and more control of the medical care of the indigent by full-time physicians,

WHEREAS, some of our County Societies are considering and have accepted the full-time physician for the above-mentioned care, to the possible future detriment of all parties concerned, be it

Resolved that the Council of the New York State Medical Society, or a duly appointed committee, promulgate plans and rules for the furtherance of the free choice of physician for the medical care of the certified medical indigent, be it further

Resolved that at least twice each year each county unit receive from the Council or Committee advice and instructions to accomplish a state-wide free choice of physician

SPEAKER FLYNN Dr Noehren's report will be referred to the Reference Committee on New Business C, of which Dr Floyd J Atwell is Chairman

32 Council Study on Aviation Medicine

Section 81

DR BENJAMIN JABLONS, *New York* I might say this is not being introduced for the County Society of New York, but is a personal resolution

WHEREAS, the programs of national defense encompass the creation of a huge aviation force of anywhere from 10,000 to 25,000 planes,

WHEREAS, such a force will create a great many medical problems incident to the proper care and training of a competent personnel, therefore be it

Resolved that this subject be referred to the Council for study and action for the purpose of disseminating proper information regarding the physiology and medical possibilities of this phase of medicine

SPEAKER FLYNN Dr Jablons' resolution is referred to the Reference Committee on New Business B, of which Dr Frederic C Conway is Chairman

33 Internship as a Requisite for License to Practice Medicine in New York State

Section 75

DR CHARLES GULLO, *Livingston* Recently two bills were presented into the Legislature the Osteopathic Bill and the Chiropractic Bill that you all know about The Osteopathic Bill has been passed in the Assembly so far We, of Livingston County, feel that our Society as a group has done very little constructively to meet the demands of the osteopaths and the chiropractors For many years the osteopaths have had introduced and have tried to have passed such a law as is before the Senate today, and unless we can offer something constructive rather than negative, as we have in the past, I do not believe we have any business to oppose this measure

The State of New York, along with a few other states, allows a graduate upon finishing his education to take an examination and then start to practice medicine without the necessary requirement of internship

May I say this is just a personal resolution as we did not have time in Livingston County to approve this as we meet only once every three months

I believe that the Medical Practice Act should be amended so that every applicant, before entering upon the examination in the State of New York to practice medicine, must also be required to serve an internship of at least one year In that way we will not only safeguard the public so that those who practice medicine are properly trained, but we will be accomplishing something more than that because today, after all, all our graduates practically have to take an internship, but there are those who do not, and if the osteopaths do succeed—and the chances are they might, because we as a group have practically no lobby in Albany I was speaking to one of the members of the Legislature after this thing happened He said at the time that this bill was before the House, the place was swamped with men representing this particular group, but the Medical Society of the State of New York was conspicuous by its absence. If this measure were passed, and this particular amendment to the Practice Act were in force, it would require every osteopath before practicing medicine—medicine that they wish to practice in the State of New York—to have interned in a hospital accepted and approved by the American College of Surgeons, but they will not be equipped to do so unless they take other measures to equip themselves to do it, so the resolution reads

Measures be taken to have enacted into law

1. To require that all applicants to practice medicine in New York State must, besides passing present requirements, be required to spend at least one year as an intern in an acceptable hospital approved by the American College of Surgeons.

SPEAKER FLYNN That first resolution is referred to the Reference Committee on New Business A, of which Dr. George Baehr is Chairman.

34 Basic Science Law

Section 76

DR. CHARLES GULLO Livingston I have another resolution which refers to the Chiropractic Bill, which was defeated. Our state does not require to our surprise in Livingston County, and I believe to the surprise of the majority of the members of our Society that a man wishing to practice chiropractic need take an examination. He can just set up a shingle any time and any place he pleases. What have we done in the past to combat this? Practically nothing except to say "We don't want you to practice that." They practice it anyhow. There are a few states, however, where they have not gotten away with it so easily and if time—

SPEAKER FLYNN Do you not think it would be better to discuss your resolution when the Committee makes its report?

DR. GULLO Yes. It reads

Measures be taken that a law be enacted requiring that all persons desiring to practice any of the branches of medicine such as chiropractic, naturopathy, and other similar groups must, before allowed to practice their art pass an examination on the basic sciences besides meeting present requirements.

SPEAKER FLYNN This second resolution of Dr. Gullo's will be referred to the same Reference Committee on New Business A of which Dr. George Baehr is Chairman.

Are there any further resolutions?

35. Citizenship as Requirement to Practice Medicine in New York State

Section 83

DR. HOMER J. KNICKERBOCKER Ontario I wish to present the following resolution for the Medical Society of the County of Ontario

WHEREAS the Medical Society of the County of Ontario on July 12 1928 adopted an amendment to its Bylaws viz Any person of foreign birth applying for membership in the Medical Society of the County of Ontario, shall present documentary evidence of full citizenship in the United States of America, before such application shall be considered by the Society and

WHEREAS although duly reported to the Council of the Medical Society of the State of New York, no definite ruling has yet been obtained relative to the legality of such addition to the Bylaws of the Medical Society of the County of Ontario, therefore be it

Resolved that such matters of this nature relate to membership in the Society

tively within the jurisdiction of individual County Medical Societies.

SPEAKER FLYNN The resolution of Dr. Knickerbocker is referred to the Reference Committee on New Business B of which Dr. Frederic C. Conway is Chairman.

36. New York State Department of Education - Physician as Director of Division of Health and Physical Education

Section 77

DR. C. J. F. PARSONS Westchester I wish to present the following resolution of the Westchester County Medical Society

WHEREAS, the House of Delegates adopted a resolution in 1930 (See 85 Minutes of the House of Delegates 1930) providing that the Medical Society of the State of New York take such steps and sponsor such legislation as may be necessary to require the appointment of a duly qualified physician as Director of the Division of Health and Physical Education of the State Department of Education, and

WHEREAS, no bill has been introduced into the Legislature or other action been taken to effect such a change in the Education Law therefore be it

Resolved that the House of Delegates reaffirm the resolution passed in 1930, and direct the Council of the State Society to introduce and seek the passage of such legislation, requiring the appointment of a duly qualified physician to the aforementioned directorship.

SPEAKER FLYNN The resolution of Dr. Parsons is referred to the Reference Committee on New Business A of which Dr. George Baehr is Chairman.

Are there any further resolutions?

(There was no response.)

SPEAKER FLYNN Are there any reports of Reference Committees?

37 Report of Reference Committee No. V on Report of Council

New Section on Gastroenterology and Proctology--Scientific Assembly Committee

DR. HOMER J. KNICKERBOCKER During the past year a new Section on Gastroenterology and Proctology came into being. Your Committee welcomes this new section and wishes it all success. Your Committee commends the plan whereby the various committees, namely the committee on arrangements, the committee on scientific program, and the committee on scientific exhibits act in concert as a scientific assembly committee. This plan is to be commended because each subdivision retains its individual functions while all the activities are coordinated. We recommend the continuance of this plan.

I move the recommendation of the Committee. The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried.

Technical Exhibit

DR. KNICKERBOCKER The plan whereby an individual member or a committee of members handle a technical exhibit at annual meetings

ings thereby controlling more easily the character of the exhibits as well as saving commissions usually paid to outside solicitors is endorsed as long as it gives equally good results. We recommend its continuance.

I move the recommendation of the Committee.

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried.

The A. Waller Suter Lectureship

DR. KNICKERBOCKER. The establishment of this Lectureship is gratefully acknowledged. It is our sincere hope that others of like character, perhaps along section lines, may be subsequently established.

We are also duly grateful to Dr. Francis Carter Wood for his generosity in donating to the fund whatever honorarium may be due this year. This would appear to set a precedent that in course of time might build the fund up to the amount originally intended by the testator.

I move the adoption of the report of the Committee.

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried.

In Memoriam to Dr. Frederick H. Flaherty

DR. KNICKERBOCKER. Your Committee feels that no more fitting expression of our esteem could be had, and recommends the adoption verbatim of the resolution unanimously passed by the Council on October 13, 1938.

I move the recommendation of the Committee.

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried.

"M D" License Plates

DR. KNICKERBOCKER. Your Committee endorses the adoption of the report as published, and recommends the continuance of the plan of issuing special "M D" license plates to the members of the State Society. We recommend a vote of thanks to those members whose efforts culminated in securing special automobile license plates for the members. Your Committee respectfully urges that every doctor having these plates be especially cautious not to abuse any possible courtesy which these plates may carry.

It so happens that some of our families have been parking in front of hydrants and in other forbidden territory and have not been pulled in. They probably will be sooner or later.

I move the adoption of the recommendation of the Committee.

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried.

New York State Board Nominations

DR. KNICKERBOCKER. We recommend the adoption of the report as published and the nominations as made. We also desire to express our pleasure at the increasing confidence in the organized medical profession as shown by the various branches of our state government.

I move the recommendation of the Committee.

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried.

Changes in Group Plan Rates and Coverage for Malpractice Insurance

DR. KNICKERBOCKER. We desire to express our gratitude to the Committee which has accomplished so much for our members. We recommend the adoption of the report as published.

I move the recommendation of the Committee.

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried.

DR. KNICKERBOCKER. I would now move the adoption of the Report of the Committee as a whole.

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried.

38 Report of Reference Committee on Report of the Secretary

DR. LOUIS A. VAN KLEECK, *Nassau*. Before presenting the Report of the Committee on the Report of the Secretary, I wish to state that I, as Chairman of this Reference Committee, do not feel that the Secretary's Report is a reflection of all the numerous activities to which our Secretary has in the past year so wholeheartedly and with such sincere and conscientious effort devoted his whole time, but as your Reference Committee can only report on the Report of the Secretary as submitted I shall proceed to give the Reference Committee's report.

The Reference Committee finds that it is impossible to report in detail on the vast amount of work which has been accomplished by the Secretary since the last Meeting of the House of Delegates, May 9, 1938. During the past administrative year the social and economic aspects of medicine have had a direct relationship on the events of the country in general, and due to these factors the work of the headquarters office has been greatly increased. Many of these matters required most urgent action.

The Committee desires to voice its approval of the comprehension and the efficiency of the headquarters office and also to commend the splendid work and capable judgment of the Secretary.

Membership. We note the increase of 1,176 new members and also with profound regret the loss by death of 180 members, with other changes as published in the Report of the Secretary makes a total net gain of 648 as of December 31, 1938. The total increase of membership over the past five years is over 3,000.

We wish to congratulate the twenty honor societies.

We wish to commend the Secretary and the clerical force for the work entailed in keeping the roster of all physicians in the state up to date, as provided in the bylaws.

We approve the action of the Secretary in sending the usual card and explanatory letter to all physicians in the state so that the necessary information for the DIRECTORY may be available at any time that it may be desired.

Coordination of Activities. As this subject is covered in the Report of the Council, this Reference Committee refers recommendations to that report.

We feel that the officers of the State Society

should receive gratitude and appreciation of the Society for the time and energy that they have devoted to the publicity of the organized medicine.

As increased office space is required for the publication of the JOURNAL and greater efficiency and saving of time could be accomplished by centralizing the various office units now separated and also to facilitate travel the Committee recommends that the Council be empowered subject to its discretion to obtain suitable offices.

We wish to especially commend the work done by the Secretary on Public Health Malpractice Insurance, Preparations for the Annual Meeting JOURNAL Publication Medical Publicity the Medical Care Survey Medical Relief and Medical Expense Indemnity Insurance.

The Committee is mindful of the vast amount of work accomplished by these various and multitudinous duties.

We note the assistance and cooperation of the officers and committee members. This unity of interest augurs for the efficiency of the organization as a whole.

The Reference Committee notes with satisfaction and appreciation the work of Miss Dougherty for her supervision of the office and her unflinching assistance to the General Manager and also of the clerical force for maintaining the tradition of the office even under the trying circumstances of overtime increased work, and crowded quarters.

The Committee wishes to add its approval and endorse the thanks expressed by the General Manager.

In conclusion, the Committee wishes to express its approval for the replete yet concise report as a whole.

I move the adoption of the report of the Reference Committee.

The motion was seconded.

DR. GEORGE W. KOSMAK I would like to amend that section of the report referring to the change of quarters and add the words there "subject to approval by the Board of Trustees." I think that is a very important amendment.

DR. VAN KLERCK I accept that amendment.

SPEAKER FLYNN It being accepted it becomes part of the report of the Reference Committee.

The motion was seconded and there being no discussion, it was put to a vote and was unanimously carried.

39 Report of the Reference Committee on Report of Board of Censors

DR. LOUIS A. VAN KLERCK, Nassau The House of Delegates in 1938 approved the Reports of the Board of Censors (April 1 1938) relative to the appeal by Doctor Donald R. Keller, of Westhampton Beach from a decision of the Suffolk County Medical Society excluding him from membership.

The Suffolk County Medical Society as instructed by the Board of Censors, again voted on the application of Dr. Donald R. Keller with the result that Dr. Keller was denied membership. Dr. Keller appealed from this decision excluding him from membership and the Board of Censors of the Medical Society of the State of New York

heard this appeal on February 9 1939. The Board of Censors after careful consideration and discussion of all records and grounds for appeal reached the conclusion by a vote by ballot of 6 to 1 (the President and Secretary not voting) that the judgment appealed from should be affirmed.

This decision was duly transmitted by the Secretary in writing to both appellant and respondent.

The Reference Committee approved the action and report of the Board of Censors and moves the adoption of the report.

I move the recommendation of the Reference Committee.

The motion was seconded and there being no discussion it was put to a vote and unanimously carried.

40. Report of Reference Committee on Reports of the District Branches

DR. LOUIS A. VAN KLERCK, Nassau The Reference Committee wishes to commend the Reports of the eight District Branches.

In our review of the reports of these eight District Branches your Reference Committee notes the high quality of the scientific programs and also the arrangements made for the comfort and entertainment of the members at these meetings. We feel however that the attendance especially in the larger urban communities, while improved is not commensurate with the effort expended. Within the limitations of the budget allowed the Reference Committee would recommend that wider publicity be given these District Branch meetings, stressing both their educational value and the opportunities offered for the membership to obtain closer contact with the activities and efforts of the organized profession as conducted by our State Society.

The Reference Committee recommends continued assistance and encouragement for the work and purpose of the District Branches.

We wish to note with appreciation the interest and attendance of the President and state officers at each of the Annual District Branch Meetings. This custom greatly adds to the interest of the meetings.

The Committee is gratified to note the complete and detailed report of each District Branch President.

I move the adoption of the report of the Reference Committee.

The motion was seconded and there being no discussion, it was put to a vote and unanimously carried.

DR. VAN KLERCK I move now for the adoption of the Report of the Committee as a whole, with the slight amendment which was suggested by Dr. Kosmak and accepted.

The motion was seconded and there being no discussion, it was put to a vote and unanimously carried.

41 Report of Reference Committee on New Business A on Council Forwarding Report of Action of Each Meeting to County Societies

Section 26

DR. GEORGE BAEHR, New York In regard to the resolution of Dr. Wood of the County of

Westchester, Reference Committee on New Business A recommends approval of the resolution introduced by Dr Wood, with certain changes in wording

The resolution, as approved by the Reference Committee on New Business A, reads as follows

"WHEREAS, it is desirable that the County Medical Societies be directly and currently informed of all actions and policies of the interim-governing body of the State Society, therefore be it

"Resolved that the House of Delegates hereby instructs the Council, or other interim-governing body, to forward a report of the actions taken at each meeting of the said governing body to the Secretary of each County Society—such report to be forwarded as soon as possible after each regular meeting and before the next succeeding meeting of the Council "

I so move

The motion was seconded

VICE-SPEAKER BAUER It has been moved and seconded that the report of the Reference Committee be adopted, carrying with it the amended resolution of Dr Wood Is there any discussion?

DR WILLIAM H ROSS I move to amend that to provide for publishing it in the JOURNAL It will save expense and will cost considerably less Those reports are quite voluminous

DR BAEHR This matter was discussed in the Reference Committee, and the Reference Committee decided against that action on the grounds that the report of the Council to the Secretary of each County Society would be sufficient It is merely a report of the actions taken It is not the minutes nor the complete transactions as to what transpired at the meetings of the Council

Secondly, it was felt that the publication of these actions taken, many of which are preliminary, in a state journal circulated very widely might give rise at times to misunderstandings, and it would be better to have them go directly to the Secretary of the County Societies It is merely a matter of mimeographing a report of the actions taken, and the Secretary of the State Society thought it was not too burdensome and could be accomplished

VICE-SPEAKER BAUER Was there a second to Dr Ross' amendment? There being no second, we come to the adoption of the Committee's Report Is there any further discussion? Your action on this report carries with it the amended resolution of Dr Wood

There being no further discussion, the motion was put to a vote, and was unanimously carried

42 Report of Reference Committee on New Business A on Principles of Professional Conduct for New Licensees

Section 18

DR GEORGE BAEHR, *New York* The Reference Committee on New Business A recommends the approval of the resolution of Dr Francis Kimball, New York County, with certain changes in wording, which are acceptable to him

The resolution, as amended, reads as follows

"Resolved that the Secretary of the State

Board of Medical Examiners be requested to send to the Secretary of the Medical Society of the State of New York the name of each person to whom they issue a license to practice medicine in the State of New York, and be it further

"Resolved that the Secretary of the Medical Society of the State of New York be and is hereby instructed to send a copy of the Principles of Professional Conduct of the Medical Society of the State of New York to each person to whom a license is issued to practice medicine in the State of New York, together with a letter of explanation and advice to him to apply for membership in the County Medical Society in which he establishes legal residence and/or his principal office "

I move the adoption of the resolution as amended

DR HOMER J KNICKERBOCKER, *Ontario* I would like to offer an amendment, "and the date thereof" be inserted relative to the license

DR BAEHR That is acceptable

The motion was seconded

There being no discussion, the amendment was put to a vote, and was unanimously carried

VICE-SPEAKER BAUER Now we come to the amended Committee's report, which carries with it the approval of the resolution of Dr Kimball as amended by the Reference Committee

There being no discussion, the amendment was put to a vote, and was unanimously carried

43 Report of Reference Committee on New Business A—Public Medicine Assembly Bill Int. 523

Section 23

DR BAEHR, *New York* Although some of the statements in the preamble to Dr Benjamin Davidson's resolution are true, other statements are not founded upon acceptable evidence, and the conclusions derived therefrom as recorded in the resolution are unwarranted and in fact contrary to the policy of the Medical Society of the State of New York as established after careful study of the problem of medical care. Assembly Bill Int. 523, print 535, known as the Goldstein bill, is poorly conceived and contrary to public policy

The Reference Committee on New Business A, therefore, recommends that the resolution of Dr Davidson be disapproved, and I so move

The motion was seconded

VICE-SPEAKER BAUER The motion is on the report of the Reference Committee carrying with it the loss of the resolution

There being no discussion, the motion was put to a vote, and was unanimously carried

44 Report of Reference Committee on the Report of the President

DR ROBERT BRITAIN, *Delaware* The Report of the President, Dr William A Groat, is a sincere reflection of experience gained by faithful, scholarly, and untiring efforts in behalf of the Medical Society of the State of New York.

It calls attention to attainments that have resulted from the combination of our financial, legislative, and professional resources It emphasizes that our most important aim and duty is to continue the practice of medicine on its

highest scientific and moral standards. It conveys the impression of a most sympathetic understanding of human needs.

We commend it most heartily to the members of our Society.

I move the report of the Reference Committee.

The motion was seconded and as there was no discussion, it was put to a vote and was unanimously carried.

45. Report of the Reference Committee on the Address of the President-Elect

Section 13 72

DR. ROBERT BRITTAIN *Delaware*. The President Elect asks that each member carry his share of the burden of the Society. He recommends the close inspection and the economic distribution of funds, a thorough investigation of our expenditures to see where items may be, if possible reduced. He recommends the appointment of a committee by this House of Delegates to study these facts—this committee to report to the Council their findings, to investigate the cost of publication of JOURNAL, reduction of salaries and expenses where there seems to be an excess, continuance of a Workman's Compensation Committee. The President recommends the consideration and study of the licensure of alien physicians, active survey of physicians who are not members of their local medical societies to get them to become members.

This Committee approves of these recommendations.

I move the report of the Committee.

The motion was seconded.

VICE-SPEAKER BAUER. The question is before you on the adoption of the Committee's report. Is there any discussion?

DR. GEORGE W. KOSMAK. I would like to propose an amendment to that portion of the report which refers to the appointment of a committee from the House of Delegates to study the various items of expenditure etc. It would seem to me Mr Vice-Speaker—I see the Speaker has been rendered inactive for the moment—that this matter be turned over to the Board of Trustees who have in mind doing this very job. I think it is unnecessary to appoint another committee from the House of Delegates to take care of this matter. I therefore, would like to amend that portion of the report to substitute for a special committee from the House of Delegates the words the incoming Board of Trustees.

DR. GRANT C. MADILL. I second that motion.

VICE-SPEAKER BAUER. The amendment has been made and seconded to substitute the Board of Trustees for appointment of a committee by the House of Delegates. Is there any discussion on the amendment?

SECRETARY IYING. Dr Kosmak, I think is mistaken in thinking that the recommendation meant the appointment of a committee of the House of Delegates. All we appoint here are reference committees. Special committees of the Society are appointed by the President subject to the approval of the Council. I just wanted to correct what seemed an error in understanding.

VICE-SPEAKER BAUER. According to the bylaws, the Speaker of the House of Delegates only appoints the reference committees that

report at the session for which they are appointed any committees other than that must be appointed by the President with the consent of the Council.

DR. KOSMAK. That does not change my opinion in the least. I think that this function is one that should be turned over to the Board of Trustees. They are more familiar with the facts of the case. There is no need for the appointment of a special committee. This matter can very well be taken up and fully considered by the Board of Trustees.

VICE-SPEAKER BAUER. The question is still before you on the amendment. Is there any further discussion?

DR. BRITTAIN. Has there already been a committee appointed for this purpose?

VICE-SPEAKER BAUER. I think not. Is there any other discussion? If not are you ready for the question on the amendment? All those in favor of Dr Kosmak's amendment say Aye those opposed No. The Ayes have it and the amendment is carried.

The question now is on the amended report of the Reference Committee. Is there any discussion on that? If not all those in favor of the adoption of the amended report say Aye those opposed No. The report is adopted (later recommitted).

Are there any other reference committees ready to report?

DR. JAMES H. BORRELL. I would suggest on any further amendments that are offered from the floor the microphone be used.

ASSISTANT SECRETARY PODVIN. I do not believe half of the men heard that.

DR. ARTHUR S. DRISCOLL, *Richmond*. I know that I for one, did not hear it. I do not know what the purposes of that amendment were and the men all around me are in the same situation.

CHORUS. Yes! Yes! We did not hear it.

VICE-SPEAKER BAUER. The amendment was to substitute the Board of Trustees for the appointment of a special committee from anywhere else in the Society.

Are any other reference committees ready to report?

(There was no response.)

VICE-SPEAKER BAUER. I will declare a recess of ten minutes until other committees have their reports prepared.

After Recess

VICE-SPEAKER BAUER. The House will be in order.

Gentlemen, the Chair is informed that a very large percentage of the House did not understand on what they were voting before we recessed. The Chair would therefore be very glad to entertain a motion for reconsideration.

DR. SAMUEL J. KOPETZKY *New York*. I move that it be reconsidered.

The motion was seconded.

VICE-SPEAKER BAUER. It has been regularly moved and seconded that we reconsider the Report of the Reference Committee on the Report of the President Elect. Is there any discussion?

DR. KOPETZKY. The only discussion is the fact we did not hear it.

VICE-SPEAKER BAUER. Hereafter anyone who gets the floor will be asked to come up and

use the microphone so there will be no excuse for everybody not hearing what has been said

Is there any discussion on the reconsideration? If not, all those in favor of reconsidering, will say "Aye", those opposed "No" The vote is carried The Report of the Reference Committee on the Report of the President-Elect is before you just as though nothing had been done

Dr Kosmak, will you come up and use the microphone and explain your amendment again?

DR GEORGE W KOSMAK Preliminary to that I believe you should have the motion read

DR JOHN J MASTERSON, *Kings* In order to have this properly discussed we should have the Chairman of the Reference Committee make his report again, as most of us did not hear it in the first place

VICE-SPEAKER BAUER The report was not understood either Will the Chairman of the Reference Committee come and reread his report?

DR BRITTAIN The President-Elect asks that each member carry his share of the burden of the Society He recommends the close inspection and the economic distribution of funds, a thorough investigation of our expenditures to see where items may be, if possible, reduced He recommends the appointment of a committee by this House of Delegates to study these facts—this committee to report to the Council their findings, to investigate the cost of the publication of JOURNAL, reduction of salaries and expenses where there seems to be an excess, continuance of a Workman's Compensation Committee The President recommends the consideration and study of the licensure of alien physicians, active survey of physicians who are not members of their local medical societies to get them to become members

This Committee approves of these recommendations

I move the report of the Committee

VICE-SPEAKER BAUER The point was made that the House can authorize the appointment of a committee, but any continuing committee must be appointed by the President, with the approval of the Council

Dr Kosmak, will you come up and give your amendment again?

DR GEORGE W KOSMAK Mr Vice-Speaker and Members of the House, my amendment referred specifically to that portion of the Reference Committee's report which dealt with the appointment of a special committee by the House of Delegates to study certain details of expenditures, and so on My amendment was based on the belief that the appointment of such a committee is unnecessary and, therefore, I amended that portion of the report to read that the matter be referred to the incoming Board of Trustees

By way of discussion I would like to say that this matter has already been taken up by the previous Board of Trustees and has been given considerable study A detailed examination of the expenditures of the last five years has been drawn up, and there seems to be no need for this House of Delegates to appoint another special committee We should endeavor to concentrate our work as much as possible in the hands of those who are already familiar with the situa-

tion and who can, therefore, render a much more satisfactory report than any group of new men that will have to go into the question again and present its report

Thank you!

VICE-SPEAKER BAUER Dr Kosmak has moved that an amendment be made to the Committee's report, and that the Board of Trustees be substituted for the special committee Dr Madill seconded that amendment The amendment is now before you for discussion.

PRESIDENT-ELECT TOWNSEND Mr Vice-Speaker, and Ladies and Gentlemen of the House of Delegates, my recommendation has been somewhat twisted in its interpretation In the first place I said nothing about this House of Delegates appointing a committee. I recommended that they authorize the appointment of a committee I assume this House has the judgment, and the wisdom, and the prudence not to disturb a presidential prerogative of naming the committee

In the previous sentence in my address to you I told you clearly that I believe in financial economy If I merit your confidence, then you must have some reasonable belief in my good judgment I certainly have no intention, if it comes to my hands, to appoint one gentleman from Buffalo and another from Plattsburg, and another from Watertown, and bring them down to New York City every ten days to two weeks with an expensive bill that will run you up to \$1,000 or more at the end of a year That is entirely out of my mind

My recommendation was that you give me authority to appoint a group of gentlemen, four or five men, of wisdom, of foresight, of vision, living in the fairly immediate neighborhood of our headquarters, where the expense of attending a meeting would be only ten to twenty five cents—and I do not think you would receive a bill for that carfare—and study, think, look at the checks, look at the vouchers, look at everything concerning money, jot it down, come back to the Council, and in a short succinct report say "Do you know this is a fact? Do you know that is a fact? Don't you feel, perhaps, this could be changed or that could be cut down?"

Naturally, the Trustees have given us \$3,000, or \$1,000, or whatever the sum was, but if they have given us \$3,000, and we turned them back \$2,600, that is a saving The Trustees should be grateful to us Their time is taken up on far, far greater matters than this matter of fact finding and recommending to the Council.

If you will stick to the recommendation, and leave that to work itself out, and give me a chance to exercise such judgment as I may have, I rather feel in my heart that you will be the recipient of a great deal of benefit from the saving, because the cost will be very little. I think complications, reduplications of committee work, and multiplicity of committees are just horrid It is utterly unnecessary, and for that reason I would be very cautious as to adding to the expense of the State Society a committee widely distributed geographically

That is my reason for opposing Dr Kosmak's amendment I leave it in your hands

DR. HOWARD FOX, *New York* Mr Speaker, Ladies and Gentlemen of the House, the Presi-

dent Elect has already explained the situation and makes it unnecessary for me to go into any explanation. I merely want to say at this moment that I think the least we can do is to show our confidence in the President Elect who has thought over this matter very carefully and accept what he has recommended. (Applause)

DR. KOSMAK May I have the floor for a minute? I think Dr Townsend entirely misunderstood my amendment. My amendment was based on the report of this Reference Committee, and unless I am greatly mistaken the Reference Committee recommended the appointment from the House of Delegates of a committee. I ask that the original motion of the Reference Committee be read.

SECRETARY IRVING The President Elect asks that each member carry his share of the burden of the Society. He recommends the close inspection and the economic distribution of funds a thorough investigation of our expenditures to see where items may be, if possible, reduced. He recommends the appointment of a committee by this House of Delegates to study these facts.

DR. ARTHUR S DRISCOLL I move that the entire matter be referred back to the Reference Committee so that they may bring in a clear recommendation.

The motion was seconded and as there was no discussion, it was put to a vote and unanimously carried.

VICE-SPEAKER BAUER It is so recommended.

46. Report of the Reference Committee on Report of the Council—Part I on Public Health and Education, and Supplementary Report

DR. WALTER D LUDLUM The first portion of this report is taken up with matters of procedure. These are approved by your Reference Committee.

American Medical Association Special Session

The next item is the report of the Council's action in regard to the special session of the American Medical Association on September 16-17 1938 and the report of the New York State Society's delegates back to the Council including in full, the recommendations, five in number adopted at that special session.

Your Reference Committee recommends that this Society adopt the recommendations made to and adopted by the American Medical Association on September 17 1938, as its expression of policy relative to these matters.

I so move.

The motion was seconded, and there being no discussion, it was put to a vote and unanimously carried.

DR. LUDLUM Your Committee further recommends your approval of the action of the Council in placing the Society on record as in full accord with the recommendations adopted by the Special Session of the House of Delegates of the American Medical Association of September 16-17 1938 and for the remainder of its action as reported to all the County Societies under date of November 20 1938.

If that needs explanation I would say that it is in reference to the same matter but, in the first place, we adopted as the policy of the State

Society those recommendations, and in this particular paragraph we approve the Council taking that action for us.

I move the adoption of the report.

The motion was seconded and there being no discussion, it was put to a vote and unanimously carried.

Postgraduate Medical Education and Public Health Matters

DR. LUDLUM Your Reference Committee observes the activity of the Committee on Postgraduate Medical Education and Public Health, urges that in our very proper efforts toward economy the activities of this committee be not curtailed and recommends that you voice your approval by vote.

I so move.

The motion was seconded and there being no discussion, it was put to a vote and unanimously carried.

Maternal Welfare

DR. LUDLUM The Special Committee on Maternal Welfare offers three precise and detailed recommendations. Your Reference Committee recommends that you express your approval of the essence of these recommendations and instruct the Council to carry them out so far as may be possible.

Possibly in explanation I would refer you to that column in the report and call attention to the fact that there is much detail involved in that, all of which we cannot demand precisely, but we approve of the general proposition and want to carry it out as fully as may be.

I so move.

The motion was seconded and there being no discussion it was put to a vote and unanimously carried.

Dietetics Institutes

Section 8

DR. LUDLUM In regard to the supplementary report made this morning the first item refers to a Four Day Institute on Dietetics as presented by you and your Reference Committee. The idea is excellent and your Reference Committee recommends that it be approved and the Committee on Education be encouraged to carry it out if when and as it may be feasible. More particularly with regard to the registration fee we recommend that this be approved. If the Committee on Education recommends it in any individual case particularly with the object of "assuring a regular attendance and assuring those who have registered that they will not be disturbed by a vacillating attendance."

I move the recommendation.

The motion was seconded and there being no discussion it was put to a vote and unanimously carried.

School Funds and School Health Work

Section 8

DR. LUDLUM With regard to the next two subjects The Reallocation of School Funds' and 'The Recent Inquiry made by the State Board of Regents as pertains to school health work,' these matters are by no means settled at the present time and your Reference Committee recommends that the Committee on

Education be requested to conduct the study to the end of making precise recommendation

I so move

The motion was seconded and there being no discussion, it was put to a vote and unanimously carried

Sulfanilamide

Section 8

DR LUDLUM With reference to the fourth matter, namely, the "Restriction of the Sale of Sulfanilamide and its Derivatives as well as other drugs, to sale on Physicians' prescriptions only," your Reference Committee recommends that the Council Committee proceed so far as it may be able to make this effective, such restrictions either to be imposed by existing agencies or through new legislation

I move the recommendation

The motion was seconded and there being no discussion, it was put to a vote and unanimously carried

DR. LUDLUM I move the adoption of the report *in toto*

The motion was seconded and there being no discussion, it was put to a vote and unanimously carried

SPEAKER FLYNN I would like to speak to you of an omission here in the Report of the Reference Committee on the Council, Part V referring to the Principles of Professional Conduct That has not been taken up in the report of that committee, so I am referring that part of it back to that committee for further consideration and report, Dr Knickerbocker, Chairman

47 Report of Reference Committee on New Business B on Appointment of Special Committee on Ophthalmological Public Relations

Section 20

DR FREDERIC C CONWAY This is on the resolution introduced this morning, reading

"Resolved that the Medical Society of the State of New York be requested to appoint a special committee on Ophthalmological Public Relations at the next meeting of the House of Delegates"

Your Committee disapproves of the resolution

We feel that this resolution needs no action by your Reference Committee as the matter properly belongs to the Committee on Public Relations of the Council We would, however, suggest that it be given early consideration by that committee

I move the adoption of the report of the Reference Committee

The motion was seconded

SPEAKER FLYNN The motion is on the adoption of the report of the Reference Committee, which carries with it the disapproval of the resolution Is there any discussion?

DR PHILIP I NASH, *Kings* Can we have the reasons why it was disapproved?

DR CONWAY Your Reference Committee felt that the Society, and the House of Delegates particularly, is already overburdened with committees, and where we have committees that overlap it should be referred to the original committee that has the power to act in the matter

DR NASH That does not answer the ques-

tion I want the reason why it was disapproved

DR CONWAY It was disapproved because it properly belongs to the Committee on Public Relations of the Council

DR NASH You do not disapprove of it in principle though?

DR CONWAY No, we merely refer it back to the Council, and suggest that it be given early consideration by the Committee on Public Relations

DR NASH That was a misunderstanding on my part. I thought the Committee was disapproving of it on principle.

DR CONWAY No

DR W GUERNSEY FREY, JR., *Queens* I am speaking as a member of the Legislative Committee of the Eye Section of the Academy of Medicine, and as Chairman of the Legislative Committee of the New York Ophthalmological Society The reason that this resolution was introduced is that problems affecting ophthalmology and affecting the public health arise from time to time, resolutions are introduced in the State Legislature having to do with the practice of optometry and ophthalmic dispensing, and the attitude of the Medical Society of the State of New York is not always consistent in regard to these problems

We had the instance three years ago of having a bill to regulate the practice of dispensing opticians, which was endorsed by the ophthalmologists of the metropolitan area, and was opposed by the Legislative Committee of the State Society There seems to be no authoritative body to which reference can be made to get the opinion of ophthalmologists The Executive Officer and the members of the Legislative Committee of the State Society refer from time to time and write to and telegraph to individual ophthalmologists throughout the state for their opinion which they express as individuals This resolution was drawn up by a committee of ophthalmologists in the metropolitan area, after corresponding with ophthalmologists throughout the state It was introduced in abstract by the member from New York County The resolution provided for the designation of a committee from the Eye Section of the State Society, which committee could speak with much more authority than the individual members who may be consulted from time to time

DR JOSEPH S LAWRENCE I do not know whether I understood the nature of this explanation of the resolution nor just what it is that the resolution is intended to accomplish, but I did hear—if I heard correctly—that there was some inconsistency with regard to my action and the action of the Committee on Legislation

I want to challenge that immediately and refute it There was a difficulty last year with regard to the optometry bill A bill was introduced, and it was approved by a number of the County Societies, and no opposition was presented to the bill until it passed the Assembly and then the Senate When the Legislature was about to close, opposition arose on this bill The Legislative Committee considered it immediately, and the Legislative Committee in response to the increased number of oppositions that were brought in reversed its standing and opposed the bill Before the Governor signed the bill, I happened to be in a group where he was.

and be asked those of us present to confer with him in regard to this bill. He said that the bill had been approved by the Department of Education but just when it had come to his desk it was disapproved and the Medical Society had moved to disapprove of it, and he wanted to know whether he had understood correctly. I said yes. We were acting in response to what we call the fan mail, and we do it as nearly as we can, and as accurately as we can. It occasioned our taking two positions last year but we were against it before the Governor signed the bill, and the Governor vetoed it.

This year we attempted to forestall any such confusion so we asked the Chairman of the Section on Ophthalmology to name for us a certain number of ophthalmologists in the state that he thought would be in a position to advise us. After that the Committee on Legislation invited the optometrists to present their bill for a discussion prior to the hearing. All that was done with certain ophthalmologists invited to be present at the time. After that the bill was not introduced for quite a while the optometrists bill.

The opticians' bill was introduced and the Committee has always approved that but in the meantime there was misunderstanding. It was thought the optometrists bill has come in very early but it did not go in until two weeks ago. There was a public hearing on it, and it is now combined with the opticians' bill. The two bills are formed as one bill but your Committee on Legislation has been very careful with this bill as it has with any bill and it has consistently sought the advice of the ophthalmologists of the state concerning any legislation in this field.

I think that the Committee can have no objection whatever to the appointment of a committee of ophthalmologists to advise but I say again I am responding because there seemed to be an attack upon the sincerity and honesty of the Committee on Legislation and me.

I thank you.

SPEAKER FLYNN Is there any further discussion?

DR. THOMAS P. FARMER Mr Speaker and Members of the House of Delegates. I am speaking in support of the Reference Committee's report. Their recommendation I think should be worded that the resolution presented be not adopted in place of their saying that they are opposed to it because I think every body favors the idea which prompted bringing in this resolution to the House of Delegates. On the other hand the method is already set up for dealing with this problem that is, we have our own Committee on Public Relations and if we set up individual committees on public relations for each branch of medicine we will never accomplish anything in public relations. All the public relations of the State Society should be coordinated under one committee. There is nothing at all to prevent the ophthalmologists from consulting this Committee on Public Relations and expressing their ideas, where I am sure they will receive very sympathetic attention and consideration.

I might say that the speaker before Dr Lawrence did not adequately describe conditions. I am not sure whether he knows that the Council

of the State Medical Society without any urging on the part of ophthalmologists but because of their own consideration of this problem adopted a motion that it be the sense of the Council of the State Medical Society that any legislation extending the privileges of optometrists in the field of ophthalmology be opposed as well as any legislation which restricted the ancillary services of opticians to ophthalmologists. I do not think you can find the least bit of fault with that policy. That is the policy guiding the State Medical Society at the present time until it is reversed by this House. (Applause)

SPEAKER FLYNN Before I put that question I will ask Dr Conway to read that again in order that you may thoroughly understand it.

DR. CONWAY Do you mean the resolution?

SPEAKER FLYNN Yes.

DR. CONWAY Resolved that the Medical Society of the State of New York be requested to appoint a special committee on Ophthalmological Public Relations at the next meeting of the House of Delegates.

Your Reference Committee disapproves of the resolution.

SPEAKER FLYNN Would you like to make that amendment to the Reference Committee's report Dr Farmer that you suggested?

DR. FARMER I would like to change Dr Conway's phraseology and in place of saying they opposed it to say that the resolution be not adopted. It is all the same thing in the final analysis I suppose.

DR. CONWAY I accept that.

The amendment was seconded.

DR. PHILIP I. NASH Kings. I move that the original motion be adopted.

SPEAKER FLYNN The question will be on Dr Farmer's amendment.

DR. NASH I am willing to withdraw my motion provided the recommendation of this committee about the disapproval be dropped from their report.

SPEAKER FLYNN That has been done in the wording that Dr Farmer suggested. Dr Farmer's amendment which was accepted by the Committee was that the resolution be not adopted instead of saying that the committee disapproved of it.

DR. NASH Very well I will withdraw my motion then.

SPEAKER FLYNN All those in favor of the motion that the resolution be not adopted, that is an acceptance of the Committee's report as changed by Dr Farmer and as accepted by the Committee, calling for the nonadoption of the resolution for the reasons given, say Aye contrary. No. The motion is carried, and the resolution is not adopted.

DR. JOHN J. MASTERSON Kings. I think the reason for the small vote was that nobody knew what they were voting upon. I do not know whether we approved the original resolution or disapproved of it.

SPEAKER FLYNN We approved the Committee's report.

DR. LUDLUM To disapprove of the resolution.

SPEAKER FLYNN That was changed by the amendment which was accepted by the Committee, and it was put that the resolution be not

adopted, and not that the Committee disapproved of it

DR. LUDLUM The speaker in putting the motion said, "All those in favor of the resolution, say "Aye" and he got about two or three responses, and the same way when he called for the "Nay" vote he got two or three responses. The motion was intended to be approving the recommendation of the Reference Committee which disapproved the resolution.

SPEAKER FLYNN That wording was changed by Dr Farmer, and accepted by the Committee, so that it would read "that the resolution be not adopted"

DR. LUDLUM May we have the motion made on which we are to act then, the opposite motion?

DR. NASH I do not think Dr Ludlum heard me withdraw my motion, therefore, you are voting on the recommendation of the Reference Committee, with the changed phraseology, as has been stated

SPEAKER FLYNN Will you kindly read your recommendation with the changed phraseology?

DR CONWAY Your Committee recommends that this resolution be not adopted

SPEAKER FLYNN Now you are voting on that recommendation of the Committee that the resolution be not adopted. All those in favor of the recommendation of the Committee calling for the nonadoption of this resolution, say "Aye", those opposed, "Nay". The resolution is not adopted

48 Report of Reference Committee on New Business B on School Health Work

Section 21

DR CONWAY This is on the resolution proposed by the Medical Society of the County of Westchester, reading

"WHEREAS, the medical profession should not only participate but assume leadership in determining the future of the school health program in New York State, and

"WHEREAS, the recent Inquiry of the State Board of Regents found that the present program is 'almost entirely uncorrelated with the educational program as a whole and unrelated to any broader community responsibilities,' and pointed out the need of important changes of policy, many of which involve the school physician and the medical profession in the community, and

"WHEREAS, there is an evident need for an immediate reconsideration of

1 the economic factors underlying the school medical service,

2 the educational qualifications of school physicians and the establishment of professional supervision of their work,

3 the professional status of the school physician in the school system and his relationship to his colleagues in the community,

4 the proper basis of remuneration for the school physician and the proper scope of his required services,

5 the desirable functions of the school physician in health education, therefore be it

"Resolved that the Medical Society of the State of New York appoint a special commis-

sion, representative of school physicians, private physicians, and experts in health education, and charge this commission with the duty of formulating recommendations for the House of Delegates looking toward a practical program in answer to the following question

"What changes are needed in law and in administrative practice to place the school health service upon a sound economic and professional basis, to equip the school physician for leadership in health education, to correlate the school health program with the educational program as a whole, and to correlate the school health inspection service with the official health agencies and the medical profession in the community?"

Your Committee disapproves of the resolution inasmuch as Dr Farmer's Committee already has the matter under advisement. Your Committee feels, however, that the matter is of extreme importance and suggests that it be given early consideration by that committee.

I so move

The motion was seconded

DR. ARTHUR F. HEYL, *Westchester* May I amend this motion, which amounts to a disapproval of this resolution and a recommendation that Dr Farmer's Committee from the Council consider this at its earliest convenience, so that the House of Delegates will empower Dr Farmer at his discretion to utilize representatives of school physicians, private physicians, and experts in health education to facilitate what is embodied in this original resolution.

The amendment was seconded

DR. WALTER D. LUDLUM, *Kings* I would like to second that amendment. I had a little discussion about this matter, and I have given it consideration. I think it is a big job for one committee in and of itself alone. With all the other duties that are imposed upon Dr Farmer's Committee I do not think that the Committee itself, without additional assistance, can adequately cover this matter.

SPEAKER FLYNN Is there any discussion on the amendment?

DR. FARMER May I suggest that in those last speeches the word "Dr Farmer" be eliminated and "Chairman of the Committee on Public Health" substituted?

DR. HEYL I will accept that amendment.

There being no further discussion, the amendment was put to a vote and was carried.

SPEAKER FLYNN Now we will have your action on the report of the Committee as amended

There being no discussion, the motion was put to a vote, and was carried unanimously

49 Report of Reference Committee on New Business B on Race, Color, or Creed Restrictions on Physicians

Section 16

DR. FREDERIC C. CONWAY With the consent of Dr Peter M. Murray, who introduced this resolution, it was changed to read

"WHEREAS, a rapidly changing social order is demanding a reorientation of the attitudes and responsibilities of individuals and agencies engaged in providing for the medical care of the public,

'WHEREAS, the entire strength of all elements engaged in the practice of medicine should present a united front in facing and solving these problems in the interest of the public health

'WHEREAS, the Negro physician numbering more than 5 000 in the United States and about 350 in New York State bears the direct responsibility for the care of approximately 13 000 000 citizens whose collective health problems form one of the most challenging areas in the entire battle line against sickness and disease

'WHEREAS, these physicians have not only demonstrated individually and collectively their ethical and professional fitness to shoulder their just responsibilities but have shown a zeal and a devotion to the health problems of their people worthy of the best traditions of American Medicine

'WHEREAS, the best interests of the entire medical profession and indeed of the entire public demand that they receive identical opportunity for medical education for professional experience in hospital and clinic for participation in public health programs, public and private in short all of the rights, privileges and responsibilities inherent in regular membership in organized medicine,

'WHEREAS, the County Medical Society is the basic unit of the American Medical Association, membership in which is a prerequisite for membership in the American Medical Association

'WHEREAS, south of the Mason Dixon line Negro physicians are generally and systematically excluded from County Medical Society membership making membership in the American Medical Association and affiliation with organized medicine impossible,

'WHEREAS this exclusion along racial lines strikes at the fundamental rights of this large group of physicians and indirectly lowers the quality of medical care which they must deliver to an already underprivileged group whose health problems admittedly press more firmly for solution than those of any other racial group

'WHEREAS, these Negro physicians have time and again demonstrated their constancy and heroic devotion to the democratic form of government and all which that term implies and have strongly recorded their position toward the pending medico-economic issues as identical with that of organized medicine now therefore be it

Resolved that the Medical Society of the State of New York, through its House of Delegates records as its considered opinion that any and all restrictions imposed on any American citizen (this is changed from minority group) solely on the basis of race or religion, is not only inimical to the cause of the public health with which we are so deeply concerned but dangerous to the entire body politic of our democratic form of government be it further

Resolved that the members of the New York State Medical Society, especially those in positions of key responsibility in educational charitable and public health enterprises such as medical schools hospitals, clinics etc be and

are hereby urged to consider seriously the removal of any' (any' for these')

restrictions as a matter not only of simple justice, but in the light of their inherent capacity to hamper and restrict the entire medical profession in rendering the best possible service to the public and further that they be urged to use their good offices and influence in removing any' (any for all')

restrictions based solely on race or religion, to the end that our proud boast of a truly democratic form of government a truly liberal and unselfish medical profession be less honored in the breach than in the observance be it further

Resolved that the House of Delegates of the Medical Society of the State of New York instruct its delegates to the House of Delegates of the American Medical Association to present at its next meeting and to use every honorable means to secure its passage the following resolution to wit

Resolved that the House of Delegates of the American Medical Association declare its belief that membership in the various constituent County Societies of the American Medical Association should not be denied to any person solely on the basis of race color or creed (creed was substituted for religion)

Your Committee approves this resolution as amended.

The motion was seconded, and as there was no discussion it was put to a vote and was unanimously adopted

50. Report of Reference Committee on New Business B on Woman Delegate to the American Medical Association

Sections 24 91

DR. FREDERIC C CONWAY On the resolution introduced by Dr Emily D Barringer this was amended to read

'WHEREAS, it is a critical time in the history of American medicine when it is important that all physicians should unite in safeguarding the interests of the profession and

'WHEREAS, the American Medical Association especially needs at this time the active interest and loyal support of all its members and

'WHEREAS, there are about 8 000-9 000 women physicians in the United States, many of them eligible for membership in the American Medical Association, and many of them already members thereof and

'WHEREAS, these women physicians have in many states organized city associations, state associations, and there is also a national organization known as the American Medical Women's Association and the members thereof have found it difficult to build a powerful organization because of the relatively few women and lack of large funds and furthermore it is undesirable to segregate the women physicians interests from the interests of the profession as a whole and

'WHEREAS, the ratio of women physicians to men physicians is so small that the chance of representation in the House of Delegates of the various State Medical Societies is almost nil

and

"WHEREAS, we believe that the Women's Medical organizations have much to give in big-visioned ideas, vigorous work, and loyalty if their wishes can only be made articulate, therefore be it

"Resolved that the Women's Medical Association of New York City in Executive Session, respectfully request and urge the House of Delegates of the Medical Society of the State of New York to recommend to the House of Delegates of the American Medical Association that they grant a seat to a woman delegate in the House of Delegates "

We stopped the resolution there, and cut out a last clause reading "that this position shall be permanent and be filled each year by the President or President-Elect of the American Medical Women's Association "

Your Committee approves of the resolution, as amended, and suggests that it be presented to the House of Delegates of the American Medical Association for its consideration

The motion was seconded

SPEAKER FLYNN Is there any discussion?

DR. IRVING GRAY May I ask whether the Constitution of the American Medical Association permits of such a course being followed?

DR. CONWAY My understanding is that it does not It was merely presented so that it might be given consideration by that body

There being no further discussion, the motion was put to a vote, and was carried unanimously

SPEAKER FLYNN We will now vote on the report of the Committee as a whole, as amended

The motion was put to a vote, and was unanimously carried

DR. IRWIN E. SIRIS, *Kings* Will you entertain a resolution?

SPEAKER FLYNN Yes

51 Resolution on Report of Board of Trustees in Regard to Publication of DIRECTORY

Sections 61, 63

DR. SIRIS This is the resolution

WHEREAS, the Board of Trustees in its *annual* report recommended the omitting of the publication of the DIRECTORY for 1939, and,

WHEREAS, in view of the several hundred physicians entering practice in our state each year, and

WHEREAS, the DIRECTORY has additional value on account of the compensation ratings of our members and in view of the changes in these ratings from time to time, and

WHEREAS, in view of these facts the DIRECTORY after one year becomes of very little value, therefore be it

Resolved that the Board of Trustees be requested to publish the DIRECTORY for 1939 and each year thereafter

SPEAKER FLYNN I will refer that to the Committee on the Report of the Treasurer and Board of Trustees

DR. WILLIAM KLEIN, *Bronx* It has already been taken up by the Reference Committee on the Report of the Board of Trustees and discussed in detail

SPEAKER FLYNN We will have to wait for that report then The reference of this resolution will be postponed until the Reference Committee on the Report of the Board of Trustees has made their report, because I understand it has been taken up by them very fully On second thought, it will do no harm to refer it to them It is the same committee anyway

52 Resolution Regarding Principles of Professional Conduct Relating to Contract Practice

Section 78

DR. JOSEPH WRANA, *Queens* I have a resolution I would like to submit

WHEREAS, the Code of Ethics of the Medical Society of the State of New York has no section dealing with contract practice, and

WHEREAS, a definite interpretation of this phrase is extremely necessary so that all County Societies in the State of New York may interpret contract practice in the same manner, be it

Resolved that a new section shall be added to the Principles of Professional Conduct and shall be interpreted in such a manner as to prohibit members of respective County Societies from engaging in any form of contract practice which does not allow free choice of physician to the patient, except where a third party pays for all expenses incurred in the treatment of the patient It shall be interpreted so that members of Mutual Benefit Associations or employee associations who pay all or a portion of the cost of medical care to its members, shall have free choice of physician

SPEAKER FLYNN This resolution will be referred to the Committee on New Business A, Dr. George Baehr, Chairman

53 Resolution Regarding Legal Counsel Assistant on Legislation

Section 74

DR. M. E. MARSLAND, *Westchester* This resolution is presented by the Medical Society of the County of Westchester

WHEREAS, in the Supplementary Report of the Council's Committee on Legislation for 1938 it is stated "In the early part of the session, Dr. Lawrence and his secretary can do the work very comfortably, but as the session progresses and hearings are held, Dr. Lawrence is obliged to spend more time in the capital At the same time, toward the latter part of the session, bills are introduced more rapidly and immediate action is more imperative, so that the strain on the office becomes almost intolerable," and

WHEREAS, continuous active representation of the Society before the Legislature is of vital concern both to the public and to the profession, and

WHEREAS, representation before the Legislature frequently involves technical legal considerations requiring expert knowledge of law rather than of medicine, and acquaintance with legislative procedure, therefore be it

Resolved that the House of Delegates do instruct the Council of the Medical Society of the State of New York to retain full-time legal counsel to assist and supplement the Society's present representation before the Legislature

SPEAKER FLYNN This resolution of Dr. Marsland's will be referred to the Reference Committee on the Report of the Council—Part IV Dr. Charles A. Anderson Chairman

54 Report of Reference Committee on New Business C on Milmoee Osteopathic Bill—Assembly Int. 1428

Section 25

DR. FLOYD J. ATWELL Your Committee has considered the resolution introduced by Dr. Irwin F. Siris, of Kings, and we found it advisable to make certain minor changes in the construction of the resolution which do not affect its intent so that it now reads as follows:

"WHEREAS, osteopathy is a system of treating disease wherein drugs are not used or surgery with instruments performed, and

"WHEREAS there is a bill—Milmoee Assembly Introductory No. 1428—which has passed the Assembly and which would permit osteopathic physicians to use drugs, antiseptics and biological products and perform minor surgical procedures and

"WHEREAS the bill is indefinite in its construction and we believe impossible of administration therefore be it

"Resolved that the House of Delegates of the Medical Society of the State of New York hereby express its concern for the public welfare and the standards of medical education—should this bill become a law be it further

"Resolved that this House of Delegates communicate its concern to the Committee on Education of the Senate and inform them of the dangers of permitting the use of drugs, antiseptics and biological products and the performance of minor surgical procedures by unqualified or inexperienced men who have not had the educational requirements required by the Regents of the State of New York for those who prescribe drugs and perform minor surgery Be it further

Resolved that the Medical Society of the State of New York go on record as being unalterably opposed to this Osteopathic Bill be it further

Resolved that copies of this resolution be telegraphed to Roy M. Page, Chairman, Committee on Education and to Senator Joseph Hanley and John Dunnigan—Majority and Minority leaders respectively of the State Senate and that the telegrams be confirmed by letters by our State Secretary, Dr. Irving

We recommend the adoption of this resolution as amended

I so move

The motion was seconded

DR. JAMES F. ROONEY I think this is a most important thing. We have been dealing with this question year after year for the last twenty-five years. Much to-do was made at the Legislative hearings concerning the present qualifications of osteopaths that they have to pass the same examinations as the regular physician, that they have to follow the same course of study and that therefore they are just as well qualified as the regular physicians to do any thing within the field of medical service. As a

matter of fact gentlemen when this law was first passed it was signed by the present Chief Justice of the Supreme Court of the United States when he was Governor. There were licensed by fiat approximately 470 osteopaths who had if anything worse training than the present chiropractor. Since they have been required to take an examination for licensure to the best of my recollection there have been less than forty licensed by examination.

What this bill will do will be to admit the forty licensed by examination whose standards are not equal to those which we require and who have come in since the requirement for examination was made valid but we will license the approximately 418 still remaining who had an educational value of approximately four and one half to five months of our first year course of medical study.

One thing further—the moment we do this we open the doors again for the demand of the chiropractors to do the same thing. Then we have the naturopaths and we have any number of quacks who will have a precedent to demand licensure upon the same basis as those which the Legislature may now grant to the osteopath.

I feel that not alone should we approve of this resolution but that if this thing does pass the Senate—and I am inclined to believe it will pass the Senate because the support of this bill has not come from the osteopaths alone or their patients, but there have been a very large number of individuals in the state government who not only this past year but every year for the last twenty have favored doing it and many of those are in the Education Department—let us at least stand up and be men for the public good (Applause)

DR. SAMUEL B. BURK New York Mr Chairman and Gentlemen I have just listened with interest to the discussion of Dr. Rooney and I would like to know the attitude of the Board of Regents on this subject if we are able to get some word from them.

SPEAKER FLYNN Would you like to talk to that Dr. Madill?

DR. GRANT C. MADILL Mr Speaker and Members of the House of Delegates the first year that I became a member of the Board of Regents a bill similar to this was introduced. At that time there was a thorough discussion of the bill and further than that a thorough discussion of the whole subject of permitting the osteopaths to carry on any practice except that specified by the law under which they were licensed.

As a result of that discussion—and it has been continued since—the Regents approved of the policy of having one standard for all those who made application for the practice of the medical arts in this state. We felt that they should have the same premedical education that they should have the license when they had acquired sufficient knowledge to increase their practice.

There are now in this state practicing osteopathy between 400 to 500. There are 24,000 registered physicians in the State of New York. This bill has one objection which is probably the most important objection and that is in the matter of the definition of minor surgery. It is true that the Regents and many lay people feel that

inasmuch as this group of practitioners are required to take exactly the same examinations as the graduates of our regular registered medical schools in this state, they are entitled to some consideration, as they must know something about surgery.

In this bill minor surgery is mentioned, and I agree that it is impossible to definitely say what minor surgery is.

The first thing that the Regents did in the way of arriving at some definite standard for the education of those wishing to practice the medical arts of this state was to pass a rule that the osteopaths should take the same premedical course and training that the regular medical students took. That was passed, and that is now a law. We had an idea that that would perhaps stop this short cut of those who wished to practice medicine by shortening the period of time. This was rather a blow to some of the schools of osteopathy, and one of those schools, the one in Philadelphia, accepted the situation, and has complied with the rules that have been adopted by the Education Department of the State.

This matter of doing surgery, and the amount of training they have had, and their knowledge of drugs are important.

I think so far as the surgery is concerned, about the same rules and the same conscience that controls the surgery of the recent graduate in medicine in the regular schools applies to the osteopath. Those who graduate in medicine in our regular registered schools are privileged to practice anything from ophthalmology to proctology. Whether they will do surgery without an internship, without experience, or without surgical judgment, depends upon the conscience of the man. The same applies to the osteopath, and I might say that I have had, and the Regents have had, many letters from the older school of osteopaths who are most positively opposed to any expansion of the privileges of this school.

The history of medicine, so far as its being retroactive is concerned, is pretty definitely in favor of granting a privilege to those who have already rights in the matter of the practice of the profession. When I graduated in medicine, all that was required after graduating and receiving a diploma from the medical school was to present this diploma to the county clerk and register. There was plenty of opposition to that. There were many who objected that a waiver was established, and those who had been in the practice of medicine for a certain length of time were not deprived of rights which they had. Then the next move that was made in law legalizing and qualifying men to practice medicine was the examination, the establishment of a state board of examiners, and those who had been in practice for a certain length of time came under the waiver. They could not be deprived of their rights because of any new law that had passed requiring them to take examinations, and so it has gone on down. All of these improvements have come from within the medical profession, the matter of elevating the medical profession.

I think that the school of osteopathy is anxious to improve its standards and to merge itself into the regular school for the practice of medicine.

We had exactly the same problem to deal with in connection with Hahnemannism, when the homeopaths came in. They have gradually disappeared and now no one thinks of any difference in the status of a graduate of a homeopathic college and one from a regular recognized school of medicine.

It seems to me that if we will give and take, be patient just a little, by a process of evolution we can now soon reach a standard so that every one who wishes to practice medicine will comply with the same standards.

We had no hesitation in disposing of the chiropractic bill when it came before us for our opinion. All we are asked to do as a Board of Regents is to give our opinion as to this bill or that bill, and we had no hesitation whatever in pointing out the fantasy of the system of chiropractic, and that is ended—I feel that that is ended.

These gentlemen who are practicing this school that we are opposing is one that has made its position pretty clear. They are represented in the Board of Examiners. I talked with one of the Medical Board of Examiners today about the papers that he reviewed, the examination papers. He said that he did not know who was an osteopathic student or graduate or who was a regular medical school graduate, and so it is with all the examinations that come before this board.

I think that inasmuch as these men, this small band—there are only a few of them that I think will indulge in the practice of surgery, as a matter of fact we have to have a good deal of faith in some of our recent graduates in medicine who have no experience when they are turned out to practice anything, including surgery—they are represented on the Board of Examiners, they are represented on the Grievance Committee, and I may say for the ethics of these men that not a single man has been brought before the Grievance Committee for consideration of any infraction of the law that limits their practice. On the other hand, we have a band of outlaws practicing medicine, and we cannot stop them. We cannot convict them, and they can practice almost anything and when they are brought for trial before a jury they are acquitted. There have been one or two cases that have been convicted in the Court of Special Sessions in New York City, but in the most flagrant violations of the law in the practice of medicine when they have come before the juries they have been acquitted. These men could do the same thing. An osteopath could amputate a toe and nothing would be done about it. Suppose he amputated a toe, and he is brought before the Committee, and suppose he is then brought before a jury, what chance would there be of convicting him?

These men I am convinced are anxious to elevate their standard. I think they have complied with the rules and regulations inasmuch as they have not violated the law that we have been able to ascertain. They have strictly complied with the law, and I am in favor of reaching a point in the practice of medicine in this state so that they will all comply and come in through the practice of medicine in this great profession just under one standard.

SPEAKER FLYNN Is there any further discussion?

DR. RICHARD H. SHERWOOD *Niagara* With the fullest respect to the person and sentiments of our last speaker I would like to recite the experience we had in Niagara County with legislators heretofore sympathetic with medicine. We were much astonished to hear from our Legislative Committee at the last moment the day before the bill was passed and referred to the Committee on Education of the Senate I believe, that one of them, an attorney, was in favor of licensing the osteopaths. Eleven of us called him in a period of two or three hours during a Sunday afternoon when he was trying to digest his Sunday dinner and perhaps not in the best shape to cope with us. We thought we had rather the best of the argument. However he voted the other way.

He raised the point, which I think the resolution makes vulnerable, and that is that the osteopaths have fulfilled the educational requirements that the doctors fulfill but he was unable to refute, even though he was a lawyer my contention that the osteopaths were in sincere in that they privately repudiate to the public that for which they request public license by the Department of Education of the state.

I called to his attention as an illustration a schoolmate of mine who prior to 1910 as a hobby used to take examinations in different subjects, and he accumulated twice as many points as were necessary to graduate from high school. He merely boned up on the subject and went in and took the examinations and passed them. I cited that as an illustration of how easy it is for people of modest intellectual attainments to pass our examinations. We have had enough such in our own profession. We have found out after they were licensed of their apparently insufficient ability to practice medicine but their sufficient ability to pass examinations.

I think we should broaden the base of our objection to this bill. It is timely. It is before this committee, as I understand it. We should emphasize the fact of their insincerity in not believing the tenets of the various sciences upon which our practice rests. It seems certainly insincere to say the least that they become licensed to practice something in which they do not believe. I think, perhaps, if I made any point whatsoever with this attorney it was when I put my question whether he thought a man who did not believe in the law should be licensed to practice law because he could pass the examinations.

The second point is that it is not a recognized science and I think on those two bases rather than for the reason that they lack educational qualifications we may properly protest their license by the State Department of Education, which in effect would thereby be giving face to something which for years we have thought had no face.

I would like to suggest that this resolution be referred back to a committee for a rewording of the language upon which the House of Delegates may object to this law if it sees fit.

Thank you!

DR. ARTHUR S. DRISCOLL, *Richmond* I agree with Dr. Rooney. I think we lose sight of the fact that a smokescreen is being thrown around this whole thing. These men twenty-five or thirty years ago applied for a license in

the State of New York to do what? To practice osteopathy? Why? Because osteopathy was going to be the saviour of the world. They were going to manipulate and adjust people and cure everything. After their qualifications have been brought up to a certain point, now they come in and they want to practice medicine. Why even talk about that? Even if their qualifications were twice as high as those of a doctor, they should be kept in their field and that is to practice osteopathy and not medicine (Applause).

DR. JOHN J. BUETTNER *Onondaga* Mr. Speaker and Members of the House of Delegates I want to reiterate what Dr. Driscoll has said. When we consider that these men were licensed to practice osteopathy when we consider that there are only 400 of them in the state, and during the last twenty-five years only forty more have been admitted and the fact that at this time they are admitting they were wrong in their original contentions and in order to cure people they must now resort to drugs or minor surgery I feel we have a big point there in opposing this bill. I do not think we ought to allow them to go ahead, irrespective of what their educational qualifications are. They are admitting that they were wrong, and I feel that if they had the conviction of what they started out with we would have had a greater number of osteopaths who would have applied for examination and for entrance into the medical field. Evidently the small number is due to the fact that they appreciate in order to meet demands and to cure people they must follow the science of medicine and as such they are going into medicine rather than into osteopathy. I feel that this resolution should prevail and that the Medical Society should go on record as opposing this bill.

SPEAKER FLYNN There is a motion to recommit made by Dr. Sherwood.

The motion was seconded.

SPEAKER FLYNN Is there any debate on the recommitment?

DR. JAMES F. ROONEY I see no reason why we should recommit this bill. I think it would be very unwise in any way with the Educational Committee of the Senate to use personal terms like insincerity. We all know that it is insincere, and I wish that I could take you back with me to the first hearing that they had before the Senate Education Committee before they were licensed by Governor Hughes, who signed the bill by the Legislature of that time. I just want to relate this instance because we are talking about educational requirements that they are meeting that they want to really be good boys, they want to join the real medical profession, and they want to raise themselves by their bootstraps. The Dean of the Osteopathic School in St. Louis appeared before this hearing to tell how osteopathy cured disease. He was asked a question, as to whether he believed in the germ theory of disease. He said That is a figment of the imagination. Germs are nothing but scavengers. I asked him the question as to whether he believed in the use of diphtheria antitoxin for a child with diphtheria. He said there was not any such disease as diphtheria that diphtheria was merely a foul thing coming into the throat as a result of disturbance of the

relationship between the seventh cervical vertebra and the first dorsal, and that serum was not alone unnecessary but was dangerous and poisonous, and that the reason children died with diphtheria was because they were given serum

The Chairman of that Education Committee was old Senator Brackett, of Saratoga, one of the most brilliant minds that the Legislature has ever had. Brackett began to frown. Before that he was for them. He came down from the Lieutenant-Governor's desk, and as he came down the steps he said these words, "The damn fools have cut their own throat."

Now, gentlemen, the men who were licensed three years afterward are the same ones about whom Brackett made that statement. The point of fact is that the chiropractor exists today simply because the osteopaths raised their standards, so the chiropractors adopted parts of their doctrine and magnified them and gave a short, easy course of six to eight months, which was before what the osteopaths gave before the state began to register them.

I regret very much to differ with my good friend, Dr. Madill. Much as I regret it, I still differ with him. I regret to hear him say the words "lawless members of the medical profession" spoken in an assembly such as this. I know of no way by which lawless members of the medical profession cannot be reached and are not being reached. (Applause) I will say further that the number of lawless medical physicians in this state and in this union are infinitely lower than those of any other profession, with the exception of the clergy—and I am not so sure we will exclude those either. (Laughter) The mere fact that out of 480 osteopaths nobody has ever come up before the Medical Grievance Committee does not mean anything in the way of argument to me, as against 40 or 50 a year, or 60 or 100, out of 16,000 physicians.

There is one further thing, now that this subject is germane—we have got to do something about the Medical Grievance Committee. We have got to do something to find out what is being done in relation to their recommendations, but that is another topic that I hope I have an opportunity to speak to you about later.

This whole thing has arisen because these men want to do work for which they are not trained. When the argument is made that they have to pass the same examination, and that we have medical student graduates who perhaps are not completely fit to do major surgery, I say I will take my chances on being operated by the last graduate of a Class "A" medical school who has been properly taught, who has been watched throughout his whole course in his last two clinical years, who has had an opportunity to do some assistant work, at least coming in contact with surgical patients, as against an osteopath who can pass the examination but who has never been in a hospital where modern surgery is practiced. (Applause)

We are not talking alone about surgery. What about drugs? What about these potent drugs that have just been given to us in the last year and a half to two years? What about serum? What about allergy? What about medicine? What about diphtheria? What about all the rest of the infectious diseases? What about smallpox? They do not believe in

them. It is absolutely a violation of the tenets of their religion. (Laughter) One might just as well talk about licensing the clergy because these quack things are cults, they are not science.

I think Dr. Madill will grant you there is only one school in the United States, one osteopathic school today whose students are even admitted to examination in the State of New York.

There is this last thing that you should keep in mind: there were 480-odd osteopaths licensed by fiat of the Legislature with less than one and one-half years' training in punching backs, 40-odd licensed by examination with some kind of training gradually increasing—but only gradually increasing. Do you want to give them the power to prescribe potent remedies and to operate upon the public of the State of New York?

SPEAKER FLYNN: Discussion is on the recommitment.

DR. SAMUEL B. BURK, New York: Mr. Speaker and Ladies and Gentlemen, I have a lot of respect for the answer to my question as given by a member of the Board of Regents, but I want every man here to consider that from time immemorial we have not been worrying about what the doctors do or what they do not do except insofar as it affects the health and welfare of the community. That is our problem. Can we, as medical men, give approval to the acts of these men who are supposed to be able to do surgery, to do vaccines, to use antiseptics, to use anesthetics, and to experiment on the public, when we know that they are not so qualified, both from their training and from their beliefs? Gentlemen, please consider that phase of the matter.

It seems to me that we are all in accord with the ideas as propounded by Dr. Rooney and as propounded by some of the other speakers. What we want is action. When you speak to a legislator as to what is going on, he will tell you that he received a half dozen cards from the doctors and possibly several hundred, or it may even run to several thousand, from the other side. This bill is still before the Senate, and you still can do some real missionary work, if you will take it upon yourselves to carry out the suggestion that I have just recommended.

How few lawyers would agree that a notary public, irrespective of what his education is, can go into court and try a law suit? Is there any difference in the comparison? These men have not had the training, they have not had the experience, yet they are willing to experiment and learn on their patients.

DR. BENJAMIN JABLONS, New York: I should like to recite an experience that I had that lends added weight and point to Dr. Rooney's remarks. A number of years ago I was asked to see a patient as a result of an emergency call in the office of an osteopathic physician. After I had completed my mission, this osteopathic physician showed me with great pride a cage of copper wire and an instrument with gadgets which related to the Abrams' electronic diagnostic machine that some of you may recall. I was amazed when I was informed that there were at least ten osteopathic physicians in the City of New York who had these gadgets in

this type of cage. If anybody who had not been licensed to practice medicine, osteopathic or otherwise had attempted to diagnose disease by this type of apparatus the laws of the State of New York could have reached him but this illustrates what happens when you license people to practice even a cult.

SPEAKER FLYNN Discussion is on the recommitment.

DR. RICHARD H. SHERWOOD I rise to a point of information. My recollection is that I simply made a suggestion and not a motion to recommit. The point upon which I desire information for the House and myself is the language of the words of the objection which is going to be transmitted to the Legislature. If the last speaker or whoever introduced the resolution would read that language for our information I should appreciate it.

(Dr. Sherwood was handed a copy of the resolution.)

DR. SHERWOOD I will read that portion of the resolution to which I referred.

Resolved that this House of Delegates communicate its concern to the Committee on Education of the Senate and inform them of the dangers of permitting the use of drugs antiseptics, and biological products and the performance of minor surgical procedures by unqualified or inexperienced men who have not had the educational requirements required by the Regents of the State of New York for those who prescribe drugs and perform minor surgery.

I move you that this resolution be recommitted for changes or additions to the language in that paragraph just read.

SPEAKER FLYNN The debate is still on the recommitment.

DR. WILLIAM M. PATTERSON *New York* Why cannot what has just been said be written down and let us all sign it and send it to the Legislature right now?

DR. RICHARD H. SHERWOOD The reason I want this amplified is that the legislators in our district say that the educational requirements have been met so if this House again states that the educational requirements have not been met we will not be making any new point but covering the whole of the argument. Our point is refuted by the statement of Dr. Madill that they have met the educational requirements, and it is for that reason that I have moved that the language be added to or changed to provide a broader base upon which this House of Delegates may rest its opposition to the enactment of the law at this time.

DR. GRANT MADILL My statement was that they had met the pre-educational requirements. That was the extent of it.

SPEAKER FLYNN The debate is on the question of the recommitment.

DR. JAMES F. ROONEY The fact is that there are only forty of them who have met the educational requirements because when this bill went into effect to license them by fiat there were 480-odd licensed without any educational requirements whatsoever.

DR. JOHN J. MASTERSON *Kings* The reason Kings County when they introduced this resolution did not go into all the reasons or arguments as to why the osteopaths should not

be licensed, was because we had some consideration for your time. We felt that if this bill were passed by the Senate and went before the Governor for signature, we would then have an opportunity to present our arguments *in toto*. Therefore I do not think that anything can be gained at this time by resubmitting the resolution as presented by Kings County and I hope our colleague from Niagara will withdraw his recommendation that it be recommitted because all the arguments that he has presented may be presented later on if we do not kill the bill in the Senate.

The question was called for and the motion was put to a vote and was defeated.

SPEAKER FLYNN The motion is lost and the motion now before the house is on the adoption of the report of the Reference Committee. Is there any discussion?

DR. JAMES F. ROONEY I dislike to take up the time of the House, but I think this is an extraordinarily important affair. This matter may come up for action tonight. It only passes the lower house by a very few votes.

CORRUS One.

DR. ROONEY One vote. It will probably pass the Senate unless we put our protest in now. That protest should be worded very definitely that the medical profession of the State of New York opposes this bill on the basis of the fact that it will license completely to practice medicine in all of its phases except perhaps major surgery—and as Dr. Madill has said he could not and I do not think anybody can define what minor surgery is—men, over 80 per cent of whom have had no prior training in any of the essential arts of medicine.

The question was called for and the motion was put to a vote and it was unanimously carried.

53 Report of Reference Committee on New Business C on Physicians' Home, Inc.

Section 17

DR. FLOYD J. ATWELL Your Committee has considered the resolution introduced by the Council which reads as follows:

WHEREAS the Physicians Home Inc. has formally asked the Medical Society of the State of New York to nominate a number of physicians for appointment to its Board of Directors and

'WHEREAS, the Physicians Home was incorporated with an endowment by bequest for the following purposes, (a) to create and maintain in the State of New York a home for aged indigent physicians and their wives or widows and to give assistance, financial or otherwise to such physicians and their wives and widows and orphans and needy minor children of physicians and (b) to do all things necessary suitable and proper to accomplish and further the purposes described in (a) above, and particularly to receive and acquire by grant gift, purchase devise bequest or otherwise property of all kinds and to hold maintain invest, accumulate, and dispose thereof or the income therefrom for said purposes all in the manner prescribed or permitted by applicable law and

"WHEREAS, the Home is at present caring for five aged physicians who are without funds, and

"WHEREAS, nominations to its Board of Directors would in no way make the Medical Society of the State of New York responsible for the conduct of this work, financially or otherwise, and

"WHEREAS, the objectives of the Home are highly meritorious, therefore be it

"Resolved that the House of Delegates of the Medical Society of the State of New York accede to the request of the Physicians' Home, Incorporated, for nominations to its Board of Directors, and be it further

"Resolved that the House of Delegates instruct the Council to make nominations for the Board of Directors of the Physicians' Home, Incorporated, when sought "

We recommend the adoption of this resolution.

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried

56 Report of Reference Committee C on New York State Library

Section 28

DR. FLOYD J. ATWELL The only other matter I have is not a resolution, but a telegram

[To be continued in the next issue]

from Joseph Gavit to Dr. Joseph S. Lawrence, Hotel Syracuse, reading

"Please call Society's attention to fact that proposed 15 per cent cut in already insufficient appropriation for state library means drastic cut in service to physicians because of reduced staff and purchase fund. Prompt protest to Senator Thompson would be appreciated here."

In view of our present lack of detailed information in regard to the budget, your Committee deems it inadvisable to take any action on this request at the present time

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried

57 Report of Reference Committee on Report of Council—Part V—Revision of the Principles of Professional Conduct

DR. HOMER J. KNICKERBOCKER We recommend the Committee on the Revision of the Principles of Professional Conduct be continued, as requested

I so move.

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried

SPEAKER FLYNN We will now recess until 8 00 P M

The session recessed at 5 25 P M.

NEW CANCER TREATMENT

A treatment of cancer which has been successful in causing 100 per cent disappearance of malignant tumors in mice and which gives promise of being successful in treating human cases in which the tumor can be reached from the surface, was reported to the National Academy of Sciences at the final scientific session of its annual meeting in Washington on April 25

The treatment was reported by Dr. G. Failla and Dr. K. Sugiura, of Memorial Hospital, New York, who were introduced to the academy by Professor Harold C. Urey, of Columbia University. The paper, read by Dr. Failla, created considerable discussion

The treatment consists of injecting distilled water into the tumor, plus x-ray treatments, which need be only half the dosage formerly given in treatments

The treatment thus far has been applied only to animals but these tests have been so successful that it probably will be only a brief time before the treatment can be extended to human cases. All that Dr. Failla would say was that "it is logical to expect that the results we have achieved

with animals can also be achieved in human cases "

In testing his theory Dr. Failla used mice in which he transplanted a type of cancer tissue known as carcinoma 180, which is always fatal unless treated with x-rays or radium

When he injected water into the tumors, Dr. Failla informed the academy members, the tumors became radiosensitive and their tissues were destroyed with half the dosage of x-rays ordinarily required

Several groups of mice were used in the tests. In one group x-rays alone were applied to the cancers and in another the same amount of x-rays plus the injection of distilled water

When 500 roentgens were given alone the tumors regressed, or grew smaller, to the extent of 2 per cent, but in the group that received the water treatment in addition, the tumors regressed 30 per cent

A dose of 750 roentgens to the group receiving x-rays alone showed a 50 per cent regression, but in the group that received the water injections in addition, the tumors disappeared

The Professional Club

of the

Medical and Public Health Building
of the New York World's Fair

PHYSICIANS, public health workers, medical scientists, and other professionals visiting the New York World's Fair 1939, will find reserved for their exclusive use the Professional Club. Here members of the nation's professional health, medical, dental, and nursing associations have a place to meet their colleagues in quiet, congenial surroundings.

Unique to this or any other World's Fair, the club occupies an area of 5,000 square feet on the main floor of the Medical and Public Health Building, which is located on the Theme Plaza, its main entrance being directly opposite the Helicline leading around the Perisphere to the Trylon, where much of importance takes place daily.

The visitor will find awaiting him a comfortable lounge, attractively decorated and furnished, a bar and a snack bar, checking facilities, rest rooms, stenographic service, telephones, and other conveniences of a private club.

Membership in the club is limited to accredited members of the medical and public health and allied professions and to representatives of exhibit sponsors. Professional members pay no dues, but there is a small certification charge to cover the cost of validating credentials. Among the organizations whose membership cards entitle their owners to admittance to and use of the Club are

American Dental Association
American Dental Hygienists Association
American Dietetic Association
American Hospital Association
American Medical Association
American Medical Library Association
American Nurses Association
American Pharmaceutical Association
American Public Health Association

American Veterinary Medical Association

Army and Navy Physicians, Surgeons, and Dentists

Association of Women in Public Health

Catholic Hospital Association

National League of Nursing Education

National Organization for Public Health Nursing

New York Academy of Medicine

Pan-American Medical Association, Inc.

United States Department of Agriculture—Bureau of Animal Industry

United States Public Health Service

PRODUCTS of manufacturers sponsoring scientific and educational exhibits in the Medical and Public Health Building are on display in showcases set artistically into the walls of the lounge. The club serves as a place where these and other sponsors of exhibits in the main exhibition halls may meet members of the medical and allied professions under pleasant circumstances.

The Medical and Public Health Exhibit, being both scientific and educational, comprises probably the largest single enterprise of its kind heretofore undertaken specifically for adult health education. The exhibit is in two sections. A vast Hall of Man, which sets forth in unique fashion essential information on human anatomy and physiology, is under the sponsorship of the American Museum of Health, with generous assistance from a number of philanthropic foundations and public spirited life insurance companies and commercial institutions.

The list of organizations whose participation in the Hall of Man entitles them to representation in the Professional Club includes

The American Museum of Health, Inc
 The Oberlaender Trust
 Carnegie Corporation of New York
 Aetna Life Insurance Company
 Connecticut General Life Insurance Company
 The Connecticut Mutual Life Insurance Company
 The Guardian Life Insurance Company of America
 John Hancock Mutual Life Insurance Company
 Metropolitan Life Insurance Company
 New York Life Insurance Company
 The Travelers Insurance Company

Adjoining the Hall of Man is the Hall of Medical Science and Public Health—an outstanding collection of exhibits on such subjects as tuberculosis, pneumonia, syphilis, maternity, and child health. One of its high spots is the famed Carrel-Lindbergh artificial heart. Each of these exhibits is sponsored by a separate organization, whose representatives are eligible to club membership. The complete list of sponsors of exhibits in this Hall includes

American Medical Association
 American Museum of Health, Inc
 American Public Health Association
 American Social Hygiene Association
 American Veterinary Medical Association
 The Dental Society of the State of New York
 Maternity Center Association
 Medical Society of the County of Queens, Inc
 National Committee for Mental Hygiene
 New York City Cancer Committee
 The New York Institute for the Education of the Blind
 J B Pierce Foundation
 Queensboro Tuberculosis and Health Association
 Rockefeller Foundation
 W A Baum and Company
 The Bayer Company
 Becton, Dickinson and Company
 Cherry-Burrell Corporation

Ciba Pharmaceutical Products, Inc
 Eli Lilly and Company
 Lederle Laboratories, Inc
 Mead Johnson and Company
 Parke, Davis and Company
 E R Squibb and Sons
 West Disinfecting Company, Inc
 Winthrop Chemical Company, Inc.

Local physicians, public health workers, and allied professionals will use the club to entertain out-of-town guests brought here by the many meetings of national and international groups to be held in New York during the Fair. Members of the International Congress of Microbiology meeting in September, 1939, to use one example, may turn to the club not only for information regarding the medical and public health resources in and about the city, but for guidance in seeking authoritative local sources of information on the latest developments in technical aspects of their specialized fields.

Management of the club is vested in a board of directors which includes officers of the county medical societies of the five boroughs constituting the City of New York and of adjacent Westchester and Nassau counties. It is a nonprofit membership organization, incorporated under the laws of New York State.

The officers of the club are Dr James R Reuling, Jr, president, Dr Edward R Cunniffe, vice-president, Dr Matthias Nicoll, vice-president, Dr B Wallace Hamilton, treasurer, and Mrs Wilhelmina Rayne Walsh, secretary.

The membership of the board of directors includes, in addition to the officers, Dr Alfred Hellman, chairman, Dr John Bauer, vice-chairman, Dr Earle Brown, Dr Joseph Eller, Mr Franklyn Fischer, Dr Harvey B Matthews, Dr Frederick Schwerd, Dr J Peter Hoguet, Dr Chas Gordon Heyd, and Dr Russell W Tench.

The club has its own private entrance, leading from the garden court of the Medical and Public Health Building into surroundings which combine an intensely modern atmosphere with the bizarre

Designed and executed by Miss Francine Baehr, mural painter and stage designer of New York, the rooms illustrate that decoration may be combined with utility. In the main lounge, to use one example, the continuous lighted row of display cases set into the wall is made an effective feature of the decorative scheme. Topping the sixteen foot wall next to the ceiling is an uninterrupted band of corrugated mirror. Color and the absence of corners give a feeling of space. The focal point of the room is an adjoining curved wall containing a mirror from floor to ceiling, winged by lighted glass blocks. One of the original features of this wall is the mural of medicomicroscopic derivation in a surreal mood. In the curved arc on either side of this wall are two large ottomans surrounding white palms, in which flood lights are hidden.

Entering the Chess Bar, the visitor finds himself on a huge chessboard of red and black. He may go either to the leopard-covered seats around the wall, where he is served on a chess-castle table or to a white chessman seat and sip his drink at the bar. He may not forget that this is a club for professions allied with medicine, for apothecary jar lamps

light the bar, and a mural showing animals taking their turn at vivisectioning men of research adorns the back bar.

The Algerian influence which pervades the cocktail lounge at the left of the Chess Bar is suggested by two large black pineapple plants and a rolling strip-screen at the entrance to this room. Here Miss Baehr has decorated lemon yellow walls with black tropical palms and imaginative forms to give a modern North African atmosphere. A black lacquered mirror at the far end of an adjoining alcove gives the impression of night. Two black lamps, of an original design of African grotesque figures, feature the lighting arrangement. A white floor serves to accentuate the furnishings.

The room one enters from the other side of the bar is in great contrast to the others, and yet ties up to the unique impression. The floor is also white but the furniture, created and built especially for this room is jade green. An original decorative design of artificial, brilliantly lacquered fruit runs the circumference of this room. This divides the wall coloring, which is silver up to five feet and black to the ceiling. Black lighted tables are thrown in striking relief by the white floor and chartreuse ceiling.

ARTIFICIAL FEVER OF VALUE IN TEN DISEASES

Although the treatment of more than fifty diseases by means of artificial fever has been tried its value has been proved in only about ten diseases. Dr. Frank H. Krusen and Dr. Earl C. Elkins, of Rochester, Minnesota, report in the *J.A.M.A.* for April 29.

Pointing out that fever therapy is probably of little or no value in the treatment of many diseases the authors add that in some it may even be hazardous.

Studies they explain seem to indicate that the chief usefulness of fever induced by physical means lies in the treatment of gonorrhea, both acute and chronic and its complications such as arthritis, prostatitis, ulcers, urethritis and others. It would appear that artificial fever may be of value in syphilis, particularly when combined with drug treatment. While artificial fever may be helpful in intractable bronchial asthma and in selected

cases of chronic infectious arthritis, chorea and undulant fever the clinical data are not sufficient to permit any final conclusions. Its value in about forty other diseases remains to be proved.

Continued study has emphasized that production of fever by physical means is strictly a hospital procedure, that it is essential that a well trained personnel be in complete charge that skilled nurse technicians administer the treatments, and that a physician be in constant attendance.

Patients to be treated by fever should be selected with as much care as those who are to undergo major surgical operations. The dangers of artificial fever such as hemorrhage and sudden death are extremely rare when the treatment is in the hands of a competent, well organized group.

Across the Desk

Bagging Beauty's Booty

IN JUST a few days now, on June 25, to be exact, a big change will come over the old corner drug store

New labels will adorn the beauty lotions and the old household remedies familiar since grandma's time. For on June 25 the new Food, Drug, and Cosmetic Law goes into force, except for some provisions postponed to January 1, and all drugs and cosmetics must display prominently the list of their ingredients and instructions for safe use or dosage.

All "new drugs" must have the approval of the Secretary of Agriculture before they can be sold to the general public, even on a physician's prescription. And reports from Washington say the new preparations are coming in at the rate of two a day. Hundreds are awaiting the official tests made to find if their claims are reliable and if they have any poisonous or deleterious effects in the dosages recommended.

In the 163rd year of the Republic we are at long last to try to stop grasping patent-medicine profiteers from infiltrating noxious mixtures into the systems of our people. Undoubtedly a wide-awake country

Protect Our Hebes and Shebas

And we are going to do more than that, now that we are off to a good start. The millions of our fair sex who gaze with envy at the pulchritude of the movie stars and hopefully touch up their faces, lips, nails, and rippling tresses with this and that, advertised to transform them as if by magic into Shebas and Hebes, are to be protected from pestiferous preparations that eat the skin, blind the eyes, and ruin the health.

At this moment a goodly number of rats are running around in cages in the Washington laboratories of the Food and Drug Administration, dyed with weird combinations of colors. They are the "guinea pigs" of American feminine

beauty. Patches of their fur are shaved off and the dyes found in lipstick, rouge, and nail polish are applied, to find if there is any poisonous reaction.

Millions and perhaps billions in golden booty are rolling into the coffers of the cosmetic manufacturers from our daughters of Eve who flutter up longingly toward beauty, and clearly the least we can do is to see that their looks are not marred or ruined by their fine attempt to besprinkle America, like the Turk's paradise, with the hours of dreamland.

It's Bewildering

A bewildering array of aids confronts my lady when she decides to be beautiful or bankrupt. She can buy scores of soaps, face creams, make-up materials, deodorants, powders, hair dyes, skin-tighteners, pore-cleansers, vitamin creams, skin peels, skin foods, and facial packs. Once "cold cream" was enough for a dozen uses—but not now. The masterminds of the cosmetic industry have seen to that. Now fair femininity must have tissue creams, cleansing creams, liquefying creams, bleaching creams, sun-tan creams, turtle-oil creams, vitamin creams, wrinkle creams, depilatory creams, skin foods, texture creams, massage creams, "youthifying" creams, and probably several more appearing while this page is going through the press.

True, most of them are harmless, being nothing in the world but vaseline, mineral oil, or wax, or a combination, with perfume, and perhaps boric acid or an astringent like zinc oxide. When milady pays \$25 for two ounces, she is paying for the advertising, the fancy box, the oriental rugs on the floor, the rent of the beauty parlor, the salary of the well-named "skin specialist," and the proprietor's vacation on the Riviera. The same thing can be bought, as theatrical cold cream, for from 75 cents to \$1.50 a pound.

All, however, are not so innocuous, as is

pointed out in an entertaining book called *Health, Hygiene, and Hooy*, by Dr W W Bauer, Director of the Bureau of Health Education of the A. M. A. Creams and pastes for removal of hair have to be powerful enough to dissolve it, and if not used with enough care they may remove the skin, too, or cause ugly discolorations. In the same class are skin tightenors, astringent creams, and wrinkle creams. They are supposed to make the wrinkles vanish, but "they may actually make two wrinkles grow where one grew before." Worst of all are the "skin peels," containing caustic chemicals that take off the outer layers of the skin, sometimes causing bad inflammations of the tender lower layers thus left bare.

Bleaching creams, too, may be harmless (and useless) or powerful (and dangerous). A freckle-remover that really removes freckles is likely to take the hide along with the freckles. The sensible thing to do is to go to a physician skilled in such work, and risk no regrets.

Merchants of Illusion

Well, if the caustic pastes for hair removal are dangerous, then what method is safe? Only one, we are told by Dr Bauer. That method is electrolysis—the electric needle. It must be done by a skilled operator, and the process is tedious and costly, but he assures us that it is the only safe and permanent way.

Depilation by x-ray is permanent, but never justified, he says in italics, because the x-ray also makes permanent and unsightly changes in the skin and may cause cancers, although these effects may not appear for months or years. Unwanted hair, he recommends, may be removed from time to time harmlessly with a razor or rendered invisible by bleaching.

When in doubt about any cosmetic,

the best plan is to consult a doctor and avoid results that may be disastrous to beauty, instead of helpful. The advertisement is merely sales talk. A cosmetic manufacturer is reported to have said to a gathering of his business associates:

"Remember, we do not sell merchandise, we sell illusion."

Too Much of a Good Thing

Again, an example of too much of a good thing is seen in the attempt to overwork the current craze for vitamins. Undoubtedly a splendid aid for those who do not get them already in their daily food, they are being pushed indiscriminately upon everybody with such lurid claims that Dr Bauer simmers them all down to 'vum, wigor, and witamins.' You are to rub vitamins into your skin in a vitamin cream, chew them in chewing gum, suck them in cough drops, and, next week, perhaps, smell them in so-and-so's cologne. Some beauticians urge you to massage the skin with vitamin 'F,' which is now identified as part of the vitamin B complex. So 'the only present function of F in the vitamin alphabet is to part from his money the person whose name starts with the same letter.'

Underneath it all is the wish for 'charm.' If the woman needs it in her social life, the man, too, needs it in his business, only he calls it "personality." It can't be rubbed on the skin or poured on the hair. It comes with abounding health, balanced nerves, a clear brain, the feeling of power and *joie de vivre* that flows from bodily and mental well-being. These are not to be had at the beauty parlor. They arise naturally when the bodily activities are operating normally and harmoniously.

And there is one man to consult about that. The family physician.

W S W

"My dear," said the loving wife, the doctor says I must have a change of climate.

"Well cheer up," replied her fond spouse, spring will soon be here. —Exchange

Books

Books for review should be sent to the Book Review Department at 1313 Bedford Avenue, Brooklyn, N Y. Acknowledgment of receipt will be made in these columns and deemed sufficient notification. Selection for review will be based on merit and the interest to our readers.

REVIEWED

The International Medical Annual A Year Book of Treatment and Practitioner's Index, Edited by H. Letheby Tidy, M D and A. Rendle Short, M D. Octavo of 615 pages, illustrated. Baltimore, William Wood and Company, 1938. Cloth, \$6 00.

Brief summaries of the best of recent advances in surgery, medicine, and the specialties by some of the most prominent men in England again make this annual volume well worth scrutinizing. Stanley Davidson has a good section on purpura. His careful studies, as well as Witts', tend to show that the much-publicized treatment of purpura with snake venom and parenteral ascorbic acid has not been substantiated. "Blood transfusion," he says, "still remains the sheet anchor of medical treatment in all the hemorrhagic diseases." A. G. Gibson briefly reviews Parkinson and Hoyle's outstanding contribution to the study of so-called "emphysema heart." This paper, which appeared in the *Quarterly Journal of Medicine*, should be read in the original by all interested in internal medicine. Tudor Edwards has great praise for the treatment of lung abscess advocated by Neuhof and Touroff.

ANDREW M. BABEY

A Synopsis of Physiology By A. Rendle Short, M D and C. L. G. Pratt, M D. Third edition. Duodecimo of 325 pages, illustrated. Baltimore, William Wood and Company, 1938. Cloth, \$3 50.

This is the third edition since 1927. In looking through the twenty-six chapters, it is noted that the authors have brought the material up to date. The inclusion of chapters on endocrine glands, metabolism, diet and growth, and on the brain, is sufficient proof that the latest advances in physiology have been incorporated.

MORRIS ANT

The Harvey Lectures Delivered under the auspices of The Harvey Society of New York. Series XXXIII. Octavo of 275 pages. Baltimore, The Williams & Wilkins Company, 1938. Cloth, \$4 00.

This group of lectures continues to maintain the customary high level of dissertations on the newer contributions to medicine by men who have themselves been actively engaged in making these contributions.

The lecture by Selig Hecht on "The Nature of the Visual Process" is concerned with the analysis of the physiologic properties of visual perception. The lecture by Einar Lundsgaard on "The Pasteur-Meyerhof Reaction in Muscle Metabolism" deals with the role of lactic acid formation in muscle contraction.

There is an important lecture by Cecil Drinker on "The Functional Significance of the Lymphatic System," in which he discusses the lymphatic circulation. Peters' lecture on "Transfers of Water and Solutes in the Body" represents a summary of much of his own work.

A lecture by Stanley on "The Isolation and Properties of Tobacco Mosaic and Other Virus Proteins" represents one of the most important fundamental contributions to medicine in the past few years. The author has succeeded in isolating and crystallizing the protein of tobacco mosaic virus and has demonstrated that, after establishing its purity by 15 recrystallizations, this substance still possesses the pathologic properties of virus and conforms to all the Koch postulates.

Harry Goldblatt's paper on "Experimental Hypertension Induced by Renal Ischemia" deals with a summary of his excellent work on the induction of hypertension by renal artery compression.

NUMBER 12

Editorial

Weak Foundation

The Administration's National Health Program and the Wagner National Health Bill draw their main support from the National Health Survey conducted by the United States Public Health Service. Whenever anyone questions the wisdom of governmental intervention in medical care on the unprecedented scale contemplated by the President and Senator Wagner, the latter point to the enormous amount of untreated illness supposed to have been disclosed by the National Health Survey. Does this survey really prove that a third of the nation is without necessary medical care? And were the methods and qualifications of its investigators such as to command unquestioning belief?

Let it be understood to start with that the National Health Survey presents the results not of standardized controlled medical investigation of the entire country but of a house-to-house canvass of 740,000 urban families and 36,000 rural families, representing less than 3,000,000 persons in all. The enumerators entrusted with the determination of chronic disease and physical impairment were lay workers taken from the relief rolls of the WPA. For their information they had to rely mainly on the replies to certain questions they were instructed to ask. The results of such a canvass can hardly be considered authoritative from the medical point of view.

Wholly apart from deliberate malingering, many of the answers must be taken with a grain of salt. The survey covered a period of eighteen months and people were asked to recall the number and duration of illnesses during that period. The possibility of error under these circumstances is obviously great, yet there is nothing to indicate that the government took steps to ascertain the percentage of probable error in the returns.

Other factors impel one to question the representativeness of the information garnered. For one thing, certain conclusions based on information from strictly urban areas are represented as applying to the entire country. For another, there is no token that the sample group is rightfully comparable to the rest of the population on the basis of income, occupation, age, sex, and marital status.

Apart from factual accuracy, however, the results of the National Health Survey are open to question on the grounds of bias. Throughout the published reports there is a definite tendency to paint as black a picture of the nation's health as possible. The interpretation of mortality rates is often at variance with the views of the outstanding vital statisticians of the country.

Naturally drastic remedies seem more palatable to the general public when the situation is made to appear very grave. This is not the scientific approach, however, nor is it conducive to a strictly accurate, honest report.

A Better Approach

A state health program that has taken months to formulate cannot be fully analyzed in one week. Nevertheless it is already apparent that the report of the Temporary State Health Commission, headed by Assemblyman Lee B. Mailler, differs in several important and beneficial respects from some of the underlying concepts of the National Health Program and the Wagner National Health Bill.

For one thing, the State Health Plan sponsored by the Mailler Commission recognizes that the medical profession, and more specifically the general practitioner, is the nucleus of most health work, whether public or private. To this end it urges expansion of the laboratory and hospital facilities available to the general practitioner and more opportunities for graduate medical education, particularly in the rural districts. It proposes that approved general hospitals reorient their role to give the family doctor "increased opportunity to treat cases that fall within his sphere of competence" and enable him to "make more effective use of modern therapeutic and diagnostic equipment."

On the important question of prepayment for medical care the stand of the Mailler Commission is liberal without recklessness. It urges "immediate revision of the insurance law to permit and encourage sound voluntary health insurance schemes." Recognizing that the medical profession must have strong reasons for its overwhelming opposition to compulsory insurance, it wisely defers this controversial issue for further study.

Many of our most important health problems are too complex to

be solved overnight. The Mailer Commission has had the courage and good sense to acknowledge this. Among the questions it recommends for further study, in addition to compulsory health insurance, are public provision for medical care, amendment of the Unemployment Insurance Law to provide sickness benefits, and the development of a school health program. In all these fields far more can be accomplished by far-reaching study and carefully controlled experimentation than by the hasty adoption of radical panaceas.

My Doctor

In these days when so many derogatory remarks are being directed against the doctor acting as an "individual" in the maintenance of the physical and mental health of the public, it is a comforting privilege to read the homely contribution of Bradley¹ on answers to the common questions of parents whose children are suffering from convulsive disorders. This vague and dreaded syndrome may be of no serious significance but in many instances it may be the result of a condition which will be present throughout life. In either event, it is only the individual family physician who can succeed in maintaining the mental stability of the parents.

To such questions as "Has my child epilepsy? Will my child outgrow his fits? Is this condition inherited? Will it harm other children to see my child having a fit?"—no casually interested panel doctor, government social worker, or compulsory health insurance administrator can give answers that will be reassuring to the mother and father. Even in the scientific investigation of convulsive disorders, the cut and dried routine must always be carried out in a hopeful spirit that is impossible under a regimented form of medical practice, which, because of the limitations imposed upon it, does not allow for the treating of the child patient *and his parents and close relatives* who, if not properly approached psychologically, will eventually suffer from the strain of mental stress and anguish.

Our proponents of regimented medicine have unfortunately disregarded "the art of medicine." They view medicine only in the light of its scientific accomplishments—its mastery of the epidemic diseases, its exalted advances in surgery. But the *individual* case of diphtheria, the *individual* case of a ruptured appendix, constitutes an *individual* problem for the patient *and his kin* which any form of regimented medicine does not take into account. And psychiatrists have proved that the establishment of a healthy mental status is extremely important in attaining a cure.

¹ Bradley C. Rhode Island Med. J. 31: 135 (1933)

Current Comment

"We are so violently opposed to it that we shall *strangle* the first person who proposes it—whatever his age or civil status! No profession can fight death with one hand and summon it with the other. With this attitude there can be no compromise! Let there be no doubt about *that* in anyone's mind!"—The *Westchester Medical Bulletin* recently, on the subject of euthanasia

. . .

"Medicine has an ancient and honorable tradition. Long experience has taught us that there are some things we may accept as certainties. It has taught us that altruism is a virtue. It has taught us also that improvement of one's professional capacity by painstaking study and research, research perhaps for a few and study for the great majority of us, is beyond peradventure in the interests of patients as well as ourselves. . . . Whether medicine can be practiced more satisfactorily under state subsidy and control is a much mooted question. Many feel that it cannot. They feel that change should be gradual and evolutionary rather than revolutionary. To them there is no greater menace than those who come forward with doctrinaire proposals for the solution of economic, social, or medical problems"—We have quoted the above from an editorial in the *Journal* of the Michigan State Medical Society

. . .

"One scarcely needs to point out that if the Society were interested primarily in creating work for doctors, the best thing it could do would be to 'pooh-pooh' the idea of health examinations and preventive services!

"But silly and unjust as this implication of self-interest is in itself, it is a symptom of a far graver disorder in the body politic—an endemic disease that we may call *paternalitis viridans*. For those who impugn the motives of organized medicine in its preventive programs

are the same who go about clamoring for state medicine for all. They are the lay workers who say to parents—"Why take your child to your own physician when you may just as well take him to the free clinic?" They are the lay workers who insist that the overburdened, underfinanced school medical services should carry the whole burden of child health work in the community.

"We discern, to our deep dismay, a rapidly increasing tendency on the part of parents to relegate to public agencies many responsibilities concerning their children, which by all the rules of time and reason belong solely to the parents themselves. We suppose that these parents would rise up and smite any long-haired visionary who proclaimed that all children are essentially the wards and property of the State, and that parents are entrusted with the rearing of their offspring only at the pleasure of the State! Yet we suggest that the attitude of many parents today with reference to the health supervision of their children is building a case for someone who in the not-too-distant future will proclaim the triumph of *paternalitis viridans*. We feel the tendency in that direction has gone quite far enough!"—Common sense and indignation in the May issue of the *Westchester Medical Bulletin*

. . .

"It has been known that physicians have been asked to call upon as many as one hundred cases in a day in government controlled medicine in one country.

"There are fourteen hundred and forty minutes in twenty-four hours. Allowing fifteen, which is too little in some instances, for each case, it makes a total of fifteen hundred minutes.

"Can the doctor give adequate treatment and an adequate examination under such working conditions? When can he eat and sleep?"—The *Bulletin* of the Bergen County Medical Society of New Jersey questions the situation

CESAREAN SECTION

Its Relation to Maternal Mortality

PAUL TITUS, M D , Pittsburgh, Pennsylvania

THE family physician who is a general practitioner may not be especially concerned with the actual performance of cesarean sections in his community, because this is a major surgical operation that he, himself, never undertakes. Nevertheless, the family physician is often the first to see and recognize many instances of obstetric complications, he then has the serious responsibility of deciding who is the most capable man to be called as consultant, and he is one of those who decide in consultation what shall be done in such emergencies. In other words, he is the guardian of the safety of many women in his community and as such he is vitally interested in everything that may have a bearing on this.

We have heard again and again about what has been spoken of as the abuse of cesarean section. This term has an unfortunately vague significance to many of us. We know it means that too many cesarean sections are being done. Because we no longer view the operation with alarm, however, we may be inclined to minimize its dangers, and to be somewhat indifferent to its "abuse," which is, literally, its employment when not absolutely required.

Improvement in surgical technic has lessened the risk from cesarean section. As a result of this it has been possible to broaden and increase the number of indications for its employment. This should have been and actually has been an obstetric gain. Contracted pelvis is no longer anything more than one of several excellent reasons for delivery by section whereas formerly it was the chief one of only a few reasons. Placenta praevia, premature separation of the placenta, pelvic tumors, cardiac or pul-

monary disease, and nephritis are some of these other indications for the operation with a definite lowering of the mortality rate for mothers with these complications from that of former days.

Thus obstetric gain has been almost entirely offset in many communities by the unfortunate and radically dangerous belief that this major surgical operation is now safe enough to be undertaken for the slightest of obstetric difficulties by anyone with any degree of surgical skill. Innumerable examples of this tendency can be cited.

In certain communities there have been operators who will permit women themselves to decide to be delivered by cesarean section solely in order to avoid labor pains. Recently, in and around Pittsburgh a series of births of twins by cesarean section was reported in the daily newspapers. The fact that each of the twins is usually smaller than a single baby and therefore, should be born even more readily than average by the natural route, did not deter these operators. One wonders how much they were influenced in their decisions by the thought of "making the newspaper headlines."

Not long ago there was a case recorded in which the obstetrician suspected twins, confirmed this by x ray, but found that one fetus appeared to be a monstrosity. The patient fell into labor and delivered herself of the normal twin, whereupon dystocia developed with the second on account of certain of its malformations. Instead of an embryotomy, and despite the local exposure and traumatism from the first delivery, the subsequent examinations, and the attempt at forceps delivery of the mass, this monstrosity was removed by abdominal section.

*Read by invitation at the Annual Meeting of the Medical Society of the State of New York
New York City May 13 1938*

The patient died of sepsis on the fifth day after operation

Eclampsia was formerly considered an urgent indication for cesarean section. The death rate among eclamptics treated by section is much greater (41.5 per cent in the New Orleans Survey¹) than in those treated conservatively. Section during an eclamptic attack is now viewed as being absolutely hazardous and ill-chosen.

In many instances, delayed labor, whether due to inertia or merely to slow dilatation of the cervix, as well as breech presentation in primiparas, have been considered reasons for cesarean section. The operation offers the surgeon an easy and spectacular way out of an obstetric difficulty, but for the patient it is not the safest way.

From what has been outlined above, it appears that unnecessary sections are being done on several accounts. First to contend with is the injudicious or inexperienced surgeon with little or no obstetric ability. In the face of a difficulty, cesarean section flashes instantly into his mind. Then there is the honest but misguided physician who believes genuinely that this is the only solution for his patient's difficulty. His obstetric ability is insufficient to tell him differently. Section for eclampsia, or for all instances of borderline contraction of the pelvis are examples of such situations. Another loose "indication" propounded for section has been that a patient who has had one difficult labor may be more easily delivered and simultaneously sterilized by laparotomy. Risk to the patient does not seem to be a deterrent factor in the minds of these operators, but how would they explain to the relatives when a patient died in order to be sterilized?

About a year ago, Lynch, of the University of California, established the fact that more than half of a series of deaths following cesarean section which he investigated occurred in women who had previously given birth to children through the normal birth passages. The responsi-

bility for this sort of a situation rests clearly on the medical attendants of these women.

In contrast to Lynch's report is the fact that many patients who have been delivered by cesarean section could have been delivered through the natural passages by version and extraction, or by forceps, or even spontaneously if the operator had had sufficient obstetric judgment to wait for full dilatation of the cervix. Every obstetrician has had the opportunity of delivering women naturally who had had a cesarean section in a previous pregnancy for the vaguest of reasons.

As stated above, the rising incidence of the performance of cesarean section with its attendant risks is outstripping its obstetric gain even when conservatively applied for new but valid indications. Fraser and Sparling² say that the performance of this operation should be limited in the bulk of cases to the following five reasons:

- 1 Pelvic contraction, or cephalopelvic disproportion
- 2 Neoplasms obstructing the birth canal
- 3 Hemorrhage (placenta praevia)
- 4 Toxemia
- 5 Repeat sections

These are broad indications, generally speaking, but are rigidly restricted ones when contrasted with some of the loose reasons for performing the operation alluded to above.

It requires keen obstetric judgment to decide conservatively when to operate, what type of operation to choose, and how to avoid infection before and during the operation, as well as hemorrhage following it. A well-trained obstetrician will strive to avoid rather than to choose delivery by cesarean section in the face of an obstetric emergency, and many times will be entirely successful where the untrained man would subject his patient to the greater risk of section. In a recent publication³ I took occasion to say, with ample reason, "cesarean section is not an

operation for the general surgeon, for these reasons, but should be done as exclusively as local community conditions permit by men adequately trained in the specialty of obstetrics and gynecology. Any hospital with a high proportion of its total deliveries accomplished by cesarean section may be looked upon with grave suspicion. This indicates that the obstetric ability of its attending physicians who are responsible for this is below average."

Stander⁴ reports that during twenty-five years, ending in 1930, the incidence of cesarean section in 13,336 deliveries at the Johns Hopkins Hospital was 17 per cent, a figure which he terms slightly high due to their large percentage of colored patients with contracted pelvis. He says further that the rate for any maternity clinic should certainly not range above 4 per cent. In private practice it should be much lower, 1 per cent being a high rate for such patients. In my clinic the incidence has been 4.34 per cent, the reason being that this represents a small service with a high rate of consultation or abnormal admissions.

Lynch⁶ has reported also on an unusually large series covering a considerable area of territory. In 524,117 births, 12,005 were delivered by cesarean section, an incidence of 2.5 per cent. The reason for approaching the operation with trepidation is to be found in a surgical mortality of 4.1 per cent among these 12,005 sections.

The mortality rate from this operation throughout the country generally is probably much more than this, being highest in those hospitals in which the ratio of cesarean section to natural deliveries is the greatest. This is due to the logical combination of poor obstetric judgment and poor surgical ability.

In this connection nothing has been said here regarding the high incidence of morbidity which accompanies cesarean section, as compared to delivery through the vagina. Subsequent invalidism is parallel to the morbidity rate and the compara-

tive results are not pleasant ones to review.

None of this is intended as a condemnation of delivery by cesarean section where it is clearly necessary. Under such circumstances the mother is unfortunate in being obliged by necessity to assume more of a risk than she would have had to do otherwise. I wish merely to emphasize that it must not be forgotten that there is a definite risk in every one of them.

The only criticism intended in this paper is against the unnecessary performance of cesarean section. Two questions arise when this operation is chosen for a patient by her medical attendants. The first is whether the decision was an honest one, and the second is whether they are competent to make the decision. Lynch says that this operative furor can be combated by creating the sentiment in the profession that only well-qualified obstetricians should be allowed to undertake major obstetric surgery.

I subscribe to this and would make an added suggestion. General practitioners attending pregnant women could easily arrange for all of their primiparous patients to have at least one examination late in pregnancy by a competent obstetrician in consultation with the attending physician. Many an impending catastrophe could be avoided by this simple rule, and arrangements could easily be made for the expense not to be prohibitive.

Such consultations would discover in advance when a section may be necessary because of pelvic contraction, for example, and the operation may then be an elective one. The maternal mortality from section is lowest when it is done as an elective operation before or soon after the beginning of labor.

Holland's⁴ studies made some time ago from a series of 1,953 of the classical type of sections done by a number of different operators are illuminating on this particular point. He found a maternal mortality of 1.6 per cent in those done before labor, 1.8 per cent early in labor, 1.0 per cent late in labor, 14 per cent after induction of labor and 27

per cent after attempts at delivery by forceps. It is true that the findings from a survey now would probably be different as a result of the wider application of the low cervical type of section in the third and fourth groups, and this or the Porro operation in the last group. Nevertheless, the general situation remains about the same. Moreover, the very fact that obstetric judgment is required, not only as to when to operate but also what type of operation to perform, emphasizes the need for capable obstetric opinions on these matters in contrast to those of the casual operators.

Anticipation of possible trouble is of the greatest importance. Avoidance of meddling attempts at interference in obstetrics is of next greatest importance, especially if a cesarean section should prove to be necessary. To this end in our hospital there is a sign hanging in the obstetric scrub room with the following regulation:

"All physicians attending obstetric patients in this Hospital shall be required to call a consultant either from the official obstetric staff of this Hospital, or that of another approved Hospital, in all instances of unduly prolonged labor or delayed delivery, and before they may undertake in this Hospital any obstetric operation of greater extent than low forceps."

These consultations are made without fee unless the patient's own physician requests that a charge be made, and the rule has worked to the mutual advantage of the patients, their attending physician, and our own obstetric staff. By such an arrangement as this, the need for some cesarean sections has been recognized early and before irreparable damage has been done, while the unregulated performance of cesarean sections is entirely impossible.

Every general practitioner attending obstetric patients has a responsibility to safeguard these women when emergencies arise by calling as consultants those whom they know to be competent obstetricians. Every obstetric specialist has a responsibility that requires him to be conserva-

tive rather than radical in his judgment and practice when facing emergencies. All of us must remember that cesarean section is not a safe panacea or an easy way out of any obstetric difficulty and that it should not, under any circumstances, be undertaken without good and sufficient reasons, carefully evaluated by trained men with experienced obstetric judgment.

Cesarean section is a valuable procedure when it is limited to occasions where it is actually needed. It is being abused when it is used for insufficient reasons. In both instances it is more dangerous than a delivery by the natural passages. Its abuse is an important factor in our present high maternal mortality rate, and it is the duty of each one of us, for the benefit of our patients, to attempt to stop its abuse.

Summary

1 The lessening of risk from cesarean section by improved surgical technic has been an obstetric gain because this improvement has broadened the valid indications for the operation. This gain has been offset, unfortunately, by a radical belief that cesarean section is now safe enough to be done by occasional operators for the slightest of obstetric difficulties.

2 The average general mortality rate following cesarean section is more than 4 per cent.

3 The incidence of birth by cesarean section to births by the natural passages should not be more than about 5 per cent.

4 In those hospitals where much higher ratios of delivery by cesarean section are found, obstetric judgment and conservatism are presumably deficient, and maternal mortality rates usually are proportionately higher than average.

5 Hospitals should not permit the performance of cesarean sections without a routine requirement of consultation with a competent obstetrician. The type of section to be chosen should be decided at this consultation, because one type of operation may be safer than others under certain circumstances.

6 Both the incidence and the danger of cesarean section could be diminished if general practitioners attending obstetric patients would arrange for their primiparous patients to have at least one consultation with a competent obstetrician late in pregnancy

Discussion

Dr H. J. Stander, *New York City*—I wish to state that I am wholly in accord with the deductions and conclusions of Dr Titus' paper. Although the risk from cesarean section by unproved surgical technic has been definitely decreased the unfortunate outcome in many instances, has been a broadening of the indications with the result that this operation is often being performed in the face of clear contraindications. It is my belief that the knowledge and appreciation of the contraindications to cesarean section has not kept pace with the improvement in surgical technic. No one, not trained in practical obstetrics is competent to decide as to the advisability of a cesarean section operation. Certainly the general surgeon without hospital training in obstetrics, cannot appreciate the danger of actual or potential infection in a patient who has been in labor for ten hours or more. As I have stated elsewhere, it takes more knowledge to know and more courage to heed the contraindications to cesarean section than it does to perform the operation. Infection either present or potential, is ever the real danger signal in any contemplated cesarean section operation. The most ideal circumstances for the operation are those attendant to the elective procedure and to go a step further any justifiable decision as to an elective operation can be arrived at only by those giving to their patients proper and adequate prenatal care.

It is indeed a commentary on present-day medicine when the maternal death rate from cesarean section is in the neighborhood of 10 per cent throughout this country. That thor-

ough study of maternal mortality published in 1933 by the New York Academy of Medicine, Committee on Public Health Relations showed clearly the reasons for this appalling death rate at least insofar as New York City was concerned. In many instances the operation was performed by general surgeons and it is revealing to note that during the year 1931 surgeons delivered 3 562 women in New York City with a maternal death rate of 9.9 per 1 000 live births. The committee writes 'The extremely high death rate for the surgeons may be due in part to the higher percentage of cesarean sections among their cases. Of the total fatal cases attended by surgeons 30 per cent had cesarean operations while only 23.6 per cent of the fatal cases attended by obstetricians had cesarean section. The rate even with this factor considered remains extremely high and must reflect to some extent the quality of the professional services of surgeons in this field. It is not unlikely that their training and attitude incline them to excessive use of instrumentation.'

One can hardly conceive how these operators could by the very nature of their training have an appreciation of the contraindications to a cesarean section. It is my opinion that perhaps one of the most pernicious practices in American obstetrics is the fact that general surgeons and others, without proper or even any obstetric training not only perform but actually decide as to the advisability of the cesarean operation. The study conducted by the New York Academy of Medicine revealed the astounding fact that cesarean section preceded almost a fifth of all maternal deaths. Evidently cesarean section is too often a procedure of last resort instead of being elective on a valid indication, such as marked degrees of contraction of the pelvis with cephalopelvic disproportion.

As one reads in the medical journals the numerous reports on cesarean section and studies the annual reports of various maternity clinics one is led to the inevitable conclusion that this operation is performed far too frequently and that the operators are too often not trained obstetricians with the result that section is invariably performed too late in labor. It cannot be too strongly recommended to the medical profession that we must all endeavor to bring about a sharp reduction in the number of cesarean sections performed, that the classic operation must be limited to the elective procedure, and lastly that adequate prenatal care is essential if we are to eliminate cesarean section as a measure of last resort after hours of labor and in presence of actual or potential infection.

VITAMINS IN NERVOUS HEALTH AND DISEASE

HERMAN WORTIS, M D , New York City

(From the Division of Psychiatry, Bellevue Hospital, New York City, and the Department of Psychiatry, New York University, College of Medicine)

THE role of the vitamins in nervous health and disease has only recently reached the stage where it seems possible to bring a semblance of order out of apparent chaos. It will be the purpose of this paper to review the recent advances in this field and to relate some of our experiences at Bellevue Hospital.

Vitamin A

Night blindness, often called "hemeralopia" or "nyctalopia," is now considered the commonest and earliest manifestation of avitaminosis A.¹ Largely through the work of Wald² it is now known that the ability to see under dim illumination is due to the visual purple of the retinal rod cells. He has further shown that light bleaches the visual purple and that its adequate regeneration is dependent upon an adequate supply of vitamin A or its precursor, carotene. In avitaminosis A regeneration of visual purple is therefore seriously delayed and vision in dim light greatly impaired. The relationship of lack of vitamin A to traffic accidents at night should therefore be further investigated.^{1,3}

In nutritional (avitaminosis A) night blindness there are no gross organic or even ophthalmologic signs. The patient may, however, complain of pain, photophobia, lacrimation, and redness of the eyes,⁴ but the condition may be entirely asymptomatic. In the treatment of these cases, Barborka⁵ has used vitamin A with uniformly good results.

That vitamin A is essential to nervous economy also has been demonstrated by Mellanby^{6a-c} and Zimmerman,^{6f} who were able to observe, in animals fed a vitamin A deficient diet, disseminated demyelinating lesions, chiefly of the ascending tracts of the spinal cord. Fur-

thermore, if ergot was added to the diet, these lesions were made worse. This may explain why convulsive ergotism occurs only at times of famine. In addition, the nerve cells, chiefly those of the posterior root ganglia, Clarke's column, and the dentate nucleus, also show degenerative changes and sometimes disappear. In the peripheral nerves, the afferent fibers are frequently degenerated. Similar lesions are also found in the optic, trigeminal, and sciatic nerves. Mellanby further suggests that vitamin A deficiency may be the cause of multiple sclerosis and combined system disease. He stresses the value of early treatment—in the case of multiple sclerosis before neuroglial overgrowth has invaded the patches of degenerating nerve fibers, and in the case of combined system disease before irreversible changes in the neural elements have set in. It should, however, be noted that the almost miraculous remissions of multiple sclerosis are unlike those seen in any other deficiency syndrome, and I have seen relapses under diets perfectly adequate in vitamin A. Furthermore, the peripheral nerves that are the seat of marked pathologic changes in experimental avitaminosis A usually escape damage in multiple sclerosis.

As an index of vitamin A deficiency, blood lipid determinations, especially cholesterol, have been investigated. Rall and her co-workers⁷ reported in dogs fed on a vitamin A deficient diet a rise in blood cholesterol simultaneous with the appearance of symptoms. Feeding of vitamin A or carotene caused a return to normal. Liang and Wacker⁸ reported similar findings in rats. On the other hand, Collazo⁹ reports a decrease in blood cholesterol in rats fed a vitamin A de-

ficient diet and states that the brain cholesterol was markedly increased by feeding large amounts of the vitamin. Gildea¹⁸ in a careful study of human beings presenting deficiency syndromes, concluded that the serum lipid content (including cholesterol) was directly proportional to the nutritional state of the patient—falling in starvation, and vice versa. At the present time, therefore no definite conclusions can be drawn.

Vitamin B

Nelson,¹¹ in an excellent review of the vitamin B factors, states that only the B₁ and the Pp factors have any definitely known application to human biochemistry or nutrition. The other factors of the B complex, however, are the subject of intensive study at present.

To Eijkman¹² goes the credit for being the first to make carefully controlled experiments in the study of a disease of dietary origin. In 1897 he concluded that beriberi resulted from the eating of decorticated rice and that the feeding of rice polishings caused prompt restoration of the disturbed functions.

The neuropathologic lesions resulting from vitamin B₁ deficiency have recently been reviewed by Davison and Stone.¹³ Their experiments revealed vacuolation, liquefaction necrosis, and chromatolysis of the ganglion cells in the mesencephalon, metencephalon, and spinal cord, as well as disintegration of the myelin sheaths of the peripheral nerves of animals placed on deficient diets—but they emphasize that general inanition, which frequently follows in the wake of vitamin B₁ deficiency, may cause similar lesions.

Clinicians, however, have shown conclusively that peripheral neuritis may result from vitamin B₁ deficiency. Wechsler,¹⁴ in a series of brilliant clinical studies, came to the conclusion that alcoholic neuritis, as well as pregnancy neuritis, was associated with a vitamin deficiency, and suggested the use of the term peripheral neuropathy to parallel myelopathy and encephalopathy. Since inflammatory changes are not found in the peripheral nerves, his suggestion should

be accepted. Furthermore, Strauss¹⁵ in 1935 gave a pint to a quart of blended whiskey daily to each of 10 alcohol addicts with peripheral neuropathy provided that they took a high vitamin diet and vitamin B₁ parenterally. On this regimen he observed that such patients recovered just as quickly as a control group who received no whiskey.

Jolliffe¹⁶ and his co-workers in a series of very careful studies (using Cowgill's formula¹⁷) have shown that (1) every alcohol addict with polyneuritis had an estimated inadequate vitamin B₁ intake, (2) no alcohol addict with an estimated adequate vitamin B₁ intake had polyneuritis. They further demonstrated that vitamin B₁ in adequate dosage was therapeutically effective in the great majority of such cases and that in those cases where therapy failed, it was suggested that irreversible pathologic changes had set in. It was therefore concluded that alcohol had no chronic, toxic action on the peripheral nerves and that polyneuritis in the alcohol addict was due to vitamin B₁ deficiency. In this respect a recent pathologic study by Wechsler, Jervis, and Potts¹⁸ is of interest. They showed that the nervous system, while resisting the action of alcohol as well as of B avitaminosis alone, is very susceptible to a combination of the two. It may therefore be said that while the importance of vitamin deficiency in alcoholic polyneuritis has definitely been established, the possible sensitizing effect of alcohol remains to be determined.

Furthermore, the polyneuritis of pregnancy has also been successfully treated with vitamin B₁.^{14,19} The condition is associated not only with increased metabolic demands on the part of the mother and fetus, but is frequently complicated by pernicious vomiting with resultant nutritional depletion. The importance of parenteral therapy in this condition is illustrated by a patient of mine, who showed practically no response to very high vitamin therapy by mouth, and remained blind, practically paralyzed, and bedridden for a period of four months. In addition, she showed a mental picture

resembling a Korsakoff psychosis. Intravenous therapy was then resorted to, and twenty-seven injections of 6.6 mg each of synthetic vitamin B₁ resulted in such complete recovery that within one month the patient had 20/20 vision in both eyes and is now able to carry on a perfectly normal existence. In fact, she recently wrote me that she had entered and won a roller skating derby. (It may be that I was too enthusiastic in feeling that her mental condition was cured!)

Vorhaus, Williams, and Waterman²⁰ have reported excellent clinical results in 100 cases of various types of neuritis treated with vitamin B₁. It has also been suggested that vitamin B₁ is of value in multiple sclerosis,²¹ trigeminal neuralgia,²² polyneuritis due to metals,²³ neuritides of isolated nerves and of undetermined etiology,²⁴ chorea,²⁵ herpes zoster,²⁶ funicular spinal disease,²⁷ and even in tabetic root pains.²⁸ My own results with cases of multiple sclerosis, trigeminal neuralgia, and chorea have been entirely negative.

In cases of toxic neuritis, however, it would seem advisable to give vitamin B₁, but specific therapy aimed to eradicate the focus of infection or metallic poison must accompany this. None of the clinical reports really prove the efficacy of vitamin B₁ therapy in these latter conditions and conclusions simply cannot be drawn at this time.

Cases of optic neuritis occurring in the course of severe nutritional deficiency do, however, show marked benefit when placed on B₁ therapy. Carroll²⁹ has reported such instances, and my own experiences confirm his results. Here again the success of the treatment frequently depends on the stage at which it is instituted—the temporo-macular bundles because of their phylogenetic youth are particularly susceptible to vitamin lack, and irreparable damage may result.

Selfridge,³⁰ in a study of patients with chronic progressive deafness, suggested that dietary factors were at play and was able to markedly help several with diets rich in vitamins—particularly the B com-

plex. It had been previously shown³¹ that pigeons placed on a polished rice diet developed decreased vestibular chronaxia, which was promptly restored to normal when they were fed an adequate diet.

More recently it has been suggested that avitaminosis B₁ may be the cause of the Korsakoff psychosis.^{32 a, b, c} In the light of some as yet unpublished work this hardly seems likely. In the first place, most of the *acute* alcoholic deliria, including the acute confabulatory Korsakoff type, clear up if given sufficient quantities of sugar, water, and salt. In fact Frank and I have obtained excellent results with several such cases fed on a B₁ deficient diet. Furthermore, the recent work of Jolliffe and his co-workers on the chronic Korsakoff psychosis shows that while vitamin B₁ seems to help, its exact value in this condition still remains to be determined.^{32 d} In the chronic type it is, of course, possible that irreversible pathologic changes have already set in.

The intrathecal injection of vitamin B₁ has been stressed by Stern²¹ who suggests that it may be more practical since a barrier may exist between the blood and spinal fluid. He further suggests that alkali and proteolytic enzymes in the intestine may destroy vitamin B₁, and that even if the vitamin reached the central nervous system, excessive alkalinity might destroy it. He reports favorable results in a series of cases ranging from carcinoma with metastases (in which pain was relieved) to localized neuritides, pyramidal tract disease, multiple sclerosis, poliomyelitis and von Recklinghausen's disease.

He also states that "vitamin B₁ has a powerful rejuvenating action unknown to any other drug and is one of the most valuable therapeutic agents at our command." Such extravagant therapeutic claims are of course subject to further clinical confirmation. Moreover, Stern's theoretic deductions are often difficult to follow.

The Biochemical Lesion in Vitamin B₁ Deficiency—It is now generally accepted

that vitamin B₁ is a catalyst needed for the oxidative removal of the lower degradation products of carbohydrate metabolism. Since the respiratory quotient of the brain tissue is unity, indicating that the brain utilizes sugar as its essential foodstuff, the importance of such a finding is apparent. Work already completed²² shows that vitamin B₁ is intimately connected with carbohydrate metabolism and more particularly with two very important catabolites of carbohydrate metabolism, lactic and pyruvic acids. It has in fact been demonstrated that in the avitaminotic brain, pyruvate is formed from lactate in the absence but not in the presence of vitamin B₁. Indeed, addition of vitamin B₁ causes pyruvate to disappear. The connection between these findings in the brain and the more familiar anatomic lesions in the peripheral nerves and perhaps the spinal cord has not as yet been demonstrated, but the fact that vitamin B₁ can affect the chemical integrity of nervous tissue (brain) is important.

Further Platt and Lu²⁴ have been able to demonstrate an accumulation of pyruvate in the blood and spinal fluid of beriberi patients in the Orient. In a few cases methylglyoxal (another intermediary product of carbohydrate metabolism) was found. Geiger and Rosenberg²⁵ described the appearance of methylglyoxal in the urine and cerebrospinal fluid of infants suffering from vitamin B₁ deficiency.

Vitamin B₂

It has been suggested that a deficiency in more than one factor of the vitamin B complex is involved in pellagra and that pellagra as it is now recognized consists of two or more different conditions.²⁶ It is, however, known that human pellagra is frequently associated with changes in the central and peripheral nervous system.²⁷ The cerebral effects are irregularly distributed, the frontal lobes more particularly the large pyramidal cells showing the greater involvement and the spinal-cord lesions involving es-

entially the dorsal and lateral columns, resulting in the clinical syndrome of dorsolateral sclerosis. Orton and Bender²⁸ suggested that the cord lesions might be due to a superimposed virus infection or other changes. Tucker²⁹ also suggested that a neurotropic virus might be responsible. In addition there is frequently an associated demyelinating peripheral neuritis and involvements of the nerve roots, more particularly the posterior nerve roots. Zimmerman and his co-workers³⁰ have been able to reproduce essentially similar lesions in dogs fed on a vitamin B₂ deficient diet.

Furthermore the nervous system lesions in combined system disease accompanying pernicious anemia resemble pellagra and since both are frequently associated with achlorhydria, a possible connection is suggested.

The etiology of the nervous system lesions in human pellagra, however, is still not clear. Spies,³¹ for example, has observed that the peripheral neuropathy in a case of human pellagra became more severe while the mucous membrane lesions were healing nicely under nicotinic acid therapy. On the other hand, I have observed in 2 similar cases that with heavy doses of vitamin B₁ the peripheral neuropathy cleared nicely, while the skin, mucous membrane and spinal-cord changes were not appreciably affected. Two possible explanations are offered: (1) the spinal cord lesions are irreversible, (2) the spinal-cord lesions have a different etiology from the peripheral neuropathy which is probably caused by avitaminosis B₁.

The response of the encephalopathic phenomena seen in avitaminotic states to nicotinic acid is soon to be reported on by Jolliffe and his co-workers.

Vitamin C

Vitamin C (cevitamic acid) is present in both blood and cerebrospinal fluid and is capable of passing from one to the other. It is present in the brain and spinal fluid only in its reduced form, whereas in the blood a portion of it occurs in the

reversibly oxidizable form. The subject of blood vitamin C and its urinary excretion has been recently reviewed in a series of papers by Wright and his co-workers.⁴² We⁴³ have recently reported on the role of vitamin C in nervous economy, and our results may be summarized as follows:

1. It is present in relatively large amounts in the spinal fluid.

2. Tissue extraction work reveals that the adrenal, brain, and pars intermedia of the hypophysis contain large amounts of vitamin C. Since these organs are intimately connected with nervous metabolism, further investigation on the functional relationship of vitamin C to these tissues is indicated.

3. Scorbatic animals consistently showed marked hypertrophy of the adrenal gland. It has been further established that there is a very intimate relationship between vitamin C and the adequate functioning of the adrenal gland.

4. Although there are many reports in the literature of neurologic and mental changes accompanying scurvy,⁴⁴ no proof has been given that the neuropsychiatric sequelae are specifically the result of a deficiency of vitamin C in the diet. Davison⁴⁵ placed 7 guinea pigs on a scorbutic diet. Pathologically the peripheral nerves of these animals showed slight disintegration of myelin and on rare occasions destruction of the axis cylinders. In addition to this, the various nerve cells, especially the anterior horn cells, disclosed pathologic changes such as vacuolation, liquefaction, necrosis, swelling, and pyknosis. He noted, however, similar pathologic changes in guinea pigs that were totally starved and was therefore unwilling to attribute any of the changes noted to avitaminosis C. In contrast, Zimmerman⁴⁶ states that animals with advanced avitaminosis C have uniformly failed to show lesions of the central nervous system other than occasional petechiae.

5. Jungeblut⁴⁷ has shown that vitamin C has definite protective and therapeutic value in experimental poliomyelitis,

and Stern²¹ recently suggested that the intrathecal injection of vitamin C in this connection might prove of value. These suggestions are interesting but need further clinical confirmation.

6. It is, moreover, interesting that as regards age, species, and tissue, vitamin C concentration parallels the rate of oxygen consumption, suggesting participation in oxidations. But this relationship breaks down in that the gray and white matter of the brain have equal vitamin C contents and quite different respiratory rates.⁴⁸ In addition, we have been able to show that the cortical gray matter of scorbutic guinea pigs, although showing a markedly reduced cevitic acid content, shows no decrease in oxygen consumption as compared to normal animals. The respiratory quotient also remains unity, indicating that such animals are still able to oxidize their usual foodstuff, namely dextrose.

7. Myers and McCormick⁴⁹ noted that their scorbutic guinea pigs became nervous and apprehensive. Our own guinea pigs acted in much the same fashion and responded to very slight noises by running wildly about the cage.

Many articles have recently appeared in the literature attempting to correlate certain clinical neuropsychiatric syndromes and vitamin C deficiency. Our own study on 103 alcoholics^{43a} led to the following conclusion: Alcoholic conditions associated with neural or mental changes have subnormal vitamin C levels in the blood and spinal fluid, whereas those without neural or mental changes tend to have normal vitamin C levels in the blood and spinal fluid. That vitamin C is directly concerned in causing the totality of these changes is not at all clear and hardly seems likely. The findings do suggest, however, that there is a large nutritional factor in the production of nervous and mental changes in chronic alcoholics.

A high content of vitamin C in the cerebrospinal fluid has been reported in hypertension, a strikingly low one in

multiple sclerosis, and no change in stupor, sleep, and narcosis.⁴⁰ We have observed that febrile diseases decrease the vitamin C content of the spinal fluid, probably because of the resulting increased metabolism and need for this substance. Furthermore, Bersot⁴¹ suggests that many neurotic manifestations are caused by hypovitaminosis and are relieved by the administration of vitamin C. Such a claim can only be based on an improper understanding of the mechanism of neuroses—our results are negative along these lines. He further points out the importance of vitamin C deficiency in many patients with catatonia, arteriosclerosis, and senility. In these latter cases we too have observed that vitamin C deficiency does frequently exist but here the feeding habits and absorptive mechanisms are at fault, and the injection of huge amounts of vitamin C does not alter the clinical picture unless there be a complicating scurvy. Monahan,⁴² in a similar study of schizophrenic patients, found consistently low figures in mute, catatonic, and apathetic patients, whereas in paranoid or agitated patients normal and high figures were found. These latter results essentially parallel our own and suggest that the vitamin C findings are conditioned by the feeding habits and metabolic needs of the patient. Hirata and Suzuki⁴³ treated 10 cases of advanced muscular dystrophy with vitamin C, which in their opinion was superior to any other available therapy. Their chemical studies suggest that the effects of such therapy may be attributed to the direct action of vitamin C on the adynamic musculature. I have had no experiences with vitamin C in these conditions.

In summary it is suggested that vitamin C may play a role in nerve tissue metabolism, that this role is probably subordinate, and that the mechanism of its action is not as yet clear.

Vitamin D

Vitamin D is intimately related to ergosterol and cholesterol. It is further

known that the human brain can synthesize or catabolize cholesterol. In addition, ergosterol is found in large amounts in the fetal brain but the amount falls rapidly after birth. The calcium of the brain falls to 25 to 35 per cent of its normal value in rickets.⁴⁴ The clinical correlation of these findings remains to be determined.

Infantile tetany shows a prompt response to vitamin D therapy. The mechanism of this latter phenomenon is not clear and is probably not entirely an effect on the calcium metabolism.

Vitamin E

Evans and Burr⁴⁵ have shown in addition to the sterility effect, a peculiar paralysis in a large percentage of the suckling rats born from mothers deprived of vitamin E. Furthermore, this paralysis was prevented by feeding the mother large amounts of vitamin E throughout her lactation period.

The relationship of this peculiar paralysis to muscular dystrophy is now being investigated.⁴⁶

Summary

I have attempted to call attention to some facts pertinent to the role of the vitamins in nervous metabolism. Further investigations along these lines and the closely related field of biochemistry will undoubtedly yield much valuable information to the neuropsychiatrist.

Correspondence

Dr Peter Irving, Secretary
Medical Society of the State of New York
2 East 103rd Street
New York, N Y

DEAR DR IRVING

About four years ago a physician representing the Physicians' Home in this state called on our local county medical society and requested the privilege of presenting the work of the Home before the assembly. None of us knew much about the Home, so because of the prejudice of one surgeon against one member of the executive committee of the Home the representative was not heard.

Now comes our surprise. We had a member who was a highly respected specialist. He and his wife occupied a high position in the community. Through financial misfortune and age they lost their savings and had to look for assistance. Who took them in? The Home did. There are

some of us now who feel heartily ashamed, and we are disposed to do our part if we could know again what it is all about. Who knows but that he or his wife may be just the ones who may need this assistance!

The Woman's Auxiliary is becoming splendidly organized, but there is still a field for an outlet for its work. If it is reasonable and possible, why could not the Auxiliary be given an interest in the control and management of the Home, and then make its welfare one of their own particular interests? I have no interests in either party except that my wife is a member of the Auxiliary, but the idea appeals to me greatly. At least it appears to be worthy of discussion.

If you should publish this letter, please omit my name and address, for obvious reasons, though I should be glad to acknowledge it publicly except for the persons involved.

May 12, 1939

M D, Syracuse

parison is made between percentage of reactions between men and women Table 5 shows this. It is seen that the incidence of postpuncture headache is far higher in women than in men quite analogous to the comparison of Puerto Ricans with other racial elements. The question again arises as to whether this

TABLE 5.—RELATIONSHIP BETWEEN SEX AND SPINAL PUNCTURE REACTIONS

| Sex | Reactions | Total Punctures | Percentage |
|--------|-----------|-----------------|------------|
| Male | 147 | 508 | 28.9 |
| Female | 76 | 173 | 43.9 |
| Total | 223 | 681 | 32.8 |

greatly increased susceptibility in women due to a higher suggestibility, to their racial status, or to some far more subtle factor.

TABLE 6.—RELATIONSHIP BETWEEN NEUROSYPHILIS AND SPINAL PUNCTURE REACTIONS

| | Total Reactions 203 | |
|----------------------------|---------------------|------------|
| | Number | Percentage |
| Asymptomatic Neurosyphilis | 27 | 12.1 |
| Meningovascular | 12 | 5.3 |
| General | 8 | 3.6 |
| Paralysis | 2 | .9 |
| Atrophy (without Tabes) | 1 | .5 |
| | 50 | 22.4 |

there is an interesting relationship between the presence of neurosyphilis and spinal puncture reactions. Table 6 shows that fewer than 25 per cent of those considered to have neurosyphilis developed postpuncture headaches. Of these, more than half were asymptomatic, and one additional quarter had the diffuse meningovascular type of neurosyphilis. It is perhaps justified in the generally accepted view that postpuncture headache more often signifies that the spinal fluid will

These figures show that postpuncture headache usually indicates cerebrospinal negativity or disease of some degree. In this particular instance, 22.4 per cent of those having postpuncture reactions following spinal tap had evidence of spinal fluid or a mild involvement of the cerebrospinal axis.

Conclusions

A study was made of cisternal and spinal puncture reactions occurring in four

major clinics operated by the Department of Health of the City of New York.

2 Of 178 cisternal taps, 18 patients developed significant postpuncture reactions (10.1 per cent). Of 681 spinal punctures, 223 patients developed significant postpuncture headaches (32.8 per cent).

3 Reactions to cisternal puncture were much milder, only two reactions lasted longer than three days. Spinal puncture reactions averaged 4.32 days.

4 A relationship between race and incidence of reactions was shown in the case of spinal punctures. The percentage relationship was: Negro, 27.04 per cent; White, 32.9 per cent; and Puerto Rican, 43.1 per cent.

5 A relationship between sex and the incidence of reactions was shown in the case of spinal punctures. The percentage relationship was: males, 28.9 per cent; females, 43.9 per cent.

6 A relationship between neurosyphilis and the incidence of spinal puncture reactions was seen, tending to bear out the tradition that postpuncture headache usually indicates a negative spinal fluid, or but minor changes in the cerebrospinal axis. Neurosyphilis was present in 22.4 per cent of reactions. Of these, 17.4 per cent were the less severe cases of asymptomatic neurosyphilis and diffuse meningovascular neurosyphilis. In other words, it could be stated of this group that postpuncture headache was 95 per cent assurance that the spinal fluid was negative or cerebrospinal involvement was of mild degree.

7 Speculation regarding the undue incidence of postpuncture reactions in these clinics pointed to the rush of large clinics with inadequate facilities for postoperative rest, long elapsed time between leaving the clinic and getting to bed, subway rides, difficulties in technique in less experienced hands and possibly lack of physical stamina and increased suggestibility, as evidenced in the higher incidence of reactions among females and Puerto Ricans.

MALIGNANCIES IN INFANCY AND CHILDHOOD

A Clinical and Pathological Survey of 64 Consecutive Cases

D WILLIAM SCOTT, M D , New York City

(From the Department of Pediatrics, the New York Post-Graduate Medical School and Hospital, Columbia University, New York)

IN THIS paper a report of a survey is made based on a clinical and pathologic study of 64 consecutive cases of malignancies in infants and older children as they were admitted to the wards of the New York Post-Graduate Medical School and Hospital. The various types of malignancies, age and sex incidence, symptoms, signs, course, diagnosis, and treatment are carefully analyzed. The cases included in this series were all confirmed by a study of the gross pathologic findings at operation, as well as by microscopic examination of tissues obtained from biopsies and necropsies and by roentgenograms.

Although the incidence of malignant tumors in infancy and childhood is not very high, it is the appalling death rate caused by them that is alarming. It is hoped that early diagnosis and prompt irradiation therapy with the aid of surgery will help toward lowering the mortality rate.

The various types of malignancies will be discussed in the order of their frequency as they occurred in this collection.

Types—Whether the kidney or the eye is the most frequent neoplasm seen in infancy and childhood is still an open question. Picot¹ in a study of 414 cases of malignancies in children found the following order: eye 100, kidney 80, bones 67, brain and meninges 31, and abdomen and pelvis 19. D'Espine and Piso² in a review of 393 cases found the eye and orbital structures were involved in 52 per cent of the cases, the kidney in 20 per cent, bones in 17 per cent, brain

in 5 per cent, and abdomen and pelvis in 4 per cent. Porter and Carter,³ and Helmholtz³ also observed that the eye malignancies led the kidney in frequency. Duzan⁴ in an analysis of 182 cases found the eye leading the kidney in occurrence.

On the contrary, Steffen⁵ in a tabulation of over 900 cases found that the neoplasms of the kidney and adrenals were the most common, tumors of the eye and the orbit second in frequency, those of the brain and meninges third, and those of the bones fourth. Wollstein⁶ and Mixer⁷ report the kidney and adrenals as the most frequent site of malignant disease during the first decade of life. In Abt's⁸ *Pediatric Textbook* we find the following statement: "In adult life the stomach, uterus and liver lead in the order named whereas in childhood the kidney, eye and bones are frequently involved."

In this series, as seen in Table 1, neoplasms of the kidney and adrenals were most common, with those of the eye, bones, brain, retroperitoneal glands, mediastinum, liver, ovaries, pharynx, and thyroid following in the order named.

The incidence of neoplasms in infancy and childhood cannot be accurately computed, for it is not a reportable disease and the diagnosis can only be definitely established by operation and by biopsy and necropsy reports. It is obvious, therefore, that many cases of malignancies have probably died without having had a definite diagnosis made and therefore its incidence is much higher than that recorded.

Age—The ages in which the neo-

TABLE 1.—A STUDY OF 64 CONSECUTIVE CASES OF MALIGNANCIES IN INFANCY AND CHILDHOOD FROM THE WARDS OF THE NEW YORK POST-GRADUATE HOSPITAL AND MEDICAL SCHOOL

| Types According to Frequency | | No. of Cases |
|---|--|--------------|
| 1 Malignancies of the kidney and adrenals | | 13 |
| a—Embryonal adenomyosarcoma (Wilms) | | |
| b—Neuroblastoma of adrenal | | 4 |
| c—Primary carcinoma of the kidney | | 3 |
| 2 Glioma of the retina (retinoblastoma) | | 12 |
| 3 Malignancies of bones | | 10 |
| a—Periosteal sarcoma of humerus | | |
| b—Periosteal sarcoma of jaw | | |
| c—Fibrosarcoma of index finger | | |
| d—Osteogenic sarcoma of left femur | | |
| e—Osteogenic sarcoma of the clavicle | | |
| f—Fibrosarcoma of humerus | | |
| g—Endothelial myeloma—right os | | |
| h—Giant cell sarcoma—neck of the femur | | |
| i—Sacrococcygeal carcinomatous teratoma | | |
| j—Endothelial myeloma—left clavicle | | |
| 4 Malignancies of the brain | | 8 |
| a—Glioma of the cerebellum | | 4 |
| b—Glioma of the cerebrum | | 2 |
| c—Cyst of the 3rd ventricle with pubertas praecox in a female child | | |
| d—Cerebellar astrocytoma | | |
| 5 Retroperitoneal lymphosarcoma | | 5 |
| 6 Malignancies of the mediastinum | | 3 |
| a—Liposarcoma or thymoma | | |
| b—Teratoma | | |
| c—Primary carcinoma of the thymus | | |
| 7 Primary carcinoma of the liver | | 2 |
| 8 Primary carcinoma of the ovary (embryonal) | | 2 |
| 9 Fibrosarcoma of the pharynx | | 1 |
| 10 Primary carcinoma of the thyroid | | 1 |
| Total | | 64 |

| | |
|---|----|
| Age and Sex Incidence | |
| Under 6 months of age | 9 |
| Between 6 months to 1 year | 5 |
| 1-2 years | 4 |
| 2-3 years | 15 |
| 3-4 years | 0 |
| 4-5 years | 4 |
| 5-6 years | 7 |
| 6-7 years | 2 |
| 7-8 years | 1 |
| 8-9 years | 3 |
| 9-10 years | 1 |
| 11-13 years | 4 |
| Females 26 males 29 | |
| Earliest case: 2 days of age | |
| Oldest case: 13 years of age (age limit in wards 13 years of age) | |
| Malignancies most commonly seen during first 3 years of life (26 cases) | |
| Forty-six cases seen within the first 5 years of life | |

plasms occurred range from 2 days to 13 years. However, it is important to mention that since cases over 13 years are not admitted to our wards we therefore have this age limit in this survey. From Table 1 it can be noted that the malignancies are most commonly seen during the first 5 years of life, 46 of the 64 cases, or 72 per cent, occurring during this age period.

Kidney Neoplasms

Malignancies of the kidney and adrenals, because of their frequency in early life and because of the high mortality resulting from their incidence, are by far the most important. In this review,

tumors of the adrenal and kidney numbered 20, or 31 per cent. The embryonal adenomyosarcoma of the kidney (Wilms) is the most common type of kidney tumor seen in infancy and early childhood. It was noted in 13 cases (see Table 2). The other 7 cases were divided between neuroblastoma of the adrenal (4 cases) and primary carcinoma of the kidney (3 cases) (See Tables 3 and 4.)

Since neither the scope of this paper nor time permit a lengthy discussion of the various types of malignancies, only the salient features will be mentioned.

The embryonal adenomyosarcoma, known also as congenital mixed tumor or Wilms' tumor, usually makes its appearance before the 5th year of life. In this study, 9 out of the 13 cases, or 69 per cent, were recognized within the first 3 years of life, and 11 cases, or 84 per cent, within the first 5 years of life. The other 2 cases were between 5 years and 6 years

TABLE 2.—KIDNEY NEOPLASMS (20 CASES)

| Types | No of Cases |
|---|-------------|

| c—Five died within 3 mo. p o | |
| d—One died of bronc. pneumonia 3 mo. after diagnosis | |
| e—Five unaccounted for | |

Walker⁹ in his review of 155 cases found that 84 per cent of the cases occurred within the first 5 years of life, and 16 per cent above this age period. He also reported in this same series their occurrence in the fetus and the newborn. Although embryonal adenomyosarcoma is rarely seen during the second decade, cases have been reported in adults. Kilbane and Lester¹⁰ reported a case in a man of 48 years of age.

Sex—Six were males and 7 females.

Concerning the origin of this type of tumor there has been much discussion, and no general agreement has been reached. The fact that its occurrence has been noted in the fetus and at birth establishes its embryonal and congenital origin.

Symptoms—As a rule, the earliest manifestation of Wilms' tumor is the presence of a mass in the abdomen. In this series, as noted in Table 2, a perceptible mass was present in all 13 cases. In 3 of these cases the mass was noted by the physician, which emphasizes the value of a thorough physical examination regardless of the chief complaint, and in the other 10 cases the mother either complained of the child having a lump in the abdomen or of an enlarged abdomen. Loss of weight, abdominal pain, loss of appetite were next in frequency, vomiting, pallor, constipation, ascites, and jaundice were also noted. Hematuria, a cardinal symptom in neoplasm of the adult genitourinary tract, is not very common. It was observed microscopically in only 3 cases. Metastasis was observed in 4 cases. In 3 cases the liver alone was involved, and in 1 the portal circulation and intestines.

Diagnosis—This is usually established by palpation of the mass on physical examination, by pyelography, the operative findings, and by the microscopic examinations from biopsies and necropsies. Aspiration biopsy may be employed when in doubt. A kidney neoplasm must be differentiated from adrenal tumors, hydronephrosis, congenital polycystic kidney, spleen when tumor is on

left side, and other extrarenal tumors.

Prognosis—Unfavorable. The outlook would be much brighter if the condition were recognized early and preoperative and postoperative irradiation were applied. Operative cures without irradiation are not very common. Wollstein has reported six and one-half years and thirty years postoperative survivals or cures.

Treatment—The treatment of choice in the absence of extensive metastasis is preoperative irradiation, nephrectomy, and postoperative irradiation.

Outcome—In this group of 13 cases of the Wilms' type of malignancy 5 died within three months after operation, 1 died of bronchopneumonia three months after the diagnosis was established, 1 is living and well five and one-half years after nephrectomy, 1 was last seen two and one-half years following operation, and 5 are unaccounted for.

Neuroblastoma of Adrenals

This tumor arises from the medulla of the adrenal gland and is associated with the sympathetic nervous system, from which the adrenal medulla is developed. At times it is bilateral and occasionally it does not arise from the adrenal but from the sympathetic nerve tissue in the abdomen or thorax. Boyd¹¹ says "The microscopic picture resembles that of a sarcoma and formerly the tumor used to be called 'adrenal sarcoma of children'. The tumor consists of undifferentiated small round cells (neuroblasts), a few imperfect ganglion cells and fibrils. The fibrils are arranged either in longitudinal bundles or in little rounded masses around which the cells are grouped in a rosette form. These rosettes are characteristic of the tumor."

Neuroblastoma of the adrenals is usually seen in early infancy and up to about 4 years of life. Of the 4 cases included in this group of neoplasms, 1 was 3 months of age, 2 were under 2 years, and 1 under 4 years.

Sex—Three were males and 1 a female.

Types—Two types of adrenal neuro-

blastomas have been described—the Pepper and the Hutchinson. The Pepper type, as described by Pepper in 1901,¹² involves the right adrenal, is very malignant, and metastasizes to the liver and lungs but never to the skull and long bones. The Hutchinson type of neuroblastoma, described by Hutchinson in 1907,¹³ arising from the left adrenal is very malignant and metastasizes to the skull, orbit, long bones, and lymph nodes. Three of the cases discussed here involved the left adrenal and therefore were of the Hutchinson type, while the other was of the Pepper type.

Symptoms—Here also a perceptible mass was observed in the 4 cases. Pallor, vomiting, loss of weight, swelling and ecchymosis of the left eye, loss of appetite, abdominal pain and pressure symptoms were noted (Table 3). Hematuria was absent in the 4 cases. A black and blue eye on the left side should always direct the pediatrician's attention to the abdomen. Metastasis occurs rapidly and principally through the lymphatics. In 3 cases metastasis occurred in the eye, vertebrae, long bones, and lymph nodes. In the 4th case, the Pepper type it occurred in the liver.

Diagnosis—This is arrived at by the palpation of the mass on physical examination, pyelography, operative findings, and microscopic examination from biopsies and necropsies.

Prognosis—This is always bad. They grow and metastasize so rapidly that when the cases reach the physician they are inoperable. The 4 cases described here were inoperable and died within one and one-half months, three months, and 2 cases in two months, from the time they were recognized. Campbell¹⁴ found an operative mortality of 30 to 40 per cent. Of the 20 cases he studied, all died. Despite the fact that they usually die at operation or shortly after, Lehman¹⁵ has reported a case of neuroblastoma that has survived fifteen years after operation and when last seen was in good health.

Treatment—Preoperative radiation therapy, surgery, and postoperative ir

radiation by the divided dose method should be employed.

Outcome—Mortality 100 per cent. The 4 cases died.

Primary Carcinoma of the Kidney

Primary carcinoma of the kidney is an extremely rare condition in children. Gallard,¹⁶ in a study of 1,063 cases of carcinoma of the kidney, found only 6 cases under 10 years of life. Campbell was able to find only 2 cases reported. Helmholtz states that only 3 per cent of the tumors in children are carcinomatous, whereas in adults 90 per cent are carcinomatous and 10 per cent sarcomatous. In his series of 750 cases of malignancies in children, primary carcinoma of the kidney was not found. Ewing¹⁷ is also of the opinion that the carcinomas are rare in comparison to the mixed tumors. Some investigators believe that there are cases reported as carcinomas that are really mixed tumors.

In this series, 3 cases have been diagnosed as primary carcinoma of the kidney, all of which have been checked by competent pathologists (Table 4)

Age and Sex—One was 6 months, 1 under 5 years, and the other under 7 years. Two were females and the other a male

Symptoms—Here also a perceptible mass was noted in the 3 cases. Abdominal pain, vomiting, fever, cough, shortness of breath, fatigue, and anorexia were also noted. Hematuria, a frequent symptom in adult carcinoma of the kidney, was absent

Metastasis—Occurred in the lungs, pleura, and intestines

Diagnosis—Made by the same procedure described under Wilms' type

Prognosis—Very grave. One died three months, 1 six months, and the other two and one-half years after operation

Treatment—The same as advised under previous kidney conditions

Outcome—Mortality 100 per cent. The 3 cases died

Glioma of the Retina (Retinoblastoma)

As has been mentioned, the question as to whether the retinal glioma or malignancy of the kidney and adrenals is the most common neoplasm in infancy and early childhood is still an open one. Nevertheless, its frequency justifies its importance

Accurately speaking, glioma of the retina is a misnomer, for it does not have its origin from the neuroglial cells and bears no resemblance whatever to the glioma of the brain. This extremely malignant tumor should be more correctly called neuroepithelioma of the retina, or retinoblastoma. It is more closely related to the neuroepithelioma seen in the suprarenal gland. The glioma contains no glia fibers and, as it seems to develop from the retinal analogue of the embryo, it is better to call it a retinoblastoma. The presence of rosettes of columnar cells, a frequent though not constant finding, also suggests the neuroepithelioma or neuroblastoma

| 1-2½ yrs p o | |

Since the retinoblastoma may make its appearance at birth and is usually seen under 4 years of age, it may be regarded as of congenital origin. Verhoeff,¹⁸ however, has reported a case in a patient of 48 years. It is believed that this is the only case on record of retinoblastoma in a person over 15 years of age. At times it shows a familial and hereditary tendency, occurring in more than one child of the same family and in several generations

In this survey, it was observed, as seen in Table 5, that 10 cases (83 per cent) were found in children under 4 years, resembling in this respect the neuroblastoma of the adrenal. The other 2 occurred between 4 and 7 years. Neither any hereditary nor familial characteristics were included in this series. One case had bilateral involvement of the eyes

Sex—Cases were equally divided between both sexes

Symptoms—What most frequently attracts the mother's attention is the appearance of a white spot on the eye (Fig 1). This is the whitish reflection behind the child's pupil that gives the eye the appearance of a cat's eye in the dark. Table 5 reveals that this was noted in 8 cases (66 per cent). Enlargement of the eye was seen in 6 cases (50 per cent), poor vision in 4 cases (33½ per cent),

redness and swelling in 2 cases (16 per cent), and bilateral involvement in 1 case (8 per cent). Unfortunately, dilatation of the pupil, an important and frequent finding, was only mentioned in 3 cases (25 per cent).

Metastasis—Since it has a tendency to spread along the optic nerve, secondary intracranial growths are common and are usually responsible for deaths. Metastasis generally involves the lungs, preauricular and retroperitoneal lymph glands, and long bones. Other organs are less frequently involved. Whether involvement of the other eye is a second primary tumor or metastasis is still a moot question. Berens¹⁹ believes in the former view. He states that the tumor is often seen in the second eye long before evidence of generalized metastasis can be discovered, and that occasionally cures result after enucleation of the worst eye with irradiation of the other less affected eye. Of the 12 cases reported here, metastasis resulted once in the sacrum and spinal cord.

Diagnosis—Established by the appearance of the eye and pathologic re-

FIG 1 Showing white spot behind pupil

port from the organ removed on operation.

Prognosis—Depends upon early recognition and is fair if enucleation is performed before extension along the optic nerve takes place.

Treatment—Enucleation of the affected eye as soon as possible followed by irradiation is the treatment of choice. Before this step is taken, the presence of metastasis should be excluded by a careful examination of the child and x ray of the long bones and of the lungs.

When both eyes are involved, bilateral enucleation is repugnant to the parents. They prefer death of the child. The procedure of choice in this situation is to remove the larger eye and treat the other with radium externally or with radium needles inserted into it. This plan was followed in the 1 case of bilateral involvement mentioned here. Enucleation was performed in all 12 cases.

Outcome—Unfortunately we were not so successful in our follow up of this group. Of the 12 cases, 2 are known to be dead and 10 are unaccounted for.

Bone Tumors

Malignant bone tumors may be either primary or secondary. The latter type, which is usually encountered after middle life, is carcinomatous, while the former, or primary, is sarcomatous and is usually seen during adolescence. The osteogenic

FIG 2 Osteogenic sarcoma, left femur

sarcoma and endothelioma of bone (endothelial myeloma, Ewing's tumor) are the malignant bone tumors that are chiefly met with in childhood and adolescence. The benign giant cell tumor is included here for the purpose of comparison and discussion. It occurs as a rule in persons under 30 years of age.

Of the 10 bone tumors included in this series, 6 belong to the osteogenic group, 2 to the endothelial group, 1 to the benign giant cell tumor, and 1 was classified as a sacrococcygeal carcinomatous teratoma.

Age and Sex Incidence—Nine cases were under 6 years of age, with 8 males and 2 females (Table 6).

While most of the osteogenic sarcomas arise beneath the periosteum at the end of the shaft of the long bones and grow into the medullary cavity, there is a highly malignant type known as the periosteal sarcoma, which arises from the periosteum apparently from the outer layers, growing outward without producing any changes in the shaft or medullary portion (Fig 2).

Osteogenic sarcoma, the most malignant and most frequent bone tumor, is most commonly seen between the ages

of 10 and 30. It is also not infrequently observed under 10 years of age. In fact, the 6 cases all occurred under 6 years of age (Table 6).

Symptoms—The earliest symptom is a persistent dull aching pain, which is worse at night. It may be accompanied by a low-grade temperature, which has led many a physician to think of rheumatic fever. A constant, at times intermittent, unexplained pain should suggest the idea of osteogenic sarcoma. It usually precedes the appearance of the tumor by weeks or months. The fusiform-shaped mass is as a rule located at the end of the bone and fades away on the shaft. All of the 6 cases under discussion here were seen after the appearance of the swelling.

| | d—Sacrococcygeal carcinomatous teratoma unaccounted for | |

Metastasis—Takes place mainly through the blood stream, due to the vascular arrangement. The lungs are most frequently involved. Metastasis to the lungs occurred in 1 case. Before considering any operative step it is necessary to x ray the lungs for metastasis.

Diagnosis—Established by the symptoms of pain and later swelling and with the aid of the x ray. Biopsy is objected to by some who feel that it accelerates growth. Since it resists irradiation while the giant cell tumor responds to it, irradiation may act as a therapeutic test in establishing the diagnosis. This procedure not only assists in arriving at the diagnosis, but restrains the growth and favors successful amputation.

Prognosis—Very bad but not hopeless, especially if the diagnosis is made early by x ray and if proper treatment is immediately instituted. The age is also a determining factor, the prognosis being worse in the very young.

Treatment—After the tumor mass has failed to respond to irradiation and the diagnosis of osteogenic sarcoma is made, immediate amputation should be done. Since metastasis occurs frequently, surgery or radiotherapy or a combination of both do not offer much in the treatment of osteogenic sarcomas. Recoveries, however, have been reported. The mortality rate can only be reduced by early diagnosis.

Outcome—Of the 6 cases under consideration in this report 1 died eleven months after diagnosis and the other 5 are missing.

Endothelial Myeloma (Ewing's Tumor)

The other type of bone tumor seen in children is known under several names as Ewing's tumor, endothelioma of bone and endothelial myeloma. At the present time, this bone tumor has been established as a distinct and important clinical and pathologic entity. Endothelial myeloma is a disease of childhood occurring usually between the ages of 5 and 15 years, and rarely over 30. The small and flat bones are usually involved, such as the tibia,

humerus, femur, fibula, clavicle, and os calcis. It is believed that the tumor probably starts from some type of endothelial cell in the medullary cavity.

Of the 2 cases considered here, 1 was 11 months of age and the other 2 years of age, 1 was a female and the other a male.

Symptoms and Course—The onset of the disease is usually marked by pain, which at first is intermittent then continuous, fever, and the appearance of a swelling. This picture often follows a history of a fall or trauma and therefore strongly suggests osteomyelitis. One of the cases which I will discuss later presented such a picture.

Metastasis—Spread occurs within the shaft both longitudinally and transversely by means of bone canals. Distant spreads occur to the lungs, lymph nodes, and other bones. Bone metastases are very important in the differential diagnosis, for they are rarely seen in osteogenic sarcoma.

Prognosis—Very bad. The disease may be held in check by irradiation for several years, but usually results in death. Ewing,² however, states that cures have been reported by irradiation alone. Our case is still alive after seven years. He also reports that in 24 fatal cases, the average duration of life was nineteen months, and in 54 cases, both dead and alive, the average duration was over three years. One of the cases died nine years after amputation from other causes.

Diagnosis—Established by x ray, response to radiotherapy, and metastasis to other bones.

Treatment—As soon as the diagnosis is made, immediate treatment by irradiation in full doses and over a considerable period of time is necessary. One of the most striking characteristics of this tumor is its response to irradiation. It may melt away completely only to recur. With this in mind, irradiation therapy should be continued long after the signs of the disease have disappeared. Some believe in amputation and irradiation but Ewing states that secondary tumors occur

FIG 3 A Shows endothelial myeloma of right ulna in 1930 before radiotherapy, age 2 years
 B Shows condition after irradiation C Shows condition March, 1938

in children so early that amputation is of little value. Our case, which was treated by irradiation alone, is alive today, seven years after its recognition.

E S, a female child aged two years, was admitted to the hospital on November 13, 1930, with the complaint of fever, pain, and swelling of the right forearm. About two and a half weeks prior to admission the child fell, injuring her right forearm. The following day the arm was observed to be swollen and painful. The child also had fever. X-ray at that time was negative, and on November 12 x-ray revealed the presence of an endothelial myeloma of the right ulna. X-ray therapy was immediately started and the last x-ray taken in March, 1938, revealed no abnormality except a slight degree of cortical thickening in the midshaft of the right ulna (Fig 3). The child today is 9 years of age and enjoying good health. Mortality rate can be reduced only by

early diagnosis and the institution of proper treatment.

Outcome—Two cases of endothelial myeloma were recorded, the above-mentioned case and 1 of the clavicle, who died of bronchopneumonia two weeks after the diagnosis was established.

Giant Cell Tumor

Giant cell tumor was formerly called giant cell sarcoma because this benign tumor was believed to be malignant. It is included in this discussion because it has to be differentiated from the malignant bone tumor. It is usually seen in children and young people under 30 years. It occurs principally at the ends of long bones. The center of the bone is widened with a thinning of the cortex, which condition predisposes to spontaneous fracture. The x-ray picture is highly characteristic. It shows a rarefied multicystic appearance resembling bubbles,

FIG 4 Giant cell tumor neck of left femur

thinning of the cortex and is sharply demarcated (Fig 4). It is highly vascular, and death may occur from hemorrhage. Trauma is usually associated with it but the true condition exists before trauma occurs. Metastasis does not occur in this type.

Treatment—The giant cell tumor responds to irradiation. Surgery, with its risks of hemorrhage and infection, is being rapidly displaced.

Outcome—The 1 case of giant cell tumor in this series is alive after operation and is receiving irradiation therapy.

Brain Tumors

In this series there were 8 cases of brain tumors. Although they do not occur as frequently as in adults, about 14 per cent²¹ develop symptoms before 15 years of age.

The glioma is the most common brain tumor in childhood. The proportion of cerebellar to cerebral tumors in children is about 2:1, whereas in adults it is 1:5.²²

The most common type of glioma encountered in children is the slow growing,

comparatively benign brain tumor consisting of astrocytes. According to the classification of Bailey and Cushing,²³ these gliomas are known as astrocytomas. The astrocytoma is most frequently located in the cerebellum. Since this type of glioma very often undergoes cystic degeneration due to its avascular structure, cerebellar cysts in children as a rule represent degenerated astrocytomas.

The next type of glioma commonly seen in children is the rapidly growing, highly cellular malignant tumor known according to the classification of Bailey and Cushing² as the medulloblastoma. It usually originates in the midline of the cerebellum from the roof of the fourth ventricle.

In this study, as evidenced in Table 7, 1 was classified as an astrocytoma, 1 as a medulloblastoma, 5 under the heading of glioma, and 1 as a cyst of the third ventricle.

FIG 5 Cyst of third ventricle showing pubertas praecox

Age and Sex—All but one occurred under 9 years of age. Five were males and 3 were females.

Symptoms—The classical symptoms of headaches, staggering gait, vomiting, irritability (laughing and crying), dizziness, convulsions, and slow speech as shown in Table 7 were present at one time or other. While choked disc is frequently seen, it may be absent in the infants because the imperfectly ossified sutures may expand on increased intracranial pressure. The presence of local symptoms depends upon the location of the neoplasm and the presence of increased intracranial pressure.

Metastasis to distant organs rarely occurs. The invasion is usually local.

Diagnosis—Established by the presence of the signs and symptoms, x-ray, and encephalography. It must be differentiated from tubercle, brain abscess, gumma, and encephalitis.

Prognosis—Generally bad. The course is usually progressive and terminates in death. The astrocytoma, which is relatively benign, will kill the patient by causing increased intracranial pressure. Cushing states that the average time of survival after operation for the astrocytoma is six years, while for the medulloblastoma it is six months before operation and six months after.

Treatment—Although complete extirpation is difficult, it should be done if possible. Suboccipital decompression may give relief and preserve the eyesight for a while. X-ray therapy should be part of the follow-up treatment.

Outcome—In this series 1 case was lost to observation, 5 cases died within five months following operation, 1, one year after operation, and the case of the cyst of the third ventricle is still alive.

Cyst of the Third Ventricle with Pubertas Praecox in a Female Child

Before leaving this section on brain tumors, I would like to state that the case of the cyst of the third ventricle with pubertas praecox in a female child, though not a malignancy, was reported because of its interesting points. I therefore shall refer to it separately.

A female child, 3 years and 2 months of age, was admitted on October 26, 1936, with the complaint of inability to talk, walk, and stand, or use the right arm or leg. Physical examination revealed a well-developed and nourished child showing evidence of adiposity and premature sexual development: large mature-looking breasts, external genitalia comparable to those of a child at the age of puberty, and sparse pubic hair (Fig 5). A right hemiparesis, thalamic type of pain on that side, marked ankle clonus of the right foot, and bilateral optic atrophy were also noted. The urine was negative for prolactin. On November 16, 1936, ventriculogram showed a large mass filling the region of the third ventricle with enlarged ventricular system on the left and internal hydrocephalus (Fig 6). On December 3 cra-

notomy was done, the third ventricle was entered and the cyst was incised, cauterized, and removed. On discharge from the hospital she showed signs of improvement. She was brighter and recognized people, and although she was still unable to walk, the hemiplegia was improved.

During her last visit it was noted that she had made considerable mental progress. She now can talk and behaves in a manner that approaches normal.

Until the time of the operation, even though the encephalogram revealed a tumor in the third ventricle, the diagnosis of pineal tumors was given serious consideration despite the child's sex.

Pineal tumor is a rare condition that usually occurs in the second decade of life. It gives the symptoms of increased intracranial pressure, localized symptoms, and at times those of *pubertas praecox*. Before the age of puberty children with tumors of the pineal body, in addition to manifestations due to general or localized pressure, present a picture of premature physical and sexual development which has been called by Pellizzi *macrogonitismia praecox*. This syndrome is not a very common one. Haldeman²⁴ in 1927 reviewed the literature and found that of 113 cases of pineal tumor recorded, only 16 cases under 13 years of age showed premature sexual development, all occurring in males. Harrox²⁵ in 1925 stated that there was only 1 case of verified pathologic condition in the pineal body of a female subject showing premature adolescence and that in this case there was a hypoplasia of the pineal body. Again in 1937 Harrox²⁶ declared that this syndrome with one possible exception has always occurred in males. This fact aroused considerable interest in the discussion of this case for a tentative diagnosis of pineal tumor was made.

Just why this picture of premature physical and sexual development occurs in some children and not in others is difficult to explain. Whether this syndrome is a result of disturbed function of the pineal body is still a debatable ques-

FIG. 6. Roentgenogram (ventriculogram), showing cyst of third ventricle.

tion. Against the argument that it is due to the destruction of this body which by some is considered a gland we have the failure of development of precocity in animals after destruction of the body and failure to produce growth in animals after feeding the extract. Furthermore, cases have been reported in which there has been a complete destruction of the pineal body without the development of *pubertas praecox*. Harrox and Bailey in 1925²⁷ reported a case of pineal tumor with infantile development. Relationship between *pubertas praecox* and tumor of the pineal body can be disproved by the presence of the syndrome in tumors of the third ventricle without involvement of the pineal body. Such cases have been reported by Weiland,²⁷ Harrox and Bailey,²⁸ and Bailey.²⁹ All of these have been found in male subjects. To these, this case of cyst of the third ventricle presenting signs of a brain tumor and that of premature sexual development in a girl of 3 years of age may be added. Premature sexual development may also make its appearance in cases of tumor of the adrenal, ovary, and testicle.

Thus, we can see that the explanation for the appearance of premature sexual development in these cases is still obscure and mysterious.

FIG 7 Roentgenogram showing displacement of kidney by retroperitoneal tumor

The following features are of interest in this case its rarity, sex, clinical resemblance to pineal tumor, and the fact that it shows that symptoms of brain tumor and pubertas praecox can occur in tumors located in other regions of the brain besides that of the pineal body

Retroperitoneal Lymphosarcoma

Retroperitoneal lymphosarcoma is not as uncommon as one might be led to believe. A tumor formed of retroperitoneal lymph nodes produces abdominal enlargement and frequently this disease is mistaken for a kidney or adrenal tumor. Its course is usually rapid and is almost invariably fatal. At times intestinal involvement is also present, making the exact origin of the neoplasm doubtful. The 5 cases under discussion were all under 6 years of age and 2 were males while the other 3 were females.

Symptomatology—As illustrated in Table 8, the symptoms are similar to those produced by a kidney neoplasm.

Metastasis—Occurred in other lymph nodes, lungs, brain, and liver.

TABLE 8—RETROPERITONEAL TUMORS (5 CASES)

| | 1 lymphosarcomas | No. of Cases |
|---|---|--------------|
| 1 | Age and sex incidence | |
| | Between 6 months and 1 year | 1 |
| | Between 2 and 3 years | 2 |
| | Between 3 and 4 years | 1 |
| | Between 5 and 6 years | 1 |
| | 1 males 3 males 2 | |
| 2 | Symptoms | |
| | a—Perceptible mass | 4 |
| | b—Abdominal pain | 2 |
| | c—Loss of weight | 1 |
| | d—Loss of appetite | 3 |
| | e—Convulsions | 1 |
| | f—Constipation | 2 |
| | g—Limp in right leg | 1 |
| 3 | Metastasis | |
| | a—Lungs and brain | |
| | b—Lymph glands | |
| | c—Lungs and liver with ascites | |
| | d—Spine | |
| 4 | Diagnosis | |
| | a—Perceptible mass | |
| | b—Operation | |
| | c—Path report | |
| 5 | Prognosis | |
| | a—Bad—usual course is rapid, progressive, and fatal within a few months | |
| 6 | Treatment | |
| | a—Operation | 4 |
| | b—X ray | 1 |
| 7 | Outcome—all died | |
| | 2 yrs duration—died | |
| | 3 mo duration—died | |
| | 1 1/2 yrs duration—died | |
| | 5 mo duration—died | |
| | 3 mo duration—died | |

Diagnosis—A differential diagnosis between a kidney tumor and a retroperitoneal has more than academic value, for it will spare the child an unnecessary operation. As a rule, more than one mass is felt. Other small, freely movable abdominal masses may be palpated, confusing the picture with T B C, peritonitis, and Hodgkin's. Urographic studies will usually show displacement of kidney and help in the recognition of the disease (Fig 7).

Prognosis—Grave. The usual course is rapid, progressive, and fatal within a few months.

Treatment—Operation is of little value, for the condition is usually widespread. Operation was performed on 4 cases, and the usual picture of scattered involvement was observed. The more conservative method, radiation, appears to be the treatment of choice.

Outcome—The 5 patients died. Of the 4 cases operated on 3 died within one month of the operation and the other within three months. If we consider the time the abdomen appeared to be enlarged as the date of the diagnosis, we can conclude that no case survived longer than two years since its recognition.

| | b—Liposarcoma or thymoma—Irradiation |
| 7 | Outcome—three patients died |

Mediastinal Tumors

Three cases of mediastinal tumors were encountered in this review. In 1 case the diagnosis has not been definitely established, there being a difference of opinion between two of our leading authorities on the subject. One has classified it as a liposarcoma, the other as a thymoma. In view of this, we shall just mention it in passing. The other 2 cases are teratoma of the mediastinum and primary carcinoma of the thymus gland.

Ewing³⁰ describes a teratoma as a tumor composed of tissues and organs of one, two, or three germinal layers as monodermal, bidermal, or tridermal types. Boyd³¹ says, "It is an attempted formation of a new individual within the tissues of the patient. A malignant growth however may develop in a teratoma. It is discussed here among the malignancies because of its high mortality and because it is potentially malignant."

The occurrence of a tumor in the mediastinum and not originating from the normal mediastinal structures is rare and particularly so in children. Hedblom,³² reviewing the literature and with his own 6 cases included, brought the number of cases of intrathoracic dermoid cysts and teratoma to 191. Houghton³³ in 1936 raised the total number to 216.

Intrathoracic dermoid cysts and tera-

FIG. 8. Roentgenogram showing mass behind heart and areas of calcification in left lung.

tomas are especially rare in children. In 1924 Smith and Stone³¹ searched the literature and accounted for 10 cases in children under 12 years of age. Wilcox and Wollstein³² in 1931 reported a case of mediastinal teratoma containing tissues of the three germinal layers and brought the number of cases under 12 years of age to 14. Eight of these cases were in children under 5 years of age, while 6 were dermoids and 8 teratomas. In these reviews, the case of Smith,³¹ a dermoid cyst in the mediastinum of an infant, was not included and therefore the number should have been 15. Hedblom's report in 1933 included 22 cases of intrathoracic cysts and teratomas in children under 12 years of age. Since then cases of mediastinal teratoma in children have been reported by Lawrence and Herzberger³⁴ and by Wheatley,³⁵ the latter case being the one included in this series of malignancies. The infrequency of this condition can thus be appreciated.

Symptoms—Those that are due to pressure on neighboring structures, as cough, dyspnea, asthma, and cyanosis.

Diagnosis—Established by the aid of the x ray, which in addition to the mass

at times shows areas of calcification in the lungs (Fig 8) Examination of the aspirated fluid and thoracotomy confirm it At times it is difficult to differentiate it from an empyema

Prognosis—Bad The mortality rate is extremely high

Treatment—Since the teratoma is potentially malignant, it should be completely extirpated whenever possible

Primary Carcinoma of the Thymus

Primary carcinoma of the thymus is a relatively rare disease and especially so in children It is its rarity in childhood that prompts me to make a brief comment

H A, a female child 2 years of age, was admitted to the ward on July 28, 1932, with the complaint of dyspnea, cough, and prominence of the chest wall At the age of 3 months the child gave a history of breath holding and cyanosis X-ray at that time revealed an enlarged thymus for which radiotherapy was given On June 1, 1932, eight weeks before admission, her mother noticed that the anterior chest was prominent and that the child had dyspnea and cough X-ray on July 1, 1932, showed an enlarged thymus (Fig 9) X-ray therapy was again instituted but the child became progressively worse and was admitted to the hospital on July 27, 1932 (Table 9)

Physical examination showed a well-developed and nourished female child, 2 years of age, breathing noisily both on inspiration and expiration with an inspiratory dilatation of the alae nasi and retraction of the lower intercostal spaces Pigeon breast deformity and slight cyanosis of lips and cheeks were also noted A diagnosis of mediastinal tumor was made The child died one week after admission Necropsy report Primary carcinoma of the thymus gland

Crosby³⁶ in 1932 made an extensive and thorough search of the literature on malignant growths of the thymus gland and was able to collect 166 cases in all Forty-four of these were classified as carcinomas and 122 as sarcomas His

FIG 9 Roentgenogram showing primary carcinoma of the thymus gland

review is even more startling when one notes that only 3 cases of primary carcinoma of the thymus occurred in children under 13 years of age The survey showed that carcinoma of the thymus usually occurs after the age of 40 During the same year, Symmers³⁷ reported 25 malignant growths of the thymus and not a case under 13 years of age was found Slesinger³⁸ in 1936 brought the total number of cases of primary carcinoma of the thymus to 53 Touroff's³⁹ case of primary carcinoma of the thymus in a child brought the total in children up to 4 Since then no other case has been reported in childhood With this case, which has been briefly presented here, the number of primary carcinomas of the thymus under 13 years of age has been extended to 5

Carcinoma of the Liver

Primary carcinoma of the liver in infancy and childhood is a relatively rare and rapidly fatal disease Death usually occurs within three to four months following its recognition Its rarity can be appreciated when one learns that up until 1933 only 100 cases were reported in the literature²²

In this review, 2 cases of primary carcinoma of the liver were encountered

Both were males, 10 months of age and the other 11 years

Symptoms—As seen in Table 10, the outstanding symptoms were enlarged abdomen, loss of weight, fever, vomiting abdominal pain, cough, and chest pain

While metastasis is not a very common occurrence it occurred in the lungs in 1 of the cases.

Diagnosis—Established by physical examination, operation, and pathologic report.

Prognosis—Grave The patient usually dies within a few months after recognition

Outcome—Both of the cases died within this period of time.

Carcinoma of the Ovary

While ovarian tumors in children are seen more often during the second decade of life, that is, about the age of puberty and just after, cases have been reported during the first decade and even as early as in a 7-month fetus.⁴⁰ Tumors of the ovary comprise about 1 per cent of all tumors in children.²¹

Loeb and Levy,⁴¹ in reviewing the literature up to 1931, brought the number of cases of ovarian cysts and tumors in children under 10 years of age to 115. Of these, 10 were listed as primary carcinoma of the ovary and 16 as carcinoma or sarcoma. Of the 64 cases surveyed here, 2 cases of primary carcinoma of the ovary were observed. In 1 of these children the condition was recognized at 2 years of age and in the other at 9

Symptoms—The child as a rule is not brought to the physician until the abdomen becomes enlarged or until a mass is perceptible. As shown in Table 10, this enlargement may be accompanied by vague abdominal pain, loss of weight, anorexia, and fatigue. While it was not noted in these 2 cases, sexual precocity (adult distribution of hair, enlargement of the breasts and external genitalia, and menstruation) may be present as a result of ovarian tumors.

Metastasis—From Table 10 it is obvious that these tumors metastasize to

TABLE 10—PRIMARY CARCINOMA OF THE LIVER
(2 CASES)

| | No. of Cases |
|---------------------------------|--------------|
| 1 Age and sex incidence | |
| 1-10 months of age | |
| 1-11 years of age | |
| Males | |
| 2 Symptoms | |
| a—Enlarged abdomen (palp. mass) | 2 |
| b—Loss of weight | 2 |
| c—Fever | 2 |

| 6 Outcome—both died | |

PRIMARY CARCINOMA OF THE OVARY (EMBRYONAL)
(2 CASES)

| | |
|---------------------------------------|---|
| 1 Age and sex incidence | |
| One between 2 and 3 years | |
| One between 9 and 10 years | |
| Females | |
| 2 Symptoms | |
| a—Fatigue | 1 |
| b—Poor appetite | 1 |
| c—Abdominal pains | 1 |
| d—Loss of weight | 2 |
| e—Enlarged abdomen | 2 |
| 3 Metastasis | |
| a—Lungs | |
| b—Lymph nodes | |
| c—Abdominal organs | |
| d—Left ovary | |
| 4 Prognosis—bad | |
| 5 Treatment—operation and irradiation | |
| 6 Outcome—death | |

the lymph nodes, the ovary, abdominal organs, and lungs

Diagnosis—Arrived at by careful physical examination, operation, and microscopic examination of the operative specimen. When signs of premature sexual development are present, there three other conditions that must be ruled out: tumors of the suprarenal cortex, of the pineal body, and of the third ventricle. The latter two can be excluded by the fact that they are almost always found in the male, by encephalography and by the absence of a mass in the abdomen. The other can be differentiated by the male type of sexual precocity. If it occurs in a female the masculine characteristics manifest themselves as hypertrichosis, change in voice, and hypertrophy of the clitoris.

Treatment—Consists in complete extirpation as early as possible before metastasis has occurred and postoperative irradiation. Unfortunately, this was done in both cases after metastasis had set in.

TABLE 11—FIBROSARCOMA OF THE PHARYNX (1 CASE)

| | |
|--|--|
| 1 | Age and sex incidence 5 years of age Female |
| 2 | Symptoms a—Swelling of the left jaw b—Sore throat c—Difficulty in breathing and swallowing d—Internal strabismus (left) e—Foul breath f—Loss of weight |
| 3 | Metastasis Cervical lymph nodes |
| 4 | Treatment a—Tracheotomy b—Radium c—X-ray |
| 5 | Outcome Patient died five months after illness |
| PRIMARY CARCINOMA OF THE THYROID GLAND (1 CASE) | |
| (A rare disease—18 cases reported to date) | |
| 1 | Age and sex incidence 11 years of age Male |
| 2 | Symptoms a—Mental and physical retardation b—Hoarseness c—Difficulty in breathing |
| 3 | Prognosis Fair if surgery with the aid of irradiation is resorted to early |
| 4 | Treatment a—Subtotal thyroid resection b—Radiotherapy |

The question of postoperative irradiation is still a debatable one, the fear of ovarian hypofunction being the issue. I believe the more popular view is to irradiate all cases of malignant tumors of the ovary in children.

Prognosis and Outcome—As a rule grave, but if the condition is detected early and before it metastasizes the outlook will be much brighter. Of the 2 cases under discussion, 1 died four months after recognition of the disease and the other died four years after first operation and x-ray therapy.

Primary Carcinoma of the Thyroid

Primary carcinoma of the thyroid in children under 14 years of age is not a common occurrence. It is more commonly seen in females than in males. In Pemberton's⁴² series the proportion was 2:1 in favor of females. The case reported here occurred in an 11-year-old boy.

E. C. was admitted to the hospital on March 3, 1933, with the complaint of a mass in the neck since birth, which had become progressively larger. With this he also gave evidence of being physically and mentally retarded. Hoarseness was present since birth but was more pro-

nounced during the past two years. A slight difficulty in breathing was also present (Table 11).

The patient had had three previous operations for goiter at 6 months, 7 years, and at 9 years of age.

Physical examination revealed a large swelling in the neck, occupying practically the entire anterior region. The mass was firm and nodular. On March 25, 1933, a subtotal thyroid resection was performed.

The patient expired on March 28, 1938.

Pathologic report Multiple adenocarcinoma of thyroid, probably of fetal origin.

Kennedy⁴³ in 1935 searched the American literature for twenty years and found 6 cases in which carcinoma of the thyroid gland affected children. To these he added his own 8 cases, bringing the total to 14. In 1937 Hare⁴⁴ reported 3 additional cases of carcinoma of the thyroid in children under 13 years of age and brought the number to 17. The case reported herewith makes the total 18.

Prognosis—As a rule, carcinoma of the thyroid in children is of low malignancy, growing slowly and metastasizing after a long period of time. It is also peculiarly radiosensitive. These factors all point to a favorable prognosis. Of the 8 cases reported by Kennedy, 7 were known to be alive after having the disease from two years to thirteen and one-half years.

Treatment—Consists of surgery and radiotherapy.

Fibrosarcoma of the Pharynx

Although cases have been reported in childhood, sarcoma of the pharynx is not a very common disease in children. The tumor may begin either in the nasopharynx within the tonsillar tissue or from the pillars and spread downward. Regardless of age, a unilateral enlargement of a tonsil should cause one to suspect the possibility of a malignancy. The disease may remain within the tonsil for a variable period of time and then break through the capsule and spread to the

neighboring glands and thus render the outlook grave (Table 11)

The case under discussion occurred in a female child of 5 years of age. Apparently the growth had begun in the tonsil, for prior to admission to our hospital a tonsillectomy had been performed at another institution. Soon after that the condition became progressively worse, and despite radium treatment, the child died five months after onset of the disease.

General Outcome

Unfortunately, 22 cases (35 per cent) were lost to observation. However, a study of the 42 known cases reveals that 1 embryonal adenomyosarcoma is alive today apparently cured, five and one-half years following nephrectomy and another was last seen two and one half years after operation, living and well. The case of Ewing's tumor of the ulna is enjoying good health today, seven and one-half years after treatment was started. Since the cases of the giant cell tumor and cyst of the third ventricle, although still alive, are not malignancies, they are not included among the survivals of malignant disease. Only 3 cases therefore, have survived beyond two and one half years. Seven additional cases, which were clinically diagnosed as malignant, were not admitted to this group because of a lack of confirmatory microscopic examination. It is obvious therefore, that the mortality rate would have been much higher.

Summary

1 A study of 64 cases of malignancies in infants and older children is made. All were confirmed by a study of the gross pathologic findings at operation as well as by microscopic examination of tissues obtained from biopsies and necropsies.

2 The various types of malignancies, the age and sex incidence, signs, symptoms course, and treatment are discussed.

3 Forty six, or 72 per cent, of the cases were encountered during the first 5 years of life.

4 The cases were about equally divided between both sexes, 35 being males and 29 females.

5 Tumors of the kidney and adrenal led in the order of frequency, with those of the eye, bones, brain, retroperitoneal glands, mediastinum, liver, ovary, pharynx, and thyroid gland following in the order named.

6 Wilms type of kidney tumor was the most common neoplasm in infancy and childhood.

7 Such rare conditions as primary carcinoma of the kidney, thymus, and thyroid, mediastinal teratoma, and cyst of the third ventricle with pubertas praecox in a female child are discussed.

8 Of the 64 cases, 22 were lost to observation, and of the 42 known cases, only 5 are known to be alive today (2 of which are not malignant).

9 Seven cases that were clinically diagnosed as malignant were not included because of lack of pathologic confirmation.

10 Death rate, therefore, must be higher than that recorded.

Conclusions

Since it has been demonstrated in this study, even though the number is very small, and by others that children can survive malignant disease if recognized early and radiotherapy is applied either alone or combined with surgery, the disease should not be regarded as entirely hopeless. Another encouraging feature is the fact that such neoplasms as the Wilms tumor of the kidney (the most common), endothelial myeloma, and carcinoma of the thyroid are radiosensitive. Recent advances in the application of radiotherapy and early recognition of the disease offer the best hope of decreasing this frightfully high mortality rate.

The author is indebted to Drs John Frederick Erdmann, Chas Gordan Heyd, and Henry H Ritter for the case that they each contributed to the departments of pathology and roentgenology for their cooperation in the collection of the pathologic specimens and roentgenograms and to Dr Adolph G De Sanctis, director of the pediatric service.

Discussion

Dr Albert Preston Knight, *Waverly*—Dr Scotti is to be congratulated upon the selection of his subject particularly because of the difficulty in diagnoses, of the unavoidably bad prognosis, and of the usual hopelessness of any treatment. His fine, careful, scientific research, and his splendid "follow-up" of this interesting group, together with his courage in presenting a group of cases whose mortality is so distressingly

high deserves the highest commendation His fine paper offers a hope that a technic may be developed by others than himself, by which, through early diagnosis, a lowered mortality may be obtained The very vagueness of the early symptoms, or even the absence of them, may be considered a reason for the oversight of these neoplasms, and Dr Scotti's paper is bound to induce a consciousness of the possible meaning of such signs and symptoms which cannot be correlated with the simpler diagnoses

His observation, in this series of cases—that the highest incidence of occurrence of these neoplasms is found in the third year of life—is extremely interesting, particularly since this is the period in which the general practitioner or even the pediatrician sees but little of the child, his infant-feeding period is over, and his contact with contagion and accidents has not yet begun, hence the opportunity for close observation for neoplastic development is markedly decreased just at the point wherein an early diagnosis is so notably important and so liable to be missed completely It requires the development of a "tumor-consciousness" and the retaining of that consciousness which will be of most help in the search for these rare, but so vitally important conditions

It has been my fortune, good or otherwise, during the past week to see a possible sarcoma of the uterus upon our pediatric service at the Robert Packer Hospital in Sayre Since it falls in this particular class of cases, which Dr Scotti has presented, I beg to presume to discuss our findings as indication of the very points which Dr Scotti has brought out so ably in his paper

A little girl, aged 9 years, was admitted to the service for study on May 1, 1938 The chief complaint was a mass in the lower abdomen pain on urination, and pain in the lower abdomen About the 19th of March, only six weeks ago, the child complained for the first time, of a sense of fullness after eating a usual meal, and there was noted an increased irritability Upon the morning of April 19, 1938, she was seized with a sudden severe pain just above the pubis, which continued throughout the day, and which was thought by the mother to be due to constipation and for which she was given an enema. At this time the mother noted the mass in the lower abdomen, and thought it was due to a distended bladder but observed that following micturation, the size of the mass failed to decrease. She was seen by her local doctor four days later, and was admitted to the local hospital, not our institution, for study The report from this hospital reached us that there was found a well-defined, firm, tender suprapubic mass,

extending four fingers above the umbilicus in the midline, and it was symmetrical in outline. The child's temperature was 100 F. She was catheterized and there was no alteration in the size of the mass. The following day the cervix was dilated and four ounces of dark bloody fluid was lost and the uterine cavity was found to be enlarged. Following dilatation of the cervix the mass increased in size. Other points in the history were as follows: (1) that she complained of headache and pressure in the temporal regions about six weeks ago and was fitted with glasses; (2) that she had lost about 10 pounds in the past month; (3) that she complained of a sense of fullness after eating and that constipation had developed since her first hospitalization; (4) that she has cramp-like pains in her lower abdomen when urinating; (5) easily disturbed nervously; (6) an interesting point in the family history is that the mother had an ovarian dysfunction.

Following admission to our service the outstanding points in the physical examination were as follows: Temperature 101.2 F. rectal pulse 128, respiration 22. Dry and hot skin. Irritable but cooperative. Slight adenoma of thyroid gland. No abnormal breast development or secondary sex characteristics. Physical examination of thorax was negative for pathologic findings. In the abdomen there was a pyriform mass, lying in the midline, and symmetrical above the symphysis and extending upward to the umbilicus. The tissue over this area was very tender, associated with a slight rigidity and a slight tenderness in the costo-vertebral angles. On rectal examination one noted a firm mass 10 cm. above the anal ring which was quite hard and the whole area was exquisitely tender.

A cystoscopic examination was done, and proved negative for any pathologic findings.

The roentgen report noted a midline abdominal tumor mass arising from the pelvis, probably an enlarged uterus. The report upon the lung fields showed no pathologic changes.

The laboratory tests showed the following points of interest: the Friedman's test was positive in normal concentration of urine; the urinary studies were constantly negative except for a slight trace of albumen; the Kahn test was negative; the tuberculin reaction was negative; and the blood chemistry showed no particular change from the normal figures. No marked secondary anemia was observed, though the white cell count was 19,700 with a differential count of 88 per cent polymorphonuclears and a lymphocyte count of 12 per cent.

On May 5 1938 a laparotomy was done. In the midline, in the lower abdomen there was a

pyriform mass the anterior surface of which was adherent to the anterior abdominal wall. These adhesions were freed with much difficulty and on entering the peritoneal cavity there was found a mass extending upward from the cervical region of the uterus contiguous with this organ and completely masking it. Its anterior surface was somewhat rough, and had many bleeding points from the freeing of the adhesions; it was somewhat soft in consistency though the mass itself was not particularly vascular since there was but little bleeding when it was incised for a specimen for biopsy. Anteriorly the bladder was adherent as were loops of small bowel upon the proximal surface, with adhesions of both ascending and descending colons upon either side. Marked vascularity with distended veins laid on either side of the mass which together with the adhesions made mobilization and removal impossible.

A biopsy was done and frozen sections were made followed later by paraffin sections, which showed sarcoma to be present in which degeneration had begun. This one section was taken from the anterior surface of the mass and indicated only the tissue available for biopsy in that region, hence a complete pathologic diagnosis is impossible until autopsy permits study of the entire mass with its possibilities of teratoma with sarcomatous degeneration as a further consideration.

The abdomen was closed and the patient returned to the ward in good condition. Except for a slight postoperative rise in temperature she is progressing nicely as far as the laparotomy itself is concerned. Deep roentgen-ray therapy is to begin as soon as the abdominal wound is healed, with the hope of alleviation of some of the symptoms which are bound to develop. Further studies of the case are to be done and reported later.

It is felt that the history of this case definitely illustrates the vagueness of the signs and symptoms early in the development of the tumor mass and emphasizes the need for a tumor consciousness which Dr. Scotti has brought to our attention.

Dr. Alfred F. Hocker, New York City—Dr. Scotti's paper is a timely one because it impresses us with the fact that cancer is not only a disease of advanced age but occurs also in infancy and childhood. Although the pediatrician sees relatively few cases of cancer in his practice a paper on the subject tends to make him more alert to its possibilities and thereby to recognize the disease in an earlier stage. Dr. Scotti has tersely stated the end results obtained by the best accepted methods of treatment employed during

the past few years. They conform with those of other observers and the only conclusion we can make is that they have been uniformly poor.

Surgery has practically reached the limit of its possibility in the cure of cancer in the young. X-ray therapy is less static and with the improvement in equipment and, the technic of administration, offers, either alone or in combination with surgery, some hope for the cure of certain types of the disease. If cure cannot be obtained then I am certain that the benefit in prolonging life comfortably is substantial.

One feature common to tumors of children is that the localities in which they originate are different from those affected by neoplasms of adults. For example, the great proclivity of infants and children to malignant tumors of the kidney and eye is in marked contrast to the rarity of tumors of these organs in adults. The data presented by Dr. Scotti furnishes evidence of the unusually high incidence of renal tumors in children.

For many years the primary treatment of Wilms' tumors has been by nephrectomy alone or nephrectomy supplemented by pre- and post-

operative x-ray therapy. Because recurrences are so frequent after operations, Dean, Ferguson, Alcock, and others believe that this treatment should be discarded.

Due to the radiosensitivity of Wilms' tumors, which depends on its congenital origin, embryonal structure, and unstable vascularity, x-ray therapy alone is now becoming the treatment of choice. Cases treated in the past few years by new and improved techniques of irradiation have shown encouraging results in the hands of several observers. Dr. Walter McNeill reported on a patient with Wilms' tumor at the last meeting of the American Urological Association who was treated in September, 1934, and who is still alive at the present time without evidence of disease. Alcock has 2 cases which have survived over four years and Dean has recently declared that irradiation alone is the treatment which will be pursued in the future.

These immediate results are at least encouraging and point out that continued study and further improvements in x-ray technic may produce a more uniform and favorable survival rate in the treatment of Wilms' tumors.

The Forty-first Annual Meeting of the Medical Library Association will be held June 27-29, 1939, at the Academy of Medicine of Northern New Jersey, 91 Lincoln, Park, Newark. The program will include addresses, discussions, and demonstrations on library procedure, medical history, and literature.

This association consists of about 250 of the medical libraries of this country and Canada, together with their librarians and a group of supporting members who are chiefly physicians in-

terested in medical literature and libraries. The officers of the association are as follows: president, Mr. James F. Ballard, Boston; vice president, Dr. George R. Minot, Boston; secretary, Miss Janet Doe, New York; treasurer, Miss Louise D. C. King, Baltimore; chairman of executive committee, Miss Marjorie J. Darrach, Detroit.

Everyone who is interested in a wider knowledge of medical literature and in the development of medical libraries is invited to attend.

Deaths of New York State Physicians

HOUSE OF DELEGATES
MINUTES OF THE ANNUAL MEETING
[Continued—see page 1246 for index]

April 24 and 25, 1939

Evening Session

Monday, April 24, 1939

The session reconvened at 8 30 o'clock.
SPEAKER FLYNN The House will be in order
Is there a quorum present Mr Secretary?
ASSISTANT SECRETARY PODVIN There is

58. Amendments to Constitution and Bylaws
Sections 15 87

SPEAKER FLYNN The first order of business
this evening is certain amendments and revisions
to the Constitution and Bylaws which are before
you for action. I am going to ask Dr Podvin
the Assistant Secretary to read the first section

Change of Dues Year

Bylaws—Chapter I Section 2

ASSISTANT SECRETARY PODVIN This first
change in the Bylaws merely refers to changing
the date of the fiscal year and so it has no relative
importance as to change of meaning of the By
laws except the changing of dates. It reads as
follows

CHAPTER I SECTION 2

Add to (a) new sentence following the words
and payable

The dues year shall coincide with the
fiscal year July 1st to June 30th of the
succeeding year "

That part in the old constitution reads

The term 'good standing' is hereby defined
as (a) A member is in good standing when his
dues to his County Society and the assessment
of the State Society have been paid when they
are due and payable

and you add to that

The dues year shall coincide with the fiscal
year July 1st to June 30th of the succeeding
year

The second change

'Change (b) first sentence by deleting the
words May 31' and inserting the words De-
cember 31st,' making it read

A member whose dues and assessments are
unpaid after December 31st of any current
year is not in good standing '

It is the same sentence as appears in the present
Bylaws, only a change of date.

The third change

'Change (c), first sentence, by deleting the
words December 31' and inserting the words
June 30th, and making it read

A member whose dues and assessments are
unpaid after June 30th of any current year
shall automatically be dropped from the
rolls of membership

Add a new portion to be known as (d) to read
as follows

'The change of the dues' year shall first
become operative on July 1st, 1940 pro-
vided, however that County dues and State
assessment shall be paid at half the annual
rate for the six months period January 1st
1940 to June 30th 1940 the full regular
annual rate to be paid thereafter as hereto
before provided '

You see that is to make the change in the fiscal
year beginning July 1 so that in 1940 we will pay
half dues for the first half of the year and then
full dues for the last half and for the first six
months of the next year

In the event of the adoption by the House of
Delegates of the foregoing sentences, (a) (b)
(c) and (d) It will be necessary to change the
following previously suggested amendment
(d)

Dues and State assessment of a member
elected or reinstated after November 1st
shall be credited to the ensuing calendar
year all rights and privileges of member-
ship, however dating from the time of elec-
tion,

to read as follows

(e) Dues and State assessment of a mem-
ber elected or reinstated after May 1st shall
be credited to the ensuing calendar year
all rights and privileges of membership
however dating from the time of election.

In the event that the amendments changing
the dues' year should not be adopted, there
would still be before the House for action the
previously suggested amendment to Section 1
which would become sentence (d) allowing
dues collected after November 1st to be
credited to the ensuing calendar year

That is submitted by the Council, and I as-
sume is before the House for adoption. I so
move.

The motion was seconded.

DR. MERWIN B MARSLAND Westchester I
raise the question about the wording of this
amendment where it speaks of reinstatement af-
ter May 1 being credited to the ensuing calen-
dar' year Is it the intention there to say to the
ensuing fiscal year?

DR. JAMES F ROONEY, Albany I think Dr
Marsland is quite right, because the intention of
the Board of Trustees was that all of the dues
collected after May 1 in the event of the adop-
tion of these amendments, was to be credited to
the ensuing fiscal year not the ensuing calendar
year In conformity with our present procedure
where the fiscal year runs from January 1 to
December 31 and where all dues collected after
November 1 of that calendar year are credited to
the ensuing calendar year this wording should be
changed to read the ensuing fiscal year on
members elected or reinstated after May 1 and
not the ensuing calendar year

DR WALTER D LUDLUM, *Kings* I also agree with that statement

DR. LEO F SCHIFF, *Chnton* I move that Section (e) be amended by substituting the word "fiscal" for the word "calendar" in referring to the year

The motion was seconded, and as there was no discussion, the motion was put to a vote, and was unanimously carried

SPEAKER FLYNN Is there a desire to adopt (a), (b), (c), (d), and (e) en bloc, or would you desire to take each one separately They all pertain to the same subject, the changing of the fiscal year

DR. JAMES F ROONEY Yes, just the necessary changes to make effective a fiscal year running from July 1 to June 30 I think the members may be interested to know why the proposal was made that the fiscal year be changed The reason for it is this All officers take office immediately after the Annual Meeting of this Society, which usually occurs in the late spring months, in contradistinction to the old procedure of the Society, which is a heritage from the old Medical Society of the State of New York before the consolidation of the Association and Society, which the Society was obliged to meet in January of every year concurrently with the Legislature for the supposed effect upon legislative opinion, and all the meetings had to be held in Albany At that time it was perfectly all right to run the fiscal year from January 1 on because the meeting was always held before the third week in January, and when those officers took over it meant a very easy financial adjustment from January 1 to December 31 After the consolidation, after the breakup and consolidation of the old Society and, shall one say, withdrawing Association due to a rift at that time, the meetings were held in the spring, but there has been no change made in the Constitution or Bylaws to adjust the fiscal year in conformity with the change of the time of meeting, so that our treasurer's report and all the rest of the financial affairs of the Society have been running on two bases a fiscal year ending December 31 and an annual year beginning usually the 1st of June

In order to adjust those differences the Trustees felt that they should be brought into conformity, and they suggested that the fiscal year run from July 1 to June 30 It is going to make it very much easier for accounting purposes, for the audit, for the conduct of the financial affairs of the Society, and for a better understanding on the part of the membership All of these proposed amendments are merely one, embodying the necessary changes in various portions of the Constitution and Bylaws relating to the fiscal year I move you, Mr Speaker, therefore, that the House consider all of these amendments as one amendment, and that we vote on the matter as a whole

The motion was seconded, and as there was no discussion, the motion was put to a vote, and was unanimously carried

Component County Medical Societies—Policies Bylaws—Chapter XV Section 89

SPEAKER FLYNN The next is a proposed amendment to Chapter XV of the Bylaws

ASSISTANT SECRETARY PODVIN Also submitted by the Council

"Amend by adding a new Section 7 to read

"The component County Medical Societies, their officers, committeemen, and members shall not initiate any policy, propose any legislation or participate in any activities that are contrary to the policies of the Medical Society of the State of New York This shall not be interpreted to prevent a component County Society from initiating any policy applicable to the profession within its boundaries and within the framework of adopted policy of the Medical Society of the State of New York"

SPEAKER FLYNN You have heard this proposed change read to you by the Assistant Secretary What is the pleasure of the House of Delegates?

DR ARTHUR S DRISCOLL, *Richmond* I move the adoption of the proposed change.

The motion was seconded

SPEAKER FLYNN It is now open for discussion

DR GEORGE BAEHR, *New York* This impresses me, Mr Speaker, as a gag rule which will do the Medical Society of the State of New York no good

DR LAURANCE D REDWAY, *Westchester* Mr Speaker and Gentlemen of the House of Delegates There is before this House for your consideration a new section, being an amendment to Chapter XV, Section 7, of the Bylaws of the Medical Society of the State of New York

You have read it, probably, with the same amazement as we in Westchester amazement that the honorable Council of the State Society could presume to ask men of intelligence to squander their time in the serious consideration of a measure which would gag their utterance, stifle their opinions, and limit their thinking This is an amendment which would confine to the limits of county concentration camps the thoughts and activities of the various County Societies, their officers, committeemen, and members Is this a State Medical Society or a Bund?

It can't happen here? We, of Westchester, say it *has* happened here Before your eyes is the evidence, a measure, which, gentlemen, would replace the free and untrammelled processes of American democratic practice by the strangulation of authoritarian rule, in this Society, in the State of New York The honorable Council of the Medical Society of the State of New York has the effrontery to ask you to confer that power upon it

But that is not the worst, gentlemen Degrading and vicious as the measure is, insulting to your ideals and intelligence as is the fact that you are being asked even to consider it, far worse in its ultimate effects and implications is the fact that it could have been written at all

Who in this honorable Society, or what group, is responsible? That, gentlemen, is important It is a foregone conclusion that you will defeat the measure—I hope unanimously But you will not thereby have altered the fact that within the Medical Society of the State of New York some, some group inoculated with the virus of authoritarian power has conceived it, has openly coveted the abridgment of your constitutional right of free speech and liberty of action Some person, some group of sufficient persuasiveness has prevailed upon the honorable Council of this Society

to place this blot upon the otherwise proper agenda of last year's and this year's meeting displaying to the public contempt on the record this measure in all its vicious and degrading implications of suspicion fear and neurotic excitement.

If this has happened once. It can happen again. We, of Westchester, call upon you gentlemen not only to defeat the measure but to conduct an inquiry into its origin. We call upon the Speaker of the House to require a rising vote on this measure that we may all ascertain the extent if any and the locality, if such there be, wherein the support of such an undemocratic and disgraceful proposal may be found. (Applause)

DR. WALTER P. ANDERTON *New York* I move you the question.

SPEAKER FLYNN The question is called for. Those in favor of the previous question say Aye, those opposed No. The motion is lost.

DR. JAMES F. ROONEY I think what my friend, George Bachr, has just said and what my friendly enemy Redway who has taken me over the coals within the last year for maligning misinterpreting and misrepresenting everything in relation to a question that came before the last House is quite correct. I think as this amendment is worded it would be a most unfortunate thing if we put it in our Constitution and Bylaws. I believe the intent of this thing is quite correct however. That intent is this, and I can speak from experience. This Society has had great trouble in the legislative halls for many years by self-constituted representatives of Medical Societies and supposed groups in Medical Societies appearing at legislative hearings and representing the fact that they spoke for the Medical Society when they did not speak for anything of the sort. There is nothing that can abridge the right of any citizen in the United States to petition any Legislature or any Congress. There is nothing in the law of the State of New York or in the Constitution and Bylaws of this State Society that can abridge the right of any citizen to ask to have any bill introduced that he can persuade a legislator to introduce for him. But there is one important thing that cannot be forgotten. If this Society is going to stand for anything in relation to legislation that it expects to have carried through it can only be done by unity of effort.

There should be complete, absolute, and free discussion of all legislative policy in the Society but once that policy is decided upon it should be a democratic representative proposition that the minority who is licked takes their medicine goes home and licks their wounds, and sticks to the majority opinion. Other than that there will be no representative government and we are going to deal with soviets—soviets.

I think this amendment can be changed to accomplish that purpose without curbing initiative. Personally when I first read it I laughed at it. Let me reread it for a moment. Shall not initiate any policy—for heaven's sake, where do policies in this Society initiate except in the County Society? They have to initiate there. Prohibiting any County Medical Societies, their officers, committeemen and members from initiating any policy—why of course they have to initiate in the mind of someone—propose any legislation or participate in any activities—there is not anything in the Constitution and Bylaws of this Society or anything that you can

possibly write into them that can prevent any member from coming before any legislative hearing and saying, I am Dr. Jones. I am a member of the Medical Society of the State of New York. I represent myself, and I am opposed to this legislation, and take your chance on a hearing. That is all right, but if you go there and say I am Dr. Jones, and I represent Westchester County as has been done and I have had to deal with it—I had to deal with it by getting a telegram within three-quarters of an hour stating they did not represent Westchester County for the benefit of the Committee but that is another story—that is all wrong.

Let us see how this wording would suit the opponents. The component County Medical Societies their officers or committeemen—not members—shall not propose any legislation contrary to the declared policies of the Medical Society of the State of New York and end it there.

If we do that it means that if the House of Delegates has declared a policy and we have agreed to it in the House of Delegates assembled or in the Council acting for the House of Delegates, and there has been plenty of chance for discussion, plenty of opportunity for a hearing and we have initiated or inaugurated a policy for the Medical Society of the State of New York, then if five counties out of the sixty in this state go before the Legislature and say We are against it, immediately all these weak-kneed guys up there have a chance to say 'What the hell the medical profession is, as usual, disorganized, and we can vote as we please, we will get nowhere.'

That gentlemen in essence is the reason I proposed it and the resolution of the House was carried out exactly to that effect some eight or nine years ago or twelve years ago, because I had to meet the situation hand running for seven years.

Let us reread it, let us consider it, and I would be interested to hear the discussion from that angle. I propose to amend this amendment as follows.

The component County Medical Societies their officers or committeemen, shall not propose any legislation contrary to the declared policies of the Medical Society of the State of New York.

SPEAKER FLYNN Is that a substitute or an amendment to this?

DR. ROONEY This is a substitute for the proposed amendment. I move the substitute motion.

The motion was seconded.

DR. ROONEY A gentleman here raised a question. This says, shall not propose any legislation. I feel that the word propose will cover the question of introduction of legislation or appearing contrary to the declared policies of the Medical Society of the State of New York in relation to pending legislation because that is proposed legislation.

Now gentlemen, take this one thing into consideration. Bear in mind we are going through a crucial period. Bear in mind we are going through a crucial period in relation to the position of the physician to the body politic in this country. Bear in mind that our opponents, the propagandists and the politicians, are anxious to

secure either the actual or the apparent disorganization of this profession on the basis of the old maxim of Julius Caesar, *divide et impera*, break them up into small groups and lick them piecemeal. For that very reason this is the time when more than ever before legislative bodies the profession of medicine ought not alone to be united but ought to appear to be united. If we have dissension, gentlemen, it is like the old story of the gentleman in the first Congress who said, "Gentlemen, we must either hang together or we will hang separately." So that I feel I want to explain that question of the word "propose." If someone else has a better word let him go to it.

DR. WILLIAM S. COLLENS, *Kings* "Initiate" is a better word.

DR. ROONEY No, not "initiate."

SPEAKER FLYNN How does it read now?

DR. ROONEY "The component County Medical Societies, their officers or committeemen shall not propose—"

CHORUS In the Legislature

VOICE How about "introduce?"

DR. ROONEY Let me think for a moment, gentlemen. (Laughter) It is not in the Legislature. I still think that "propose" covers it. I do not think we can choose a better word. That means to propose to the Legislature or to propose before a legislative body the advocacy of legislation that is in opposition to the declared policies of the State of New York.

VOICE Why not say it, then?

DR. LOUIS A. FRIEDMAN Why don't you put it in those words then?

VOICE "Shall not sponsor?"

DR. ROONEY Advocate or propose.

DR. LAURANCE D. REDWAY, *Westchester* Point of order! I arose to a point of order on Dr. Rooney's behalf, the point being that the new amendment which Dr. Rooney is proposing must follow the ordinary routine prescribed by the Bylaws—

CHORUS No! No!

DR. REDWAY I asked that question as to whether it must or must not, whether it may be voted on tonight or whether it will have to follow the usual routine of being published for a year and voted on at a subsequent meeting, in which case a little more time would be available for the proper wording of such a resolution.

SPEAKER FLYNN Is Mr. Brosnan or Mr. Clearwater in the room to answer that?

DR. ROONEY May I speak to that? He asked me the question, Mr. Speaker, as a matter of point of order. The moment an amendment to the Constitution or Bylaws is proposed, with due notice having been given of that change, any modifications or substitutions can be made at the meeting at which that is noticed for action.

MR. BROSNAN Correct.

SPEAKER FLYNN All right, Dr. Rooney, continue!

DR. WALTER D. LUDLUM, *Kings* Another point of order, may I ask when this amendment was proposed to the House?

SPEAKER FLYNN Last year.

DR. ROONEY Shall I read this briefly again? "The component County Medical Societies, their officers or committeemen, shall not propose or advocate any legislation that is contrary to the declared policies of the Medical Society of the State of New York."

Dr. Redway asked a question as to what has

to be done to initiate such legislation. The Legislative Committee or the present Council Committee on Legislation cannot of itself initiate any legislation whatsoever. The House of Delegates declares the policy. The other governing branches of the Society simply take that declared policy and adapt it to the exigencies of the time and of the moment and instruct the Committee on Legislation to prepare for introduction into the Legislature the legislation that conforms to the declared policy of the Society. You are safeguarded all along the line, and during that time before the Committee on Legislation you have plenty of opportunity to confer with them, to talk with them, to represent your views to them, and to have your opinions heard.

Bear in mind one thing. The only purpose of this amendment is to prevent the evils of apparent disorganization and disunion of the profession. I think that when you speak about not initiating a policy, I am frank to say, as I said in the beginning, that the amendment unfortunately is poorly worded. The intention is excellent, but it is poorly worded, and I propose that amendment as the substitute for the originally proposed amendment.

DR. LEO F. SCHIFF, *Plattsburg* I both agree and disagree with Dr. Rooney.

DR. ROONEY You always have.

DR. SCHIFF I hope you will agree with me when I get through.

DR. ROONEY I hope so. I sometimes do that.

DR. SCHIFF There is not any question as to the value of a properly drawn amendment which will not interfere with the rights of any individual doctor having his opinion and expressing it on his own behalf. I do not think we should pass an amendment whereby we say one thing which is supposed to mean something else. Let us find the word. There is a word I don't know myself. I am as one-track as you are, but I think the best thing for us to do is to think it over, and in order to do that lay it on the table for a little while, referring it to a committee or back to the Council, if that is necessary, in other words, not act on it until we get the right word which will stand so that we will have an amendment which will prevent interference by members of this Society solely on their own account who in some way misrepresent themselves or allow it to appear as if they were representing the Medical Society when they express their own views. For that reason I move that this amendment be referred to a committee to be appointed by the Chair for clarification and presentation later during this meeting.

The motion was seconded.

DR. ROONEY I accept, Mr. Speaker.

CHORUS Was that a motion to table or to refer?

The reporter read Dr. Schiff's remarks as transcribed above.

DR. ROONEY I will accept the motion made by Dr. Schiff to refer this to a committee appointed by the Speaker for clarification of verbiage and rereference back to this House at a later period this evening or tomorrow morning, as may be designed by the Speaker. I will accept that motion.

DR. WILLIAM S. COLLENS, *Kings* I want to discuss the motion, I wish to talk against the motion to refer and also to talk on this amend-

ment. Obviously the proposed amendment contains in it a spirit which is very similar to the spirit of the original amendment. On the other hand the type of wording that Dr. Rooney proposes I should like—

DR. SAMUEL J. KOPETZKY *New York* Point of order! My point of order is we are debating a reference and not the question. The gentleman is discussing the question. The motion before the House is shall or shall we not refer to a committee appointed by the Speaker to report back later in the evening or tomorrow morning.

SPEAKER FLYNN Your point of order is well taken.

DR. COLLENS I will talk about it tomorrow then, Mr. Chairman.

DR. EDWIN A. GRIFFIN *New York* A point of information. The first original amendment was killed so how can we have an amendment to a killed first amendment?

SPEAKER FLYNN It was not killed. The question was called for and the motion was put to a vote and was unanimously carried.

DR. WALTER D. LUDLUM *Kings* Could not one of the standard reference committees be this committee?

DR. ROONEY It is up to the Chair. It would only have to be a small committee.

SPEAKER FLYNN The Chair will now appoint that Committee to amend Section 7 Chapter XV of the Bylaws. That Committee will be composed of Dr. Leo F. Schiff, Dr. Laurance D. Redway and Dr. James F. Rooney. (Applause)

*Board of Trustees—Execution of Contracts
Bylaws—Chapter V Section 2
Section 61*

ASSISTANT SECRETARY PODVIN A third amendment was introduced by the Board of Trustees.

Amend Section 2 Chapter V by the insertion before the last sentence of the following:

"The Board of Trustees shall make and execute all contracts for the Society."

DR. FREDERIC B. SONDERN The Bylaws at the present time cover the situation that no contract, no resolution, no recommendation, or anything else that has to do with money can be passed without the approval of the Board of Trustees. As a matter of fact since the existence of a Board of Trustees no contract has ever been made without their full consent and the signature of the Chairman of the Board of Trustees affixed to every contract concerning the spending of money that we have ever made consequently I believe this amendment is unnecessary.

DR. JAMES F. ROONEY It seems to me that I am in a disagreeable frame of mind this afternoon and tonight, and the worst of it is I disagree with my friends but then I am sort of noted for that sort of thing and I am afraid some of you may agree with that. (Laughter) I do not agree with Fred. He is quite right in what he says. The present Bylaws say that all contracts shall be subject to the approval of the Board of Trustees. The approval of the Board of Trustees and the making of the contract by the Board of Trustees are two entirely different things. The contracts are essentially made by the Council with the various contractees. What happens is that the contracts are made, and they come to the

Board of Trustees for approval essentially in relation to the sum embodied in the contract and such other legal provisions of the contract as the Board feels necessary to safeguard the interests of the Society. That is all that the Board of Trustees has to do with the contracts. If they suggest any changes, the contract must be referred to the Council discussions must ensue and a meeting of minds must take place. I think it is for you gentlemen to determine, after having heard from the Treasurer this afternoon and after having read the report of the Board of Trustees as to whether or not you desire to reposit in that Board which is charged with the responsibility for all of the financial affairs of the Society the right to make contracts of themselves. I merely represent to you the facts. All that we have the opportunity of doing today is to approve or disapprove, we cannot make or break. What the Board of Trustees asks with this provision is the right not only to approve but to make the contract. I feel that if it is the thought that that is too much power to place to them—and I am against reposing the power in any Board of Trustees in this Society that has been reposed in the Board of Trustees of the American Medical Association. The moment we get to that point in my opinion we have gotten to the point of being a relatively undemocratic group. But I feel that this power in relation to financial expenditure—and I think the Trustees are all of a common mind with me—had best at least at present be reposed in that Board.

SPEAKER FLYNN Is there any further discussion? All in favor say Aye opposed No. We will have to call for a standing vote. It takes two-thirds. All those in favor will please rise now all those opposed will please rise. The vote is 86 in favor and 32 against. The motion is carried.

Revisions—Notice formally given by Dr. James F. Rooney to the 1938 House of Delegates

SECRETARY IRVING A year ago Dr. Rooney gave notice as shown in the amendments section of your annual reports, that he would present an amendment to Article IV of the Constitution and Chapter IV of the Bylaws, and to make such other changes in other Articles and Sections as to bring the whole Constitution and Bylaws into conformity. In view of the fact that this will require quite an extended survey of the interrelationship of all the provisions I desire to give this verbal notice, and to state that after consultation with the Counsel of the Society I shall submit the written proposals in time to meet the requirement of the Constitution and Bylaws concerning the publication of proposed amendments thereto.

Dr. Rooney submitted the following amendments in time for publication in the March 15 issue of the JOURNAL.

DR. ROONEY Will the Secretary yield?

SECRETARY IRVING Yes.

DR. ROONEY With the permission of the Speaker and the House I feel that perhaps we can save some time in reading the number of pages that contain the amendment to Article IV and the necessary correlative amendments to bring the Constitution and Bylaws into conformity.

Might I ask the privilege of the House to discuss the purpose of this so that we will save time, Mr Speaker, and save the Secretary's voice?

SPEAKER FLYNN You have the privilege, Dr Rooney

DR. ROONEY Gentlemen, the story is this. As those of you who are familiar with the old constitution will realize, this proposes going back to the old executive council and executive committee, with a diminution in the number of standing committees and a diminution in the number of members of the standing committees.

I have no criticism to offer as to the changes that were made in our Bylaws two years ago except this. I think our present method of choosing councilors is undemocratic and unrepresentative. I have watched the election of councilors and the way the members of the present Council have been elected, and it has been a sort of hodge-podge, a catch and gather proposition at the end of every election morning. We do not have representation on the Council of all of the sections of the state as we had under the old council where every district branch had a representative who spoke for that branch on the council.

There was one feature of the old council that was a bad feature, and that was this: there was a lack of even, fair representation for the Greater City of New York, the First and Second District Branches in relation to councilors, and there was a preponderance of representation from the upstate judicial districts, with which our districts conformed for the upstate members.

Unfortunately, in the printing of the proposed amendments there was a section that was intended to correct this failure of proper representation of Greater New York in the Council that I will read to you in a moment. In other words, my proposal is that instead of having one councilor from the First and Second District Branches we have two councilors from the First and Second District Branches and one from each of the other district branches. That will at least lessen the disproportionate representation of upstate in relation to the proportion of the physicians in Greater New York and those upstate, which is about fifty-fifty, very nearly.

The second thing is we have a Council that meets nearly every month now, with the exception of the summer months. Last year those Council meetings took up a whole day, sometimes longer than a day. This year our President, Dr Groat, has held them down to a shorter time. Last year the average report of the minutes of the Council comprised anywhere from 24 to 40 pages, this year they have been fewer in number. With the old council, the council met twice a year unless it was called in special meeting, and the essential functions of the Society were carried on by an executive committee of ten, of whom three were the president, the past-president and the president-elect, as well as the secretary and the treasurer, and five councilors elected to the executive committee by the council of whom three must, of necessity, be councilors, that is, the presidents of the district branches. That meant on the executive committee at every meeting various districts were represented by their own chosen representatives, chosen in their own localities, chosen from their own men, and these men speaking for them.

The criticism of the old council was essentially

the criticism of the expenditure of the standing committees. We will grant that that had become rather inordinate. The economy made by the present Council as compared to the last two years of the old council, when we include the Legislative Bureau and the Legislative Committee, which was always included in the expenses of the old standing committees in relation to the council, has been a matter of approximately \$2,000 to \$4,000.

This is only my own personal opinion, and I am not speaking for the Board in relation to these amendments. I am not speaking for the Board of Trustees, I am speaking only for myself personally. In my opinion any large group cannot function as efficiently as a comparatively small one. In that connection I always like to think of the old Scotch story that the best kind of a committee is one of three members, one of whom is dead, one of whom is sick, and the other fellow who does the work. In the end that is what every committee comes down to.

My proposal in all of these amendments relates essentially to reconstituting the old council, the old executive committee representation on the council of every district in the state, instead of a council which is chosen solely by us, by the House of Delegates, which may be more or less representative, but which is not essentially representative in the fashion that the old council was. That, gentlemen, is the purpose of these proposed amendments.

I feel that the Society will be more democratically constituted in its Council if these proposals are adopted. The ad interim House of Delegates—and this is with no criticism of the personnel of the present Council, for whom I have the highest regard—will enable the affairs of the Society to be more efficiently conducted. A small executive committee has all of the power to carry on the work of that Council, to put into effect its direction, to call special meetings of it, and to conduct matters by referendum if it is necessary—just as much power as this present Council has, but a much smaller body, and in my opinion a very much more efficient body.

There is one further thing. I have reduced the number of standing committees and have still further reduced the number allowed to be appointed upon those standing committees. The standing committee chairmen are, as under the old constitution and bylaws, to be elected by the House of Delegates.

In order to facilitate discussion, Mr Speaker, unless there be objection, I move the adoption of the proposed Bylaws relation to the reconstitution of the Council and such other changes as are necessarily correlated therewith.

The motion was seconded.

VICE-SPEAKER BAUER Point of information, you move the adoption of the Bylaws, but you also have your proposed changes in the Constitution as well.

DR. ROONEY Constitution and Bylaws, Mr Chairman, proposed Constitution and Bylaws of the Society, to make effective a return to the old council executive committee and the limited number of standing committees as mentioned in the proposed Bylaws.

One thing further, if I may beg the indulgence of the House again. I want to read to you again, if you care to follow me, the change I spoke

about If you will look at page 58 under the heading Constitution Article V I propose this be amended by adding after the word delegates five Trustees and one Councilor from each District Branch except the First and Second from the First and Second District Branches there shall be two Councilors who shall be the President and President Elect of the respective District Branch, giving the First and Second Districts two councilors a president and vice-president instead of one councilor as all of the remaining branches in the state have

SPEAKER FLYNN This motion is up for adoption It has been seconded

DR. ARTHUR H. HEYL, *Westchester* A point of information The motion includes everything published in the JOURNAL from the beginning of the second half of page 60 through page 68 and ending on page 67 is that correct?

DR. ROONEY To the top of 67 with one exception that I should like to except and that I should like to have submitted separately Mr Speaker and that is the final sentence which reads

These amendments to the Bylaws will take effect at the termination of the Annual Meeting of the Medical Society of the State of New York in 1940

I have heard considerable discussion in the House today asking why that should go over to 1940 I have no interest in that particularly and I feel that we had better leave that separately so that the House can determine whether these amendments will take effect immediately and go into effect in 1939 or whether you wish to postpone the effect of them to 1940 so with that exception I will answer the gentleman's question that it includes everything down to the end of the second column on page 68 Everything with the exception of that last sentence is included in my motion.

SPEAKER FLYNN Is there any further discussion?

DR. LEO F. SCHIFF, *Clinton* I would like to ask Dr. Rooney if these proposed amendments provide for some means of retiring the present Council who hold over or whether it is intended to retain such councilors.

DR. ROONEY Curiously enough Dr. Schiff you have hit upon the nub of the concomb If these take effect in 1940 the councilors elected next fall would take office as councilors but even though they take effect in 1939 the present distinct branch presidents will become councilors except as they are now members of the House of Delegates.

DR. SCHIFF I did not mean that I was referring to those members of the Council, those nine members who are elected three four and two There will be six members left over I wanted to know if your amendment took care of those, or are we going to let them expire or get out of office as time goes on?

DR. ROONEY The office is done away with and that means the term ends.

DR. SCHIFF Does it so state in these Bylaws?

DR. ROONEY It is not necessary It supersedes the old constitution and bylaws

DR. JAMES M. DOBBINS, *Queens* I would like to ask Dr. Rooney for a clarification of Section 4 at the top of page 61 The Council shall be the executive and administrative body of the Society

and shall control all arrangements for the annual meeting shall elect an Executive Committee of the Council to carry on, etc. Then referring to page 62 Chapter V Section 1 reads At its first regular meeting the Council shall choose by a majority vote five members of the Council three of whom shall be councilors, who together with the President the President Elect the Secretary the Treasurer and the immediate Past President shall constitute the Executive Committee It seems to me as though the Executive Committee, as proposed by Chapter V there are five members who ipso facto need not be elected to become members of the Executive Committee, yet Section 4 says that you shall elect an Executive Committee

DR. ROONEY The point of fact is this Those members are ex officio members of the executive committee just as they are now of the Council that is the president past president president elect secretary and treasurer As to the five members of the Council three of whom shall be councilors that means this Dr. Dobbins It leaves the Council free to select two men who may or may not be members of the Council. Is that quite clear? Three must be members of the Council, but it leaves the opportunity for the Council to elect let us say the assistant secretary and the assistant treasurer to act with the executive committee, and in the past that has been the usual course I do not recall—and Dr. Irving will correct me if I am in error—any other than a member of the Council who has ever been a member of the executive committee.

SECRETARY IRVING I think you are correct The usual custom was to elect the Speaker and then a Chairman of a Committee on Arrangements.

DR. ROONEY The Speaker and the Chairman of the Committee on Arrangements

DR. THOMAS H. CUNNINGHAM It seems to me that we are going to get into a terrible mess here, and we are not going to accomplish any useful purpose. As I understand Dr. Rooney the only thing that he hopes to gain by this change—I am sure you can realize what a complicated affair it is going to be, and if we once get into it I'll tell you right now that it is going to be five years at least before we have settled down and begin to function properly under our amended Constitution and Bylaws—is a more democratic type of governmental machinery that is a more representative type.

I cannot conceive of a more representative type of machinery than we have now and I would just like to briefly sketch it as it is In the first place all of the power of this organization now is vested in the county groups The county groups nominate and elect delegates, you gentlemen here. These delegates meet as a House of Delegates and this House of Delegates is vested with all of the power and authority of the entire organization This House of Delegates is the legislative and the executive body of the organization. The Council is elected entirely by this House of Delegates, and is elected only to represent this House of Delegates while this House of Delegates is adjourned Every officer of the organization is elected by this House of Delegates I cannot imagine anything more representative Let us go back for just a moment The County Societies elect delegates, the dele-

gates meet and formulate policies, then the delegates necessarily adjourn in three or four days, and they select and elect a group of men who are to represent them when they are not in session. Your Constitution and Bylaws provide that if any problems come up that seem too big for the representatives (that is, the Council and the officers) to take care of, they shall call back the House of Delegates to consider them.

Just the minute you get into Dr. Rooney's scheme you are going to have representatives for this House, which this House will not select or elect, and that is not representative government.

Four or five years ago this organization realized that you had gradually been developing a bureaucracy. You started to act a generation ago with a very simple type of organization machinery, and as new problems came up and new responsibilities faced the organization, you added on little parts here and there to meet those responsibilities. Four or five years ago you had a bureaucracy that was very inefficient and very expensive. You had groups of men functioning as committees, perfectly well-meaning, honest, intelligent men working on committees, but who were not accomplishing very much because there was no integration of their activities. There was no central organization through which one committee could learn of the activities of another committee. I, personally, know of the chairman of one of the standing committees some five or six years ago going to Albany and urging the legislative leaders to pass a certain bill while at the same time the chairman of another standing committee was there urging them to vote against the bill.

I know also of one standing committee, in fact I was on it, that worked for several months and spent a great deal of time and a great deal of money considering a project which had already been settled by another committee. That was because there was no interlocking of the organization's activities.

As I say, four or five years ago this group decided you wanted a new organization machinery. You appointed a committee that studied the matter for a year. If you think back, it was quite an intelligent committee. That committee brought in a report. You accepted the report. You then appointed another committee, and somebody allotted a couple of thousand dollars, or at least to cost a couple thousand dollars, to finance the next committee, which worked on this matter for a year and held meetings at very frequent intervals and devoted a great deal of time and thought to it. That committee brought in a report at Rochester. This House of Delegates accepted that, with some changes.

At the present time you have a perfectly good machinery, with the exception that there are some squeaks in that machinery. Those squeaks are due to the fact that those changes were made in Rochester, and Dr. Rooney suggested those changes in Rochester. (Laughter)

That is the only difficulty that is now taking place in the functioning of this organization, although I will have to say this. We are not yet functioning under that new machinery as efficiently as we might. For the last couple of years we have been in a transition stage, but in the report of the Board of Trustees—and I

think the members of the Board will bear this out—you will note we are gradually cutting down expenses. The year before last, which was the first year we functioned under the new machinery, we had thirty committees, and we had 108 or 110 members on those committees. Last year we only had five or six committees, with perhaps 30 to 40 members on them. That, of course, cuts expenses. It brings our activities more closely together, and generally stands for better and more modern government.

After that expenditure of time, and of money, and of thought, I just cannot see this group here going back, which you are being asked to, to that old organization machinery, waste all the money and all the effort, and when as a matter of fact the new machinery is not functioning fully and will not be for another year or two. As I said before, I cannot see it. (Applause)

DR. ROONEY. I am very interested to find from my friend, Cunningham, that I am the master of squeaks. I will probably have to get a new degree or something to tack onto my name for that. I don't know just exactly what it will be, the letters to tag on at the end of my name, because I am a Master of Science now, but I propose M S Q.

It is very interesting to hear my friend, Cunningham, orate about what the old machinery was and how much of a bureaucracy it had become. It is a very interesting thing because I have been active in this Society for twenty-five years. I lived in the old machinery for a year, or two, or three. I was one of the bureaucrats, and what a bureaucrat I was! You ought to be afraid of your bureaucrats.

When he speaks of representative government, I recall that some years ago we instituted the direct primaries for our election of United States Senators instead of sending them from our State Legislature. We talk about representative government, when in this House the origin of all good electing is continuing a group to represent it and the state as a whole, and if that is not the way bureaucracies begin, I would like to know what is.

I am very interested to hear that two years is not a sufficient time within which to put into effect these great savings that we were promised were going to occur in relation to the new organization. It seems to me that I have been hearing that in relation to the National Government since 1933. As I said, I do not desire to deal with personalities, and I have no personal recommendations to make in relation to the men who formulated the changes that we made in our organization. It is quite true that I did at that time change the then proposed Constitution and Bylaws. Unfortunately, I feel that at that time I did not go quite far enough, and that is one of the reasons we have had this difficulty.

We have heard about savings and expenditures. I have here a five-year summary of the expenses and disbursements of the Council standing committees, special committees, and what not. I would like to read them to you, if I may, rather briefly. In 1933 and 1934 we have no complete summary because the committee's expenses at that time were not summarized. In 1934 and 1935 they were not summarized completely, but in the last year of the old organization, of 1935-36 the total expenditures were \$16,999.35. In

1930-37 they were \$10,203.04. In 1937-38, they were \$15,800.30 exclusive of the Legislative Bureau and not adding in the Workmen's Compensation Bureau which if it were added would make the total expenditure in 1935-36 \$19,140.25 in 1936-37 \$20,214.04 and in 1937-38 \$23,139.33. The expenditures for the Council committees are comparable in some way—and only in some way—with the old committees and they run about the same.

Dr. Cunningham raised one question that I think is germane and that is the matter of administration, the lack of integration of the committees and the excess of a number of special committees. That is the fault of the administration and it is the fault of the House of Delegates—

CHORUS No no

Dr. ROONEY The fault of the House of Delegates in appointing special committees. I still protest that the objections to my proposal of returning to our old organization which served us admirably and had a few squeaks, as the present one has—in my opinion not nearly so many as the present one has—is a perfectly proper one. Now I leave the matter gentlemen to your decision.

Dr. EDWARD C. WOOD Westchester All this discussion of democracies and bureaucracies and financial figures is very interesting but I think we are all missing one very important point. I personally received this report two or three weeks ago, I cannot give the exact date but roughly speaking three weeks ago. Revision of the Constitution and Bylaws is a most important matter. I have not had a chance to read this over carefully and to compare it with the previous Constitution and Bylaws and come to my own opinion as to what I favor or what I do not favor. Some of the proposals may be good and some of the proposals may be not so very good nevertheless we are being asked by the proponents of these revisions to sit here tonight and consider them when I feel I and definitely most of the members of the House are not familiar with them.

I think that this is much too important a matter to consider in this hasty fashion in an evening meeting when everybody gets tired as the evening gets on and the discussion becomes more and more irrelevant. Therefore, Mr. Speaker I move that all these resolutions, these proposals be laid on the table until the next meeting of the House of Delegates in 1940.

The motion was seconded and it was put to a vote, and was carried.

ASSISTANT SECRETARY PODVIN May I present a resolution?

SPEAKER FLYNN Dr. Podvin has a resolution he wishes to offer.

59 Workmen's Compensation—Reduction in Budget of Industrial Council

Section 84

ASSISTANT SECRETARY PODVIN This morning, as the representative of this Society I attended a meeting of the Industrial Council. It was a special meeting of the Council. The matter before us was the New York State budget for the ensuing year. While we may have differences of opinion as individuals in many of the features of that budget there are one or two items in the budget which concern us very intimately. There-

fore, without delaying you further I have a resolution that I would like to submit, and after it has been acted upon by the proper committee if further discussion is necessary I will be glad to give it at that time.

This is the resolution

WHEREAS, a recent study of the compensation department made by the Industrial Council determined that more funds than recommended in the original budget submitted by Governor Lehman were needed for its proper administration and

WHEREAS, the proposed reduction of \$170,077.00 in the present proposed budget would result in crippling this important service and

WHEREAS, this would necessitate the suspension of arbitration hearings, delay the adjudication of cases and cause resultant hardships and injustice to injured employees and eventually added expense to employers and

WHEREAS the expense of this department is borne by the insurance carriers be it

Resolved that this Society express its disapproval of these reductions and be it further

Resolved that the Council be directed to take immediate action to convey the attitude of this Society to the proper authorities

SPEAKER FLYNN This is referred to Reference Committee on New Business B of which Dr. Frederic C. Conway is Chairman

60 Report of the Reference Committee on the Report of the Treasurer, and Supplementary Report

Section 10

Dr. SONDERM The detailed statement of the Treasurer partially certified by the Chartered Public Accountants is before you in the published report and deserves your critical study. Your Committee desires to call your particular attention to the Supplementary Report of the Treasurer which he has read to you. Here you have the opinion of an unbiased expert on the financial standing of your Society. He indicates that you are spending 92 per cent of your income from all sources and contends that the remaining 8 per cent is an insufficient proportion of saving to ensure a sound financial structure in view of present-day instability in world affairs, in medical economics and in financial values. His comments on the larger items of expenditure and his repeated admonitions for more conservative spending deserve the attention of this House and the Board of Trustees.

Your Committee is impressed with the large total of salaries and begs leave to bring this to the attention of the Board of Trustees with the hope that these items particularly in the higher brackets may be modified.

Your Committee notes with regret Dr. Kosmak's intimation that he will not accept reelection, which seems unfortunate to us. He deserves the appreciation by the Society of his efficient service during the years he was in office.

Mr. Speaker I move you the adoption of this portion of the report.

The motion was seconded and there being no discussion it was put to a vote and unanimously carried.

61 Report of the Reference Committee on the Report of the Board of Trustees

Sections 62, 64

DR SONDERN Your Reference Committee commends the detailed and informative nature of this report and urges thoughtful study of it by all members of this House. Its conservatism throughout and the repeated pleas for less spending by the Society deserve your active support.

While the Board of Trustees knows full well its power under the Bylaws to control and restrict expenditures, it is, however, at all times anxious to agree to the wishes of this House and the Council in the interim, and probably for this reason desires your cooperation in order that it may not be accused of interfering with your mandates or those of the Council.

Nevertheless, it is the duty of the Board of Trustees under Section 2 of Chapter V of the Bylaws to observe and work under the provision "All resolutions or recommendations of the House of Delegates or Council pertaining to expenditures of money must be approved by the Board of Trustees before the same shall become effective." In other words, the Board of Trustees has the vested power to control the expenditures of the Society in every detail and if the Society is spending more than it should, the responsibility is unquestionably that of the Board of Trustees. It is easily possible that the Board of Trustees has given more weight to the mandates of the House of Delegates and the requests of the Council and less than they should to the financial ability to meet the resulting expenditures.

I move you the adoption of this portion of the report.

The motion was seconded and there being no discussion, it was put to a vote and unanimously carried.

Five-Year Study of Expenditures

Section 64

DR SONDERN Under the heading "Consideration of Financial Problems Directed by the House of Delegates," the Trustees call attention to a mandate of the 1938 House of Delegates "That the Trustees critically analyze the expenditures of the last five years and the benefits accruing, and make recommendations to the 1939 House of Delegates." As your Reference Committee fails to find such tabulation in the report, we beg leave to recommend a new such survey, the results to be reported to the 1940 House of Delegates.

I move you the adoption of that section of the report.

The motion was seconded and there being no discussion, it was put to a vote and unanimously carried.

Authority of Trustees to Execute Contracts

DR SONDERN Relative to the recommendation to amend the Bylaws to include the execution of all contracts by the Trustees, it is the opinion of your Reference Committee that while there is no objection to such addition, the Bylaws are already sufficiently explicit on the control of not only contracts but all other actions involving the expenditure of money. In fact, up to the present, all contracts involving expenditures have had the full approval of

the Board of Trustees, and were signed by the Chairman of that Board as representing the Society.

I move the adoption of that section of the report.

The motion was seconded and as there was no discussion, it was put to a vote and unanimously carried.

Audit

DR SONDERN The Reference Committee feels that a complete audit in which the accountants be furnished with all vouchers and all other data as they may need for a complete survey of expenditures and income be mandatory upon the Trustees.

I move you the adoption of that portion of the report.

The motion was seconded and there being no discussion, it was voted and unanimously carried.

Fiscal Adviser

DR SONDERN The Committee disapproves the recommendation of the Board of Trustees in the employment of a fiscal adviser.

I move you the adoption of that portion of the report.

The motion was seconded.

DR JAMES F. ROONEY I do not know any bank on the four corners of any country village that has an investment fund of \$150,000 that does not have a fiscal adviser, even up to the large metropolitan institutions. The Board of Trustees of this Society are not brokers. They are not bankers. So far as concerns investments in these troublous times the Board of Trustees feels, if it is going to fulfill its function to this Society, it should have the opportunity of securing expert advice. That was the reason for the request that we be empowered to secure investment counsel for a comparatively small sum of money in relation to the change in markets existing all over the world. I feel that this recommendation of the Committee should not prevail. I feel that the Board of Trustees should be permitted to secure proper investment counsel in order to advise them wisely as to investments, and I trust that the recommendation of the Reference Committee will not prevail in regard to the nonemployment of a fiscal adviser.

DR WILLIAM H. ROSS From twenty-two years of experience as the head of a board of directors having to do with an investment fund of \$286,000, not very different from the investment principal of the State Society, from long experience that board of directors employs a fiscal adviser costing five times as much as we propose to ask of this Society. We can employ a competent man, an officer of the Chase National Bank, the depository of our funds, for \$300. He furnishes to us the information on each one of the securities. He digs out for action of the board of directors threatened changes in the interest rate, and submits that to the board of directors. It is the most economic expenditure of \$300 that I know anything about. The advice, largely given by letter, if carried out and if continued—and we may have these reports twelve times a year if we want them—is given to the Treasurer and the investment committee of the Board of Trustees. It is not possible for you to expect of a board of trustees who are prac-

ting doctors that they should also have competent financial knowledge. The expense to the Society for this service is a mere drop in the bucket and it is capable of being multiplied to the interest and advancement of this Society several times. It is a very small expenditure for a very splendid and a very large service.

I could multiply these words many times. I know whereof I speak. I think I may take you into my confidence and tell you that I happen to be the president of a bank having a million dollars of investments, and we employ a fiscal adviser although we have had years of training in that five-member board of directors. We would not think of trusting our own judgment not confirmed by a man who spends all of his time in financial affairs.

SPEAKER FLYNN Is there any further discussion? Before we vote on the adoption of the report or recommendation of the Reference Committee, I am going to ask Dr. Soudern to read it again.

DR. SONDERN The Committee disapproves the recommendation of the Board of Trustees in the employment of a fiscal adviser.

DR. JAMES F. ROONEY I move a substitute for the motion of the Reference Committee that this House of Delegates approve the recommendation of the Board of Trustees for the employment of a fiscal adviser.

The motion was seconded.

DR. WILLIAM H. ROSS State the cost please.

DR. ROONEY At a cost of not over \$300 per annum—not to exceed \$300 per annum.

The motion was seconded.

SPEAKER FLYNN The motion before you is a substitute motion. Is there any discussion on the substitute motion.

The question was called for and the motion was put to a vote and was carried.

DR. SONDERN Under various captions the Trustees ask a number of direct questions of this House. These seem to call for comment on the part of your Reference Committee and will be presented to you by us at the conclusion of this report.

Directory *Sections 51-63*

Concerning the publication of the DIRECTORY the Board of Trustees recommends that its publication be omitted for the year 1939. Your Reference Committee is not in accord with the statement that omitting the DIRECTORY for 1938 was without real complaint especially in the metropolitan area. Greater New York and vicinity is definitely in need of an annual medical directory. This portion of the state includes a large proportion of the membership and the annual DIRECTORY is a potent factor in securing new members for the Society in the urban areas. It seems most probably true that the expense formerly charged to the compilation and publication of the DIRECTORY was more than actually necessary for the purpose and that the use of more modern and time saving procedures could produce a useful volume at a much smaller cost. In consequence, your Reference Committee would recommend that the Society publish a DIRECTORY this year and alternate years thereafter with possibly supplements in the intervening years and I so move.

The motion was seconded.

DR. JOHN J. MASTERSON *Kings* I believe that the DIRECTORY published every year is very important, especially in the metropolitan area as Dr. Soudern states and if the Board of Trustees feels that a supplement can be brought out each year taking care of all the changes that would probably serve our purpose just as well but I do not approve of the report of the Reference Committee that a supplement may be brought out every other year.

CHORUS Will be.

DR. JAMES F. ROONEY This question of the publication of a DIRECTORY with an annual supplement is a part of the proposal of the Board of Trustees. It is one of our original ideas that we could publish the DIRECTORY every alternate year and in the intervening period a supplement containing the changes for the year and in that manner probably save the Society from \$5,000 to \$8,000 a year. I mean every alternate year. The publication cost of the DIRECTORY the full DIRECTORY will remain approximately as it is now unless wages and printing costs go down but we can save about \$5,000 to \$8,000 every other year that can be applied to other purposes or the accrual of our investment fund by publishing a DIRECTORY every other year and a supplement in the intervening year. That supplement will contain all the changes and it will become an integral part of the preceding DIRECTORY.

DR. WILLIAM KLEIN *Bronx*. I think where it said possibly there was a mistake in the typewriting. The Reference Committee recommended that a DIRECTORY be published in 1939 and published every alternate year and supplemented in the intervening year. That supplement was not possibly but absolutely. I think the word possibly was put in by the stenographer by mistake. It is a mandate to publish a DIRECTORY every other year and also a mandate to publish the supplement in the intervening year.

DR. SONDERN That is correct. I move to eliminate the word possibly therefrom as stated by Dr. Klein. From rough figures we thought we would save in the neighborhood of \$8,000 by not publishing the DIRECTORY every year.

DR. ARTHUR W. BOOTH The American Medical Association publishes a very elaborate census for the doctors every two years.

DR. JAMES F. ROONEY Three years.

DR. BOOTH They are supposed to do it every two years but even if they do it every three years, if the Society cares to they can have the New Jersey the Connecticut and the New York printed separately by the A.M.A. at a cost much cheaper than what you are now doing it for.

DR. WILLIAM H. ROSS I have a letter from the Secretary of the American Medical Association giving his opinion, and not an actual quotation, that a section of the A.M.A. Directory may be furnished to this Society 18,000 copies for \$2,600 with the statement that this is not accurate and may be cut down when we make the study also we may have such additional information in it as we choose to have, such other classifications of members, the list of hospitals the list of schools that we may include New Jersey and Connecticut, all of which would have to be worked out and a definite estimate to be ob-

tained before any action is taken. That matter should be looked into before definite action is taken, as a saving of one-half of the cost or more may be effected in this way. We have not had the time to find out the exact cost as yet, in fact, we have not gone into the matter at all in that way except for this provisional estimate and the letter of the Secretary of the A.M.A. imparting this information to us.

Also I would like to have you think whether a mandate to publish the DIRECTORY, when the last copy cost more than \$16,000, shall be decided arbitrarily by this House of Delegates in advance of knowing just where we are going to make cuts in the expenditures if the principle is adopted that we must live within our dues income. Just think that through for yourself.

DR THOMAS P. FARMER: After hearing Dr. Ross speak, it seems to me that is something we ought to think over. Certainly, Dr. Ross is not able to give us enough information at the present time for us to take any action tonight. I, therefore, move that this matter be referred to the Council with power to act.

The motion was seconded.

DR JAMES F. ROONEY: Is the motion of Dr. Farmer's up for discussion?

SPEAKER FLYNN: Dr. Farmer's motion?

DR ROONEY: Yes, to refer to the Council?

SPEAKER FLYNN: Yes.

DR ROONEY: I would like to speak to that. There has been a great deal of discussion about the DIRECTORY, but if you leave this baby on the threshold of the Council's door, and you get a copy of the text of the Directory of the American Medical Association without any alphabetical index of physicians of the State of New York—because the alphabetical index of the Directory of the American Medical Association is that of all the physicians in the United States not separated by states—there may be considerable dissatisfaction unless you so approve it.

This, here, is the New York Section. There is the possibly proposed format, and I am going to take the liberty, if the Secretary and General Manager will permit me, of passing this section, the New York Section of the new Directory of the American Medical Association, around the House so that you can see it, and then if you want to refer it to the Council for their approval of the format and type of directory you are going to get, very well.

(The specimen was passed around the House of Delegates.)

SECRETARY IRVING: It is very important that we should know very soon whether we are to publish a 1939 DIRECTORY of any kind. If possible, I would like to have the House state it now, with the other matters and other phases perhaps postponed, but this year we must know now, otherwise it will be delayed.

DR WALTER D. LUDLUM, *Kings*: One item that has been lost sight of is that this DIRECTORY is used for the compensation rating, and if you use the A.M.A. you miss out on that compensation rating and, therefore, its value will be cut.

DR ROONEY: That is true.

SPEAKER FLYNN: Discussion on Dr. Farmer's motion to refer this to the Council, which has been seconded.

DR JOHN J. MASTERSON, *Kings*: This Directory of the A.M.A., which is being passed around

now, does not contain the information that we require in New York State. It has a man's name and address, but it has not his hospital connections, it has not his medical society connections, it has not his office hours, I don't know whether it has his telephonic number, it has not his compensation board ratings. Considering that the doctors are paying \$10 a year dues in the State Society, for which they are receiving the JOURNAL, I think in the interests of the effect it will have on membership in the State Society, the Board of Trustees should not consider for a moment giving the doctors the Directory of the A.M.A. because it will not serve our purpose.

DR THOMAS H. CUNNINGHAM: I simply want to say that Dr. Ross called our attention to the fact that the Secretary of the American Medical Association offered to make any changes that New York State might wish to have incorporated.

CHORUS: No, no.

DR CUNNINGHAM: Dr. Ross, did I misunderstand you in thinking that the A.M.A. is willing to put any information in additional that we may want?

DR ROSS: I did not say "any information." I did say that some information could be put in at our request, and that any information might be decided after a conference as to what it would cost to have that incorporated. But bear in mind that I have no quotation, I am not stating any fact. I am stating that this question is open, and that the A.M.A. is desirous of doing it if we want it.

DR THOMAS M. BRENNAN, *Kings*: I am fully in accord with the idea of thrift and economy in the handling of the monies of the Society, but in this case I believe this is one situation where economy should not be considered too seriously. I think we are here as representatives of the rank and file in this House of Delegates. I can see no reason for delegating the question of whether we publish this medical DIRECTORY to the Council. We are the representatives of the rank and file. The rank and file in the large communities want this DIRECTORY. It is of tremendous value to them. It is a selling point in getting members and in holding members. I cannot see any reason why the price of the publication of this Medical Directory every second year will be prohibitive, and I feel that it will bring in income to the Society.

SPEAKER FLYNN: The motion for referral is before the House.

The question was called for, the motion put to a vote, and was lost.

SPEAKER FLYNN: The question before the House is the adoption of the original motion, with the word "possibly" omitted. Will you kindly read that motion as it now is?

DR SONDERN: "In consequence, your Reference Committee would recommend that the Society publish a DIRECTORY this year and alternate years thereafter, with supplements in the intervening years."

DR WALTER D. LUDLUM, *Kings*: I move as an amendment to this recommendation that the phrase "with supplements in the intervening years" be omitted. Let us pass a motion at this time that the DIRECTORY be published in 1939 and alternate years thereafter, and then it leaves it to the House of Delegates in the intervening

years to have the privilege and opportunity if they so desire of having a DIRECTORY published also in 1940. In spite of this action they can rescind the action of this body and have it published annually and they can also provide next year for the publication of the supplement. Therefore I move as an amendment that the phrase 'with supplements in the intervening years,' be omitted.

The amendment was seconded.

SECRETARY IRVING I do not think that Dr Ludlum knows how long it takes to make the necessary corrections. They must begin early in the year in order for the thing to come out even a supplement by December 1, so I think if you leave it until next year you may go into May before any action is taken, and that will mean the DIRECTORY will not come out on time even a supplement.

SPEAKER FLYNN Is there any further discussion of the amendment of Dr Ludlum?

The question was called for and the amendment was put to a vote and was lost.

SPEAKER FLYNN Adoption of the Reference Committee's recommendation.

The question was called for and the motion was put to a vote and was carried.

A Few Facts from the Auditor's Report

DR. SONDERN Your Committee would direct your attention to the heading 'A Few Facts from the Auditor's Report.' These again emphasize the need for caution in spending and deserve every consideration of this House. Attention is called to the fact that the difference in figures of the Financial Report of the Trustees and the Treasurer's Statement is due to the fact that the former covers the period from July 1, 1937 to July 1, 1938 while the latter is for the fiscal year 1938.

The report of the Trustees relative to their activities in the settlement of the controversy concerning the JOURNAL is full of interest and definitely deserves commendation. Those directing the new JOURNAL management should have praise on what they have done and your Committee expresses the need for rigid economy and would impress this fact on the Board of Trustees.

President's Dinner

The Committee considers the President's dinner as a personal affair of the President and that it is not within the scope of the activities of the Medical Society of the State of New York.

I move you the adoption of that which is the end of the report.

The motion was seconded.

DR. GEORGE W. KOSMAK I would like to ask again, Mr. Speaker, whether you are voting on the report as a whole.

SPEAKER FLYNN Not as yet no.

There being no discussion the motion was put to a vote and was carried.

SPEAKER FLYNN Now the report as a whole including the substituted motion of Dr. Rooney. Is there any discussion?

Budget Recommendation from Supplementary Report of the Treasurer Section 10

DR. KOSMAK There is one recommendation contained there in the supplementary treasurer's report which the Reference Committee apparently has not acted upon and if you would allow me to I would like to draw attention to that Mr. Speaker namely that the budget of the Society be based on the actual income from dues and not include any other items. I believe Mr. President it would be desirable to bring that matter up for discussion in order that the next administration may be properly instructed on this point.

DR. SONDERN I would say as I recall the discussions in the Reference Committee that we felt this subject was really the business of the Board of Trustees. While in sentiment we were in favor of it at the same time conditions may arise when no matter how desirable that is it is not expedient in one particular year. Therefore I query the wisdom of tying the hands of your Board of Trustees especially when extraordinary and unexpected things may happen that will absorb not only your whole income but which may even take in a certain amount of your capital. I believe definitely this matter has been called to the attention of the Board of Trustees in the Treasurer's supplementary report and should be left to their wisdom as to how they act upon it.

DR. JAMES P. ROONEY I would like to discuss that question if I may in this way. I think that the Board of Trustees can be instructed and they should be instructed to maintain all the ordinary expenditures of the Society within the limit of the income from dues, the ordinary expenditures. There is no question about the authority of the Board of Trustees to approve such extraordinary expenditures as may arise for any emergency. That is already embodied in our law but if the Board is directed to maintain all the ordinary expenses of administration of this Society within the dues income it means gentlemen that we will have much less difficulty in cutting our cloth to suit our figure. I so move.

The motion was seconded.

SPEAKER FLYNN Is there any discussion?

The question was called for and there being no discussion, the motion was put to a vote and was carried.

DR. SONDERN We still have the adoption of the report as a whole, with the suggested changes by Dr. Rooney.

SPEAKER FLYNN Yes. Is there any discussion?

There being no discussion the motion was put to a vote, and was unanimously adopted.

62 Report of Reference Committee on Reports of Treasurer and Board of Trustees—Questions Asked by the Board of Trustees

DR FREDERIC E SONDERN We have, gentlemen, the direct questions which were asked by the Board of Trustees of this House, and the comments of your Reference Committee concerning them

*Workmen's Compensation Bureau
Sections 13, 45, 72*

DR SONDERN The Trustees ask your opinion as to whether the Compensation Bureau as now set up is satisfactory to the entire membership?

It is the opinion of your Committee that the Compensation Bureau has been beneficial to the doctors practicing in the State of New York, and should be continued without change, and I so move

The motion was seconded, and as there was no discussion, it was put to a vote and was unanimously adopted

Centralization of Offices

DR SONDERN The Trustees see the opportunity for economy, efficiency of administration, convenience of access, and a saving of time to be had from a centralization of offices on one floor

The Society now pays \$4,200 a year for rent. Offices are located on the second, fourth, and fifth floors of the Academy of Medicine. More room is needed for the JOURNAL office. Some study has been given this during the year. The Trustees recommend that this House of Delegates think this over and tell us what they would like to have done

It is the opinion of your Reference Committee that the location of the present quarters of the State Medical Society should remain in the building of the Academy of Medicine. An effort should be made to concentrate all departments to best advantage, and I so move

The motion was seconded

DR JAMES F ROONEY Mr Speaker, I do not agree with the Committee. The important thing for this Society is to collect all of its functions *under one roof and on one floor, if possible*. There is a great deal of lost effort in the separation of the functions of this Society

After discussion a substitute motion was made by Dr. Rooney, seconded and carried, "that the Trustees be authorized to continue their study of the question of a change of location and report their findings at the next annual meeting of this House of Delegates"

Officers' Expenses

DR SONDERN The Trustees ask the Society how far it wishes to go in bearing the expense of officers in attendance at unofficial meetings. At the present time only the President is allowed a per diem of \$15 when engaged in official business. All officers are allowed traveling expenses when engaged in official business. Traveling expenses have been interpreted as railroad fare and hotel bills. Does the Society desire to establish a per diem in lieu of expenses other than railroad fare?

Your Committee disapproves of payment of expenses of officers in attendance at unofficial

meetings. Relative to reimbursement for attendance at official meetings, your Committee recommends careful scrutiny by the Trustees before payment, and I do so move

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried

Appropriations for District Branches

DR SONDERN The Trustees ask the House of Delegates to comment upon district branches exceeding their appropriations

It is the opinion of your Committee that the Board of Trustees, having the power, should not allow the expenditure of more money by the district branches than allocated in the budget, and I so move

The motion was seconded, put to a vote, and was carried

63 Report of Reference Committee on the Report of the Board of Trustees Concerning Resolution in Regard to Publication of DIRECTORY

Sections 51, 61

DR FREDERIC E SONDERN My Committee has a further resolution, introduced by the Medical Society of the County of Kings, Dr. Irwin E. Siris, reading

"WHEREAS, the Board of Trustees in its annual report recommends the omitting of the publication of the DIRECTORY for 1939, and

"WHEREAS, in view of the several hundred physicians entering practice in our state each year, and

"WHEREAS, the DIRECTORY has additional value on account of the compensation ratings of our members and in view of the changes in these ratings from time to time, and

"WHEREAS, in view of these facts the DIRECTORY after one year becomes of very little value, therefore be it

"Resolved that the Board of Trustees be requested to publish the DIRECTORY for 1939 and each year thereafter"

Your Reference Committee has dealt with this subject in detail, and in consequence moves that this resolution be tabled

The motion was seconded, put to a vote, and was unanimously carried

64 Supplementary Report of the Board of Trustees—Review of Expenditures for Last Five Years

Section 61

DR WILLIAM H ROSS There has been a reference within the past half hour this evening to the mandate of the House last year that a critical examination or study be made of the expenditures of the last five years, and the benefits accruing to the membership and to the public therefrom, and to make recommendations to this House of Delegates thereon

The study has been made so far as it could be made from figures. It is not complete. A month of labor has been put in on it. I submitted it to the Board of Trustees, and we believed that it would be better to hold it over until next year. You have heard it commented on by the Reference Committee, and that is the reason I

am making this statement. The figures such as they are I now submit as a supplementary report from the Board of Trustees. They cover rent of the central office rent of the Bureau of Public Relations, rent of the Legislative Office. They cover the cost of telephones for the last five years and that one item I will read \$137 71 for 1933-34 \$204 77 for 1934-35 \$382 61 for 1935-36 \$213 07 for 1936-37 They cover postage and stationery printing contingent fund traveling expenses, general president secretary council and A.M.A. delegates salaries, secretary (Dr Dougherty before his death) Dr Irving recently salaries office manager emeritus, executive officer legal counsel and office employees. So it goes on for eight pages. It will take one hour to read the figures but I submit it as a supplementary report (See pages 1224 1225 1226)

SPEAKER FLYNN Do you want to have that go to a Reference Committee?

DR. ROSS I would like to have you know that the Trustees have made an honest effort and a very diligent effort to carry out the mandate of the House of Delegates, but with all of the changes it is not always possible to compare every year however, the study is here for you to consider

DR. WILLIAM M. PATTERSON New York I move the acceptance of the report

The motion was seconded and as there was no discussion it was put to a vote and was unanimously carried

65. Report of the Reference Committee on the Report of the Council—Part II, Medical Care Surveys in New York State and Medical Relief

DR. THOMAS M. BRENNAN Your Reference Committee on Report of the Council—Part II having to do with Medical Care Surveys in New York State and Medical Relief respectfully submits the following report

American Medical Association Survey

Your Committee notes with satisfaction the active participation of the Medical Society of the State of New York in two Medical Care Surveys in New York State, through committees selected and appointed by the Council

The Committee on American Medical Association Survey headed by Dr O W H. Mitchell of Syracuse, choose to initiate the survey by making a cross-section of the sixty two County Societies. The work is not yet completed but the report promises to be enlightening and reliable.

Distribution of Physicians in New York State

The State Society's study relative to the distribution of physicians in the state state hospitals, etc is practically complete. In this connection the Reference Committee wishes to congratulate and compliment Dr Joseph S. Lawrence on bringing up to date and publishing his study of the distribution of physicians in New York State. The wisdom shown by the Council in giving this wide publicity is reflected in the number of editorial and news column comments appearing in the daily press

From the many deductions which can be drawn from this study your Committee believes added emphasis should be given the following

1 Resident physicians and hospitals are distributed throughout the state in such fashion that no area is without adequate medical service.

2 Improved conditions for transportation and communications in the rural districts have increased the usefulness of the physician many times over what it was just ten years ago

3 Improved living conditions are attracting young men to locate in the rural areas

4 There is no marked difference in the ages of the men practicing in the rural districts as compared with those in the urban districts

5 Nursing service as part of a public health program demands prompt study

New York State Temporary Commission to Formulate a Health Program

In regard to the survey by the New York State temporary commission to formulate a health program in response to an invitation by the Chairman of the Commission the Council arranged to have the State Society properly represented at a hearing held in New York City December 13-16 1938. At that time the state representatives handed in written answers to five questions previously submitted by the Commission. These answers were supplemented with oral discussion at the hearing by our representatives. Your members of your Reference Committee have reviewed the questions and answers and do now approve of the form manner and substance of each answer

I move approval and adoption of the portion of report of the Council having to do with Medical Care Surveys

The motion was seconded and there being no discussion was put to a vote and unanimously carried

Administration of Medical Relief Sections 18 80

DR. BRENNAN In regard to the discussion of medical relief your Committee noted with interest that the Council through its Committee on Public Relations and Economics Dr A J Hambrook of Troy Chairman has conferred at length with representatives of the State Department of Social Welfare looking toward the establishment of suitable rules and regulations governing this work.

The experience of that Committee has emphasized the fact that in regard to medical relief the setup has been far from satisfactory. Attention is directed to the following Too much centralization of authority too many arbitrary decisions. The medical profession has too little to say about its own activities under the Social Welfare act. Administrative rules are too rigid as a consequence there has been too much red tape. To remedy some of these evils and annoyances the Committee advocates the establishment of a professional advisory committee in each county giving it the authority in local problems now vested in medical social workers or in the Departments of Social Welfare at Albany. In regard to the establishment size, and composition of these committees, your Reference Committee is in accord adding that emphasis be placed on the requirement that nominations be placed on the County Medical Society for appointment by the local Commissioner of Welfare

fare The necessity on occasions for one or more survey boards in conjunction with each committee can be anticipated

It is admitted that perhaps not all counties will need committees Where the relief problem is small the local compensation board could do double duty

Under this setup your Reference Committee recognizes the necessity for a state professional advisory committee to coordinate the activities of the county committees and act as a buffer between them and the State Department of Social Welfare It would emphasize the absolute necessity of making this committee, as far as possible, a continuing committee This committee would be charged with responsibility of getting local committees under way and providing instruction and guidance in their work

In some counties where the work will be heavy, the appointment of a part-time or full-time medical director of relief may become necessary Such an appointment should be made only upon recommendation and nomination by the County Medical Society The qualifications required of such an appointee have been set forth by the Committee on Public Relations and Economics and seem to your Reference Committee to be entirely satisfactory

In regard to the fee schedule, the Committee on Economics advocates a more reasonable fee schedule for payment of the relief patient's own chosen physician and insists that continuity in treatment by family physician is essential In accepting a fee schedule, 25-50 per cent less than the Workmen's Compensation fee schedule, emphasis is placed on the very definite charitable contribution the doctor is making to the community in working under such a schedule The duties of the professional advisory committees have been reviewed and seem to meet the situation adequately at this time, although changes may be suggested by accumulated experience

Your Reference Committee wishes in closing to compliment the work of the Council through its Committee on Public Relations and Economics We approve the proposed revision to provide a system of administration comparable to the Workmen's Compensation with local autonomy in working out the medical relief problem

We have no specific recommendation other than the continuation of this committee and further study by them of the vast problems involved in the question of medical relief and in the correlation of the activities of agencies participating in the administration of the solution of this problem

We feel that the Council has approached the situation with tact and good judgment, that they are in intimate contact with the Department of Social Welfare of the State of New York and have gone as far in suggesting measures corrective of abuses as they can under the law as at present constituted We feel that new legislation, relative to social welfare and its relation to medical practice may become imperative and, perhaps, inevitable before evils now existent can be completely eradicated When such legislation comes up for consideration, the Medical Society of the State of New York, through proper committees and through legal counsel, should seek to participate in the formulation of such legislation, and if need be, initiate the program

I move the adoption of the recommendation of the Council

The motion was seconded

DR PHILIP I NASH, *Kings* This is of such vital importance to each of the component County Societies I would like to add to this resolution that a copy of this report be sent to the Secretary of each County Medical Society in the state

SPEAKER FLYNN That will be published in the JOURNAL anyway?

SECRETARY IRVING Yes, but it can be sent individually without any trouble

DR NASH How long will it take before it is published in the JOURNAL?

SECRETARY IRVING It can be sent very readily to the secretaries of the County Societies very soon I think that is very important It is of vital importance, especially at this time, to the Economics Committees, and if you will make such a ruling I will carry it out

SPEAKER FLYNN I do That will be included in this part of the report

DR NASH Will you include that in your resolution?

DR BRENNAN I will be glad to do that

The question being called, the motion was put to a vote, and was unanimously adopted

DR BRENNAN I now move the report of the Committee as a whole

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried

66 Report of Reference Committee on the Report of the Council—Part III on Workmen's Compensation, and Supplementary Report

Section 9

DR LEO F SIMPSON We have carefully reviewed the annual report of the Workmen's Compensation Committee of the Council, as well as its supplementary report

The work of the director of the Bureau de-

serves special commendation. His work has been characterized by thoroughness and efficiency and has been of the greatest aid not only to the compensation boards of the County Societies but to all engaged in compensation work. We recommend the continuation of this Bureau.

We would especially urge his recommendation that Workmen's Compensation boards through out the state make a concerted effort to see that the required reports are filled out promptly.

We also recommend that the County Society boards accept these standards recommended by the Bureau as guides in the qualifications of physicians and specialists.

We recommend this report of the Committee on Workmen's Compensation, as published to the House of Delegates for their approval. I so move.

The motion was seconded and as there was no discussion, it was put to a vote, and was unanimously carried.

67 Report of Reference Committee on the Report of the Council—Part III on Medical Expense Nonprofit Indemnity Insurance and Supplementary Report

Sections 7-30

DR. LEO F. SIMPSON The Report of the Council on Medical Expense Indemnity Insurance has been considered and it is recommended to the House of Delegates that the following modifications be endorsed these principles should be embodied in any plan of Medical Expense Indemnity Insurance

- 1 It must be nonprofit
- 2 It should involve cash indemnity and not medical service
3. Patients must have absolute freedom of choice in selecting a duly qualified physician from all those qualified to practice and willing to give service within the locality covered by the operation of the company
- 4 No third party may be permitted to come between the patient and his physician in any medical relation. The method of providing service must retain a permanent confidential relation between the patient and the physician.
- 5 The fees should not be below those of the Workmen's Compensation schedule but there must be no interference with higher fees being charged to the higher income group
- I recommend the adoption of these first five principles.

The motion was seconded

DR. DAVID J. KALISKI *New York* I wish to draw attention to that section which indicates that the plan shall include medical indemnity but not medical service. For the very low income group whom it is proposed to include under a medical indemnity plan it will really be necessary to provide medical service. In other words, a certain amount of the fee that will be paid by this low income group under any form of insurance policy will have to be distributed on a proportional basis between the physician rendering the service and the hospital providing the bed. It cannot be effected on a pure medical indemnity plan and that is the proposal. I am drawing that to your attention because that is the proposal of the various plans now under con-

sideration. It does not nullify the effect of the indemnity principle but it would effectively bar the inclusion of the low income group from any form of medical service if adopted in this form.

DR. HARVEY P. HOFFMAN *Erie*. The Committee feels that there should be no connection between the hospital service groups and the physicians indemnity group in other words when we set up a physicians indemnity plan it will have no connection with any hospital plan whatever. We have emphasized this fact.

The idea on the fee schedule although it will not be lower than the compensation fee schedule regardless of whether it is an indemnity corporation or a service corporation is, we will be able to reach the low income group by our medical indemnity plan.

There being no further discussion, and the question being called for the motion was put to a vote and was carried.

DR. SIMPSON In order to have these principles simplified we have advised that Sections 6 and 7 read as follows

6 All features of medical service must be under the control of the medical profession

That originally read

All features of medical service must be under the control of the medical profession. This includes all medical phases of institutions involved in the service. It being understood that hospital service is but the extension of the equipment of the physician. Also there should be no restriction on treatment or prescribing not formulated and enforced by the organized medical profession.

We thought the last part was rather redundant and we thought that the first sentence covered the ground adequately at least for the present.

All features of medical service must be under the control of the medical profession.

7 The eventual aim of any plan should be to cover medical care in the office, home, and hospital.

As originally proposed that paragraph read

The eventual aim of any plan should be to cover medical care in the office, home and hospital although at the start it may not be possible from an actuarial standpoint to cover all of these in one policy.

We thought that would be covered sufficiently by

The eventual aim of any plan should be to cover medical care in the office, home and hospital.

Amendment to the Medical Expense Nonprofit Indemnity Insurance Resolution

Before we ask for the adoption of that the Reference Committee considered a resolution by Dr. Collins, of the Medical Society of the County of Kings. His resolution was to take the place of paragraph 6 which I have just read.

All features of medical service must be under the control of the medical profession. This includes all medical phases of institutions involved in the service. It being understood that hospital service is but the extension of the equipment of the physician. Also there should be no restriction on treatment or prescribing

not formulated and enforced by the organized medical profession "

Dr Collens' substitute for that was,

"That all phases of medical activity in each county be under the control of its own board elected by the individual County Medical Societies and to function in a fashion similar to that of the compensation boards of the various counties. These functions to include qualifications of physicians and specialists, determination of fee schedules, arbitration, censorship, expulsion, inspection of cases, regulation of conduct, and ethics "

The Reference Committee felt that this might necessitate the County Medical Societies being a part of an insurance corporation, which we believe to be illegal

Secondly, the permissive legislation now proposed in Albany contemplates an ultimate setup of five major plans in the state, each not to exceed eighteen counties

We believe that it is premature because of these objections to incorporate this resolution as a part of the supplementary report of the Council on medical expense indemnity insurance

I move for the adoption of the seven principles

The motion was seconded

SPEAKER FLYNN Is there any discussion?

DR W S COLLENS, *Kings* I should like to call your attention to this item 6, which appears very innocuous, but which happens to be an extremely important item. It is something which, if passed tonight, may come back to plague us later. Let me tell you the reasons for it, and I want to discuss the arguments and the findings of the Reference Committee. As amended by them paragraph 6 reads

"All features of medical service must be under the control of the medical profession "

That may easily be construed so that any unofficial group of doctors can get together and decide how to control medical activities without having any superior board, or official board, or organized board of any form of organized medicine, have any power or control over this unofficial group. That apparently is the intent of No 6. My amendment changes that to create an official status for the group that will control and regulate all phases of medical activity. It is concerned with the election of a board by each County Medical Society to regulate the conduct of medical activities in their own county. Every county in the entire state under my amendment would have the privilege of electing its own board to regulate its own doctors. That does not mean that each county will go into the business of medical expense indemnity as interpreted by the Reference Committee, because in my amendment I state that each board is to function in a capacity similar to the present compensation board in traumatic medicine. Everybody agrees that the present board in compensation medicine is not engaged in any business by any or every stretch of the imagination, and the same holds true for any board that would regulate the control of nontraumatic medicine. The argument, therefore, that it would put the County Societies into business is entirely false, consequently the County Societies would not be legally liable

This whole thing is still within the limits of the present enacted legislation, which permits the practice of nonvoluntary medical expense indemnity. The only thing that I wish to present by means of this amendment is a method by which the medical profession will be protected by their own County Medical Societies. That is all.

Because of my reasons, therefore, I make a motion that my amendment stand.

SPEAKER FLYNN Are you making an amendment to the motion as presented by the Reference Committee?

DR COLLENS Yes, I presented an amendment this afternoon. My amendment reads—

SPEAKER FLYNN The Reference Committee has taken care of that.

DR COLLENS In view of the fact that the Reference Committee recommends that my amendment be not accepted I therefore make a motion that my amendment stand.

DR SIMPSON The Reference Committee merely stated that we considered this particular motion premature because of the chaotic state of the present subject, and not that it was not a feasible plan or might not be ultimately, but at present it was premature.

DR LEO F SCHIFF, *Clinton* I have something to offer that maybe Dr Collens will accept if he will defer the placing of an amendment for a moment.

It has struck me that there is just a little something of truth in what Dr Collens has said. At the same time there is no need to amplify the details of this medical control and I therefore suggest (Dr Collens, if you approve of it, I would suggest that you offer it as an amendment to this Committee's report, or perhaps Dr Simpson will accept it at once) that this Section 6 read simply "All features of medical service must be under the control of the medical profession, such control to be exercised by or under the direction of local County Medical Societies or the Medical Society of the State of New York." That does not bother with the details. It just tells how it is to be done, and keeps the outsiders from floating in.

DR COLLENS I should like to hear that amendment again.

DR SCHIFF "Such control to be exercised by or under the direction of local County Medical Societies or the Medical Society of the State of New York."

DR COLLENS That is all right with me, Mr Chairman.

DR SCHIFF I would rather say "The Medical Society of the State of New York or one of its component County Societies."

The amendment was seconded, and as there was no discussion, it was put to a vote, and was unanimously adopted.

SPEAKER FLYNN Now the motion is on the adoption of the report as a whole, containing the amendment of Dr Schiff.

There being no discussion, the motion was put to a vote, and was carried.

DR ARTHUR F HEYL, *Westchester* I believe there are a majority of delegates here in body but not in spirit nor in intelligence. This evening's session has now run for three hours without an intermission, and most of us devoted a fair amount of intelligence to the meeting this afternoon. Another day will dawn tomorrow. If it

does not it does not matter There will be a day thereafter If need be

I move you that this meeting for this evening be postponed to meet again tomorrow morning

The motion was seconded

Dr. JAMES F. ROONEY I would like to move an amendment that this House now adjourn to reconvene at 9 o'clock tomorrow morning

Dr. HEYL I will accept the change.

The session adjourned at 11 15 P M.

Morning Session

Tuesday, April 25, 1939

The session convened at 9 15 A M in the Plymouth Church Syracuse New York

SPEAKER FLYNN There evidently being a quorum present we will now proceed with the election

68. Elections

Tellers

SPEAKER FLYNN I will now appoint the tellers As Chairman Dr Leo F Simpson of Monroe Dr Bernard S Straits, of Yates Dr Albert A. Gartner of Erie Dr Morris R Bradner of Orange and Dr J Lewis Amster of New York.

Roll Call

We will now have the roll call

The Assistant Secretary called the roll and the following delegates responded Emerson C Kelly Frederic C. Conway William B Cornell, Lyman C. Lewis, J Lewis Amster Edward R. I move the election of these gentlemen to retired membership

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried

70 Instructions to Delegates from Bronx County Medical Society

DR WILLIAM KLEIN, Bronx I have a few resolutions here from the Bronx County Society. In view of the fact that all of them have been embodied and have been adopted in resolutions passed by the House yesterday, if it meets with the approval of the House I would like to have these put on the record as if they were read, with the notation that they have all been adopted by the House already in various other resolutions and reports of the different committees. In that way it will save a good deal of time and save me from reading them. If it so pleases the House, I will have them embodied in the record. They were all acted on already.

SPEAKER FLYNN If there is no objection, the Chair will receive this communication from the Bronx County Medical Society for what it may be worth

CHORUS What are they?

DR KLEIN Resolutions passed yesterday, most of them in the report of Dr. Brennan's committee. All of them have already been acted on.

CHORUS Read them! Read them!

DR KLEIN All right, I will

1 It is moved that our Delegates call to the attention of the Convention the existing inadequacies of medical care as enunciated by the National Health Conference and as recognized by the A.M.A. by its support of proposals one, two, three, and five.

2 It is moved that our Delegates petition the State Society to assume leadership in safeguarding the health of the people of our state by publicizing these medical needs and inadequacies as well as the methods for solving them.

3 It is moved that our Delegates recommend to the State Society that it demonstrate its interest in the economic status of the medical profession by presenting plans for adequate remuneration for the physicians who will supply the medical care under the methods planned.

4 It is moved that the Delegates remind the Convention that the A.M.A. has already endorsed certain proposals of the National Health Conference, namely, proposals one, two, three, and five.

5 It is moved that the Delegates ask for active participation and guidance in the further development of these proposals at the Annual September Meeting of the A.M.A.

6 It is moved that the Bronx County Medical Society inform its delegates of its opposition to the ratification of Chapter XV, Section 7 of the proposed Bylaws of the State Medical Society.

As you know, this was tabled until next year.

7 It is moved that the Bronx County Medical Society instruct its Legislation Committee to oppose the Lewis Bill (citizenship requirement for the practicing of medicine in New York State).

SPEAKER FLYNN All of these principles have been adopted and incorporated in other resolutions.

DR KLEIN Yes, I therefore move the House take no further action except as a matter of record.

SPEAKER FLYNN It has been moved that they be received and placed on file.

The motion was seconded and there being no further discussion, it was voted and unanimously carried.

71 Report of Committee on Prize Essays

SECRETARY IRVING A telegram has been received from the Committee on Prize Essays. There was a Prize Essay offered this year and Dr. Frank B. Cross sends in his report. "Committee on Essays advises that no award be made this year."

I move the acceptance of this report.

The motion was seconded and there being no discussion, it was voted and unanimously carried.

72. Report of Reference Committee on the Address of the President Elect

Sections 13 45

DR. ROBERT BRITTAIN This is our third time at the bat We hope to score in a single. (Laughter) We have divided this Committee's report into four sections

Committee on Financial Study

First, your Committee approves the recommendation of the President-elect authorizing the appointment of a special committee for study and investigation of the cost of the publication of the JOURNAL, reduction of salaries and expenses where there seems to be an unjustifiable excess. This committee to report their findings and recommendations to the Council

We ask for the adoption of this recommendation.

The motion was seconded and there being no discussion, it was voted and unanimously carried.

DR. BRITTAIN The next is a reference to the Board of Trustees

Your Committee approves his recommendation that there be a close inspection and economic distribution of funds and thorough investigation of our expenditures in order to secure the maximum possible reduction. We move this be referred to the Board of Trustees

The motion was seconded and there being no discussion it was voted and unanimously carried

DR. BRITTAIN The third item

Workmen's Compensation Bureau

Section 63

Your Committee approves the President-elect's recommendation that the Workmen's Compensation Committee and the Workmen's Compensation Bureau be continued.

We ask for the adoption of that recommendation

The motion was seconded and there being no discussion it was voted and unanimously carried

DR. BRITTAIN The fourth item

Foreign Physicians and Nonmember Physicians

Your Committee approves of the President's recommendation for consideration and the study of the licensure of alien physicians, and an active survey of physicians who are not members of their local Medical Societies to get them to become members

We offer this for adoption

The motion was seconded

SPEAKER FLYNN Is there any discussion?

PRESIDENT GROAT I do not want to take any of the President-elect's thunder Where Dr Brittain said President' that was President-elect

DR. BRITTAIN I beg your pardon That is so

SPEAKER FLYNN Is there any further discussion?

There being no further discussion the motion was put to a vote and was unanimously carried

DR. BRITTAIN I move the adoption of the report as a whole.

The motion was seconded and there being no discussion, it was voted and unanimously carried

73 Resolution Urging Continued Support for Preventive Health Protection Activities in the State of New York

Section 85

DR. SAMUEL B BURE, New York I am presenting this resolution at the request of the Division of Industrial Hygiene of the State Department of Labor

WHEREAS, many workers in industry are exposed to conditions conducive to occupational injuries and occupational disease and

WHEREAS the workers of New York State are entitled to protection against such conditions in order that their health may be preserved at all times and

WHEREAS local communities do not possess facilities for the conduct of such work and

WHEREAS, the only health and safety protection in New York State is lodged in the State Department of Labor Division of Industrial Hygiene and

WHEREAS this unit of the State Government has performed most commendable work and has contributed greatly to the protection of workers against accidents, silicosis and occupational poisonings and

WHEREAS, the physicians of the State of New York feel that these efforts are deserving of the full support of the State of New York, therefore be it

Resolved that the Medical Society of the State of New York, through its House of Delegates goes on record in favor of the continuation of these preventive health measures on behalf of the employed population of the State of New York and for the full support of these preventive measures and be it further

Resolved that this action by the House of Delegates be forwarded to the appropriate State Governmental Authorities.

SPEAKER FLYNN This will be referred to the Reference Committee on New Business B Dr Frederic C Conway Chairman.

74. Report of Committee on Report of Council Part IV

DR. C A ANDERSON This is the Report of the Committee on Report of Council—Part IV

Legislation

Sections 6 53

The annual report of the Council Committee on Legislation as well as the supplementary report have been reviewed by your Committee. The Committee is duly impressed with the volume of work which has been efficiently covered by the Council Committee and Dr Joseph Lawrence, Executive Officer and feels they are to be congratulated on their results. Your Committee offers the following recommendations

The Committee heartily approves of the Legislative Bulletin Service to County Society leaders and recommends their continuation.

I move the adoption of this recommendation.

The motion was seconded and as there was no discussion it was voted and unanimously carried

DR. ANDERSON The Committee recommends, subject to the approval of the Board of

Trustees, that in view of the numerically increasing and complicated legislative problems and the possibility of unforeseen contingencies arising, the Executive Officer be provided with an assistant, who shall be a duly licensed physician of the State of New York, who will be able to carry on uninterruptedly the activities of this important department

I move the adoption of the recommendation of the Committee

Reporting on the resolution presented by Dr M E Marsland, of the Medical Society of Westchester County, namely,

"Be it resolved That the House of Delegates do instruct the Council of the Medical Society of the State of New York to retain full-time legal counsel to assist and supplement the Society's present representation before the Legislature"

Your Committee disapproves of this resolution in view of the recommendation embodied in the report of the Committee and, furthermore, the subject matter relates to the practice of medicine and only in rare instances is there a strictly legal problem, which problem, can be handled by the Counsel of the Society

I move the adoption of the recommendation of the Committee

The motion was seconded

DR M E MARSLAND, *Westchester* Mr Speaker and gentlemen! It is not the intent of this resolution to change the existing status of the Society's Legislative Bureau in Albany or to displace any of its present personnel. The intent is to provide additional help, the need for which is implied in the Legislative Committee's report for 1938

It is our thought that this help would be best supplied by the employment of a legal representative. Every bill of medical interest has a legal aspect as well, and, in addition, has to be considered from the layman's point of view. We believe that a legal representative would reflect the legal and lay point of view, and his services could, perhaps, be utilized in many instances to present these aspects to the legislators more convincingly than we can

These aspects—the nonmedical aspects—of our problems are frequently of prime importance, and it is often difficult for us with our medical training and background to recognize and properly evaluate them. Our suggestion is in no way a criticism of the present structure, but offers, we believe, a way in which a good machine can be made even better. We need active participation rather than purely consultative legal advice

While the idea is not incorporated in the preamble or body of this resolution, it is to be hoped that the plan suggested would enable us to depart in some degree from the largely defensive program which we are compelled to follow under the present circumstances, because of the press of work which is now imposed. We hope that it will prove to be a step toward a legislative program which will attempt to embody and effect the resolutions of the House of Delegates, that the State Society will be able to adopt a more active program by sponsoring such legislation as may seem necessary to protect and advance the interests of the public and the profession

If this resolution is made effective, the total cost would be less than a cent per day per member. If this item seems to be prohibitive, remember that there is probably no activity of the State Society today that is of more vital interest to its members and to the public than the activities of the Legislative Bureau, and none from which the Society "gets more for its dollar," to use Dr Townsend's phrase in his address yesterday morning

Therefore, I want to make a substitute motion, Mr Speaker, that the report of the Reference Committee on this resolution be not approved, and that the original resolution shall prevail.

The motion was seconded

DR SAMUEL B BURK, *New York* On the substitute motion, I happen to be on that Reference Committee, and during the past thirteen or fourteen years it has been my privilege to serve as a member of the Legislative Committee of the Medical Society of the County of New York

With all due respect, I wish to take exception to the expression that was used as to the passive method that our representative at Albany has participated in the activities of the State Medical Society

True as it is that there are some legal phases associated with pending legislation, I believe that there is no one who can present medical problems more efficiently, more accurately, and with the greatest effect than a medical man. While we might have legal advice on special occasions, we still have the counsel of the State Society, who is ever anxious and willing to help us. However, if we start using the services of a lawyer who will try to represent the medical picture in certain cases, you will find that many of the legislators have already been primed by the opposition, and will only be too ready and anxious to give arguments which are contrary to actual medical facts. I know of no one who can better refute those arguments than a medical man, hence the recommendation as the Committee gave it was expressed bearing in mind all the various angles as were mentioned

DR ARTHUR F HEYL, *Westchester* Last evening before the hour was too late two of our delegates were debating with eloquence, candor, and intelligence a recommendation of the Board of Trustees on a similar issue, namely, that a fiscal adviser should be employed when it came to decisions of investment of money. It seems to me that this is quite parallel, and is a justification for the continuance of our present setup with a physician guiding, but with legal advice, to help frame legislation and to advise how best in addition that knowledge, which has been gained over the years, could be utilized to block laws unfavorable to the practice of medicine and physicians. I cannot see any difference at all in the specialization angle urged last night and that involved here. In fact, in this issue there is much more invested. This deals with the whole future welfare of the Medical Society of the State of New York, and not only with the investment of \$100,000 or so

DR GEORGE W COTTIS Mr Speaker, I do not know whether to be amused or irritated. So far as I know, our present Executive Officer has well performed his duties. I have heard

no criticism whatever of him and I understand in Albany he has tremendous influence. I do not understand that Dr. Lawrence has asked for any full time adviser. If he does require any legal advice we have our own counsel who is paid a good retaining fee every year and who is perfectly willing to do whatever work may be required.

I do not quite like that one cent a day idea because it is rather subtle. I have been doing a little higher mathematics in my own head and I think that would amount to \$3.65 a year and with our total dues only \$10 that is not quite so innocuous as it may sound.

In regard to the fiscal adviser I believe it is obvious that \$300 for advice as to the investment of our funds will probably pay for itself. I do not believe that the salary of a full time legal man in Albany will be justified by the results.

DR. RICHARD H. SHERWOOD *Niagara* I am neither amused nor annoyed by anything that has been said. I have been before legislative committees three times, and one cannot help being impressed by the array of expensive legal talent backing up the opposition to anything that we want done and usually anything that we do not want done.

After hearing the arguments on both sides as to whether we should have a doctor or a lawyer helping Dr. Lawrence I must confess that I am not competent to say which I feel, however sincere in the conviction that we need some kind of help. When you realize that a little band of osteopaths can set the medical profession on their heels and a few working for the chiropractors are so well organized that they can introduce detrimental legislation to the medical profession year after year you know that my statement is so. The work of our Legislative Bureau and the Committee on Legislation is most commendable, but there is a feeling on the part of some of the members of our Medical Society that something more constructive and positive should be under taken in behalf of organized medicine.

In the Department of Social Welfare of this state it is quite apparent we have growing one of the largest bureaucracies in the whole United States, whose rules and regulations have the effect of law when applied locally in our communities. We have been having some wishful conferences with them for a number of years with very little practical effect. It is with the idea not of criticizing the work that has been done, but commending it most highly and adding to that effort in the coming years that some of the doctors feel I am sure that we should have some aid. Whether it be legal or medical should be left to those active in the work and most competent to judge but we cannot go on forever fighting a defensive battle. We must change our tactics, with the realization that sometimes an attack is the best method of defense.

DR. THOMAS P. FARMER You may have been amused or annoyed by some of the remarks in this discussion but I think there have been some words of wisdom spoken. For that reason I want to ask Dr. Burk, who discussed this question, a personal question.

Dr. Burk, haven't you a legal background?

DR. SAMUEL B. BURK *New York* I have

DR. FARMER Will you tell the House of Delegates what it is?

DR. BURK Well it so happens that I have taken the course and passed the bar, and all that goes with it. That is why I spoke as I did and in the vein I did. The reason we made the recommendation was while Joe Lawrence is doing an excellent job heaven forbid if circumstances arose where Joe was temporarily incapacitated. We are all liable to such happenings and it would be well to have somebody jump in and take care of what is going on and under circumstances where there would be an unusual amount of heavy work that somebody would be able to supplement Joe in his work.

Insofar as the legal aspects are concerned it is only here and there throughout the whole year where a problem would arise that would call for legal investigation. I dare say that during the current legislative session there were possibly one or two occasions at the most where that question arose as to whether or not we ought to have some legal advice.

So far as making the necessary contacts is concerned it is only here and there that an individual at the Assembly or the Senate may comment about not knowing Joe Lawrence. I am putting the cards right on the table so that every one can see them and everyone can read them. On one or two such occasions I have had the opportunity of having such a legislator meet Joe Lawrence, and he did not associate Joe Lawrence as Joe Lawrence but as the representative of the Medical Society of the State of New York. They all heed very carefully what he has to say.

DR. FARMER I want to thank Dr. Burk for answering my question. We have listened to the only man in this House of Delegates who has legal training and he has expressed his opinion very accurately and very definitely about the need for outside legal advice. I think if we formulate our own ideas on something we do not know anything about and disregard his advice we are acting very foolishly.

DR. JOHN J. BUEBTNER *Onondaga* I have been a member of the Legislative Committee of our County Society also of the State Legislative Committee. It does seem to me that during all the years that Joe Lawrence has had charge of the work and likewise in the various reports of the Legislative Committees if they felt that a legal adviser was necessary recommendation would have been embodied at various times previous to this. They feel that the necessary legal advice may be obtained when they need it, and I feel as the previous speakers have expressed themselves particularly Dr. Burk that we would be making a mistake to change the routine as established at this time. I do feel however that an assistant is necessary in order to continue the good work and so that there would be no chance under any circumstances of a letup on that work.

DR. MERVIN E. MARSLAND *Westchester* I would like merely to straighten out some of the things that have appeared in the discussion that have been away from the intent of the resolution. In the first place there has been a great deal of talk about a legal adviser. That is a secondary consideration. What we are talking about is having someone who has active participation in the work before the Legislature, someone who in certain instances and with certain types of bills

can appear before committees, can approach certain legislators

The reason and the background for this are that in my own personal experience as a member of the Legislative Committee in approaching these men frequently we cannot get them to see our point of view, and frequently we cannot see theirs. I have had the experience of having a bill which was most objectionable from a medical point of view discussed, and my argument would be most convincing to me but the legislator could not get that point of view yet perhaps some minor point that I brought up affected him personally and was the thing that convinced him. We cannot always see things in their way, and we feel that having someone who sees their viewpoint, who speaks their own language, would be of value in certain instances, not in all. There has been no such intention to use him in all instances.

We do not like to be in the position of telling Dr Lawrence what he needs. It is merely that we feel such a man would contribute something to our Legislative Bureau that we do not have at the present time.

As far as the question of expense is concerned, the fraction of a cent a day that I mentioned, I put that in purposely. We figured out that the cost of one cigarette a day would more than twice pay for the services of such a man. We do not realize how many of us there are in the state, nor what an investment we have to protect. We have a gross income that I would estimate at \$60,000,000 a year, which is worth protecting.

The argument of not having anything but a medical man represent the Society is like the fly fisherman who would rather go hungry than use bait. We are prejudiced.

Finally we have to remember that this plan is not irrevocable. We can try it to see what it is worth, and if it does not work out it can be modified.

The question was called for, and the motion was put to a vote, and was lost.

SPEAKER FLYNN The motion before the house is the adoption of the report of the Reference Committee.

There being no further discussion, and the question being called for, it was put to a vote, and was carried.

DR ANDERSON I move the adoption of the report of the Committee as a whole.

The motion was seconded, and there being no discussion, it was put to a vote, and was unanimously adopted.

Publications

DR C A ANDERSON As to Publications, the Committee is of the opinion that the merging of the Publications Department and the Bureau of Public Relations as directed by the House in 1938, under the general chairmanship of Dr Peter Irving has been of value. We congratulate the Committee on the appearance of the *JOURNAL* as published since January 1, 1939, and feel confident that the venture will be a great success.

I move the adoption of this report.

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously adopted.

Medical Publicity

DR ANDERSON As to Medical Publicity, your Committee approves of the practice of news releases of medical events, such as meetings of the district branches, general editorials, and news events of interest to the profession and the lay public, and recommends the continuation and extension of this project.

I move the adoption of this recommendation.

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously adopted.

DR ANDERSON Regarding the matter of Speakers Service Bulletins, the fact that of 958 questionnaires sent out, 451 replies were received, and 389 physicians approved of these bulletins and desired them to be continued, speaks in favor of continuing this publication. The committee recommends the continuation of the publication of the Speakers Service Bulletins.

I move the adoption of this recommendation.

The motion was seconded.

DR GEORGE W KOSMAK I would like to move a substitute motion to the effect that this matter be referred to the incoming Council and Board of Trustees for further study.

The substitute motion was seconded.

SPEAKER FLYNN Is there any discussion on the substitute motion?

The question was called, and the motion was put to a vote, and was carried unanimously.

DR ANDERSON The Committee desires to express to Mr Dwight Anderson and his office force their deep appreciation for their untiring interest and effort in the work of his department.

I move the adoption of the report as a whole, sir.

SPEAKER FLYNN With the substitute motion.

DR ANDERSON Yes.

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried.

75 Report of Reference Committee on New Business A on Resolution Regarding Internship as a Requisite to Practice Medicine in New York State

Section 33

DR GEORGE BAEHR Regarding the resolution submitted by Dr Charles Gullo, calling for modification of the Medical Practice Act, your Reference Committee A recommends approval of the proposal of Dr Charles Gullo which would place the Medical Society of the State of New York on record as favoring the requirement of an acceptable internship of at least one year's duration as one of the requirements for a license to practice medicine.

The Committee has taken the liberty of rewording his resolution as follows:

"Resolved that the House of Delegates hereby instructs the officers of the Medical Society of the State of New York to take whatever steps may be necessary to secure the introduction of legislation to amend the Medical Practice Act, so as to require internship of not less than one year in an acceptable hospital approved for internship by the American Medical Association, before a license to practice medicine may be granted by the Board of Regents of the University of New York."

I move the resolution

The motion was seconded and as there was no discussion it was put to a vote, and was unanimously adopted

76. Report of Reference Committee on New Business A on Resolution Regarding Basic Science Law

Section 34

DR. GEORGE BAUER This is on the resolution introduced by Dr Charles Gullo reading

Measures be taken that law be enacted requiring that all persons desiring to practice any of the branches of medicine such as chiropractic naturopathy and other similar groups must before allowed to practice their art pass an examination on the basic sciences besides meeting present requirements

The Reference Committee on New Business A believes that any regulation of chiropractic naturopathy and similar irregular and unlawful and essentially fraudulent practices would be equivalent to granting them legal recognition and authorization

Your Committee, therefore recommends that the resolution be disapproved

I so move.

The motion was seconded

DR. CHARLES GULLO Livingston It is not a question of the Medical Society recognizing a chiropractor or any of these other fellows It is a question of regulating them. It was mentioned yesterday that some years ago when the law was passed requiring that the osteopaths be made to take an examination there were quite a number of them I imagine that law was passed under similar circumstances in that it was opposed by the House of Delegates. However it was eventually passed so that osteopaths have been made to take an examination You did not recognize them as physicians you recognized them as osteopaths. However one thing was accomplished You did regulate them and as a consequence was again mentioned yesterday only forty have been licensed since then In other words the law as is preventing the entrance into the State of New York of a vast number of osteopaths than we would have had otherwise.

There are other states of the Union where the basic science law has been passed and I believe investigation by the Society would find that as a consequence the chiropractor and all the rest of them are petering out

Just because we do not recognize them and we say they do not exist does not make that so They are still practicing some medicine and we as a Society have a public trust to see to it that the public is guarded from any fraudulent practitioners of medicine.

VIC-SPEAKER BAUER I am in sympathy with the Committee's recommendation but I am wondering if it is not going to accomplish the reverse. In disapproving of the resolution it might be considered in some places as approving these cults because we are refusing to disprove them. I think it would be more effective if as they were postponed indefinitely That disposes of it as effectively as disapproving of it I so move, Mr President

The motion was seconded

DR. GULLO Moy I say this the action of the Legislature during this present session indicated one thing they refused to allow the chiropractors to receive a license to practice in the State of New York that license to be issued by a Board of Chiropractors but that points out one thing—that the legislators do want them to be regulated and that they be given a license only if they meet certain requirements.

DR. RICHARD B. CUTHBERT JR. Madison I hesitate to appear on my feet before this House for the first time on an unpopular subject. However as President of the County Society last year I had occasion to have considerable discussion with Mr Milmoie our assemblyman who sponsored last year and again this year the osteopathic bill Mr Milmoie is no more favorable to the osteopath as a practitioner than you or I would be He would be no more likely to consult an osteopath than any person in this room. However he has told me that the sentiment of the Legislature is that something should be done to regulate these fellows, the osteopaths the chiropractors the naturopaths and what have you The Legislature is going to pay some attention to those men regardless of what we feel I have had it on pretty good authority that had the osteopathic bill not passed the Assembly this session the chiropractic bill would have passed

It is time for the Medical Society of the State of New York to take a leaf from Henry Armstrong's books and start going ahead instead of continuously fighting It is time we stood for steps to regulate these fellows and not continuously say We don't want them We don't see them They are here and it is time to take steps to regulate them and see what we can do in that way (Applause)

SPEAKER FLYNN The motion is to postpone indefinitely All those in favor say Aye those opposed No I will call for a rising vote All those in favor of postponing indefinitely this report of the Reference Committee

DR. MORRIS B. MARSLAND Westchester Stated the motion again

VIC-SPEAKER BAUER I moved that action on the resolution be postponed indefinitely

DR. GULLO I ask for a standing vote

SPEAKER FLYNN All those in favor of postponing indefinitely stand all those opposed The vote is 58 to postpone and 57 not to postpone I will vote in the negative making it a tie vote and the motion is lost

The motion is now on the recommendation of the Reference Committee

CHORUS Recount!

VOICE As a matter of information that was not a tie vote

VIC-SPEAKER BAUER The speaker has the right in the case of a vote where there is a difference of one to cast his vote making it a tie vote as well as to vote in case of a tie He casts vote twice, but if he votes to make it a tie that is his privilege and the vote is then lost if it is a tie vote

SPEAKER FLYNN The motion before the House is on the adoption of the report of the Reference Committee

DR. LEO P. SCHIFF, Clinton It would seem the House is almost evenly divided on this

important question it would be too bad for us to go on record in haste or through a misunderstanding even by implication recognizing any of these fraudulent practices as being legal. They are illegal, and that is the only attitude that we can take ostensibly and consistently.

In attempting to regulate by legislation anything that is illegal, we immediately elevate it to the status of legality. We are not in a position at this time to think this thing over carefully. Arguments come to our mind, as we have sat down, of something new. I believe that the most sensible solution to this would be for the Reference Committee to amend its report so that it will end in this way: that we recommend that no action be taken at this time. In that way we do not commit ourselves. I now move you as an amendment to the report of the Committee.

CHORUS We voted on that.

DR. SCHIFF That is not postponing indefinitely. The thought is slightly different.

CHORUS No, no.

DR. SCHIFF If that is not agreeable, as the temper of the House seems to indicate, I then believe it should be referred to some other committee because it ought not to be acted on at this time, gentlemen.

CHORUS Why?

DR. SCHIFF Because we are not in a position with so close a vote to decide a thing like this possibly of very great importance. I move that this be referred to the Council with power to act.

The motion was seconded.

CHORUS No.

SPEAKER FLYNN The motion before you is to refer to the Council, and that has been seconded.

DR. HORACE M. HICKS, *Montgomery* There is not a member in this House, I do not think—there may be some of the younger members here who do not remember, but the difficulty it seems to me (and I don't know that I am right in this but I fear that I am right) is that you are opening up a subject which will do something with the Medical Practice Act. As you do that you are going to open up a floodgate. You want to stop and think about it. Just as sure as you do that, gentlemen, you are going to be in trouble. It took us six years to get our present Medical Practice Act. Don't forget it, if you open it up you are opening up trouble. (Applause)

DR. HOMER J. KNICKERBOCKER, *Ontario* The way the situation stands at present, all who can comply with the Medical Practice Act may apply for examination for licensure. These men whom we are discussing have not those qualifications. As far as regulating them is concerned, they are at present outside the pale of the law, they belong to the bootlegger and the gangster, and you might as well try to regulate them. Let us prosecute them. Albany does not prosecute on complaint, and if they do they do not get convictions. That is what we need. (Applause)

DR. GULLO We all admit that these fellows are practicing illegally, and I contend that the Medical Society of the State of New York has a public trust to watch and see that those who are taking care of the sick are properly equipped to do so.

If you talk to any of your patients, from the

intelligent to the one who has no education at all, they will tell you these men should be allowed to practice. Let us mention one man who is in the Legislature today and who voted in favor of that particular legislation to have the chiropractors come in, *Assemblyman Wadsworth*. Has he any education? We grant he has. He contends that these fellows should be allowed to practice. If such a man says that, what does the rest of the public think? They come to the conclusion, the public does, that they are qualified in their particular field to do what they are doing. The public looks to us, as doctors—it does not look to the lawyers or anybody else—it is our business to see that they are qualified intellectually if not medically. If we did that, you would not have a carpenter a chiropractor, you would not have a ditchdigger a chiropractor. If these people were required to pass the basic science examinations, there is only one result that would follow, and that would be that they would come to the conclusion as their studies went along that they might as well study medicine rather than chiropractic. That is what happened to your osteopaths. That is why they have petered out, as was pointed out yesterday. We have licensed only forty in the last several years. That has happened in the other states of the Union, and it will happen in the State of New York.

DR. SAMUEL B. BURK, *New York* I do not want to inject myself, although the subject is very interesting and very important so far as the profession is concerned. It seems to me that yesterday we listened to a lot of oratory about regulating or, as a matter of fact, keeping out of the practice of medicine individuals who were not properly qualified. Today, very much to my surprise, I find there is a sentiment about regulation. I believe, and I think everyone in this room feels the same way, with few exceptions, that the practice of medicine really should take care of the health and welfare of the public. Can these gentlemen who have not had the proper training and experience take care of such problems which are dependent upon materia medica, and pathology, and the whole group of studies that every student must study before he obtains his license? I cannot see in any way how these individuals can be regulated. They are either doctors or they are not doctors.

In passing may I add that Dr. Harold Rypins of the State Board of Examiners is here, and I believe he could help us and enlighten us, if you will grant him the privilege of the floor. (Applause)

SPEAKER FLYNN Dr. Rypins!

DR. HAROLD RYPINS Mr. Chairman and gentlemen, thank you for the privilege of the floor. I shall be very brief. I have no argument to present. My whole duty, I hope, is to keep the record clear. There have been a great many inaccurate statements made here yesterday and today. I controlled myself yesterday when it was repeatedly reiterated in this House that exactly forty osteopaths had passed the state licensing examination. That is an absolutely inaccurate statement and an unfounded statement. Although I do not have the correct figures here, I can tell you that over half and probably almost three-quarters of the present osteopaths practicing in this state have passed

the regular state licensing examination other wise they would be the healthiest group in the world. They have been licensed since 1907 and if over 85 per cent of them are still living and practicing I am going in for osteopathy.

I am not going to talk about the osteopathic matter at all. I presume Dr. Baehr's resolution is directed primarily to chiropractors, the naturopaths and others of the lower level. I also assume that all of us are agreed on one program and that is how to get rid of these people. So it comes down to a question of the best procedure to get rid of them.

I have been intimately connected with this problem and have devoted about half of the last fifteen years to it, and I think you should know that we are making progress. One of the best evidences of that is that those of us who know anything at all about politics in Albany were satisfied that this was probably the best opportunity the chiropractors had ever had in the last twenty years to secure legislation because it is a matter of popular knowledge that generally speaking this is a measure which is favored by the Republicans much more than the Democrats.

CHORUS: Shame!

DR. RYFINS: And we were extremely apprehensive, in fact if Mr. Dewey had become governor I am almost satisfied we would have had chiropractic legislation.

CHORUS: No no.

DR. RYFINS: That is my opinion gentlemen. But he was not elected governor. At any rate the Republicans largely represent the upstate communities, which have been very candid in saying they want to regulate the chiropractors that what they want to do is to get them off their necks, they are tired of them. The chiropractors were able to get 37 votes in the Assembly and it was so weak they did not even try in the Senate. There must be some explanation for it. The explanation is in spite of the fact that one of the gentlemen said no prosecutions have been accomplished, the prosecutions accomplished in reality a very great deal. I would like to refer very briefly to some figures I have. While these figures do not of course refer specifically to chiropractors, I presume we would prosecute more chiropractors than any other cult or illegal practitioner of any kind.

Since 1926 we have received 4,540 complaints of illegal practice from all parts of the state. I believe that we investigate every complaint we receive. About two-fifths of these, 1,900 upon investigation we found there was no violation of the law whatsoever. For instance a doctor will write in that some optometrist is calling himself a doctor etc. That may be true but under the law there are certain optometrists who are entitled to call themselves doctor. As long as they have the legal right of course there is no violation. We have almost a similar group about two-fifths of the total number, 1,832 where the violation is of a minor or technical nature. For instance, a chiropodist who is doing a little more than a chiropodist should do or a massage operator who is using a few electric lamps or physiotherapy a whole group of these beauty culture people and massage people. If you send out an inspector and send them a notice that they have to stop almost all of these people will stop with

out going to court. That leaves a total of 808 people who will not stop without going to court. I may state right here and now that the chiropractor will not stop unless he goes to court or unless he goes to court three or four times. The gentleman alleged there were no prosecutions. There were 808 prosecutions out of which there were 753 convictions and only 55 acquittals. That is not a perfect batting average but it is higher than any criminal prosecutions by any district attorney in this state.

The result of this is twofold. One is that they get discouraged. A man may want to go to jail twice and pay a fine twice, but he usually gets discouraged after the first or second attempt. The second thing is that he is always on the defensive. In order to get a treatment by a chiropractor today my inspectors have to be introduced by some individual who will vouch for him as a person who will not give evidence, and in many cases even if he gets in—and it is very difficult now to get in—he has to sign a document saying that he will not give evidence against the practitioner. It is difficult enough to get patients anyhow as you know and fewer patients will come in by the way of a back door as they must realize that they are engaging in a bootleg practice. How long do you think they are going to continue coming? Some of the old ones will continue coming but the new ones do not come in so rapidly.

What is the practical result? In 1926 there were over 4,000 chiropractors in this state in actual practice. At the present time the chiropractors themselves—and they claim the greatest they can claim—claim about 1,000. Of these 1,000 from my experience I should say that no more than 57 are in practice, the others are running street cars or buses, or they are barbers or something during the day and if a couple of patients come in at the back door at night they are chiropractors.

What we all want to do is to get rid of these people. There are two ways of doing it. I think we have the right program if we keep at them. We certainly have done something, for there are already less than 50 per cent of what there were. They are in hiding now and some of them doing a bootleg business. We will probably never completely get rid of them all but we have attempted to do so.

SPEAKER FLYNN: Make a public issue of it and lock up two or three hundred at a time.

DR. RYFINS: I am glad we did not do that because the minute you do that as some other states have found to their sorrow they get the whole public aroused and behind them and it gets to become a public issue, and they are all heroes. They did that in Ohio. They had 200 in jail at one time. The result is that Ohio promptly licensed them. As the prior gentleman said it is a very serious business, for once you give them legal status they will acquire more legal status. We have been extremely fortunate in this state in keeping them from having any legal status. All the other states think New York State is so much better off than they are. It is a question of persistence and patience and willingness to see the thing die out slowly because it is very definitely dying out. As a person, I urge you to support the resolution of Dr. Baehr, and to let nature and the law take its course without mak-

ing the mistake now that we have won this fight, and we certainly have won it after fifteen years. It would be a mistake to reverse ourselves and say, "Well, we are licked. Let us give them some legal status." It will be a mistake for the medical profession and a mistake for the public health.

I am sorry to have talked so long, and I want to thank you very much.

DR. HERBERT H. BAUCKUS, *Eric*. I think if we postpone this matter now we really give face to the cults. The Reference Committee quite plainly has moved that we adopt its report, which in effect means that we are going to go along with enforcing the Medical Practice Act. I think that we have that question to decide, and we will soon decide it. I believe we ought to settle it and decide it right now.

DR. GULLO. Could I amend that motion before the House?

SPEAKER FLYNN. The motion before the House is on an amendment to the Reference Committee's report, and refers it to the Council for action. Dr. Schiff made that amendment.

The question was called for, and was put to a vote and was lost.

SPEAKER FLYNN. The question before the House now is on the adoption of the report of your Reference Committee.

The question was called for, and was put to a vote, and was carried. (Applause)

77 Report of Reference Committee on New Business A on New York State Department of Education—Physician as Director of Division of Health and Physical Education

Section 36

DR. GEORGE BAEHR. This is on a resolution presented by Dr. Parsons, of Westchester, reading:

"WHEREAS, the House of Delegates adopted a resolution in 1936 (Sec. 65, Minutes of the House of Delegates, 1936) providing that the Medical Society of the State of New York 'take such steps and sponsor such legislation as may be necessary to require the appointment of a duly qualified physician as Director of the Division of Health and Physical Education of the State Department of Education', and

"WHEREAS, no bill has been introduced into the Legislature, or other action been taken to effect such a change in the Education Law, therefore be it

"Resolved that the House of Delegates reaffirm the resolution passed in 1936, and direct the Council of the State Society to introduce and seek the passage of such legislation, requiring the appointment of a duly qualified physician to the aforementioned directorship."

Your Reference Committee A on New Business approves of the resolution presented by Westchester County, concerning the directorship of the Division of Health and Physical Education of the State Department of Education, but has taken the liberty of rewording it in the following manner:

"Resolved that the previous action of the House of Delegates in 1936, concerning the directorship of the Division of Health and Physical Education be reaffirmed, and be it further

"Resolved that the officers of the Medical

Society of the State of New York be directed to take the necessary steps to secure the introduction and enactment of legislation which will require that the Director of the Division of Health and Physical Education of the State Department of Education be a duly qualified physician."

I move the resolution as amended.

The motion was seconded, and as there was no discussion, it was put to a vote and was unanimously carried.

78 Report of Reference Committee on New Business A on Principles of Professional Conduct Relating to Contract Practice

Section 52

DR. BAEHR. This is on a resolution presented by Dr. Joseph Wrana, of Queens, concerning Principles of Professional Conduct Relating to Contract Practice. The question concerning the right of organized medicine to discipline its members for infractions of its rules relating to contract practice is now before the Courts of the District of Columbia. Your Committee, therefore, recommends that the resolution of Dr. Wrana, regarding amendment of the Principles of Professional Conduct Relating to Contract Practice, be tabled.

The motion was seconded, put to a vote, and was unanimously adopted.

79 Report of Reference Committee on New Business C Regarding Free Choice of Physicians in Medical Relief

Section 31

DR. FLOYD J. ATWELL. Your Committee has considered the resolution introduced by Dr. Harry C. Guess, of Erie, on the subject, "Free Choice of Physicians," and with his consent has reworded the resolution without altering its intent. The amended resolution follows:

"WHEREAS, the principle of free choice of physician by the patient is vital to the progress of medical work, and

"WHEREAS, the care of the medical indigent is daily becoming a greater proportion of medical practice and is likely to continue increasing, and

"WHEREAS, social welfare agencies are tending more and more to place the medical care of the indigent in the hands of full-time physicians without any choice by the patient, and

"WHEREAS, some county governments are considering, and some have already instituted, full-time medical care for the indigent, and

"WHEREAS, care of the indigent by full-time physicians is in most cases not real economy, and is continually subject to the evils of political interference, be it

"Resolved that the Council of the Medical Society of the State of New York promulgate plans and rules for the furtherance of free choice of physician for the medical care of the indigent, and from time to time, at least twice each year, advise and instruct the component county medical societies in this regard."

Before coming to any conclusion in regard to this resolution, your Reference Committee consulted the Reference Committee, Report of Council—Part II, and finds that their recommendations are not in any wise affected by this

resolution. As a matter of fact, it simply reiterates principles previously adopted by this Society and places on the record the specific duty for the Council which is in line with the work that they have been doing on this subject. We recommend the adoption of this resolution.

The motion was seconded and as there was no discussion, it was put to a vote, and was carried.

80 Report of the Reference Committee on New Business Con Administration of Welfare Medical Relief Practice

Sections 18 65

DR. FLOYD J. ATWELL. Your Committee has considered the resolution introduced by Dr. M. R. Bradner of Orange *in re* Administration of Welfare Medical Practice.

We find that the Council Subcommittee on Public Relations and Economics has already taken up this matter and presented a report thereon which has been considered by the Reference Committee Report of Council—Part II.

The recommendations made by the Reference Committee cover in a much broader manner than Dr. Bradner's resolution the subject of Administration of Welfare Medical Practice. Dr. Bradner's resolution calls for specific changes in the law in considerable detail. The report of the Reference Committee as adopted will provide for changes of this nature at the discretion of the Council. We feel that it would be much better to leave the changes in the hands of an experienced committee who have already made considerable study of the subject than to attempt in a meeting of this kind to decide exactly what changes are to be made.

We are entirely in sympathy with the motives that have prompted the drawing of this resolution. In view of the foregoing we recommend that no action be taken on it at this time.

DR. M. R. BRADNER, Orange. With due respect to the judgment of both these committees involved, I think there should be something more said on this question. It affects principally rural counties. The ones of us who are representing the practice of medicine in rural counties are the ones who should really think about this question a little before we table the resolution.

The present welfare setup has been functioning now for something around seven years under the Emergency Relief under which laws were established giving counties certain privileges and revamping the original poor officer law. Many of these original laws were excellent as they gave the doctor an opportunity to treat his patient and to be paid for treating his patient, until the burden of that amount of welfare work increased to such an extent that it became a public menace as to the cost of it and the taxpayers began to understand it and began to resent the amount that the work was costing them. The doctor was being blamed for he was then charging for work that he had never charged for before and hospitals were charged for their services which they had never charged for before.

About that time the whole setup was turned over to the Public Welfare although Public Welfare guided it from the beginning and it became a fixed law in the state. What has Public Welfare done? We have 60-odd counties in the state, probably 700 or 800 townships,

a dozen or more fairly large cities, and a lot of small cities and there is absolutely no uniform organization in any of those agencies. The custom of developing the poor doctor the public welfare doctor working on a contract basis and very frequently at a ridiculously small salary \$300 a year for taking care of a piece of work which may represent ten times that amount of time on his part is being increased all the time.

There is a universal custom to refuse to pay doctors who treat public welfare charges in a hospital. As soon as these laws have been passed a public welfare recipient ceases to be a recipient of straight work and there is no reason why both the doctor and the hospital should not be paid for their services. Just as it is not possible for a public official to go to the local grocery store and ask them to supply groceries to such an individual free of charge it should not be possible for them to ask either the doctor or the hospital to treat patients free of charge.

Orange County has been fairly well organized now I think, for the last five years under two agreements—one between the Medical Society and the county government, and one between the County Hospital Association and the county government. The county government has co-operated splendidly with the doctor with the exception that certain townships pay no attention to the law and pay no attention to the county government as a whole. A three hundred dollar-a-year social welfare official of a small township has legally the right to tell the doctor to go to the devil and to tell the county government that he will not abide by the rulings of the county government and to refuse to pay a doctor for services rendered on a patient that has been accepted and to refuse to pay frequently a hospital bill that has been rendered.

This resolution which Orange County has sent up here is not a personal resolution of the delegates. It has been considered by the Economics Committee, and incidentally the speaker has been the chairman of that committee for seven years, with the exception of the one year that he was the County President of the County Society and in that year we established the working arrangement with the county government. It has eight clauses but before I speak of that the Department of Social Welfare has had the opportunity to give good organization but they just have not done it. The counties are chaotic. As I said there are no two counties in the state that are uniform. There are probably no two townships in many of the counties that are uniform. Even in Orange County, where we have had seven years of cooperation with the county government, we still cannot say that we have a thoroughly well-organized county. We have our professional advisory body we practically have a single individual who is the Welfare Director, Medical Director and the Department of Social Welfare has taken some guidance from the medical profession this last year. This last year one of the reasons they have taken some is because they know that they have not set up a proper system to work under. They have not proper organization. What they have done is really to develop an extremely expensive and extremely elaborate administrative setup which organizes report and record. For instance, the care of children in the county has been categorically

divided into five classes, each with its own services, each with its own system of accounting, each with its own expenses, and the investigators of one category cannot function in another. The same way with the blind. This is a specific instance. A short time ago a county nurse was asked by a state inspector to see a child who was blind and to take that child under protection. The county representative went to see the child, and did nothing about it, but went back to the county nurse, who reported it to the County Nursing Committee, that she had been sent to see a child who was not under her jurisdiction at all, she only took care of the adults and older blind patients, she could not take care of a child. That is characteristic of the duplication of effort that we are meeting with the State Board of Social Welfare.

This resolution has eight different parts. I am not going to trouble you long, but listen to this. The first part is an attempt to standardize the fees paid to the doctors and to have official recognition of the propriety of those fees. That same paragraph advocates a contract between the Medical Society of the State of New York—not the County Societies—with the government of the State of New York, combining the acceptance on the part of the physician, of the care of all properly authorized welfare patients under the guidance and discipline of the respective County Medical Societies, and the acceptance on the part of the state of a minimum charge fee schedule to be agreed upon, for the treatment of these public welfare patients in office, home, or hospitals.

The second paragraph takes care of the acceptance of a legitimate hospital charge for hospital care.

The third has to do with disputes and arbitrations.

The fourth asks for a uniform type of county organization.

The fifth asks for economies to be effected in those counties to save money.

The sixth asks for a unified organization of township welfare procedure.

The seventh asks for a complete reorganization of the control of the State Department of Social Welfare from the standpoint of economy. Listen to this, this is approximately correct. As of the fiscal year of 1936-37, out of a budget of reimbursement to counties for public welfare expense, \$2,500,000 went for the reimbursement of counties for medical home relief, \$48,000,000 reimbursed the counties for home relief other than medical, and \$77,000,000 were largely unaccounted for, but assumed to be overhead of this tremendous mechanism of administration, control, audit, inspection, etc. You can see the amount of costs that the doctors, as taxpayers, have to bear, aside from professional considerations. The state reimburses the counties 40 per cent of the cost on these two items, and I have it from the Treasurer of Orange County that the mandatory cost to the county made necessary by the regulations of the State Board of Social Welfare cost the county all but about 12 per cent of that reimbursement.

I am going to ask you to reconsider this motion with one change. I don't quite know the parliamentary procedure, but the last paragraph reads

"Be it further resolved that these resolutions

be drafted in the form of a bill and presented to the State Legislature."

I would like to change that to read

"Be it further resolved that this Society expresses its desire to cooperate in the formulation of remedial measures as may be required."

Here is the reason. Orange County has become very tired of this. There was a time when they considered refusing reimbursement on the ground that they believed they could do a cheaper job and save themselves money by keeping it in their own backyard, but they feel the entire setup is wrong. The object is correct, but the State Board of Social Welfare with the best intentions in the world have built themselves up a sort of Frankenstein, which has interfered with their own efforts. Therefore the laws should be modified—not radically changed, but they should be modified—and there should be an attempt to unify this setup throughout the whole state.

To that effect, there is the possibility this summer that another law will be developed. The Orange County Medical Society and some of us who have been working on this have been asked to cooperate.

We passed this resolution as a medical county. We then presented it to the First District Branch meeting for its approval and recommendation. It is then presented to this body. If this body refuses to act upon it, you can immediately see the effect upon the legislative effort in Orange County, which is to our benefit. We will have to go back and not only tell them that the House of Delegates of the New York State Medical Society is not interested, but more than that the resolution that was passed last night regarding the Constitution and Bylaws prevents Dr. Stivers and myself and our Economics Committee on our County Medical Society from cooperating with these fellows in their attempt to produce a constructive law. So I am going to ask you to pass that resolution.

DR. LEO F. SCHIFF, *Clinton*. Speaking for the Reference Committee, we all realize that the welfare situation is in a bad state. Those of us who have read the reports on page 14 on Medical Relief also should realize that the Committee, of which Dr. Hambrook is the Chairman, has been doing some very constructive work along those lines. We are not going to accomplish anything, rather we are going to hinder things, by trying to turn over the whole structure rapidly with new legislation.

Our Committee consulted with the committee that brought in the report on Part II of the Council's report in reference to the work that was done, and we felt that their recommendations, of which if there is any question I presume we could get a reading at the present time, but it is not necessary, called for a continuation of the work of this committee of Dr. Hambrook's along the very constructive lines they have already shown in their report, with the added possibility of having to introduce legislation should the present setup not be changeable under the present law.

With that in mind, it would seem a great waste of effort for us to specifically tie ourselves up to any one resolution no matter how good its in

tent, how terribly great the incentive to get the change.

After all, Dr Bradner, there are many counties in the state. Many of us see the problem a little differently from Orange County and still there is some way in which we can all work together, and that way is through our appointed representatives who have already been given the mandate to do the work you ask without committing us specifically in this meeting.

I, therefore, ask all of you to vote on the report of the Reference Committee as it stands that no action be taken on this resolution without any disrespect for Orange County or any disrespect for the troubles that they are in.

SPEAKER FLYNN Is Dr Brennan the Chairman of Reference Committee on the Report of the Council—Part II in the room?

(There was no response.)

SPEAKER FLYNN I would like to ask Dr Irving the Secretary, to read that part of the report of Reference Committee—Part II of which Dr Brennan is Chairman, which speaks about medical relief.

SECRETARY IRVING There is just one paragraph that is apposite.

We feel that the Council has approached the situation with tact and good judgment that they are in intimate contact with the Department of Social Welfare of the State of New York and have gone as far in suggesting measures corrective of abuses as they can under the law as at present constituted. We feel that new legislation relative to Social Welfare and its relation to Medical Practice may become imperative and is perhaps inevitable before evils now existent can be completely eradicated. When such legislation comes up for consideration the Medical Society of the State of New York, through proper committees and through Legal Counsel should seek to participate in the formulation of such legislation and if need be initiate the program.

SPEAKER FLYNN The motion before the House is on the adoption of the report of your Reference Committee.

DR. BRADNER May I speak one second longer? I should just like to call your attention to the fact that we are not asking for a specific procedure. We are simply stating our opinion that these conditions exist, and we are outlining eight different places where we think there should be improvement. I see no interference with the functioning of the properly appointed committees or their conference with the representatives of the State Board of Social Welfare for us to go on record that we believe these points require alteration, and that we are desirous of cooperating in an effort to straighten up the differences.

DR. THEODORE WEST I cannot help but agree with Dr Bradner. I do not think passing his resolution will embarrass the committee that is already working on this medical welfare work. It is unfortunate that these two resolutions or these two bits of business tie in so closely with each other that you can hardly separate one from the other but there do stand out in Dr Bradner's resolution several points that I did not get and which did not seem to be covered by the resolution of the other committee, and that was on this matter of economy of adminis-

tration which I think is the keynote to Dr Bradner's entire bill. With \$25 000 000 paid for medical relief, they paid \$70 000 000 for overhead and administration. That is the thing that Dr Bradner's bill as I understand it, is particularly getting at.

I think this could be approved and the whole bill considered by the Committee on Medical Relief taking into consideration these suggestions of Dr Bradner's. I believe that would be a very good and proper procedure to do because I think that Dr Bradner's work shows outstandingly that the administration of medical relief is decidedly topheavy.

The question being called for the motion was put to a vote and was lost.

DR. LEO F. SCHIFF *Clinton* Inasmuch as this motion which has been lost was that no action be taken at the present time, I will now move that this resolution be referred to the Council for reference to their Committee on Medical Relief. In making that statement—I trust there will not be too much discussion and getting off the subject or any misstatement—I want to call attention first to the last paragraph of the resolution which was in the hands of the Committee. Remember your Reference Committee cannot act on a resolution that is in some doctor's mind or a change that is in his mind but must act on the printed material before it.

Be it further resolved that these resolutions be drafted in the form of a bill and presented to the State Legislature.

The objection that your Reference Committee has in committing the State Society to any specific bill is the fact that while this may be particularly applicable to the county in which the originator lives it had not had the breadth of scope that would be brought by having it taken care of by a central committee.

There is nothing in this proposed resolution, as it stands that provides for any economies. The resolution provides for an agreement between this Society and the government of the State of New York combining acceptance of various people about something between the State Hospital Association and the government of the State of New York between the government of the State of New York and the State Medical Society and the provision of a uniform organization. While those may be all very good things gentlemen I do not believe that we have time enough or are we in the right mood to discuss them properly. Therefore the best thing we can do with this, as long as we have voted actually that no action be taken at this time is to refer it to a committee which will study it, and I am sure will confer with Dr Bradner before they take any very radical action.

The motion was seconded.

SPEAKER FLYNN Would you like to discuss that Dr Bradner?

DR. BRADNER Dr Schiff's point is taken very well. I should also like to make a change in the final paragraph which I think would make it less objectionable. I should like to move that that final paragraph reading as it does now

Be it further resolved that these resolutions be drafted in the form of a bill and presented to the State Legislature be changed so as to read

"Be it further resolved that this Society expresses its desire to cooperate in the formulation of remedial measures as may be required"

DR SCHIFF There can be a motion to refer. We have what Dr Bradner has proposed, and he can also bring in his amendment to the Council after it has been so referred to it.

DR BRADNER Yes, and at any rate it is in the minutes.

The question being called, the motion to refer was put to a vote, and it was unanimously carried.

81 Report of Reference Committee on New Business B on Aviation Medicine

Section 32

DR FREDERIC C CONWAY Reporting on resolution of Dr Benjamin Jablons, the Medical Society of the County of New York, reading

"WHEREAS, the problem of national defense encompasses the creation of a huge aviation force of anywhere from 10,000 to 25,000 planes,

"WHEREAS, such a force will create a great many medical problems incident to the proper care and training of a competent personnel, therefore be it

"Resolved that this as a subject be referred to the Council for further study and action for the purpose of disseminating proper information regarding the physiology and medical possibilities of this phase of medicine"

Your Committee approves its adoption.

The motion was seconded, put to a vote, and was carried.

82 Report of Reference Committee on New Business B, Changing Education Law in Relation to Roentgenology

Section 29

DR FREDERIC C CONWAY Reporting on resolution of Dr Theodore West, Medical Society of the County of Westchester, reading

"WHEREAS, 1 The Education Law (Art 48, Section 1250) says 'A person practices medicine within the meaning of this article who holds himself out as being able to diagnose any human or physical condition, and who shall either offer or undertake, by any means or method, to diagnose any human disease or physical conditions', and

"WHEREAS, 2 The Sausser Case decision (Sausser v Health Department of the City of New York, 242 NY 66) says 'making an x-ray photograph is not diagnosis nor (is) mere explanation of what such photograph shows diagnosis', and

"WHEREAS, 3 The court ruling has nullified the Education Law as it relates to the use of x-rays in medical diagnosis, and

"WHEREAS, there is a bill—Williamson—Senate Int 1892 No 2297, which defines roentgenology as the practice of medicine and will correct the error in the Sausser Case decision

"Therefore, be it resolved that the House of Delegates be requested to give its approval to this bill and a copy of this resolution be sent to our Executive Secretary, Dr Joseph Lawrence"

Your Committee moves its adoption.

The motion was seconded and there being no discussion, it was put to a vote and was carried.

83 Report of Reference Committee on New Business B on Citizenship as Requirement for Membership

Section 35

DR FREDERIC C CONWAY Reporting on the resolution of the Medical Society of the County of Ontario presented by Dr Homer J Knickerbocker, reading

"WHEREAS, the Medical Society of the County of Ontario on July 12, 1938, adopted an amendment to its Bylaws, viz, 'Any person of foreign birth applying for membership in the Medical Society of the County of Ontario, shall present documentary evidence of full citizenship in the United States of America, before such application shall be considered by the Society', and

"WHEREAS, although duly reported to the Council of the Medical Society of the State of New York, no definite ruling has yet been obtained relative to the legality of such addition to the Bylaws of the Medical Society of the County of Ontario, therefore, be it

"Resolved that such matters of citizenship as relate to membership be considered as entirely within the jurisdiction of individual County Medical Societies"

Your Committee feels that this should be referred to the Legal Counsel who in turn should refer it to the Council for action.

The motion was seconded and there being no discussion, it was put to a vote and was carried.

84 Report of Reference Committee on New Business B on Reduction in Budget of Industrial Council

Section 59

DR FREDERIC C CONWAY Reporting on resolution presented by Dr Edward C Podvin, reading

"WHEREAS, a recent study of the compensation department made by the Industrial Council determined that more funds than recommended in the original budget submitted by Governor Lehman were needed for its proper administration, and

"WHEREAS, the proposed reduction of \$179,977.00 in the present proposed budget would result in crippling this important service, and

"WHEREAS, this would necessitate the suspension of arbitration hearings, delay the adjudication of cases, and cause resultant hardships and injustice to injured employees and eventually added expense to employers, and

"WHEREAS, the expense of this department is borne by the insurance carriers, be it

"Resolved that this Society express the hope that no reduction will be made which will interfere with the proper functioning of the Workmen's Compensation Bureau, and be it further

"Resolved that the Council be directed to take proper action to convey the attitude of this Society to the proper authorities"

Your Committee approves its adoption.

The motion was seconded and there being no discussion, it was put to a vote and was carried.

85. Report of Reference Committee on New Business B on Resolution Urging Continued Support for Health Protection Activities in the State of New York

Section 73

DR. FREDERIC C. CONWAY Reporting on resolution presented by Dr Burk for the Department of Labor reading

"WHEREAS, many workers in industry are exposed to conditions conducive to occupational injuries and occupational disease, and

"WHEREAS the workers of New York State are entitled to protection against such conditions in order that their health may be preserved at all times and

"WHEREAS, local communities do not possess facilities for the conduct of such work and

"WHEREAS the only health and safety protection in New York State is lodged in the State Department of Labor Division of Industrial Hygiene and

"WHEREAS this unit of the State Government has performed most commendable work and has contributed greatly to the protection of workers against accidents, illnesses, and occupational poisonings, and

"WHEREAS, the physicians of the State of New York feel that these efforts are deserving of the full support of the State of New York

Therefore be it resolved that the Medical Society of the State of New York through its House of Delegates, goes on record in favor of the continuation of these preventive health measures on behalf of the employed population of the State of New York and for the full support of these preventive measures and be it further

Resolved that this action by the House of Delegates be forwarded to the appropriate State Governmental Authorities

Your Committee approves and asks the adoption of this resolution.

The motion was seconded and there being no discussion, it was put to a vote and was carried

86. Report of Reference Committee on New Business B on Foreign Physicians

Section 27

DR. FREDERIC C. CONWAY Reporting on the resolution introduced by the Medical Society of the County of Niagara reading

Resolved that the Medical Society of the County of Niagara hereby resolve to request the House of Delegates to oppose admission to New York State of foreign or alien physicians

Your Committee feels that this resolution is unconstitutional and without the jurisdiction of the House of Delegates. *no move*

The motion was seconded and there being no discussion it was put to a vote and was carried

87. Notice of Submitting Change to Constitution

DR. HOMER J. LUTHERBURY, Ontario I rise to a point of privilege. Notice is hereby given of a proposal to submit for consideration at the 1940 meeting of this House of Delegates of amendments to the Constitution, Article 11, Membership, providing for the establishment of a new classification, to be known as (subdivision,

together with such amendments to other parts of the Constitution and Bylaws as will clarify and implement the proposed amendment or amendments

VICE SPEAKER BAUER This serves as advance notice of a proposed change to the Constitution as required by our Constitution and Bylaws and it will be so recorded in the minutes.

88. Report of Reference Committee on the Report of Legal Counsel

DR. M. E. MARSLAND This is a Report of the Reference Committee on the Report of Legal Counsel of which Dr Cunniffe is the Chairman

Your Reference Committee has very carefully studied this very interesting report and is impressed with the enormous increase in the amount of work brought to this department

The report is divided into three sections

A. The actual trial work of malpractice actions before courts, juries and in the Appellate Division

B Counsel work with officers committees, and different members of the Society

C Legislative advice and activities

A Litigations during the last year—Two hundred and twenty nine cases of malpractice action were concluded as against 217 cases in the previous year Of the 229 cases 55 were settled 108 were successfully completed in favor of the defendant In 6 cases however judgment was rendered in favor of the plaintiff

For some time the counsel has been advising members against careless criticism of the work of another physician before lay people This seems to be the outstanding cause of the institution of the action in most cases

The hazard of malpractice action against a physician is great not alone for the financial loss but also for the damage to his reputation and the great worry and interference with the practice of his profession in defending the action Therefore we urge upon all members, not alone to accept this advice from the counsel but also to try and spread that gospel among the other members

The report calls our attention to the protection given us by the insurance operated under the group plan with the Yorkshire Indemnity Company Counsel also expresses his appreciation of the splendid cooperation of the Insurance company with his office in working under this plan There are many members of the Society who are not as yet insured under this group plan The percentage of members insured has dropped from 57 per cent in 1930 to 46 per cent in 1939

The reason for this should be investigated Probably the outstanding factor is the reduction of the physician's income But just when times are bad suits are more frequently brought; and therefore, the need of the physician for malpractice insurance protection is greater and every effort possible should be made by the Insurance Committee to raise this percentage of insured members

In closing the past year the counsel has contributed many articles which were published in the STATE JOURNAL These articles have included the following (see pages 80-81, Annual Report, 1938-1939)

Professional misconduct Falsely advertising cure for cancer
 Physicians' automobiles Right of way
 Evidence—Privileged communications
 Surgeons' right to discontinue operation
 Validity of amendments to Workmen's Compensation Law upheld by highest courts
 Libel and slander Authorship of article in medical magazine
 Injunction to restrain practice of medicine without license
 Physicians contract restricting practice
 Lectures and sale of tablets as the practice of medicine
 Responsibility of municipality for injuries sustained in municipal hospital
 An interesting fracture case
 A cancer cure enjoined
 Illegal practice of medicine by a chiropractor
 Practice of medicine by corporation
 Revocation of physician's license upon conviction of crime involving moral turpitude
 Cancer cure—Responsibility of physician and hospital
 Practice of medicine by chiropractor

Such a list indicates that the members have an opportunity of receiving a postgraduate course in medicolegal matters by studying these articles

The counsel has also listed 16 different case reports on malpractice actions. This has afforded very interesting reading to the members of the Society, and also issued a warning to the physicians to protect themselves against such suits. This department also receives many requests for opinions or advice on various topics regarding the right and privileges or the advisability of certain actions on the part of physicians.

This report lists 36 different questions on which advice has been asked from our counsel. Many of these questions and answers would make instructive and interesting reading if published in our JOURNAL. These requests come, not alone from members, but also from committees, County Societies, and officers of County and State Societies. In addition, the counsel frequently consults with the doctors associated with the operation of the Workmen's Compensation Law, and advises constantly with the state officers and with officers of various County Societies, giving advice upon the constitutionality of the proposed amendments in the State or the component County Societies.

C. Advice is also given to the various counties of the state organization, the state committee on legislation in regard to bills that are to be introduced into the state legislature. This short summation gives us some idea of the amount of work that is brought to this department and of the fact that it is constantly increasing. We are to be congratulated upon receiving such efficient and meritorious service for this work, entailing, as it does, so many ramifications.

We congratulate our counsel for the wonderful work he has done, and the members of his department for their assistance. We note that this department expresses the appreciation of the generous cooperation furnished by the members of the Society by consultation and court attendance in malpractice actions.

We certainly hope that such a state of affairs

will continue to exist, and that the affairs of the Society will be as successfully protected as at the present time.

I move the acceptance of the report.

The motion was seconded and there being no discussion, it was put to a vote and the report was adopted.

89 Report of Special Committee on Proposed Change to Section 7, of Chapter XV—Policies of Component County Medical Societies

Sections 15, 58

DR LEO F SCHIFF Your Committee, consisting of Drs. Rooney, Redway, and myself, have drawn up a substitute amendment. It is quite evident what the intent of the amendment on page 59 was, but the wording opened a controversy.

I feel we all agree that where the Medical Society of the State of New York adopts through this House of Delegates (the representatives of the component medical societies of the counties) a policy, that shall be the policy of the State Medical Society, and that it is not fitting that any component part of the Medical Society should attack that policy on the outside.

This being a representative form of government, any attacks on such a policy should be made through the organization by resolution in the County Society, followed by action in the House of Delegates, but until the policy is so changed, to the rest of the world that is our policy. It is subversive for any individual member or County Society to attack that policy, which their own delegates have had the opportunity to vote upon in the Society.

To that end, with a slight change of wording so that there shall be no gag rule type of suggestion in the amendment, we have agreed upon the following, which we offer as a substitute for the amendment proposed.

"The component County Medical Societies, their officers or committeemen, shall not initiate or participate in any activities, outside of the structure of the Medical Society of the State of New York, which are contrary to the policies of the Medical Society of the State of New York, as expressed by the actions or in resolutions of the House of Delegates or its authorized representative bodies."

That is done because our policies are delegated to the Council in the interim between meetings of the House of Delegates, and this will permit the construction of a policy of the Council, when so authorized, to be the policy of the State Society until the House of Delegates orders otherwise.

"No member shall in any public paper, discussion, or hearing hold himself by direct statement or implication as representing the Medical Society of the State of New York, or any component County Medical Society, unless he shall actually have been so authorized by such Society, or a legally constituted representative board or committee of same having the power to confer such authority."

I so move.

The motion was seconded.

DR. WILLIAM S COLLENS, *Kings* Could we hear the first part of that resolution, and read it slowly?

June 16, 1939]

Dr. SCHIFF "The component County Medical Societies, their officers or committeemen, shall not initiate or participate in any activities, outside of the structure of the Medical Society of the State of New York which are contrary to the policies of the Medical Society of the State of New York, as expressed by the actions or in resolutions of the House of Delegates or its authorized representative bodies. No member shall in any public paper discussion or hearing hold himself by direct statement or implication as representing the Medical Society of the State of New York or any component County Medical Society unless he shall actually have been so authorized by such Society or a legally constituted representative board or committee of same having the power to confer such authority."

VICE-SPEAKER BAUER A motion has been made to substitute this for the originally proposed amendment. Discussion is now open on the substitution.

Dr. MERWIN E. MARSLAND Westchester My feeling is that this substitute resolution contains so much matter which is really new that it practically amounts to a new amendment. I therefore move that this substitute amendment be tabled, to be brought up at the next meeting of the House of Delegates.

The motion was seconded and it was put to a vote and was carried.

VICE-SPEAKER BAUER It is tabled.
Are there any other committees to report?

90 Vote of Appreciation—Speaker Flynn

Dr. LOUIS A. VAN KLEECK I know you are all tired. We have had a long session but there is one gentleman among us who has worked harder than any of the rest of us. He has conducted this House of Delegates session with equanimity with thought with precision and with dignity. I would like to make a motion to you sir that this House of Delegates by a vote voice its appreciation and thanks for the efficient manner in which Jim Flynn has conducted himself as Speaker of the House. (Applause)

VICE-SPEAKER BAUER From the applause I do not even need to put that to a vote. It is so unanimous.

Dr. FLYNN Thank you very sincerely!

VICE-SPEAKER BAUER Dr. Irving has two or three matters that need attention.

SECRETARY IRVING These have somehow slipped by

91 Women Physicians' Representation in American Medical Association

Sections 24 50

One is a communication from the Women's Medical Society of New York State as follows:

We understand that from 13 to 17 floating delegates are sent from New York State to the A.M.A.

We feel that as Dr. Emily Barringer has been a delegate from New York County it would be a gracious act to include her among the New York State Delegates.

That is signed by Dr. McGuinness, the president.

I move this be received sir

The motion was seconded, put to a vote, and was unanimously adopted

92 Medical Practice Act

SECRETARY IRVING The other also is a communication from the Women's Medical Society of New York State. It reads:

The Women's Medical Society of New York State in meeting assembled, Monday April 24 1939, desires to go on record as protesting the onslaughts against the Medical Practice Act and believe both our Society and the Medical Society of New York State of which we are also members should make a vigorous educational campaign to prevent further tampering with this Act.

I move its acceptance.

The motion was seconded put to a vote and was unanimously carried.

93 Resolution Regarding Investment of Society's Principal in Equities

Section 22

SECRETARY IRVING This is a resolution on which as yet no action has been taken.

Resolved that the Board of Trustees be authorized to invest an additional 25 per cent of the Society's investment principal in equities.

I move it.

The motion was seconded and as there was no discussion, it was put to a vote, and was unanimously adopted.

94 Votes of Thanks

Dr. ARTHUR W. BOOTH Before adjourning I want to express by way of a motion our thanks and appreciation to the Committee on Arrangements of Syracuse, the Onondaga County Society and our President Dr. Groat.

The motion was seconded, and the members arose and applauded.

SPEAKER FLYNN Before we adjourn I think that we should have the new President-elect Dr. Borrell escorted to the platform. Is Dr. Borrell here?

(There was no response.)

SPEAKER FLYNN Are there any other committees to report?

(There was no response.)

Dr. SAMUEL B. BURK New York I am addressing my remarks to the Speaker. I move you sir that we express a vote of thanks and appreciation to Dr. Baer for the capable manner in which he as Vice-Speaker has conducted this meeting. I ask for a rising vote of thanks.

SPEAKER FLYNN That is well deserved. The audience rose and applauded.

SPEAKER FLYNN Is there any further business to come before the Society?

Dr. WILLIAM M. PATTERSON New York I move also that a vote of thanks be extended to the efficient Secretary of the Medical Society of the State of New York.

The audience rose and applauded.

SPEAKER FLYNN There being no further business all reference committees having reported all resolutions having been acted upon, having transacted all our business, the reference committees are discharged with sincere thanks, and the House of Delegates stands adjourned sine die.

(The session adjourned at 12 35 P.M. sine die.)

Public Health Notes

J ROSSLYN EARP, L R C P, Dr P H
New York State Department of Health

At the A M A Convention

DR. ROBERT E PLUNKETT on May 15 described to the convention at St Louis the three point program of our division of tuberculosis (1) direct service to the people examined and studied, their families and communities, (2) research and (3) education

As regards our service to those who have, or may be suspected of having tuberculosis, he emphasized two essential features, namely, the wholehearted cooperation of the medical profession and the central position of the tuberculosis hospitals. Through each hospital center there is provided a continuity of medical service from case finding through treatment to aftercare. Tuberculosis is a community and a family problem but in the administration of tuberculosis control in this state, certainly as long as Dr Plunkett has anything to do with it, we shall never be allowed to forget that the sick individual is a person, not just a case.

The three new state hospitals have been in operation for approximately three years and during the past two full years of clinic administration, 21,804 individuals have been examined. About half

of these were examined because of contact with known cases, and 67 per cent of the new cases discovered among these "contacts" were in the minimal stage of the disease. Among patients examined because of symptoms referable to the chest, 40 per cent were in the minimal stage. In every 1,000 cases examined, 31 were found to have tuberculosis.

Each hospital is a center not only of medical service but also of teaching and of research. The division of tuberculosis has some research projects that are centered at Albany of which again some are carried entirely on their own responsibility and some in cooperation with other departments of the state government. Some of the work undertaken in conjunction with the Department of Mental Hygiene is producing results that promise to be of great significance. There is also the study of 5,000 adult admissions to fourteen general hospitals from which Dr Plunkett is able to conclude, assuming that the same conditions prevail throughout the U S., that some 45,000 cases of unrecognized pulmonary tuberculosis were admitted to general hospitals last year.

PUBLIC HEALTH CONFERENCE AT SARATOGA

The date for the annual conference of New York State health officers and public health nurses is June 27-29. Following the usual custom the conference will be at Saratoga Springs, with headquarters in the Grand Union Hotel.

It is expected that this state-wide convocation

will attract nearly 2,000 health officers, nurses, school physicians, public health workers and state officials from every county and community in the state. It planned to have outstanding persons in the public health and medical fields give addresses at the many meetings scheduled.

SERIOUS SIDE OF SUMMER PLAY

The importance of proper health supervision over summer camps is indicated by the fact that in New York State alone there are approximately 3,000 camps occupied by from two to three million persons a year and that a considerable num-

ber of outbreaks of preventable disease occur in these camps each year, said Dr C A Holmquist, Director of the Division of Sanitation of the New York State Department of Health at the meeting of the State Society at Syracuse.

The Woman's Auxiliary

To the Medical Society of the State of New York

You missed a treat if you did not attend the Fourth Annual Convention of the Woman's Auxiliary to the Medical Society of the State of New York held in Syracuse in April. Mrs. John Buettner, the capable chairman of convention, with her staff of efficient committee assistants guided delegates and friends through three days of delightful entertainment.

"Business before pleasure" gave the House of Delegates the privilege of opening the convention. Mrs. Daniel Swan, our state president, presided. From the interesting and instructive reports of the chairmen of the various committees and the report of the president, the members of the auxiliary delegation had the satisfaction of reviewing a busy and successful year. Reports of county auxiliary presidents gave some idea of the varied activities and interests of the different units.

High lights of entertainment, long to be remembered with pleasure, were the banquet and Henry Scott, the talented pianist and humorist, the delightful luncheon at the Onondaga Country Club, the musicale and tea at the Museum of Fine Arts. The Hobby Show proved that doctors and their wives have a variety of interests aside from that of health.

Back of the success of this convention were hours of planning and preparation, and for this and for their gracious hospitality the Woman's Auxiliary of New York State extends a vote of thanks and appreciation to the Woman's Auxiliary to the Medical Society of Onondaga County.

Officers elected for the coming year: Mrs. Scott Towne, president, Mrs. Luther Kice, president-elect, Mrs. John Buettner, first vice-president, Mrs. Robert Crockett, second vice-president, Mrs. Carlton Potter, treasurer, Mrs. J. E. Noll, recording secretary.

Directors are Mrs. Edwin A. Griffin and Mrs. Daniel Swan. (A complete list of

officers and their addresses can be found on page 1250.) To the American Medical Association convention to be held in 1940, in New York City, twelve delegates and their alternates were elected from the New York State Auxiliary.

To Mrs. Daniel Swan, our retiring state president, is extended a vote of appreciation for her able direction during the past year.

Greetings and loyal support to our new president, Mrs. Scott Towne, with the sincere hope that her term of office will prove pleasant and successful.

Cayuga County

The regular meeting of the Woman's Auxiliary to the Medical Society of the County of Cayuga was held May 18, 1939, at Auburn City Hospital. Mrs. Raymond Johnson, the president, presided. During the business meeting a unanimous vote was taken to send a girl to Scout Camp as a summer project of the auxiliary.

Interesting reports were given by Mrs. J. D. Sands and Mrs. G. C. Sincerbeaux, delegates to the state convention held in Syracuse in April.

The annual dinner to the doctors to be held at Springside Inn in June will mark the beginning of the summer recess.

Nassau County

The monthly meeting of the Woman's Auxiliary to the Medical Society of the County of Nassau was held Tuesday, April 18, at the Nassau Hospital Auditorium in Mineola. Mrs. Luther Kice, president, presided. Guest speakers were Dr. Eugene Calvelli, Port Washington, President-elect of Nassau County Medical Society, and Dr. Eugene Coon, Hempstead, Chairman of Legislation.

Dr. Calvelli gave a brief history of the society and then spoke of the St. Francis Cardiac Convalescent home.

Dr Coon spoke of current legislation and described the stages through which a bill advances from the time it is drafted until it is passed by the legislature.

Delegates to the state convention at Syracuse were Mrs. Kice, Mrs. Bell, Mrs. Hirsch, Mrs. Van Kleek, all state officers, and Mrs. Lally, Mrs. Connolly, Mrs. Welge, Mrs. Schirck, and Mrs. Baldwin.

The auxiliary dinner dance was held May 5 at the North Hempstead Country Club, Port Washington. Mrs. Willard Lee, program chairman was assisted by Mrs. Clymer Long and her committee.

Undoubtedly the most outstanding meeting of the current year of the Woman's Auxiliary to the Nassau County Medical Society was the meeting held at the Nassau Sanatorium at Farmingdale on Tuesday, May 23.

Dr Walsh was host to the auxiliary members and showed most interesting lantern slides covering various phases of field work in the control of tuberculosis. Dr Walsh also enlightened the members with the heartening information that a considerable decrease in the death rate of Nassau County has taken place since 1920.

The sanatorium proper consists of 416 beds of which 112 are for children. It was founded by the late Dr Davis in May, 1920, and constitutes a rather inspiring memorial to the work in the field of tuberculosis by its founder. A very delightful tea was served at the nurses home by Mrs. Kniffen and Mrs. Hubbel, members of the hospital board.

At the meeting, over which Mrs. Luther Kice presided, the auxiliary voted to become a member of the Nassau County Public Health Nursing Council. Two members will represent the above mentioned body at all of its meetings.

Reports were tendered by those delegates attending the State Medical Convention held at Syracuse. Mrs. Spencer Caldwell, chairman of the hobby show, gave an interesting report to the effect that Mrs. Henry Hirsch, of Rockville Centre, sent the most outstanding hobby

exhibit to the convention. Other reports were read by Mrs. Burke, Mrs. J. Connolly, and Mrs. Carl Welge.

The auxiliary members were delighted to have Mrs. Luther Kice made President elect of the New York State Woman's Auxiliary for 1940. Other officers gaining chairs were Mrs. Louis Lally as convention chairman, and Mrs. L. A. Van Kleek as chairman of the finance committee. The 1940 convention will be held in New York City at the Waldorf Astoria Hotel.

The annual luncheon of the Nassau County Auxiliary will be held at the North Hempstead Country Club on June 21. Golf and bridge will furnish after luncheon recreation.

Orange County

On April 4 the Woman's Auxiliary to the Medical Society of Orange County held its first meeting of the year at the home of the president, Mrs. H. F. Pohlmann, in Middletown. Following the business meeting during which four new members were greeted, there was a round-table discussion on the health insurance problem of today. This was very ably arranged and led by Mrs. W. H. Snyder of Newburgh.

Delegates named for the state convention in Syracuse were Mrs. Pohlmann, Mrs. Noll, and Mrs. Murray.

The auxiliary again accepted the kind invitation of Mrs. Pobe, of Port Jervis, to hold its June meeting at her summer home at Twin Lakes, Pennsylvania. Those who attended last year will remember her charming hospitality.

At an executive meeting of the auxiliary held April 18, at the home of Mrs. Snyder in Newburgh, plans were completed for a Health Institute sponsored by the Woman's Auxiliary and arranged by the Medical Society of Orange County. The institute was held in the amusement hall of the State Hospital in Middletown on May 9. The program was especially interesting and was attended by about 250 guests. The program included greetings from Dr. R. C. Woodman, Super-

intendent of the Middletown State Hospital and from Dr H F Morrison, of Tuxedo, President of Orange County Medical Society Speakers introduced by Dr Theodore Neumann, of Central Valley, were Dr E C Waterbury, of Newburgh, who gave an address on "Trends in Health Insurance", Dr Harry L Chant, our District Health Officer who spoke on "Marriage Laws and Social Hygiene", Dr J E Noll who spoke on "Pain as an Evidence of Disease" These talks were followed by the motion picture "The Birth of a Baby"

State News

Mrs G A Green, 122 S Second Ave, Mechanicville, New York, as state program chairman, requests each county president

to discuss with her program chairman plans for some social event to be held, if possible, during this summer recess from meetings A contribution from the proceeds is to be sent to our state treasurer, Mrs Carlton Potter, 425 Waverly Ave., Syracuse, who will forward it to the Physicians' Home This project was adopted at the state convention recently held at Syracuse, under the sponsorship of program chairmen throughout all the counties, so that each will share the contributions for this worthy cause. Program chairmen are to send to Mrs Green, by October 1, reports in duplicate of activities from the period of April 1 to October 1, and to incorporate the amount donated, if possible at this time, to the Home

Medical News

Doctors Told to Keep Up to Date

DOCTOR Terry M. Townsend, President of the Medical Society of the State of New York, told 3,000 doctors attending a State Medical Association Day meeting at the Goodrich Arena at the World's Fair on May 31 that "doctors today must go back to school again and keep in step with progress."

He said that membership in county, state, and nation wide societies stimulate interest through the interchange of ideas and experiences, and helps to keep doctors informed on technics and treatments.

Dr. Townsend declared that doctors frequently are called upon to face emergencies where immediate and accurate diagnoses are vital and that the best modern methods should be available for making these decisions.

Dr. Philip I. Nash, President of the Kings County Medical Society, urged doctors to join in seeking readjustment of medical conditions throughout the country without federal intervention. He said that he believed that a system of voluntary health insurance should be worked

out to the best interest of the public which would enable doctors to receive compensation for their work and at the same time assist all who need aid. Dr. Emily Dunning Barringer, President of the Women's Medical Association of New York, also spoke.

Dr. Max Einhorn, professor emeritus of medicine at the New York Post-Graduate School of Medicine, speaking in the Medicine and Public Health Building at a pre-convention of the National Gastroenterological Association, advised doctors against accepting such rules established either by members of the profession or other persons. Such rules, he said, might prevent the doctor from using his own discretion in certain individual cases where his own opinion would be more valuable.

'There has always been freedom of thought and practice in medicine and there has been no time that such freedom has been needed as much as today when such great scientific studies and progress are being made,' he added.

County News

Broome County

Dr. M. J. Whitelaw addressed the Broome County Medical Society at Binghamton on May 9 on 'A Theoretical and Clinical Consideration of Ovarian Hormones'. Discussion was opened by Drs. S. B. Blakely and R. J. McMahon.

Binghamton City Hospital was turned into a classroom on April 19 when nearly 200 Southern Tier physicians and surgeons assembled in the institution for their annual clinic-day program.

Highlighting the list of speakers was Dr. I. C. Rubin, of New York City, who

addressed the concluding session on 'Diagnostic and Therapeutic Value of Tubal Insufflation in Sterility'.

A complimentary dinner, served in the institution's main dining room, preceded the night session.

Afternoon was taken up with a symposium on 'Disturbances of the Gastro-intestinal Tract,' conducted by the following: dental, Dr. James T. Ivory, pediatric, Dr. Florence E. Warner, medical, Dr. Carl S. Benson, surgical, Dr. Hyman Sneierson, and obstetrical, Dr. Harry I. Johnston.

Women's board of the hospital served a tea following the afternoon program and Dr Frank M Dyer, member of the hospital board, discussed the new \$425,000 addition being erected on the grounds.

The morning and early afternoon program included demonstrations by Dr Victor W Bergstrom, Director of Kilmer Pathological Laboratory, visits to wards and operating rooms.

Chautauqua County

Dr Robert L Faulkner, senior clinical instructor in gynecology at Western Reserve University, spoke on "Cancer of the Cervix" at the meeting of the Jamestown Medical Society on April 27 at Hotel Jamestown. He showed motion pictures and slides on the subject and also a film showing the diagnosis and treatment of *Trichomonas vaginitis* with silver picrate. Dr Homer M Wellman presided and Dr Ernest J Kelley, Jr, introduced the speaker.

The society met on May 25 at the hotel when Dr Oscar J Oberkircher, of Buffalo, spoke on "Urinary Infections and Their Management." The final meeting of the season will be the annual session, spring golf tournament, and election of officers at the Moon Brook Country Club on June 29.

Cortland County

Dr Emory A Didama, of Cortland, who died on April 14, aged seventy-seven, had practiced medicine there over fifty years.

Erne County

The importance of the general practitioner in the battle for control of cancer was stressed by Dr Louis C Kress, Chairman of the New York State Committee of the American Society for the Control of Cancer, as chief speaker on the special program in observance of cancer month before the Medical Society of Erie County in Buffalo on April 17.

Dr Burton T Simpson, Director of the State Institute for Treatment of Malignant Diseases, expressed the con-

viction that mortality can be cut in half if every general practitioner does his part in the fight for control.

Dr Karl F Eschelmann, Director of the Tumor Clinic at Edward J Meyer Memorial Hospital, explained the functioning of that department of the city institution. Dr Edward C Koenig, radiologist at Buffalo General Hospital, and Dr Leon H Smith, chairman of the cancer committee of the county society, likewise participated in the program.

Air conditioning not only is useful in promoting the general health of the public but has been proved effective in the treatment of disease. Dr Albert G Young, Medical Director of the Corey Hill Hospital, Brookline, Mass, declared on April 26, at a meeting of the Air-Conditioning Council of Western New York at which hospital officials were present.

Describing the results of a study into the physiologic effect of air conditioning made at Corey Hill Hospital, one of two hospitals in the country having complete air conditioning in all departments, Dr Young told his listeners that air conditioning has effected a startling reduction in postoperative pneumonia cases.

Out of 2,110 surgical operations performed in the hospital in the last two and one-half years, postoperative pulmonary complications developed in only one-quarter of 1 per cent of the cases, as compared with an average of 6 or 7 per cent in nonair-conditioned hospitals, Dr Young said.

Corey Hill Hospital also boasts an average of only $1\frac{7}{8}$ per cent postoperative mortality, as contrasted with the $4\frac{1}{2}$ per cent average reported by other hospitals, he declared.

The confinement time of patients under treatment for rheumatism has been cut to about 40 per cent as a result of air conditioning, Dr Young added. Air conditioning also has brought welcome relief to hay fever sufferers being treated at the hospital, and has produced definite benefits in the treatment of heart disease.

Fulton County

Dr Descum C McKenney, of Buffalo, spoke on "Diseases of the Excretory Organs" at a meeting of the Medical Society of Fulton County, in the Hotel Johns town on April 20

The session was held in the coffee shop with thirty five members present. Refreshments were served at the close of the program

Jefferson County

The Medical Society of Jefferson County made preliminary plans for the establishment of a nonprofit medical insurance plan during the monthly dinner meeting at the Black River Valley Club, on April 13

Dr W Webber Young, chairman of the society's economic committee, submitted his committee's report on the insurance plan for medical expense indemnity and it was discussed by the society

The society accepted and approved the principles of the plan which offers medical insurance to persons of low incomes at nominal premiums. The plan offers medical services only

Seven physicians were elected to form a nucleus for establishing the medical insurance organization. They are Dr W Webber Young, Dr George B Van Doren, Dr Harlow G Farmer, and Dr Charles A Prudhon, all of Watertown, Dr Frederick G Metzger, Carthage, Dr Harold L Gokey, Alexandria Bay, and Dr Harlow E Ralph, Belleville

A course of lectures on heart disease, sponsored by the Council on Public Health and Education of the Medical Society of the State of New York, and arranged by the New York Heart Association for the members of the St. Lawrence and Jefferson County medical societies, were given in Ogdensburg and in Watertown, May 4, 11, and 18

On May 4 the subject was "The Degenerative Forms of Heart Disease (Hypertension and Arteriosclerosis)" The speaker was Dr Lewis A Conner of New York City

On May 11 the subject was "Rheumatic and Syphilitic Heart Disease." The speaker was Dr Cary Eggleston of New York City

On May 18 the subject was "Acute Cardiovascular Emergencies" The speaker was Dr John E Detrick, of New York City

Arrangements will be made to present two other lectures in the fall. They will be 'The Use of X ray and Fluoroscopy in the Management of Heart Disease,' by Dr Harold E B Pardee, of New York City, and 'Therapy in Heart Disease' by Dr Harry Gold of New York City

Kings County

A testimonial dinner was tendered on May 6 at the St George Hotel to Dr Philip I Nash, President of the Medical Society of the County of Kings, by the medical profession of Brooklyn

Some of the high lights which stand out in the detailed report of the directing librarian of the Medical Society of the County of Kings and the Academy of Medicine of Brooklyn for 1928 are

Greater use made of library than in previous year

Maintenance of and slight increase in financial support for literature purposes by individuals, groups, and organizations

A larger number of new publications added than in 1927

More volumes added by purchase from various funds than in preceding twelve months.

Some additions to our collection of rare and interesting older works.

A considerable number of complete sets of important journals acquired or completed during the year

Greater amount of binding done.

Increase in cataloguing work.

Addition of page boy to our personnel

Urgent Needs

Enlarged accommodations

Bequests and endowment.

Monroe County

At the regular meeting of the Medical Society of the County of Monroe, on Tues

day evening, May 9, in the auditorium of the Rochester Academy of Medicine, Dr Frederick W Williams, Associate Physician, and Chief of Diabetic Clinic, Morrisania City Hospital, New York City, spoke on "Modern Concepts of Diabetic Lower Extremities Lesions"

New York County

Dr Tracy J Putnam, Professor of Neurology at Harvard University and Neurologist-in-Chief of the Boston City Hospital, has been appointed Professor of Neurology and Neurosurgery at the Columbia University School of Medicine. He also will become the Director of Services of Neurology and Neurosurgery at the Columbia-Presbyterian Medical Center.

Dean Rappleye also announced the appointment of Dr Vernon W Lippard, Director of the Commission for Study of Crippled Children of New York City, as Assistant Dean of the School of Medicine, and resignation of Assistant Deans Charles A Flood and Lawrence W Sloan.

Dr Alexander Lambert, of New York City, who was director of the American Red Cross medical work in France in 1917 and a leader in research to aid drug addicts, died on May 9 in the Doctors Hospital, of which he was a founder, in his seventy-eighth year. He had been ill for a long time.

Dr Lambert was elected President of the American Medical Association in 1919. He had served as President of the Medical Society of the State of New York.

For many years, Dr Lambert devoted a major part of his time to the study and treatment of alcoholic and narcotic addiction. It was largely because of his initiative that the Doctors Hospital was founded. He was president of its medical board until his death.

Dr Joseph A Dillon, of New York City, national President of the Federation of Catholic Physicians' Guilds and editor of its official publication, *The Linacre Quarterly*, died on May 3 at his home, 1065 Lexington Avenue, after an illness of six weeks.

Dr Harrie A James, of New York City, seventy-eight, obstetrician who brought between 12,000 and 13,000 babies into the world during his forty-five-year practice, died on May 2 at his home, 13 West 120th Street. He had been ill four years.

Dr Lawrence J Osborne, seventy-three, a physician on the upper west side, New York City, for more than forty years, died at his home, 308 W 78th St on April 28.

Dr Osborne was stricken as he was leaving his home, medical bag in hand, to answer a call. He suffered a stroke.

Oneida County

Seventy-five doctors and dentists were present on April 20 at the Hotel Utica, in Utica, to hear Dr Joseph Eidelsberg, chief physician of the endocrine clinic, Post-Graduate Hospital, New York.

"The continued progress of clinical endocrinology," the speaker said, "promises a widening application of the use of male sex hormone therapy."

The visiting doctor discussed the use of a new synthetic chemical which he said has been giving miraculous results in hormone unbalance.

The session was the joint annual meeting of the Utica Academy of Medicine and the Utica Dental Society.

Ontario County

The Ontario County Medical Society, at its April meeting in the Clifton Springs Sanitarium, adopted a resolution in support of group hospital service insurance. Sixty-four members were present, almost the entire membership. The resolution was supported by a unanimous vote.

Dr Alfred W Armstrong, of Canandaigua, presided. After dinner at the sanitarium, addresses were given by Dr Paul V Newland and Dr Adrian S Taylor, illustrated by slides and patients.

Queens County

Dr James R Reuling, Jr, Bayside, has been elected President of the Queens-

boro Tuberculosis and Health Association, Inc., to succeed the late Dr Carl Boettiger

The campaign of the association for x ray tests in the fight against tuberculosis has resulted during the last year in more than 10,000 examinations being made in Queens About 4 per cent of those examined showed need for medical advice.

Prominent Queens physicians were guests at a steak and beer party of the Kew-Forest Medical Association in the Kew Bolmers Apartments, Kew Gardens on April 26 The association was organized recently

A paper on "Abnormal Bleedings in Females" was read by Dr Thurston Welton, Obstetrician and Gynecologist, Long Island College Hospital, and Consultant Gynecologist at Southside and Brunswick hospitals on May 5 before the Medical Society of the County of Queens

St. Lawrence County

About thirty physicians were present at the joint dinner meeting of Potsdam and Ogdensburg medical societies on April 20 at the Crescent Hotel in Ogdensburg

Dr Robert J Reynolds, of Potsdam, in an interesting paper traced the history of sulfanilamide and sulfapyridine drugs and their use in treatment of Type III pneumonia, the most severe form, which is usually 80 per cent fatal With the use of these drugs, fatality has been reduced to 20 per cent, Dr Reynolds stated.

Dr Frederick E Clark, Dr Louis J Benton, and Dr Lauchlin J Baker were appointed a committee to make arrangements for a meeting at the Ogdensburg Country Club in August, when members of the St. Lawrence County Medical Society and their wives will be guests of the Ogdensburg Medical Society

Suffolk County

Dr Frank Everett Benjamin, seventy-one of Riverhead, former President of

the Suffolk County Medical Society, died on April 30 at his home following a heart attack suffered several weeks previously

Dr Benjamin was a director and one of the organizers of the Long Island State Bank and Trust Company and a member of the staffs of the Southampton Hospital and the Mather Memorial Hospital at Port Jefferson

Sullivan County

Dr Rosetta Sherwood Hall, of Liberty, celebrated in April her first half hundred years" of practicing medicine. Local papers said she was busy planning a golden reunion of the dozen surviving women who graduated with her from the Women's Medical College of Pennsylvania. Dr Hall was the youngest of the class of 1889, it numbered forty-one

She worked in the East for forty five years, under Methodist auspices, establishing four women's hospitals and educational work for the blind and deaf Upon completion of her first twenty five years of medical practice, she was awarded a certificate of merit and a silver cup by the government of Korea.

One of the institutions that she founded was the Women's Medical College of Korea

Tompkins County

'One retired member and one active member of the Tompkins County Medical Society have recently died, and I am enclosing the notice for the JOURNAL.

April 12 1939—Dr Wilber G Fish, of Ithaca, N Y a graduate of Cleveland Medical College in 1893 Dr Fish was a past president of Tompkins County Medical Society He died at the age of eighty from prostatitis and nephritis.

April 26, 1939—Harvey L Van Pelt, of Ithaca N Y, a graduate of Cornell University Medical College in 1902 He was a member of the New York State Medical Society and of the A.M.A. He died at the age of sixty-one from a fractured skull and punctured lung due to

being hit by an automobile"—*Reported by William Wilson, M D, Secretary Tompkins County Medical Society*

Ulster County

An outbreak of septic sore throat has occurred in Malden, Cementon, and Saugerties, according to Dr Edward S Godfrey, Jr, State Commissioner of Health. A report states that all the approximately 500 cases occurred among consumers of raw milk supplied by one dealer. Most of the milk consumed in Malden and Cementon is supplied by this dealer, but only a small fraction of the Saugerties supply is thus furnished. Three of the victims died.

The dealer supplied both pasteurized and raw milk, and all the cases are apparently confined to persons consuming the raw milk he furnished. As soon as the outbreak was discovered he ceased distribution of all milk, pending investigation.

Within two hours after it was determined that raw milk was the source of the outbreak, health authorities discovered the cow that was spreading the disease and ordered the animal killed.

Westchester County

The big fun day for all the sportsmen, funsters, gourmets, and general unclaxers this year was June 7, when the Westchester County Medical Society held forth afternoon and evening at the Briar Hills Golf Club in Briarcliff Manor, says the County *Bulletin*.

There was a golf tournament with "Bill" Van Wie, of Mount Vernon, working to get his second leg on the tremendous Mead Johnson trophy cup. And there were plenty of other prizes to play for.

Tennis was played across the road at the Briarcliff Lodge. There was also soft ball, with beer at first base, and a horseshoe competition—all waged on the premises.

The committee this year specialized on the dinner, which was man-size and juicy, and the after-dinner entertainment was

more scintillating and colossal than could be conceived.

The April meeting of the Westchester County Medical Society was marked by the largest attendance recorded for any meeting of the society in its entire history—nearly 250 members being present. This distinction, remarks the *Bulletin*, was a well-merited tribute to the guest speaker of the evening, Dr Perrin H Long, of Johns Hopkins, whose talk on "The Clinical Use of Sulfanilamide, Sulfapyridine and Allied Compounds" was generally considered a masterpiece on this highly pertinent topic.

Dr Long's paper was discussed formally by Dr Harris W Campbell, of White Plains, from the standpoint of internal medicine, Dr Andrew A Eggston, of Mount Vernon, from the standpoint of pathology, and Dr F Duncan Barnes, of New Rochelle, from the standpoint of pediatrics.

A regular meeting of the New Rochelle Medical Society was held on May 8, at the New Rochelle Hospital. Dr Harold C Ingraham discussed "Gynecologic Problems Met in General Practice."

The American Bronchoscopic Society held its twenty-second annual meeting at the Westchester Country Club in Rye, on May 26. At the morning session, an address was given by the president, Dr John D Kernan, of New York City, followed by a scientific presentation. The first paper was a case report on the "Treatment of a Child Following Ingestion of 'Drano,'" by Dr David H Jones, of Mount Vernon and New York.

A number of case reports and important papers followed.

A regular meeting of the New Rochelle Medical Society was held on April 10, at the New Rochelle Hospital. Dr Fenwick Beekman, attending surgeon at Bellevue and Ruptured and Crippled hospitals, presented a paper on "Reconstruction Plastic Surgery" which was followed by a general discussion.

Hospital News

Economy at the Expense of the Mentally III

"**M**ISGUIDED efforts at economy," was the label applied by Dr John R. Ross, Superintendent of the Harlem Valley State Hospital at Wingdale, to state budget slashes aimed at the State Department of Mental Hygiene.

A general lowering of standards and a gradual reversion to the old custodial type of care were in store if the cuts were adopted, he warned.

Citing that his own hospital's budget had been cut by more than a quarter million dollars, Dr Ross said this would force dismissal of 81 employees.

Dr Ross said in his prepared statement

"If the proposed legislative budget takes effect, the Department of Mental Hygiene is going to find itself in a very serious situation. Regardless of how the money is allocated, it does not seem possible to absorb such a large cut without gravely affecting the essential services rendered by the various institutions.

"There will be a general lowering of the high standards of care of which New York State has been so proud, and a gradual reversion to the old 'custodial' type of care of the patient. The recovery and improvement rates of mental diseases will lessen and will result in a prolonged period of stay of patients in institutions which, in turn, will increase the costs for the taxpayers. Accidents will undoubtedly increase as they occur in direct proportion to the number of nurses and attendants employed to supervise patients.

Patients to Suffer

"Most regrettable of all, however, is the lot of the poor, unfortunate patients. It will be a sorry one indeed. Life has not been too kindly to them at best and it would be unjust to heap more misery upon them by denying them modern treatment and what little pleasures they have had."

This and many other similar protests had their effect and a large part of the proposed cut in appropriations for the Department of Mental Hygiene were abandoned. Dr William J. Tullany, the commissioner of the department, tells us in a letter how this happy result was brought about. He writes:

"The original legislative budget reduced the amounts recommended by the Governor by \$1,584,140. Of that sum \$1,525,000 was taken from the operating appropriations of the institutions. That is to say, from the funds required for the payment of salaries and wages and for the general maintenance items of food, fuel, clothing, medical supplies, repairs, etc. The balance was taken from appropriations for the central department offices.

"The legislative position seemed to be that with lump-sum appropriations freer use of the funds would be possible and consequently a smaller total would be required in each case. What had not been considered was that every possible economy had been anticipated in the first instance in the preparation of the executive budget which in itself was \$335,293 less than appropriations for the present year for similar items, in spite of estimated increase in patient population of 2,500.

"As soon as possible a survey of the situation was made and protests were filed with the chairmen of the fiscal committees of the legislature. Basing our appeal on the fact that expenditures for food and fuel, which constitute 75% of our maintenance expenditures, were items over which we had very little control, we predicted that the reduction would eventually lead to the elimination of some 1,600 positions in ward and dining room services. Such an eventuality, of course, was something we could not but view with considerable misgiving as the present personnel situation leaves something to be desired.

"Accordingly, we followed up our first protest with a supplemental request for the appropriation of that portion of the reduction which in our opinion represented the reductions on personal service, food, and fuel, a total of \$1,244,703. In this we analyzed the personnel situation in some detail and pointed out the absolute necessity for sufficient appropriations for food and fuel, expressing our desire to cooperate in every way possible in effecting economies without unduly sacrificing the standard of care.

"I am most happy to say that the

Newsy Notes

An address on "Newer Concepts of Pneumonia" by Dr. Kenneth Goodner of the Rockefeller Institute and installation of new hydrotherapy and physiotherapy equipment featured the rededication on April 20 of the Buffalo City Hospital as Meyer Memorial Hospital.

Dr. Goodner, an authority on pneumonia, spoke in the auditorium before the Erie County Medical Society, Meyer Memorial staff physicians, and other medical men. Dr. Nelson G. Russell presided.

The former City Hospital was renamed last winter, by action of its board of managers approved by the City Council, to honor the late Dr. Edward J. Meyer, for twenty-four years president of the board and a prominent Buffalo physician.

. . .

More than 150 state hospital physicians and psychiatrists gathered at Utica State Hospital on April 28 for a two-day conference. Results of research on the relationship between overindulgence in alcohol and insanity were given in several papers. Findings were obtained in a study of 100 cases.

. . .

Approximately seventy-five attended the annual joint meeting of the Hospital Association of Northeastern New York.
